DESIGN SUMMARY  
838 x 292 x 176 UKB Grade S 355

CONSTRUCTION

STAGE

Steel yield strength 345 N/mm²
Concrete strength 30 N/mm²
Maximum moment 1090 kNm
Moment resistance 2349 kNm
Unity factor 0.464 ≤ 1
Buckling resistance 2235 kNm
Unity factor 0.488 ≤ 1
Maximum shear force 222 kN
Shear resistance 2463 kN
Unity factor 0.09 ≤ 1

Deflection to span ratio

(G + Q) 1: 379

DESIGN SUMMARY

FINAL STAGE

Effective width 3.83 m

Stud shear resistance 81.7 kN
Studs across flange in pairs
Number of 19 mm studs see footnote
Stud spacing between see footnote

Design compressive force:
Concrete 7728 kN
Studs 5389 kN
Shear connection ratio 0.697

Partial shear connection provided

Maximum moment 2115 kNm
Moment resistance 3579 kNm
Unity factor bending 0.591 ≤ 1
Maximum shear force 428 kN
Shear plastic resistance 2463 kN
Unity factor shear 0.174 ≤ 1

Deflection to span ratio

at final stage (G + Q) 1: 312

Slab shear force 544 kN/m
Slab resistance 545 kN/m
Min transverse reinft. 968 mm²/m
Normal weight concrete (NWC) assumed

Stud spacing between each support and 1/3 point to be 150 mm.  
The number of studs required between each support & 1/3 point is 33 No.  Between 1/3 points provide nominal studs.
Location: Ex3

Composite internal beam with secondary beams located at 1/3 points to BS EN 1994-1-1:2004 the Code for the 'Design of composite steel and concrete structures'. The beam is considered to be unpropped during construction and is assumed to be simply supported.

Check on transverse reinforcement omitted.

**COMPOSITE**

305 x 102 x 28 UB Grade S 355 with 16 No. 19 dia. stud connectors @ 375 centres.

**SUMMARY**

Section is satisfactory for construction, composite, elastic, plastic, moment, shear, deflection and natural frequency requirements.

Construction stage moment 45.313 kNm
Steel beam mom. capacity 143.07 kNm
Const. stage deflection 9.055 mm
Composite stage moment 162.15 kNm
Ultimate mom. capacity 238.69 kNm
Vertical shear force 89.296 kN
Ult. shear capacity 394.52 kN
Composite stage deflection 7.1117 mm
Location: example 1 with fire resistance check

---

**Beam span**
- $L_1 = 6$ m

**Secondary beam span**
- $L_2 = 6$ m

**Concrete cube strength**
- $f_{cu} = 25$ N/mm$^2$

**Air dry density for concrete**
- $D_c = 17.6$ kN/m$^3$

**Freshwet density for concrete**
- $D'c = 18.8$ kN/m$^3$

Deck is parallel to supporting beam.
305 x 102 x 28 UB.

**Young's Modulus**
- $E = 205$ kN/mm$^2$

**Slab depth**
- $D_s = 115$ mm

**Depth of profiling**
- $D_p = 50$ mm

**Centres of profiles**
- $C_t = 300$ mm

**Width at inside of profile**
- $b = 125$ mm

**Width at outside of profile**
- $p = 175$ mm

**Profiled steel deck**
- $d_{cw}t = 0.12$ kN/m$^2$

**Reinforcement allowance**
- $r_{ew}t = 0.04$ kN/m$^2$

**Steel beam allowance**
- $s_{elf}w = 0.15$ kN/m$^2$

**Construction load allowance**
- $w_c = 0.5$ kN/m$^2$

**Other UDL on beam**
- $w'd_u = 0.33$ kN/m

**Ceiling and services**
- $w_{cs} = 0.25$ kN/m$^2$

**Imposed**
- $w_i = 3$ kN/m$^2$

**Partitions**
- $w_p = 1$ kN/m$^2$

**Wall or other UDL**
- $w'd_u = 7.83$ kN/m

---
Number of studs across flange \( nr=1 \)
Spacing of connectors \( spac1=400 \) mm

Check on transverse reinforcement omitted.

Total permanent load \( Vfp=18 \) kN

Lateral restraint from steel decking - construction phase

The following calculations are in accordance with EC3 Parts 1-1, 1-3 and SCI P360 entitled 'Stability of Steel Beams and Columns'. The objective is to investigate whether during the construction phase (prior to concrete hardening), the steel decking offers sufficient lateral restraint to the beams such that the beams may be considered as fully restraint against lateral torsional buckling.

Design assumptions:

- the steel decking is perpendicular to the beam span and is attached at every rib to the top flange of beams
- the composite floor system comprises trapezoidal steel decking and an in-situ cast concrete
- more than two equally spaced beams are present.

Beam span L=8000 mm
Length of sheeting ⊥ to beams br=6000 mm (overall length)
Steel decking thickness t=1 mm
Decking profile height hw=60 mm

254 x 102 x 22 UKB
Dimensions (mm): h=254 b=101.6 tw=5.7 tf=6.8 r=7.6
Properties (cm): Iy=2840 Iz=119 Wply=259 Wplz=37.3 It=4.15

Available sheeting stiffness - BS EN 1993-1-3, Clause 10.1.1(10)

The shear stiffness of trapezoidal sheeting is given by:

\[ S = 1000 \times (t)^3 \times (50 + 10 \times (br) \times 0.3333) \times s / (hw \times 1000) \]
\[ = 11583 \text{ kN per unit length} \]

As \( S \geq S_{req} \) (11583 kN \( \geq 4960.4 \) kN), the floor beams may be considered to be laterally restrained by the sheeting during construction phase and therefore the beam may be assumed to be laterally restrained.
UNIVERSAL BEAM

254 x 102 x 22 UKB

Beam span 8000 mm

Length of sheeting \( \perp \) to beams 6000 mm

DESIGN

Beam spacing 3000 mm

SUMMARY

Decking thickness 1 mm

Decking profile height 60 mm

Required sheeting stiffness 4960 kN

Available sheeting stiffness 11583 kN

NOTE: The steel decking is perpendicular to the beam span and is attached at every rib to the top flange of beams. The composite floor system comprises trapezoidal steel decking and an in-situ cast concrete.
Location: First floor - Small UB

Load factor for temperature gamma=1

### Plane frame analysis

Axial and bending effects can be analysed in a plane frame model.

Bending effects for hogging releasing moment:

\[
\theta = \frac{RM \cdot L}{E \cdot I}
\]

End 1 \( \theta \) deflected shape of released member

\( * * \) tangent to deflected shape at member ends

Calculate the angle (2*\( \theta \)) in radians

where 2*\( \theta \) = \( \frac{RM \cdot L}{E \cdot I} \)
NL-STRESS will apply the opposite of the releasing moment (RM) to the released member and rotate it by $2\theta$. The member is then clamped in the frame and let go.

Member distortion ($2\theta$) \[ mdfmp = \frac{(RM \cdot L)}{EI} = -0.96523E-3 \text{ radians} \]

Value of distortion for input to NL-STRESS \[ disfmp = mdfmp \cdot gamma = -0.96523E-3 \text{ radians} \]

The distortion should be input into the plane frame analysis using the MEMBER DISTORTIONS option with the following format.

\[ \text{<members>} \text{ ROTATION Z } -0.96523E-3 \]

The equilibrating stresses should be taken into account when stresses at a section due to combinations of loading are calculated.

Longitudinal effects for tensile releasing force:

Released member

\[ dL = \frac{(RF \cdot L)}{(A \cdot E)} \text{ in metres} \]

NL-STRESS will apply the opposite of the releasing force (RF) to the released member and compress it by $dL$. The member is then clamped in the frame and let go.

Member distortion \[ mdffp = \frac{(RF \cdot L) \cdot 1000}{EQ1} = 0.57712E-3 \text{ m} \]

Value of distortion for input to NL-STRESS \[ disffp = mdffp \cdot gamma = 0.57712E-3 \text{ m} \]

The value should be input into the plane frame analysis using the MEMBER DISTORTIONS option with the following format.

\[ \text{<members>} \text{ DISTORTION X } 0.57712E-3 \]

The equilibrating stresses should be taken into account when stresses at a section due to combinations of loading are calculated.

**Reverse temperature calculations**

Temperature gradient – increments of depth (Figure 9, BD 37/01)

Positive temperature diagram
Plane frame analysis

Axial and bending effects can be analysed in a plane frame model.

Bending effects for hogging releasing moment:

\[
\theta = \frac{RM \times L}{EI}
\]

End 1 \[\theta\] End 2

\[<---L---->\]

* * deflected shape of released member
**** tangent to deflected shape at member ends

Calculate the angle \(2\theta\) in radians where

\[
2\theta = \frac{RM \times L}{EI}
\]

NL-STRESS will apply the opposite of the releasing moment \(RM\) to the released member and rotate it by \(2\theta\). The member is then clamped in the frame and let go.

Member distortion \(2\theta\) \[mdfmp=(RM \times L)/EI=-0.8061E-3\] radians

Value of distortion for input to NL-STRESS \[disfmp=mdfmp \times \gamma=-0.8061E-3\] radians

The distortion should be input into the plane frame analysis using the MEMBER DISTORTIONS option with the following format.

\[<\text{members}> \text{ ROTATION } Z -0.8061E-3\]

The equilibrating stresses should be taken into account when stresses at a section due to combinations of loading are calculated.
Longitudinal effects for tensile releasing force:

Released member

\[ \frac{dL}{L} \approx \frac{RF}{E} \]

Calculate the extension of the member \( dL = \frac{RF \cdot L}{A \cdot E} \) in metres.

NL-STRESS will apply the opposite of the releasing force (RF) to the released member and compress it by \( dL \). The member is then clamped in the frame and let go.

Member distortion

\[ mdffp = \frac{RF \cdot L}{E} \cdot 1000 = 0.32175E-3 \text{ m} \]

Value of distortion for input to NL-STRESS

\[ disffp = mdffp \cdot \gamma = 0.32175E-3 \text{ m} \]

The value should be input into the plane frame analysis using the MEMBER DISTORTIONS option with the following format:

\[ <\text{members}> \text{ DISTORTION X } 0.32175E-3 \]

The equilibrating stresses should be taken into account when stresses at a section due to combinations of loading are calculated.

### Plane frame analysis

Axial and bending effects can be analysed in a plane frame model. Bending effects for hogging releasing moment:

\[
2\theta = \frac{RM \times L}{EI}
\]

* * deflected shape of released member  
**** tangent to deflected shape at member ends

Calculate the angle (2*theta) in radians where

\[
2\theta = \frac{RM \times L}{EI}
\]
NL-STRESS will apply the opposite of the releasing moment (RM) to the released member and rotate it by 2*theta. The member is then clamped in the frame and let go.

Member distortion (2*theta) \( \text{mdfmp} = \frac{\text{RM} \times \text{L}}{\text{EI}} = -0.0012649 \text{ radians} \)

Value of distortion for input to NL-STRESS
\( \text{disfmp} = \text{mdfmp} \times \gamma = -0.0012649 \text{ radians} \)

The distortion should be input into the plane frame analysis using the MEMBER DISTORTIONS option with the following format.

\[ \langle \text{members} \rangle \ \text{ROTATION} \ Z \ -0.0012649 \]

The equilibrating stresses should be taken into account when stresses at a section due to combinations of loading are calculated.

Longitudinal effects for compressive releasing force:

Released member

\[ \langle _____ \ L \ _____ \rangle \]

\[ \langle -dL \rangle \]

\[ *- - - . \]

Calculate the contraction of the member \( dL = \frac{\text{RF} \times \text{L}}{\text{A} \times \text{E}} \) in metres

NL-STRESS will apply the opposite of the releasing force (RF) to the released member and extend it by \( dL \). The member is then clamped in the frame and let go.

Member distortion \( \text{mdffr} = \frac{\text{RF} \times \text{L} \times 1000}{\text{EQ1}} = -0.48865 \times 10^{-3} \text{ m} \)

Value of distortion for input to NL-STRESS
\( \text{disffr} = \text{mdffr} \times \gamma = -0.48865 \times 10^{-3} \text{ m} \)

The value should be input into the plane frame analysis using the MEMBER DISTORTIONS option with the following format.

\[ \langle \text{members} \rangle \ \text{DISTORTION} \ X \ -0.48865 \times 10^{-3} \]

The equilibrating stresses should be taken into account when stresses at a section due to combinations of loading are calculated.

**Plane frame analysis**

Axial and bending effects can be analysed in a plane frame model.

Bending effects for hogging releasing moment:

\[
\theta = \frac{2RM}{EI}
\]

Where \( \theta \) is the angle in radians.

Calculate the angle \( 2\theta \) in radians where \( 2\theta = \frac{RM \times L}{E \times I} \).
NL-STRESS will apply the opposite of the releasing moment (RM) to the released member and rotate it by 2*theta. The member is then clamped in the frame and let go.

Member distortion (2*theta) $mdfmp = \frac{RM \times L}{EI} = -0.83745 \times 10^{-3}$ radians

Value of distortion for input to NL-STRESS $disfmp = mdfmp \times \gamma = -0.83745 \times 10^{-3}$ radians

The distortion should be input into the plane frame analysis using the MEMBER DISTORTIONS option with the following format.

```
<members> ROTATION Z -0.83745E-3
```

The equilibrating stresses should be taken into account when stresses at a section due to combinations of loading are calculated.

Longitudinal effects for compressive releasing force:

Released member

```
<--dL--> L -->
```

Calculate the contraction of the member $dL = \frac{RF \times L}{A \times E}$ in metres

NL-STRESS will apply the opposite of the releasing force (RF) to the released member and extend it by $dL$. The member is then clamped in the frame and let go.

Member distortion $mdffr = \frac{RF \times L \times 1000}{EQ1} = -0.30209 \times 10^{-3}$ m

Value of distortion for input to NL-STRESS $disffr = mdffr \times \gamma = -0.30209 \times 10^{-3}$ m

The value should be input into the plane frame analysis using the MEMBER DISTORTIONS option with the following format.

```
<members> DISTORTION X -0.30209E-3
```

The equilibrating stresses should be taken into account when stresses at a section due to combinations of loading are calculated.

Member length L=10 m
Load factor for temperature gamma=1

**Plane frame analysis**

Axial and bending effects can be analysed in a plane frame model.
Bending effects for hogging releasing moment:

\[
\theta \rightarrow 2\theta
\]

\[
\theta \rightarrow \theta(2\theta)
\]

End 1 \[ \rightarrow \] \[ \text{tangent to deflected shape at member ends} \]

Calculate the angle (2*theta) in radians where

\[
2\theta = \frac{RM \times L}{E \times I}
\]

NL-STRESS will apply the opposite of the releasing moment (RM) to the released member and rotate it by 2*theta. The member is then clamped in the frame and let go.

Member distortion (2*theta) \[ mdfm = \frac{RM \times L}{E \times I} = -0.80516E-3 \] radians
Value of distortion for input to NL-STRESS \[ disfmp = mdfmp \times gamma = -0.80516E-3 \] radians

The distortion should be input into the plane frame analysis using the MEMBER DISTORTIONS option with the following format.

\[ <\text{members}> \text{ ROTATION Z } -0.80516E-3 \]

The equilibrating stresses should be taken into account when stresses at a section due to combinations of loading are calculated.
**Longitudinal effects for tensile releasing force:**

**Released member**

\[
\left\langle \Delta L \right\rangle = \left\langle \delta \right\rangle + L
\]

Calculate the extension of the member \( \Delta L = \frac{RF \times L}{A \times E} \) in metres

NL-STRESS will apply the opposite of the releasing force \( RF \) to the released member and compress it by \( \Delta L \). The member is then clamped in the frame and let go.

**Member distortion**

\[ mdffp = \frac{(RF \times L) \times 1000}{EQ1} = 0.32202 \times 10^{-3} \text{ m} \]

**Value of distortion for input to NL-STRESS**

\[ disffp = mdffp \times \gamma = 0.32202 \times 10^{-3} \text{ m} \]

The value should be input into the plane frame analysis using the MEMBER DISTORTIONS option with the following format.

\[ <\text{members}> \text{ DISTORTION X } 0.32202 \times 10^{-3} \]

The equilibrating stresses should be taken into account when stresses at a section due to combinations of loading are calculated.

**Reverse temperature calculations**

**Temperature gradient - increments of depth** (Figure 6.2b, EN 1991-1-5)

- \( h_{n1} = 0.6 \times h = 120 \text{ mm} \)
- \( h_{n2} = 0.4 \times h = 80 \text{ mm} \)
- \( h_{n3} = 400 \text{ mm} \)
- \( h_{n4} = tsd - h - 400 = 355 \text{ mm} \)

**Temperature values** (Figure 6.2b & Table B.2 in EN 1991-1-5):

- Temperature T1
  \[ T_{R1} = \text{TABLE 2 for } h = 200, \ ds = 150 \]
  \[ = -2.3 \degree C \]
- Temperature T2
  \[ T_{R2} = -8 \degree C \]
- Temperature T3
  \[ T_{R3} = -8 \degree C \]

**Plane frame analysis**

Axial and bending effects can be analysed in a plane frame model.  
Bending effects for sagging releasing moment:

\[
\theta = \frac{(RM \times L)}{(E \times I)}
\]

Where 2*theta is the angle in radians where:

Calculate the angle (2*theta) in radians

```
SCALE 5.48                     Office 1007                 Proforma 226
```
NL-STRESS will apply the opposite of the releasing moment (RM) to the released member and rotate it by 2*theta. The member is then clamped in the frame and let go.

Member distortion (2*theta) \( \text{mdmfr} = \frac{\text{RM} \times L}{EI} = 0.001217 \text{ radians} \)

Value of distortion for input to NL-STRESS
\( \text{dismfr} = \text{mdmfr} \times \gamma = 0.001217 \text{ radians} \)

The distortion should be input into the plane frame analysis using the MEMBER DISTORTIONS option with the following format.

\[
\langle \text{members} \rangle \text{ ROTATION Z 0.001217}
\]

The equilibrating stresses should be taken into account when stresses at a section due to combinations of loading are calculated.

Longitudinal effects for compressive releasing force:

Released member

\[
\begin{array}{c}
\langle \text{dL} \rangle \\
\text{L} \\
\text{member distortion} \\
\text{mdffr} = \frac{(\text{RF} \times L) \times 1000}{\text{EQ1}} = -0.34901 \times 10^{-3} \text{ m} \\
\text{dissffr} = \text{mdffr} \times \gamma = -0.34901 \times 10^{-3} \text{ m}
\end{array}
\]

The value should be input into the plane frame analysis using the MEMBER DISTORTIONS option with the following format.

\[
\langle \text{members} \rangle \text{ DISTORTION X -0.34901E-3}
\]

The equilibrating stresses should be taken into account when the stresses at a section due to combinations of loading are calculated.

Member length $L=10\,\text{m}$  
Partial load factor for shrinkage $\gamma=1$

**Plane frame analysis**

Axial and bending effects can be analysed in a plane frame model. Bending effects for sagging releasing moment:

\[\theta = \frac{RM \cdot L}{EI}\]

Where $\theta$ is the deflection, $RM$ is the releasing moment, $L$ is the member length, $E$ is the modulus of elasticity, and $I$ is the moment of inertia.

\[\theta_2 = 2\theta\]

The deflected shape of the released member is calculated, and NL-STRESS will apply the opposite of the releasing moment ($RM$) to the released member and rotate it by $2\theta$. The member is then clamped in the frame and let go.

Member distortion ($2\theta$) $mdmfr=\frac{RM \cdot L}{EI}=0.0010906$ radians

Value of distortion for input to NL-STRESS $dismfr=mdmfr \cdot \gamma=0.0010906$ radians

The distortion should be input into the plane frame analysis using the MEMBER DISTORTIONS option with the following format.

\[\text{<members> ROTATION Z 0.0010906}\]

The equilibrating stresses should be taken into account when stresses at a section due to combinations of loading are calculated.
Longitudinal effects for compressive releasing force:

Released member

\[
\begin{align*}
\text{\(dL\)} & \quad \text{\(L\)} \\
\text{\(<\rightarrow\)} & \quad \text{\(\rightarrow\)}
\end{align*}
\]

Calculate the contraction of the member \(dL = (RF \times L)/(A \times E)\) in metres

NL-STRESS will apply the opposite of the releasing force (RF) to the released member and extend it by \(dL\). The member is then clamped in the frame and let go.

Member distortion \(mdffr = (RF \times L) \times 1000/EQ1 = -0.84932E-3\) m

Value of distortion for input to NL-STRESS \(disffr = mdffr \times \gamma = -0.84932E-3\) m

The value should be input into the plane frame analysis using the MEMBER DISTORTIONS option with the following format.

\(<\text{members}>\) DISTORTION X -0.84932E-3

The equilibrating stresses should be taken into account when the stresses at a section due to combinations of loading are calculated.

Member length \( L = 10 \, \text{m} \)

Partial load factor for shrinkage \( \gamma = 1 \)

**Plane frame analysis**

Axial and bending effects can be analysed in a plane frame model.

Bending effects for sagging releasing moment:

\[
\theta = \frac{RM \cdot L}{E \cdot I}
\]

End 1

\[
\theta, \theta(\ast\ast) \, \text{theta}
\]

End 2

\[
\theta, \theta(\ast\ast) \, \text{theta}
\]

\[
\text{2}\theta, \text{2}\theta(\ast\ast) \, \theta(\ast\ast)
\]

* * * deflected shape of released member
* * * tangent to deflected shape at member ends

Calculate the angle \( 2\theta \) in radians

where \( 2\theta = \frac{RM \cdot L}{E \cdot I} \)
NL-STRESS will apply the opposite of the releasing moment (RM) to the released member and rotate it by 2*theta. The member is then clamped in the frame and let go.

Member distortion (2*theta) \[
mdmfr=(RM*L)/EI=0.0012068 \text{ radians}
\]

Value of distortion for input to NL-STRESS
\[
dismfr=mdmfr*gamma=0.0012068 \text{ radians}
\]

The distortion should be input into the plane frame analysis using the MEMBER DISTORTIONS option with the following format.

\[
<\text{members}> \text{ ROTATION Z 0.0012068}
\]

The equilibrating stresses should be taken into account when stresses at a section due to combinations of loading are calculated.

Longitudinal effects for compressive releasing force:

Released member \[\begin{array}{c}
\text{L} \\
\hline
<\text{dL}> \\
\end{array}\] \[\begin{array}{c}
\text{---} \\
\text{---} \\
\end{array}\]

Calculate the contraction of the member dL=(RF*L)/(A*E) in metres

NL-STRESS will apply the opposite of the releasing force (RF) to the released member and extend it by dL. The member is then clamped in the frame and let go.

Member distortion \[
mdffr=(RF*L)*1000/EQ1=-0.34733E-3 \text{ m}
\]

Value of distortion for input to NL-STRESS
\[
disffr=mdffr*gamma=-0.34733E-3 \text{ m}
\]

The value should be input into the plane frame analysis using the MEMBER DISTORTIONS option with the following format.

\[
<\text{members}> \text{ DISTORTION X -0.34733E-3}
\]

The equilibrating stresses should be taken into account when the stresses at a section due to combinations of loading are calculated.

Location: Domestic floor joist example

These calculations follow the domestic floor joists example by V C Johnson in TRADA Design Aid DA1 and BS5268-2:2002.

The following assumptions are made in these calculations:
- that the timber has a moisture content of service class 1 or 2 (i.e. K2=1)
- the floor can adequately distribute any concentrated point load to at least two joists.
- the centres of joists do not exceed 610 mm
- that load sharing of the joists can occur & K8 = 1.1.

Effective span of joist  L=3.6 m
Centres of joists  crs=600 mm
Dead load including self weight  dead=0.34 kN/m²
Imposed udl load (on floor)  live=1.5 kN/m²
Imposed point load (on one joist)  PL=2 kN
Depth of section  d=200 mm
Width of section  b=50 mm
Bearing length  lb=100 mm
Strength class C18 to Table 8.
Duration of loading  K3=1
Depth factor  K7=(300/d)^0.11=1.0456
Load sharing (Clause 2.9)  K8=1.1
From BS5268-2 Table 18, bearing is < 75 mm from joist end.
Bearing Modification factor  K4=1.0

Joists: 200 mm x 50 mm @ 600 mm crs

Sample output for SCALE Proforma 256. (ans=1) Made by: IFB
Timber design to BS5268 and Eurocode 5 Date: 02/12/19
Simply supported flitched beam with general loadin Copyright 1986-2019 Fitzroy Systems Ltd. Ref No: SC256 BS

Location: Flitched timber beam with udl & point loads

Fully restrained flitched beam to BS5268-2:2002 and BS 449:1990

Beam span L=7.5 m
Section comprises steel plates to top & bottom faces of timber.
Depth of timber section d=300 mm
Width of timber section b=100 mm
Depth of steel section ds=12 mm
Width of steel section bs=100 mm
Length of bearing lb=150 mm
Bearing modification factor K4=1.0
Strength class C22 to Table 8.
Timber service class adopted tmclass=1
Timber service class modification factor K2=1 as Table 16.
Load-sharing modification factor K8=1.0

Section properties and Modular ratio

Total Inertia about xx axis in equivalent timber
Extreme fibre is steel plate Yc=Ys=162 mm
Dist of centroid to timber edge Yn=Yt=150 mm
Z to top edge of steel plate Zc=Ixx/Yc=12.765E6 mm³

Simply supported beam subjected to vertical loads.

Beam span L=7.5 m
Dist. from left support to start Lau(1)=0 m
Distance from left support to end Lbu(1)=7.5 m
Dead load (unfactored) Gku(1)=2.25 kN/m
Imposed load (unfactored) Qku(1)=1 kN/m
Maximum span bending moment 22.852 kNm
Design shear force Fve'=12.188
Duration of loading K3=1.25
Depth factor K7=(300/d)^0.11=1
Bolt diameter bd=20 mm
No of rows of bolts to be adopted NRC=1
Spacing of bolts along beam space=250 mm
Timber characteristic density $\rho_{k1} = 340$ kg/m³
Angle between grain and load $\alpha_{p1}' = 0^\circ$

**Bolt shear capacities**

Basic loads in kN will be derived from formula given in Annex G.3
Load duration for bolted connection = Medium term.
Embedded strength for timber 1
Embedding strength $f_{hd} = 0.050 \times (1 - 0.01 \times bd) \times \rho_{k1} \times K_a = 13.6$
Embedding strength (Timb 1) $f_{hd1} = f_{hd} / ((K_{90} \times \sin(\alpha_{p1})^2 + \cos(\alpha_{p1})^2)) = 13.6$
Equations G1 to G6 in annex G in BS5268-2:2002.

Basic bolt shear capacity $basic = 1 \times G_{min} / (F_d \times K_d) = 11.356$ kN
Mod factor for moisture content $K_{56} = 1$
Mod factor for number of bolts $K_{57} = 1$

Permissible bolt load $p_{bl} = basic \times K_{46} \times K_{56} \times K_{57} = 14.195$ kN

**DESIGN**
- Modular ratio 31.538

**SUMMARY**
- Timber bending stress 1.6575 N/mm²
- Timber perm. bending 8.5 N/mm²
- Steel bending stress 56.459 N/mm²
- Steel perm. bending 180 N/mm²
- Deflection 10.6 mm
- Limiting deflection 22.5 mm
- Applied shear 12.188 kN
- Shear capacity 17.75 kN
- Bearing stress 0.81253 N/mm²
- Permissible bearing 2.875 N/mm²
- Applied load per bolt 8.6992 kN
- Permiss load per bolt 14.195 kN

Bolts are 20 mm diameter in 1 row(s) at 250 mm centres.
Location: Flitched timber beam with udl & point loads

Fully restrained flitched beam to BS5268-2:2002 and BS 449:1990

Beam span L=4.8 m
Section comprises one steel web plate with a timber member on each side.
Depth of timber section d=200 mm

Total Inertia about xx axis in equivalent timber
Extreme fibre is timber section Yc=Yt=100 mm
Dist of centroid to steel edge Yn=Ys=95 mm
Z to top edge of timber Zc=Ixx/Yc=2.229E6 mm³

Simply supported beam subjected to vertical loads.

Beam span L=4.8 m
Dist. from left support to start Lau(1)=0 m
Distance from left support to end Lbu(1)=4.8 m
Dead load (unfactored) Gku(1)=1.2 kN/m
Imposed load (unfactored) Qku(1)=0.6 kN/m
Maximum span bending moment 5.184 kNm
Design shear force Fve'=4.32

Duration of loading K3=1
Depth factor K7=(300/d)^0.11=1.0456

Bolts between timber and steel plate along length of beam

Bolt diameter bd=16 mm
Spacing of bolts along beam space=500 mm
Bolts are in double shear. Width of timber for bolt stress calculation
is the section width $b$ 
Angle between grain and load $\alpha_1' = 90$ degrees
Timber characteristic density $p_{k1} = 320$ kg/m$^3$
Basic loads in kN will be derived from formula given in Annex G.3
Load duration for bolted connection = Medium term.
Embedded strength for timber 1
Embedding strength $f_{hod} = 0.050 \times (1 - 0.01 \times bd) \times p_{k1} \times K_a = 17.78$
Embedding strength (Timb 1) $f_{hd1} = f_{hod} / \left( (K90 \times \sin(\alpha_1')^2 + \cos(\alpha_1')^2) \right) = 11.182$
Equations G7 G8 G9 G10 8945.8 8945.8 6709.3 9226.4
Min value of equations G7 to G10 $G_{\text{min}} = 6709.3$

Basic bolt shear capacity $\text{basic} = 1 \times G_{\text{min}} / (F_d \times K_d) = 4.7923$ kN
Mod factor for moisture content $K_{56} = 0.7$
Mod factor for number of bolts $K_{57} = 1$
Permissible bolt load in timber $p_{bl} = 2 \times \text{basic} \times K_{46} \times K_{56} \times K_{57} = 6.7093$ kN

Design
Member: 200 mm x 108 mm overall
Modular ratio 34.167

Summary
Timber bending stress 2.3257 N/mm$^2$
Timber perm. bending 6.671 N/mm$^2$
Steel bending stress 75.489 N/mm$^2$
Steel perm. bending 180 N/mm$^2$
Deflection 9.5335 mm
Limiting deflection 14 mm
Applied shear 4.32 kN
Shear capacity 9.8267 kN
Bearing stress 0.432 N/mm$^2$
Permissible bearing 2.42 N/mm$^2$

Bolts are 16 mm diameter at 500 mm centres (10 No total).
Edge distance in the steel to be a minimum of 32 mm.
Bolts along the beam to be staggered above and below the centre line with their centres offset from the beam centre line to suit the min bolt edge spacing of 64 mm.
The minimum No of bolts required at the bearing = 2
Location: Flitched timber beam with udl & point loads

Fully restrained flitched beam to BS5268-2:2002 and BS 449:1990

Beam span \( L = 8 \text{ m} \)
Section comprises steel plates to each side face of timber section.
Depth of timber section \( d = 400 \text{ mm} \)
Width of timber section \( b = 100 \text{ mm} \)
Depth of steel section \( d_s = 375 \text{ mm} \)
Width of steel section \( b_s = 12 \text{ mm} \)
Length of bearing \( l_b = 100 \text{ mm} \)
From BS5268-2 Table 18, bearing is < 75 mm from joist end.
Bearing Modification factor \( K_4 = 1.0 \)
Strength class C18 to Table 8.
Timber service class adopted \( \text{tmclass} = 2 \)
Timber service class modification factor \( K_2 = 1 \) as Table 16.
Load-sharing modification factor \( K_8 = 1.0 \)

Section properties and Modular ratio

Total Inertia about \( xx \) axis in equivalent timber
Extreme fibre is timber section \( Y_c = Y_t = 200 \text{ mm} \)
Dist. of centroid to steel edge \( Y_n = Y_s = 187.5 \text{ mm} \)
\( Z \) to top edge of timber \( Z_c = I_{xx}/Y_c = 20.684E6 \text{ mm}^3 \)

Simply supported beam subjected to vertical loads.

Beam span \( L = 8 \text{ m} \)
Distance from left support \( L_{c(1)} = 2 \text{ m} \)
Dead load (unfactored) \( G_{k_c(1)} = 6 \text{ kN} \)
Imposed load (unfactored) \( Q_{k_c(1)} = 4 \text{ kN} \)
Dist. from left support to start \( L_{a(1)} = 0 \text{ m} \)
Distance from left support to end \( L_{b(1)} = 8 \text{ m} \)
Dead load (unfactored) \( G_{k_u(1)} = 4 \text{ kN/m} \)
Imposed load (unfactored) \( Q_{k_u(1)} = 2 \text{ kN/m} \)
Maximum span bending moment 58.52 kNm
Design shear force $Fve' = 31.5$

Duration of loading $K3 = 1.25$

Depth factor $K7 = 0.81 \times (d^2 + 92300)/(d^2 + 56800) = 0.94263$

Bolts between timber and steel plate along length of beam

Bolt diameter $bd = 20$ mm
Spacing of bolts along beam $space = 500$ mm
Bolts are in double shear. Width of timber for bolt stress calculation is the section width $b$ $bb = 100$ mm
Angle between grain and load $\alpha_1' = 90$ degrees
Timber characteristic density $p_k1 = 320$ kg/m$^3$
Basic loads in kN will be derived from formula given in Annex G.3
Load duration for bolted connection = Medium term.
Embedded strength for timber 1
Embedding strength $fhod = 0.050 \times (1 - 0.01 \times bd) \times p_k1 \times K_a = 16.933$
Embedding strength (Timb 1) $fhd1 = fhod / ((K90 \times \text{SIN}(\alpha_1')^2 + \text{COS}(\alpha_1')^2) = 10.262$
Equations G1 to G6 in annex G in BS5268-2:2002.

Basic bolt shear capacity $\text{basic} = 1 \times G_{\text{min}} / (F_d \times K_d) = 6.4748$ kN
Mod factor for moisture content $K56 = 0.7$
Mod factor for number of bolts $K57 = 1$
Permissible bolt load in timber $pbl = 2 \times \text{basic} \times K46 \times K56 \times K57 = 9.0647$ kN

**SUMMARY**

- Timber bending stress 2.2148 N/mm²
- Timber perm. bending 8.6263 N/mm²
- Steel bending stress 61.62 N/mm²
- Steel perm. bending 180 N/mm²
- Timber tensile X sec area 19000 mm²
- Steel tensile X sec area 1500 mm²
- Timber moisture class 1
- Applied tension stress 0.1275 N/mm²
- Permiss tension stress 5.1758 N/mm²
- Timber interaction factor 0.28139
- Steel interaction factor 0.36602
- Applied shear 4.32 kN
- Shear capacity 12.027 kN
- Bearing stress 0.432 N/mm²
- Permissible bearing 2.31 N/mm²

Bolts are 16 mm diameter at 600 mm centres (9 No total).

Edge distance in the steel to be a minimum of 32 mm.

The end connections are beyond the scope of this proforma.
Location: Flitched timber beam with udl & point loads

Fully restrained flitched beam to BS5268-2:2002 and BS 449:1990

Beam span \( L = 6 \text{ m} \)
Section comprises one steel web plate with a timber member on each side.
Depth of timber section \( d = 250 \text{ mm} \)
Width of timber section \( b = 75 \text{ mm} \)
Depth of steel section \( ds = 225 \text{ mm} \)
Width of steel section \( bs = 12 \text{ mm} \)
Length of bearing \( lb = 100 \text{ mm} \)
From BS5268-2 Table 18, bearing is < 75 mm from joist end.

Bearing Modification factor \( K_4 = 1.0 \)

WARNING: Strength class not recognised. The scr ref no SHOULD BE 16 or 17.
Location: Flitched timber beam with udl & point loads

Fully restrained flitched beam to BS5268-2:2002 and BS 449:1990

Beam span \( L = 5.5 \text{ m} \)
Design BM about xx (positive) \( M' = 9.1816 \text{ kNm} \)
Design shear force in y direction \( Fve' = 6.6776 \text{ kN} \)
Design axial load (+ve compress) \( F_a = 0 \text{ kN} \)
Section comprises one steel web plate with a timber member on each side.

- Depth of timber section \( d = 225 \text{ mm} \)
- Width of timber section \( b = 50 \text{ mm} \)
- Depth of steel section \( ds = 175 \text{ mm} \)
- Width of steel section \( bs = 10 \text{ mm} \)
- Length of bearing \( lb = 50 \text{ mm} \)

From BS5268-2 Table 18, bearing is < 75 mm from joist end.

- Bearing Modification factor \( K_4 = 1.0 \)
- Strength class C16 to Table 8.
- Timber service class adopted \( tmclass = 2 \)
- Timber service class modification factor \( K_2 = 1 \) as Table 16.
- Load-sharing modification factor \( K_8 = 1.0 \)

Section properties and Modular ratio

- Total Inertia about xx axis in equivalent timber
  \( Y_c = Y_t = 112.5 \text{ mm} \)
- Extreme fibre is timber section \( Y_n = Y_s = 87.5 \text{ mm} \)
- Z to top edge of timber \( Z_c = I_{xx}/Y_c = 2.2469 \times 10^6 \text{ mm}^2 \)
- Duration of loading \( K_3 = 1.25 \)
- Depth factor \( K_7 = (300/d)^0.11 = 1.0322 \)

Bolts between timber and steel plate along length of beam

- Bolt diameter \( bd = 16 \text{ mm} \)
- Spacing of bolts along beam \( space = 450 \text{ mm} \)
- Bolts are in double shear. Width of timber for bolt stress calculation is the section width b \( bb = 50 \text{ mm} \)
- Angle between grain and load \( \alpha_1' = 90 \text{ degrees} \)
- Timber characteristic density \( pk_1 = 310 \text{ kg/m}^3 \)
- Basic loads in kN will be derived from formula given in Annex G.3
- Load duration for bolted connection = Medium term.
- Embedded strength for timber 1
  \( fhod = 0.050 \times (1 - 0.01 \times bd) \times pk_1 \times Ka = 17.224 \)
  \( Embedding strength (Timb 1) \)
  \( fhdl = fhod/((K90 \times \sin(\alpha_1')^2) + \cos(\alpha_1')^2) = 10.833 \)

Equations

- \( G_7 = 8666.2 \)
- \( G_8 = 8666.2 \)
- \( G_9 = 6588 \)
- \( G_{10} = 9081.1 \)
- \( \text{Min value of equations } G_7 \text{ to } G_{10} \)
  \( G_{\text{min}} = 6588 \)

Basic bolt shear capacity \( basic = 1 \times G_{\text{min}}/(Fd \times K_d) = 4.7057 \text{ kN} \)
- Mod factor for moisture content \( K_56 = 1 \)
- Mod factor for number of bolts \( K_57 = 0.7 \)
Permissible bolt load in timber \[ pbl = 2 \cdot \text{basic} \cdot K46 \cdot K56 \cdot K57 = 6.588 \, \text{kN} \]

Member: 225 mm x 110 mm overall

Bolts are 16 mm diameter at 450 mm centres (13 No total). Edge distance in the steel to be a minimum of 32 mm. The end connections are beyond the scope of this proforma.
Location: Flitched timber beam with udl & point loads

Fully Restrained flitched beam to EC5 and EC3

Calculations include EC5 National Annex Amendment No.2.

Simply supported flitched beam with general loadings:

Beam span $L=7.5$ m
Dist. from left support to start $L_{au(1)}=0$ m
Distance from left support to end $L_{bu(1)}=7.5$ m
Permanent load (unfactored) $G_{ku(1)}=2.25$ kN/m
Variable load 1 (unfactored) $Q_{u(1)}=0.5$ kN/m
Variable load 2 (unfactored) $Q_{ub(1)}=0.5$ kN/m

Characteristic values of actions

Permanent:
Reaction at left hand end $8.4375$ kN
Reaction at right hand end $8.4375$ kN
Maximum span moment $M_{k_p}=15.82$ kNm
Maximum shear force $F_{k_p}=8.4375$ kN
Variable 1:
Reaction at left hand end $1.875$ kN
Reaction at right hand end $1.875$ kN
Maximum span moment $M_{k_v1}=3.5156$ kNm
Maximum shear force $F_{k_v1}=1.875$ kN
Variable 2:
Reaction at left hand end $1.875$ kN
Reaction at right hand end $1.875$ kN
Maximum span moment $M_{k_v2}=3.5156$ kNm
Maximum shear force $F_{k_v2}=1.875$ kN

Design values of combined actions for ULS

Design moment $M_d=gamG*M_{k_p}+gamQ*M_{k_v2}=26.63$ kNm
Design shear force $V_d=gamG*F_{k_p}+gamQ*F_{k_v2}=14.203$ kN

Design values - combination 1

Design bending moment $M_{d'}=26.63$ kNm
Design shear force $V_{d'}=14.203$ kN
Load duration factor $k_{mod}=0.8$
Section comprises steel plates to top & bottom faces of timber.
Depth of timber section       h=300 mm
Width of timber section      b=100 mm
Depth of steel section       ds=12 mm
Width of steel section       bs=100 mm
Length of bearing            lb=150 mm
Timber strength class C22.

Section design values

Design bending moment         Md=Md'*10^6=26.63E6 Nmm
Design shear force            Vd=Vd'*10^3=14203 N
Design axial load (+ve compress) Nd=0 kN
Depth factor (Clause 3.2)      kh=1.0
Bearing modification factor   kc90=1.5
Load-sharing modification factor ksys=1.0
Shear reduction factor        ksh=0.67
Bolt diameter                 bd=20 mm
No of rows of bolts to be adopted NRC=1
Spacing of bolts along beam   space=250 mm

Timber characteristic density pk1=340 kg/m³
Angle between grain and load  alp1'=0°

Bolt shear capacities

Basic loads in kN will be derived from the expressions in Section 8 of Eurocode 5.
Char. value of yield moment   MyRk=0.3*400*b*d^2.6=289640
Char. embedment strength     fhok=0.082*(1-0.01*bd)*pk1=22.304
Denominator (expression 8.31) denom=((K90*SIN(alp1')^2) +COS(alp1')^2)=1
Embedment strength (timber 1) fh1k=fhok/denom=22.304
Embedment strength (timber 2) fh2k=22.304
Factor                       beta=fh2k/fh1k=1
Expressions (a) to (e) for fasteners in single shear refer to section 8.2.3 in EC5. Zero contribution from rope effect will be considered.
Min value of equations (a)-(e) Gmin=22184
Basic bolt shear resistance   basic=Gmin/1000=22.184 kN
Design resistance per bolt    pbl=kmod/gamM2*basic=13.651 kN
Member: 324 mm x 100 mm overall
Modular ratio: 31.343

Bolts are 20 mm diameter in 1 row(s) at 250 mm centres.
NOTE: The above values relate to combination 1 and need to be compared with those of combination 2.
Location: Flitched timber beam with udl & point loads

Fully Restrained flitched beam to EC5 and EC3

Calculations include EC5 National Annex Amendment No.2.

Simply supported beam subject to vertical loads.

Beam span \( L = 4.8 \) m
Distance from left support to start \( L_{au(1)} = 0 \) m
Distance from left support to end \( L_{bu(1)} = 4.8 \) m
Permanent load (unfactored) \( G_{ku(1)} = 1.2 \) kN/m
Variable load 1 (unfactored) \( Q_{ua(1)} = 0.6 \) kN/m

Characteristic values of actions

Permanent:
Reaction at left hand end \( 2.88 \) kN
Reaction at right hand end \( 2.88 \) kN
Maximum span moment \( M_{kp} = 3.456 \) kNm
Maximum shear force \( F_{kp} = 2.88 \) kN
Variable 1:
Reaction at left hand end \( 1.44 \) kN
Reaction at right hand end \( 1.44 \) kN
Maximum span moment \( M_{kv1} = 1.728 \) kNm
Maximum shear force \( F_{kv1} = 1.44 \) kN

Design values of combined actions for ULS

Design bending moment \( M_d' = g_{amG}M_{kp} + g_{amQ}M_{kv1} = 7.2576 \) kNm
Design shear force \( V_d' = g_{amG}F_{kp} + g_{amQ}F_{kv1} = 6.048 \) kN

Section comprises one steel web plate with a timber member on each side.

Depth of timber section \( h = 200 \) mm
Width of timber section \( b = 50 \) mm
Depth of steel section \( d_s = 190 \) mm
Width of steel section \( b_s = 8 \) mm
Length of bearing \( l_b = 100 \) mm
Timber strength class C18.

Section design values

Design bending moment \( M_d = M_d'*10^6 = 7.2576E6 \) Nmm
Design shear force \( V_d = V_d'*10^3 = 6048 \) N
Design axial load (+ve compress) \( N_d = 0 \) kN
Depth factor (Clause 3.2) \( k_h = 1.0 \)

\[ fh_{ok} = 0.082 \times (1 - 0.01 \times bd) \times p_k = 23.419 \]

**Denominator (expression 8.31)**
\[ denom = ((K90 \times \sin(\alpha_{1})^2) + \cos(\alpha_{1})^2) = 1.59 \]

**Embedment strength (timber 1)**
\[ fh_{1k} = fh_{ok} / denom = 14.729 \]

**Embedment strength (timber 2)**
\[ fh_{2k} = 14.729 \]

**Factor**
\[ \beta = fh_{2k} / fh_{1k} = 1 \]

**Expressions (a) to (e) for fasteners in single shear refer to section 8.2.3 in EC5. Zero contribution from rope effect will be considered.**

**Min value of equations (a)–(e)**
\[ G_{min} = 13998 \]

**Basic bolt shear resistance**
\[ basic = G_{min} / 1000 = 13.998 \text{ kN} \]

**Design bolt resistance in timber**
\[ p_{bl} = 4 \times k_{mod} / \gamma_{M2} \times basic = 34.456 \text{ kN} \]

Design BM about \( yy \) (positive) \( Md' = 13.038 \text{ kNm} \)
Design shear force in \( z \) direction \( Vd' = 17.04 \text{ kN} \)
Design axial load (+ve compress) \( Nd = 7.1 \text{ kN} \)
Section comprises one steel web plate with a timber member on each side.
Depth of timber section \( h = 225 \text{ mm} \)
Width of timber section \( b = 50 \text{ mm} \)
Depth of steel section \( ds = 175 \text{ mm} \)
Width of steel section \( bs = 10 \text{ mm} \)
Length of bearing \( lb = 50 \text{ mm} \)
Timber strength class C16.

Section design values

Design bending moment \( Md = Md' \times 10^6 = 13.038 \text{E6 Nmm} \)
Design shear force \( Vd = Vd' \times 10^3 = 17040 \text{ N} \)
Design axial load (+ve compress) \( Nd = 7.1 \text{ kN} \)
Depth factor (Clause 3.2) \( kh = 1.0 \)
Bearing modification factor \( kc90 = 1.5 \)
Load-sharing modification factor \( ksys = 1.0 \)
Shear reduction factor \( ksh = 0.67 \)
Eff.length for bending about \( yy \) \( ley' = 5.5 \text{ m} \)
Eff.length for bending about \( zz \) \( lez' = 1.5 \text{ m} \)
Instability factor \( kcy = 1/(kc+(kc^2-rsry^2)^0.5) = 0.27274 \)
Instability factor \( kcz = 1/(kz+(kz^2-rsrz^2)^0.5) = 0.34002 \)
Percent proportion of load in timber \( gtar = 32 \% \)

Bolts between timber and steel plate along length of beam

Bolt diameter \( bd = 16 \text{ mm} \)
Spacing of bolts along beam \( space = 450 \text{ mm} \)
Bolts are in double shear. Width of timber for bolt stress calculation is the section width \( b = 50 \text{ mm} \)
Angle between grain and load \( alp1' = 90 \text{ degrees} \)
Timber characteristic density \( pk1 = 310 \text{ kg/m}^3 \)
Basic loads in \( \text{ kN} \) will be derived from the expressions in Section 8 of Eurocode 5.
Char. value of yield moment \( MyRk = 0.3 \times 400 \times bd^2 \times 2.6 = 162141 \)
Char. embedment strength \( fhok = 0.082 \times (1-0.01 \times bd) \times pk1 = 21.353 \)
Denominator (expression 8.31) \( denom = ((K90 \times SIN(alp1)^2) + COS(alp1)^2) = 1.59 \)
Embedment strength (timber 1) \( fh1k = fhok / denom = 13.429 \)
Embedment strength (timber 2) \( fh2k = 13.429 \)
Factor \( beta = fh2k / fh1k = 1 \)
Equations \( f \times g - h = 10744 \times 8497.2 - 13576 \)
Min value of equations \( f-(h) = Gmin = 8497.2 \)
Basic bolt shear resistance \( basic = Gmin / 1000 = 8.4972 \text{ kN} \)
Design bolt resistance in timber  \( pbl = 2 \times kmod / \gamma M2 \times \text{basic} = 10.458 \text{ kN} \)

Bolts are 16 mm diameter at 450 mm c/c (13 No total).
Edge distance in the steel to be a minimum of 32 mm.
The end connections are beyond the scope of this proforma.
Location: Flitched timber beam with udl & point loads

Fully Restrained flitched beam to EC5 and EC3

Calculations include EC5 National Annex Amendment No.2.

Simply supported flitched beam with general loading

Beam span L= 4.8 m
Dist. from left support to start Lau(1)= 0 m
Dist. from left support to end Lbu(1)= 4.8 m
Permanent load (unfactored) Gku(1)= 1.2 kN/m
Variable load 1 (unfactored) Qua(1)= 0.6 kN/m
Variable load 2 (unfactored) Qub(1)= 0.5 kN/m

Characteristic values of actions

Permanent:
Reaction at left hand end 2.88 kN
Reaction at right hand end 2.88 kN
Maximum span moment Mkp= 3.456 kNm
Maximum shear force Fkp= 2.88 kN
Variable 1:
Reaction at left hand end 1.44 kN
Reaction at right hand end 1.44 kN
Maximum span moment Mkvp= 1.728 kNm
Maximum shear force Fkv1= 1.44 kN
Variable 2:
Reaction at left hand end 1.2 kN
Reaction at right hand end 1.2 kN
Maximum span moment Mkvp= 1.44 kNm
Maximum shear force Fkv2= 1.2 kN

Design values of combined actions for ULS

Design moment Md1=gamG*Mkp+gamQ*Mkv1= 7.2576 kNm
Design shear force Vd1=gamG*Fkp+gamQ*Fkv1= 6.048 kN

Design values - combination 1

Design bending moment Md'= 7.2576 kNm
Design shear force Vd'= 6.048 kN
Load duration factor kmod= 0.8

Section comprises one steel web plate with a timber member on each side.
Depth of timber section \( h = 200 \text{ mm} \)
Width of timber section \( b = 50 \text{ mm} \)
Depth of steel section \( d_s = 190 \text{ mm} \)
Width of steel section \( b_s = 8 \text{ mm} \)
Length of bearing \( l_b = 100 \text{ mm} \)
Timber strength class C18.
Modulus of elasticity of steel \( E_{st} = 200000 \text{ N/mm}^2 \)

### Section design values

- Design bending moment \( M_d = M_d' \times 10^6 = 7.2576E6 \text{ Nmm} \)
- Design shear force \( V_d = V_d' \times 10^3 = 6048 \text{ N} \)
- Design axial load (+ve compress) \( N_d = 0 \text{ kN} \)
- Depth factor (Clause 3.2) \( k_h = 1.0 \)
- Bearing modification factor \( k_{c90} = 1.5 \)
- Load-sharing modification factor \( k_{sys} = 1.1 \)
- Shear reduction factor \( k_{sh} = 0.67 \)
- Effective length about zz \( L_e = 3.84 \text{ m} \)

### Bolts between timber and steel plate along length of beam

- Bolt diameter \( b_d = 16 \text{ mm} \)
- Spacing of bolts along beam \( \text{space} = 500 \text{ mm} \)
- Bolts are in double shear. Width of timber for bolt stress calculation is the section width \( b = 50 \text{ mm} \)
- Angle between grain and load \( \alpha_{l1}' = 90 \text{ degrees} \)
- Timber characteristic density \( p_{k1} = 320 \text{ kg/m}^3 \)
- Basic loads in kN will be derived from the expressions in Section 8 of Eurocode 5.
- Char. value of yield moment \( M_{yRk} = 0.3 \times 400 \times b_d^2 \times 2.6 = 162141 \)
- Char. embedment strength \( f_{hok} = 0.082 \times (1 - 0.01 \times b_d) \times p_{k1} = 22.042 \)
- Denominator (expression 8.31) \( \text{denom} = (K_{90} \times \sin(\alpha_{l1})^2) + \cos(\alpha_{l1})^2 = 1.59 \)
- Embedment strength (timber 1) \( f_{h1k} = f_{hok} / \text{denom} = 13.863 \)
- Embedment strength (timber 2) \( f_{h2k} = 13.863 \)
- Factor \( \beta = f_{h2k} / f_{h1k} = 1 \)

Expressions (f) to (m) for fasteners in double shear refer to section 8.2.3 in EC5. Zero contribution from rope effect will be considered.

Equations

\[
\begin{align*}
\text{(f)} & : & 11090 \\
\text{(g)} & : & 8654.1 \\
\text{(h)} & : & 13793
\end{align*}
\]

Min value of equations (f)-(h) \( \text{Gmin} = 8654.1 \)

Basic bolt shear resistance \( \text{basic} = \text{Gmin} / 1000 = 8.6541 \text{ kN} \)
Design bolt resistance in timber  $p_b l = 2\times k_{mod}/\gamma_M^2 \times \text{basic}=11.077\ kN$

- Design Shear resistance       | 20.56 kN                       |
- Design bearing stress         | 0.6048 N/mm$^2$                |
- Design bearing strength       | 2.2338 N/mm$^2$                |

Bolts are 16 mm diameter at 500 mm c/c (10 No total).

Edge distance in the steel to be a minimum of 32 mm.

Bolts along the beam to be staggered above and below the centre line with their centres offset from the beam centre line to suit the min bolt edge spacing of 64 mm.

The minimum No of bolts required at the bearing = 2

NOTE: The above values relate to combination 1 and need to be compared with those of combination 2.
Location: Spaced rectangular section with axial load and bending

Rectangular timber member composed of two or more equal shafts spaced apart by end and intermediate packing pieces. Member subject to axial load and bending about x-x.

Calculations to BS5268-2:2002.

Design BM about xx (positive) \( M_x' = 0.2953 \text{ kNm} \)
Design shear force in y direction \( V' = 0 \text{ kN} \)
Design axial load (+ve compress) \( F' = 4.9 \text{ kN} \)
Eff. length for bending about xx \( L_{ex} = 3500 \text{ mm} \)
Eff. length for bending about yy \( L_{ey} = 3500 \text{ mm} \)
Depth of section \( d = 175 \text{ mm} \)
Width of section \( b = 75 \text{ mm} \)
Number of shafts \( n_{os} = 2 \)
Distance between Crs of shafts \( c_{rs} = 200 \text{ mm} \)
Strength class C22 to Table 8.
Actual length of the column \( c_{oll} = 3500 \text{ mm} \)
Intermediate pack centres \( i_{pcrs} = 900 \text{ mm} \)
Timber service class adopted \( t_{mclass} = 1 \)
Timber service class modification factor \( K_2 = 1 \) as Table 16.
Duration of loading \( K_3 = 1.25 \)
Depth factor \( K_7 = (300/d)^{0.11} = 1.0611 \)
Load-sharing modification factor \( K_8 = 1.0 \)
Modification factor \[ K_{12} = (0.5 + (1 + \eta) \frac{C}{2}) - ((0.5 + (1 + \eta) \frac{C}{2})^2 - C)^{0.5} = 0.54924 \]

Actual length of end pack \[ e_{pl} = 450 \text{ mm} \]
Actual length intermediate pack \[ i_{pl} = 250 \text{ mm} \]

Location: Spaced rectangular section with axial load and bending

Rectangular timber member composed of two or more equal shafts spaced apart by end and intermediate packing pieces. Member subject to axial load and bending about y-y.

Calculations to EC5 incorporating National Annex Amendment No.2.

Design BM about yy (positive) $M_d'=0.41933\, \text{kNm}$
Design shear force in z direction $V_{dz}'=0\, \text{kN}$
Design axial load (+ve compress) $N_d'=6.958\, \text{kN}$
Eff. length for bending about yy $L_{ey}=3500\, \text{mm}$
Eff. length for bending about zz $L_{ez}=3500\, \text{mm}$
Depth of section $h=175\, \text{mm}$
Width of section $b=75\, \text{mm}$
Number of shafts $n_{os}=2$
Distance between Crs of shafts $crs=200\, \text{mm}$
Timber strength class C22.
Actual length of the column $coll=3500\, \text{mm}$
Intermediate pack centres $ipcrs=900\, \text{mm}$
Depth factor (Clause 3.2) $k_h=1.0$
Load-sharing modification factor $k_{sys}=1.0$
Factor $\eta$ from Table C.1 $\eta=1$
Max instability factor $k_c=1$
Instability factor $k_{cz}=1/(k_z+(k_z^2-rsrz^2)^{0.5})=0.73604$
Shear reduction factor $k_{sh}=0.67$
Effective length about zz $L_e=2.8\, \text{m}$
Packs for spaced columns

Fixings are required to transfer a shear force between the abutting face of the packing and one shaft.

End pack shear force \[ \text{epsf} = 1.3 \times A \times b \times sc0d/(\text{nos} \times \text{crs}) = 1696 \text{ N} \]

Actual length of end pack \[ \text{epl} = 450 \text{ mm} \]

Since \( plgs \geq gls \) \( (3.8 \geq 0.021537) \) then glue line stress on end pack is satisfactory.

Actual length intermediate pack \[ \text{ipl} = 250 \text{ mm} \]

Since \( plgs \geq gils \) \( (3.8 \geq 0.019383) \) then glue line stress on intermediate pack is satisfactory.

Location: Ply box beams with udl & point loads

Laterally restrained glued ply or OSB box beam design to BS5268-2:2002

Depth of ply or OSB section $d=350$ mm
Nominal width of each ply web $b_p'=9.5$ mm
Depth of each timber section $d_c=66$ mm
Width of timber section $b=100$ mm

Face grain is parallel to span of the beam.
Strength class C24 to Table 8.
Plywood is Canadian Douglas Fir (unsanded) to Table 45 of BS5268.
Plywood comprises 3 plies
No. of laminates per chord $l_{am27}=2$
No. of laminates in both chords $l_{am28}=4$

Since $I_{ratio} > 10$ and $\leq 20$ (11.268 > 10 and $\leq 20$) to Clause 2.10.10 the beam should be held in line at the ends and web stiffeners should be used.

Simply supported beam subjected to vertical loads.

Beam span $L=7.5$ m
Dist. from left support to start $L_{au(1)}=0$ m
Distance from left support to end $L_{bu(1)}=7.5$ m
Dead load (unfactored) $G_{ku(1)}=0.425$ kN/m
Imposed load (unfactored) $Q_{ku(1)}=0.6$ kN/m
Maximum span bending moment $7.207$ kNm
Design shear force $F_{ve}'=3.8438$

Modification factors

Duration of loading $K_3=1.25$
Depth factor $K_7=0.81*(d^2+92300)/(d^2+56800) = 0.97037$
Width modification factor $K_{14}=(300/h)^{0.11}=0.98319$

The bending design of the beam is based on the modulus of the flanges and ignores the contribution of the web plate(s). Permissible stress to be based on the tension grade stress of the timber flanges.
Web to flange connection is to be by glueing to BS6446 requirements.

No. of glue lines  \( n_{gl}=2 \)

Plywood or OSB is to be adhered to timber using nails or staples as the bonding pressure. Mod factor  \( K_{70}=0.9 \)

Length of bearing  \( l_{b}=150 \) mm

Bearing modification factor  \( K_{4}=1.0 \)

BS5268 part 2 2002 does not give any specific guidance for the design of web stiffeners. Web stiffeners should be placed under any concentrated loads and at bearing positions. Internal stiffeners should also be placed at intervals to ensure buckling of the web members cannot occur. Typically these stiffeners are at centres of between one to two times the clear depth of the web.

In this case this would be at 218 mm to 436 mm centres.

**Web splice case 1**

Splice plate half length  \( b_{s}=450 \) mm

Height of each splice plate  \( h_{s}=200 \) mm

Number of glue lines at this splice section  \( n_{sp}=1 \)

Applied shear force at splice  \( s_{fs}=1.5 \) kN

Since rollp > sigr ( 0.21938 N/mm² > 0.061296 N/mm² ) then glue line stress is within permissible stresses. Hence splice OK.

Location: Default case 3

Laterally restrained glued ply or OSB

web I beam design to BS5268-2:2002

Depth of ply or OSB section \( d = 600 \text{ mm} \)
Nominal width of ply web \( b_p' = 18.5 \text{ mm} \)
Depth of each timber section \( d_c = 47 \text{ mm} \)
Width of timber section \( b = 47 \text{ mm} \)
Face grain is parallel to span of the beam.
Strength class C18 to Table 8.
Plywood is Canadian Douglas Fir (unsanded) to Table 45 of BS5268.
Plywood comprises 6 plies
No. of laminates per chord \( \text{lam}_{27} = 2 \)
No. of laminates in both chords \( \text{lam}_{28} = 4 \)
Since \( I_{ratio} > 40 \) (88.983 > 40) to Clause 2.10.10 the beam should be fully restrained along its compression edge and web stiffeners should be used.

Simply supported beam subjected to vertical loads.

Beam span \( L = 8 \text{ m} \)
Dist. from left support to start \( L_{au(1)} = 0 \text{ m} \)
Distance from left support to end \( L_{bu(1)} = 8 \text{ m} \)
Dead load (unfactored) \( G_{ku(1)} = 0.6 \text{ kN/m} \)
Imposed load (unfactored) \( Q_{ku(1)} = 0.6 \text{ kN/m} \)
Maximum span bending moment \( 9.6 \text{ kNm} \)
Design shear force \( F_{ve'} = 4.8 \)

Modification factors

Duration of loading \( K_3 = 1.25 \)
Depth factor \( K_7 = 0.81 \times \frac{(d^2 + 92300)}{(d^2 + 56800)} \)
\( = 0.87899 \)
Width modification factor \( K_{14} = (300/h)^{0.11} = 0.92659 \)

Design is based on a composite section transformed to suit the varying Young's Modulii of the ply or OSB and timber.
Web to flange connection is to be by gluing to BS6446 requirements.

No. of glue lines \( ngl = 2 \)

Plywood or OSB is to be adhered to timber using clamps as the bonding pressure. Mod factor \( K70 = 1.0 \)

Length of bearing \( l_b = 100 \text{ mm} \)

From BS5268-2 Table 18, bearing is \(< 75 \text{ mm} \) from joist end.

Bearing Modification factor \( K4 = 1.0 \)

BS5268 part 2 2002 does not give any specific guidance for the design of web stiffeners. Web stiffeners should be placed under any concentrated loads and at bearing positions. Internal stiffeners should also be placed at intervals to ensure buckling of the web members cannot occur. Typically these stiffeners are at centres of between one to two times the clear depth of the web. In this case this would be at 506 mm to 1012 mm centres.

**Web splice case 1**

<table>
<thead>
<tr>
<th>Splice plate half length</th>
<th>bs = 600 mm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Height of each splice plate</td>
<td>hs = 450 mm</td>
</tr>
<tr>
<td>Number of glue lines at this splice section</td>
<td>nsp = 2</td>
</tr>
<tr>
<td>Bending Moment at splice point</td>
<td>bms = 9.6 kNm</td>
</tr>
<tr>
<td>Applied shear force at splice</td>
<td>sfs = 4.8 kN</td>
</tr>
</tbody>
</table>

Since \( \sigma_{rlp} > \sigma_{gr} \) (0.24375 N/mm² > 0.17075 N/mm²) then glue line stress is within permissible stresses. Hence splice OK.

Since \( bssp \leq p_{ply} \) (1.1713 N/mm² ≤ 7.0125 N/mm²) then ply or OSB bending stress at centre of splice plate is within permissible stresses. Hence splice OK.

Location: Default case 5

Laterally restrained glued ply or OSB
box beam design to BS5268-2:2002

Depth of ply or OSB section \( d = 1200 \text{ mm} \)
Nominal width of each ply web \( b_{p}' = 18 \text{ mm} \)
Depth of each timber section \( d_{c} = 147 \text{ mm} \)
Width of timber section \( b = 147 \text{ mm} \)
Face grain is perpendicular to span of the beam.
Strength class C24 to Table 8.
Plywood is Finnish Birch faced, Sanded to Table 32 of BS5268
No. of laminates per chord \( \text{lam}_{27} = 3 \)
No. of laminates in both chords \( \text{lam}_{28} = 6 \)
Since \( \text{Iratio} > 40 \) \( (47.823 > 40) \) to Clause 2.10.10 the beam should be fully restrained along its compression edge and web stiffeners should be used.

Simply supported beam subjected to vertical loads.

Beam span \( L = 16 \text{ m} \)
Dist. from left support to start \( L_{au(1)} = 0 \text{ m} \)
Distance from left support to end \( L_{bu(1)} = 16 \text{ m} \)
Dead load (unfactored) \( G_{ku(1)} = 1.2 \text{ kN/m} \)
Imposed load (unfactored) \( Q_{ku(1)} = 1 \text{ kN/m} \)
Maximum span bending moment \( 70.4 \text{ kNm} \)
Design shear force \( F_{ve}' = 17.6 \)

Modification factors

Duration of loading \( K_{3} = 1.25 \)
Depth factor \( K_{7} = 0.81 \cdot (d^2 + 92300) / (d^2 + 56800) = 0.82921 \)
Width modification factor \( K_{14} = (300/h)^{0.11} = 0.85857 \)

Bending design is to be based on the full composite section and includes the contribution of the web(s).
Permissible stress to be based on the tension grade stress of the timber flanges \( \rho_{bs} = \sigma_{tad} = 4.4817 \text{ N/mm}^2 \)
Web to flange connection is to be by glueing to BS6446 requirements.

No. of glue lines \( n_{gl} = 2 \)

Plywood or OSB is to be adhered to timber using clamps as the bonding pressure. Mod factor \( K_{70} = 1.0 \)

Length of bearing \( l_b = 150 \text{ mm} \)

Bearing modification factor \( K_4 = 1.0 \)

BS5268 part 2 2002 does not give any specific guidance for the design of web stiffeners. Web stiffeners should be placed under any concentrated loads and at bearing positions. Internal stiffeners should also be placed at intervals to ensure buckling of the web members cannot occur. Typically these stiffeners are at centres of between one to two times the clear depth of the web. In this case this would be at 906 mm to 1812 mm centres.

Depth of each timber section     $d_{c}=66$ mm
Width of timber section          $b=100$ mm
Face grain is parallel to span of the beam.
Strength class C24 to Table 8.
Oriented strand board of Grade 3 (OSB/3) to BS EN12369-1:2001 and BS EN300:1997.
Oriented strand board service class 1
No. of laminates per chord       $l_{a m 27}=2$
No. of laminates in both chords  $l_{a m 28}=4$
Since $I_{r a t i o} > 10$ and $\delta \leq 20$ (11.268 > 10 and $\delta \leq 20$) to Clause 2.10.10 the beam should be held in line at the ends and web stiffeners should be used.

Simply supported beam subjected to vertical loads.

Beam span                              $L=7.5$ m
Dist. from left support to start       $L_{u a 1}(1)=0$ m
Distance from left support to end      $L_{b u 1}(1)=7.5$ m
Dead load (unfactored)                 $G_{k u 1}(1)=0.425$ kN/m
Imposed load (unfactored)              $Q_{k u 1}(1)=0.6$ kN/m
Maximum span bending moment            $7.207$ kNm
Design shear force                     $F_{v e}^{'}=3.8438$

Modification factors

Duration of loading                  $K_{3}=1.25$
Depth factor                        $K_{7}=0.81 \times (d^{2}+92300)/(d^{2}+56800) = 0.97037$
Width modification factor           $K_{14}=(300/h)^{0.11}=0.98319$

The bending design of the beam is based on the modulus of the flanges and ignores the contribution of the web plate(s). Permissible stress to be based on the tension grade stress of the timber flanges.
Web to flange connection is to be by gluing to BS6446 requirements.

No. of glue lines \( ngl = 2 \)

Plywood or OSB is to be adhered to timber using nails or staples as the bonding pressure. Mod factor \( K70 = 0.9 \)

Length of bearing \( lb = 150 \text{ mm} \)

Bearing modification factor \( K4 = 1.0 \)

BS5268 part 2 2002 does not give any specific guidance for the design of web stiffeners. Web stiffeners should be placed under any concentrated loads and at bearing positions. Internal stiffeners should also be placed at intervals to ensure buckling of the web members cannot occur. Typically these stiffeners are at centres of between one to two times the clear depth of the web. In this case this would be at 218 mm to 436 mm centres.

**Web splice case 1**

Splice plate half length \( bs = 450 \text{ mm} \)

Height of each splice plate \( hs = 200 \text{ mm} \)

Number of glue lines at this splice section \( nsp = 1 \)

Applied shear force at splice \( sfs = 1.5 \text{ kN} \)

Since \( rollp > sigr (0.12821 \text{ N/mm}^2 > 0.061296 \text{ N/mm}^2) \) then glue line stress is within permissible stresses. Hence splice OK.

**DESIGN**

Depth of OSB/3 section \( 350 \text{ mm} \)

**SUMMARY**

Overall beam width \( 118 \text{ mm} \)

Applied BM \( 7.207 \text{ kNm} \)

Moment capacity \( 9.5048 \text{ kNm} \)

Deflection \( 19.324 \text{ mm} \)

Limiting deflection \( 22.5 \text{ mm} \)

Flange to web shear \( 0.0814 \text{ N/mm}^2 \)

Face grain is parallel to span of beam.
Timber strength class C24.
Plywood is Canadian Douglas Fir (unsanded).
Plywood comprises 3 plies.
Since \( \text{Iratio} > 10 \) and \( \leq 20 \) (11.268 > 10 and \( \leq 20 \)) the beam should be held in line at the ends and web stiffeners should be used.

Simply supported beam subject to vertical loads.

Beam span \( L=7.5 \text{ m} \)
Dist. from left support to start \( Lau(1)=0 \text{ m} \)
Distance from left support to end \( Lbu(1)=7.5 \text{ m} \)
Permanent load (unfactored) \( Gku(1)=0.425 \text{ kN/m} \)
Variable load 1 (unfactored) \( Qua(1)=0.6 \text{ kN/m} \)

Characteristic values of actions

Permanent:
Reaction at left hand end \( 1.5938 \text{ kN} \)
Reaction at right hand end \( 1.5938 \text{ kN} \)
Maximum span moment \( Mkp=2.9883 \text{ kNm} \)
Maximum shear force \( Fkp=1.5938 \text{ kN} \)
Variable 1:
Reaction at left hand end \( 2.25 \text{ kN} \)
Reaction at right hand end \( 2.25 \text{ kN} \)
Maximum span moment \( Mkv1=4.2188 \text{ kNm} \)
Maximum shear force \( Fkv1=2.25 \text{ kN} \)
Modification factors

Depth factor (Clause 3.2) \[ k_h = \left( \frac{150}{h_c} \right)^{0.2} = 1.1784 \]
Width modification factor \[ k_w = \left( \frac{150}{h_c'} \right)^{0.2} = 1.0845 \]
Load-sharing modification factor \[ k_{sys} = 1.0 \]

The bending design of the beam is based on the modulus of the flanges and ignores the contribution of the web plate(s).

Design strength to be based on the tension strength of the timber flanges.

Web service class \[ s_{ervc} = 2 \]
Web to flange connection is to be by gluing.
No. of glue lines \[ n_{gl} = 2 \]

Plywood or OSB is to be adhered to timber using nails or staples as the bonding pressure.

Length of bearing \[ l_b = 150 \text{ mm} \]
Bearing modification factor \[ k_{c90} = 1.5 \]

Web stiffeners should be placed under any concentrated loads and at bearing positions. Internal stiffeners should also be placed at intervals to ensure buckling of the web members cannot occur.

Typically these stiffeners are at centres of between one to two times the clear depth of the web. In this case this would be at 218 mm to 436 mm centres.

Web splice case 1

Splice plate half length \[ b_s = 450 \text{ mm} \]
Height of each splice plate \[ h_s = 200 \text{ mm} \]
Number of glue lines at this splice section \[ n_{sp} = 1 \]
Design shear force at splice \[ s_{fs} = 1.5 \text{ kN} \]

Since \[ p_{fv90d} > s_{igr} \] (0.36535 N/mm² > 0.061296 N/mm²) glue line design stress is within design strength. Hence splice is OK.

Web stiffeners should be placed under any concentrated loads and at bearing positions. Internal stiffeners should also be placed at intervals to ensure buckling of the web members cannot occur.
Typically these stiffeners are at centres of between one to two times the clear depth of the web. In this case this would be at 160 mm to 320 mm centres.

Web splice case 1

Splice plate half length  \( bs = 400 \text{ mm} \)
Height of each splice plate  \( hs = 160 \text{ mm} \)
Number of glue lines at this splice section  \( nsp = 1 \)
Design shear force at splice  \( sfs = 2.7 \text{ kN} \)
Since \( pfv90d > sigr \) (0.66568 N/mm² > 0.15746 N/mm²) glue line design stress is within design strength. Hence splice is OK.

Location: Default case 3

Laterally restrained glued ply or OSB web I beam design to EC5 with National Annex Amendment No.2

Depth of ply or OSB section \( h = 600 \text{ mm} \)
Nominal width of ply web \( b_{p}' = 18.5 \text{ mm} \)
Depth of each timber section \( h_c = 47 \text{ mm} \)
Width of timber section \( b = 47 \text{ mm} \)
Face grain is parallel to span of beam.
Timber strength class C18.
Plywood is Canadian Douglas Fir (unsanded).
Plywood comprises 6 plies.
Since \( \text{Iratio} > 40 \ (88.983 > 40) \) the beam should be fully restrained along its compression edge and web stiffeners should be used.

Simply supported beam subject to vertical loads.

Beam span \( L = 8 \text{ m} \)
Dist. from left support to start \( L_{au(1)} = 0 \text{ m} \)
Distance from left support to end \( L_{bu(1)} = 8 \text{ m} \)
Permanent load (unfactored) \( G_{ku(1)} = 0.6 \text{ kN/m} \)
Variable load 1 (unfactored) \( Q_{u(1)} = 0.6 \text{ kN/m} \)

Characteristic values of actions

Permanent:
Reaction at left hand end \( 2.4 \text{ kN} \)
Reaction at right hand end \( 2.4 \text{ kN} \)
Maximum span moment \( M_{kp} = 4.8 \text{ kNm} \)
Maximum shear force \( F_{kp} = 2.4 \text{ kN} \)
Variable 1:
Reaction at left hand end \( 2.4 \text{ kN} \)
Reaction at right hand end \( 2.4 \text{ kN} \)
Maximum span moment \( M_{kv1} = 4.8 \text{ kNm} \)
Maximum shear force \( F_{kv1} = 2.4 \text{ kN} \)
Modification factors

Depth factor (Clause 3.2)        \[ k_h = (150/\text{hc})^{0.2} = 1.2612 \]
Width modification factor       \[ k_w = (150/\text{hc'})^{0.2} = 1.2612 \]
Load-sharing modification factor \[ k_{sys} = 1.1 \]

Design is based on a composite section transformed to suit the varying Young's Modulii of the ply or OSB and timber.

Web service class              \[ \text{servc} = 2 \]
Web to flange connection is to be by glueing.
No. of glue lines               \[ n_{gl} = 2 \]

Plywood or OSB is to be adhered to timber using clamps as the bonding pressure.
Length of bearing               \[ l_b = 100 \text{ mm} \]
Bearing modification factor     \[ k_{c90} = 1.5 \]

Web stiffeners should be placed under any concentrated loads and at bearing positions. Internal stiffeners should also be placed at intervals to ensure buckling of the web members cannot occur. Typically these stiffeners are at centres of between one to two times the clear depth of the web. In this case this would be at 506 mm to 1012 mm centres.

Web splice case 1

Splice plate half length        \[ b_s = 600 \text{ mm} \]
Height of each splice plate     \[ h_s = 450 \text{ mm} \]
Number of glue lines at this splice section \[ n_{sp} = 2 \]
Bending Moment at splice point  \[ b_{ms} = 13.68 \text{ kNm} \]
Design shear force at splice    \[ s_{fs} = 6.84 \text{ kN} \]

Since pfv90d > sigr (0.63394 N/mm² > 0.24332 N/mm²) glue line design stress is within design strength. Hence splice is OK.
Since bssp ≤ fply (2.931 N/mm² ≤ 8.36 N/mm²) ply or OSB design bending stress at centre of splice plate is within the design strength. Hence splice OK.

Laterally restrained nailed

ply or OSB box beam design

to EC5 incorporating National

Annex Amendment No.2

Depth of ply or OSB section  \( h=450 \text{ mm} \)
Nominal width of each ply web  \( b'=18.5 \text{ mm} \)
Depth of each timber section  \( hc=47 \text{ mm} \)
Width of timber section  \( b=97 \text{ mm} \)
Face grain is parallel to span of beam.
Timber strength class C24.
Plywood is Canadian Douglas Fir (unsanded).
Plywood comprises 7 plies.
Since \( \text{Iratio} > 10 \) and \( \leq 20 \) (10.553 > 10 and \( \leq 20 \)) the beam should be held in line at the ends and web stiffeners should be used.

Simply supported beam subject to vertical loads.

Beam span  \( L=10 \text{ m} \)
Dist. from left support to start  \( L_{au(1)}=0 \text{ m} \)
Distance from left support to end  \( L_{bu(1)}=10 \text{ m} \)
Permanent load (unfactored)  \( G_{ku(1)}=0.3 \text{ kN/m} \)
Variable load 1 (unfactored)  \( Q_{u(1)}=0.6 \text{ kN/m} \)

**Characteristic values of actions**

Permanent:
- Reaction at left hand end 1.5 kN
- Reaction at right hand end 1.5 kN
- Maximum span moment  \( M_{kp}=3.75 \text{ kNm} \)
- Maximum shear force  \( F_{kp}=1.5 \text{ kN} \)

Variable 1:
- Reaction at left hand end 3 kN
- Reaction at right hand end 3 kN
- Maximum span moment  \( M_{kv1}=7.5 \text{ kNm} \)
- Maximum shear force  \( F_{kv1}=3 \text{ kN} \)
Modification factors

Depth factor (Clause 3.2) \( kh = (150/hc)^{0.2} = 1.2612 \)
Width modification factor \( kw = (150/hc')^{0.2} = 1.0911 \)
Load-sharing modification factor \( ksys = 1.0 \)

The bending design of the beam is based on the modulus of the flanges and ignores the contribution of the web plate(s).
Design strength to be based on the bending strength of the timber flanges.

Web service class \( servc = 2 \)
Web to flange connection is to be by nailing using ordinary round wire nails. Plywood or OSB to timber connection with nails driven into side grain.
Number of nail shear surfaces \( ngl = 2 \)

Nailed joint position:

Design SF at nail position \( sfs = 6.525 \text{ kN} \)

Headside member - plywood group 1 comprising:
(a) American construction and industrial plywood
(b) Canadian Douglas fir plywood
(c) Canadian softwood plywood
(d) Swedish softwood plywood
(e) Finnish conifer plywood

Ply characteristic density \( pk1 = 390 \text{ kg/m}^3 \)
Timber characteristic density \( pk2 = 350 \text{ kg/m}^3 \)
Diameter of nails \( dn = 4 \text{ mm} \)
Length of nails \( l = 75 \text{ mm} \)

Basic loads in N will be derived from expressions given in Section 8 assuming round nails.

Min value of equations (a)-(f) \( G_{min} = 968.09 \)

Char. nail shear capacity \( basic = G_{min} = 968.09 \text{ N} \)
Material factor for connections \( gamM = 1.3 \)
Design resistance per nail \( pnl = kmod*basic/gamM = 595.75 \text{ N} \)
Required centres of nails \( ncrs = ngl*pnl*Iy/(sfs*1000*fmarea) \)
\( = 128.26 \text{ mm} \)

Minimum nail spacings - EC5 Table 8.2 and Fig 8.7

Minimum spacing of nails within one row // to grain \( a1 = (5+7\cdot\cos(\alpha))\cdot dn = 48 \text{ mm} \)
Actual spacing of nails within one row // to grain \( a1 = 48 \text{ mm} \)
Spacing of rows of nails perpendicular to grain \( a2 = 5\cdot dn = 20 \text{ mm} \)
End distance (loaded) \( a3t = (10+5\cdot\cos(\alpha))\cdot dn = 60 \text{ mm} \)
End distance (unloaded) \( a3c = 10\cdot dn = 40 \text{ mm} \)
Edge distance (loaded) \( a4t = (5+2\cdot\sin(\alpha))\cdot dn = 20 \text{ mm} \)
Edge distance (unloaded) \( a4c = (5+5\cdot\sin(\alpha))\cdot dn = 20 \text{ mm} \)

Fix ply webs to the top and bottom chords of the beam. Adopt 1 row(s) of 4 mm nails 75 mm long at 128 mm centres in each chord.
Length of bearing \( l_b = 100 \text{ mm} \)

Bearing modification factor \( k_{c90} = 1.5 \)

Web stiffeners should be placed under any concentrated loads and at bearing positions. Internal stiffeners should also be placed at intervals to ensure buckling of the web members cannot occur. Typically these stiffeners are at centres of between one to two times the clear depth of the web. In this case this would be at 356 mm to 712 mm centres.

Web stiffeners should be placed under any concentrated loads and at bearing positions. Internal stiffeners should also be placed at intervals to ensure buckling of the web members cannot occur. Typically these stiffeners are at centres of between one to two times the clear depth of the web. In this case this would be at 906 mm to 1812 mm centres.

**DESIGN**

- Depth of ply section: 1200 mm
- Overall beam width: 181.2 mm
- Design bending moment: 99.84 kNm
- Design moment capacity: 284.89 kNm
- Deflection: 40.662 mm
- Limiting deflection: 64 mm
- Flange/web shear stress: 0.056875 N/mm²
- Rolling shear strength: 0.78421 N/mm²
- Design bearing reaction: 24.96 kN
- Design bearing capacity: 116.93 kN
Location: Ply box beams with udl & point loads

Laterally restrained glued ply or
OSB box beam design to EC5 with
National Annex Amendment No.2

Depth of ply or OSB section $h=350$ mm
Actual width of each OSB web $bp'=9$ mm
Depth of each timber section $hc=66$ mm
Width of timber section $b=100$ mm
Face grain is parallel to span of beam.
Timber strength class C24.
Oriented Strand Board:
Oriented strand board of Grade 3 (OSB/3) to BS EN12369-1:2001 and
BS EN300:1997.
Oriented strand board service class 1
Actual thickness of OSB $bp=9$ mm
Since $I_{ratio} > 10$ and $\sigma < 20$ ($11.268 > 10$ and $\sigma < 20$) the beam should be held in line at the ends and web stiffeners should be used.

Simply supported beam subject to vertical loads.

Beam span $L=7.5$ m
Dist. from left support to start $L_{au(1)}=0$ m
Distance from left support to end $L_{bu(1)}=7.5$ m
Permanent load (unfactored) $G_{ku(1)}=0.425$ kN/m
Variable load 1 (unfactored) $Q_{ua(1)}=0.6$ kN/m

Characteristic values of actions

Permanent:
Reaction at left hand end $1.5938$ kN
Reaction at right hand end $1.5938$ kN
Maximum span moment $M_{kp}=2.9883$ kNm
Maximum shear force $F_{kp}=1.5938$ kN
Variable 1:
Reaction at left hand end $2.25$ kN
Reaction at right hand end $2.25$ kN
Maximum span moment $M_{kv1}=4.2188$ kNm
Maximum shear force $F_{kv1}=2.25$ kN
Modification factors

Depth factor (Clause 3.2) \[ kh = (150/h_c)^{0.2} = 1.1784 \]
Width modification factor \[ kw = (150/h_c')^{0.2} = 1.0845 \]
Load-sharing modification factor \[ k_{sys} = 1.0 \]

The bending design of the beam is based on the modulus of the flanges and ignores the contribution of the web plate(s).

Design strength to be based on the tension strength of the timber flanges.

Web to flange connection is to be by glueing.

No. of glue lines \[ n_{gl} = 2 \]

Plywood or OSB is to be adhered to timber using nails or staples as the bonding pressure.

Length of bearing \[ l_b = 150 \text{ mm} \]

Bearing modification factor \[ k_{c90} = 1.5 \]

Web stiffeners should be placed under any concentrated loads and at bearing positions. Internal stiffeners should also be placed at intervals to ensure buckling of the web members cannot occur. Typically these stiffeners are at centres of between one to two times the clear depth of the web. In this case this would be at 218 mm to 436 mm centres.

Web splice case 1

Splice plate half length \[ b_s = 450 \text{ mm} \]
Height of each splice plate \[ h_s = 200 \text{ mm} \]
Number of glue lines at this splice section \[ n_{sp} = 1 \]
Design shear force at splice \[ s_{fs} = 1.5 \text{ kN} \]

Since \( pfv_{90d} > s_{igr} \ (0.4105 \text{ N/mm}^2 > 0.061296 \text{ N/mm}^2) \) glue line design stress is within design strength. Hence splice is OK.

Stressed skin timber floor joist

Glued stressed skin floor joist
with top and bottom ply sheathing

to BS5268-2:2002

Location: Stressed skin floor joists

Depth of timber joist section \( d = 200 \text{ mm} \)
Width of timber joist section \( b = 63 \text{ mm} \)
Nominal depth of top ply \( \text{dtp}' = 22.5 \text{ mm} \)
Nominal depth of bottom ply \( \text{dbp}' = 12.5 \text{ mm} \)
Plywood face grain is perpendicular to span of floor joist.

Joist span \( L = 5 \text{ m} \)
Centres of joists \( c_{rs} = 400 \text{ mm} \)
Effective width of top flange \( e_{\text{width}} = 400 \text{ mm} \)

Grade stresses

Strength class C24 to Table 8.
Plywood is Canadian Douglas Fir (unsanded) to Table 45 of BS5268
Top plywood sheath comprises 7 plies.
Bottom plywood sheath comprises 4 plies.
Timber service class adopted \( \text{tmclass} = 1 \)
Timber service class modification factor \( K_2 = 1 \) as Table 16
Member is in a load-sharing system as defined by Clause 13.
Load-sharing modification factor \( K_8 = 1.1 \)
The mean modulus of elasticity should be used to calculate deflections and displacements under both dead and imposed loads.

Loading - UDL

Other dead UDL \( G_{kux}' = 0.25 \text{ kN/m}^2 \)
Imposed load \( Q_{kux} = 1.5 \text{ kN/m}^2 \)
Distance from left support \( L_{c(1)} = 2.5 \text{ m} \)
Dead load (unfactored) \( G_{kc(1)} = 0.5 \text{ kN} \)
Imposed load (unfactored) \( Q_{kc(1)} = 0.5 \text{ kN} \)
Maximum span moment \( M' = 1.25 \text{ kNm} \)

Analysis results

Unfactored dead shear \( R_{udlhe} = G_k L/2 + Pl_ds = 0.79378 \text{ kN} \)
Unfactored imposed shear \( R_{uilhe} = Q_k L/2 + Pl_is = 1.75 \text{ kN} \)
Shear force \( F_{ve} = (G_k + Q_k) L/2 + Pl_ds + Pl_is = 2.5438 \text{ kN} \)
Maximum span bending moment \( M = (G_k + Q_k) L^2/8 + M' = 3.8047 \text{ kNm} \)
Duration of loading \( K_3 = 1.25 \)

Depth factor \( K_7 = (300/d)^{0.11} = 1.0456 \)

Width modification factor \( K_{14} = (300/h)^{0.11} = 1.0456 \)

No of spans which ply is continuous over plycon=3

Transverse stresses and deflection to be based on the clear span of ply.

**Rolling shear stress at ply/ joist interface (position B)**

Web to flange connection is to be by glueing.

Since \( E_{ayfa} \geq E_{ayfb} \) the 1st moment of area of the top flange is greater than the 1st moment of area of the bottom flange. Rolling shear will be more critical at the top ply.

1st moment of area of critical flange \( E_{aroll} = E_{ayfa} = 1.6542E9 \) Nmm

Rolling shear stress @ position B \( \tau_{0B} = F_{ve} * 1E3 * E_{aroll} / E_{Ix} / \text{conwid} \)

\( = 0.086688 \) N/mm²

Plywood is to be adhered to timber using nails or staples as the bonding pressure. Mod factor \( K_{70} = 0.9 \)

Since \( \tau_{rollp} \geq \tau_{0B} \) the applied rolling shear is less than the permissible shear. Hence OK.

Length of bearing \( l_b = 100 \) mm

From BS5268-2 Table 18, bearing is < 75 mm from joist end.

Bearing Modification factor \( K_4 = 1.0 \)

**Stresses due to bending action**

Bearing stress on ply \( 0.063595 \) N/mm²

Perm. ply bearing stress \( 2.7 \) N/mm²

Bearing stress on joist \( 0.40378 \) N/mm²

Permissible joist bearing stress \( 3.3 \) N/mm²
Location: Stressed skin floor joists

Glued stressed skin floor joist
with top and bottom ply sheathing
to BS5268-2:2002

Depth of timber joist section \( d = 200 \text{ mm} \)
Width of timber joist section \( b = 47 \text{ mm} \)
Nominal depth of top ply \( \text{dtp}' = 24 \text{ mm} \)
Nominal depth of bottom ply \( \text{dbp}' = 12 \text{ mm} \)
Plywood face grain is perpendicular to span of floor joist.

\[ \begin{aligned}
\text{Joist span} & \quad \text{L} = 6 \text{ m} \\
\text{Centres of joists} & \quad \text{crs} = 600 \text{ mm} \\
\text{Effective width of top flange} & \quad \text{ewidth} = 600 \text{ mm}
\end{aligned} \]

**Grade stresses**

Strength class C24 to Table 8.
Plywood is Finnish Birch-faced (sanded) to Table 49 of BS5268
Top plywood sheath comprises 17 plies.
Bottom plywood sheath comprises 9 plies.
Timber service class adopted \( \text{tmclass} = 1 \)
Timber service class modification factor \( \text{K2} = 1 \) as Table 16
Member is in a load-sharing system as defined by Clause 13.
Load-sharing modification factor \( \text{K8} = 1.1 \)
The mean modulus of elasticity should be used to calculate deflections and displacements under both dead and imposed loads.

**Loading - UDL**

Other dead UDL \( Gkux' = 0.183 \text{ kN/m}^2 \)
Imposed load \( Qkux = 1.5 \text{ kN/m} \)

**Analysis results**

Unfactored dead shear \( \text{Rudlhe} = Gk \cdot L / 2 = 0.91568 \text{ kN} \)
Unfactored imposed shear \( \text{Ruilhe} = Qk \cdot L / 2 = 2.7 \text{ kN} \)
Shear force \( Fve = (Gk+Qk) \cdot L / 2 = 3.6157 \text{ kN} \)
Maximum span bending moment \( M = (Gk+Qk) \cdot L^2 / 8 = 5.4235 \text{ kNm} \)
Duration of loading \( K3 = 1.25 \)
Depth factor \( K7 = (300/d)^{0.11} = 1.0456 \)
Width modification factor \( K14 = (300/h)^{0.11} = 1.0456 \)
No of spans which ply is continuous over plycon=3
Transverse stresses and deflection to be based on the clear span of ply.

**Rolling shear stress at ply/joist interface (position B)**

Web to flange connection is to be by glueing. Since $E_{ayfa} \geq E_{ayfb}$ (4.9686E9 $\geq$ 3.1897E9) the 1st moment of area of the top flange is greater than the 1st moment of area of the bottom flange. Rolling shear will be more critical at the top ply

1st moment of area of critical flange $E_{aroll}=E_{ayfa}=4.9686E9$ Nmm
Rolling shear stress @ position B $\tau_{rB}=Fve*1E3*E_{aroll}/E_{Ix}/conwid=0.31024$ N/mm²

Plywood is to be adhered to timber using nails or staples as the bonding pressure. Mod factor $K_70=0.9$
Since $rollp \geq \tau_{rB}$ (0.76106 $\geq$ 0.31024) the applied rolling shear is less than the permissible shear. Hence OK.
Length of bearing $lb=100$ mm
From BS5268-2 Table 18, bearing is < 75 mm from joist end.
Bearing Modification factor $K_4=1.0$

Location: Stressed skin floor joists

Glued stressed skin floor joist with top and bottom ply sheathing to EC5 with NA Amendment No.2

Depth of timber joist section \( h=200 \text{ mm} \)
Width of timber joist section \( b=63 \text{ mm} \)
Nominal depth of top ply \( h_{tp}'=22.5 \text{ mm} \)
Nominal depth of bottom ply \( h_{bp}'=12.5 \text{ mm} \)
Plywood surface grain is perpendicular to span of floor joist.

Joist span \( L=5 \text{ m} \)
Bearing length \( lb=100 \text{ mm} \)
Centres of joists \( crs=400 \text{ mm} \)
Effective width of top flange \( ewidth=400 \text{ mm} \)

Characteristic strength properties

Timber: Based on Table 1 & 3 in BS EN 338:2016(E).
Timber strength class C24.
Plywood:
Plywood is Canadian Douglas Fir (unsanded).
Top plywood sheath comprises 7 plies.
Bottom plywood sheath comprises 4 plies.

Member is in a load-sharing system as defined in EC5 Clause 6.6.
Load-sharing modification factor \( k_{sys}=1.1 \)
The mean modulus of elasticity should be used to calculate deflections and displacements under both permanent and imposed loads.
Bending moments and shear forces

Simply supported beam subject to vertical loads.

Beam span \( L = 5 \text{ m} \)
Distance from left support \( L_c(1) = 2.5 \text{ m} \)
Permanent load (unfactored) \( G_{kc}(1) = 0.5 \text{ kN} \)
Variable load 1 (unfactored) \( Q_{ca}(1) = 0.5 \text{ kN} \)
Dist. from left support to start \( L_a(1) = 0 \text{ m} \)
Distance from left support to end \( L_{bu}(1) = 5 \text{ m} \)
Permanent load (unfactored) \( G_{ku}(1) = 0.18 \text{ kN/m} \)
Variable load 1 (unfactored) \( Q_{ua}(1) = 0.6 \text{ kN/m} \)

Characteristic values of actions

Permanent:
Reaction at left hand end \( 0.7 \text{ kN} \)
Reaction at right hand end \( 0.7 \text{ kN} \)
Maximum span moment \( M_{kp} = 1.1875 \text{ kNm} \)
Maximum shear force \( F_{kp} = 0.7 \text{ kN} \)
Variable 1:
Reaction at left hand end \( 1.75 \text{ kN} \)
Reaction at right hand end \( 1.75 \text{ kN} \)
Maximum span moment \( M_{kv1} = 2.5 \text{ kNm} \)
Maximum shear force \( F_{kv1} = 1.75 \text{ kN} \)
Depth factor (Clause 3.2) \( k_h = 1.0 \)
Width modification factor \( k_w = (150/lardim)^{0.2} = 0.94409 \)
Width modification factor \( k_w = 1.0 \)
Bearing modification factor \( k_{c90} = 1.5 \)
Shear reduction factor \( k_{sh} = 0.67 \)
No of spans which ply is continuous over \( plycon = 3 \)
Transverse stresses and deflection to be based on the clear span of ply.
Permanent udl load on floor \( G_{udl} = 0.45 \text{ kN/m}^2 \)
Variable udl load on floor \( Q_{udl} = 1.5 \text{ kN/m}^2 \)
Permanent max point load on floor \( G_{pl} = 0.5 \text{ kN} \)
Variable max point load on floor \( Q_{pl} = 0.5 \text{ kN} \)
Rolling shear stress at sheathing/joist interface (position B)

Web to flange connection is to be by glueing. Since Eayfa ≥ Eayfb (3.2451E9 ≥ 2.5475E9) the 1st moment of area of the top flange is greater than the 1st moment of area of the bottom flange. Rolling shear will be more critical at the top sheathing.

1st moment of area of critical flange Earoll = Eayfa = 3.2451E9 Nmm

Design rolling shear stress at B:

Bearing length \( l_{b} = 100 \text{ mm} \)
Centres of joists \( c_{rs} = 600 \text{ mm} \)
Effective width of top flange \( e_{\text{width}} = 600 \text{ mm} \)

Characteristic strength properties

Timber: Based on Table 1 & 3 in BS EN 338:2016(E).
Timber strength class C24.
Plywood:
- Plywood is Finnish Birch-faced (sanded).
- Top plywood sheath comprises 17 plies.
- Bottom plywood sheath comprises 9 plies.

Member is in a load-sharing system as defined in EC5 Clause 6.6.
Load-sharing modification factor \( k_{sys} = 1.1 \)
The mean modulus of elasticity should be used to calculate deflections and displacements under both permanent and imposed loads.
Bending moments and shear forces

Simply supported beam subject to vertical loads.

Beam span \( L = 6 \text{ m} \)
Distance from left support to start \( L_{\text{au}}(1) = 0 \text{ m} \)
Distance from left support to end \( L_{\text{bu}}(1) = 6 \text{ m} \)
Permanent load (unfactored) \( G_{k\text{u}}(1) = 0.24 \text{ kN/m} \)
Variable load 1 (unfactored) \( Q_{a\text{u}}(1) = 0.9 \text{ kN/m} \)

Characteristic values of actions

 Permanent:
 Reaction at left hand end \( 0.72 \text{ kN} \)
 Reaction at right hand end \( 0.72 \text{ kN} \)
 Maximum span moment \( M_{k\text{p}} = 1.08 \text{ kNm} \)
 Maximum shear force \( F_{k\text{p}} = 0.72 \text{ kN} \)
 Variable 1:
 Reaction at left hand end \( 2.7 \text{ kN} \)
 Reaction at right hand end \( 2.7 \text{ kN} \)
 Maximum span moment \( M_{k\text{v}1} = 4.05 \text{ kNm} \)
 Maximum shear force \( F_{k\text{v}1} = 2.7 \text{ kN} \)
 Depth factor (Clause 3.2) \( k_{\text{h}} = 1.0 \)
 Width modification factor \( k_{w} = (150/l_{\text{ardim}})^{0.2} = 0.94409 \)
 Bearing modification factor \( k_{c90} = 1.5 \)
 Shear reduction factor \( k_{\text{sh}} = 0.67 \)
 No of spans which ply is continuous over \( \text{plycon} = 3 \)
 Transverse stresses and deflection to be based on the clear span of ply.
 Permanent udl load on floor \( G_{\text{udl}} = 0.45 \text{ kN/m}^2 \)
 Variable udl load on floor \( Q_{\text{udl}} = 1.5 \text{ kN/m}^2 \)

Rolling shear stress at sheathing/joist interface (position B)

Web to flange connection is to be by glueing.
Since \( E_{\text{ayfa}} \geq E_{\text{ayfb}} \) (10E9 \( \geq 7.3847E9 \)) the 1st moment of area of the top flange is greater than the 1st moment of area of the bottom flange. Rolling shear will be more critical at the top sheathing.
1st moment of area of critical flange \( E_{\text{aroll}} = E_{\text{ayfa}} = 10E9 \text{ Nmm} \)
Design rolling shear stress at B:
Since \( p_{\text{fvr}} \geq p_{\text{svr}} \) (1.9213 \( \geq 0.47579 \)) the design rolling shear stress is less than the design shear strength. Hence OK.

Deflection of frame under applied loading: 0.0080205 m
Empirical value: \[ \text{def1} = \frac{L^2}{(4290 \times H)} \times (\frac{L}{26.6} + 1) \]
= 0.0097026 m
Location: Fink truss on grid line D

Span of truss \( L = 6 \, \text{m} \)
Rafter point load \( W = 7.6 \, \text{kN} \)
Slope of roof \( \theta' = 21.8^\circ \)

\[ \begin{align*}
-\text{ve tension} & \quad 7.6 \, \text{kN} \\
7.6 & \quad 68.805 \\
6.627 & \quad -9.5007 \\
7.0565 & \quad 14.113 \\
-9.5007 & \quad -19.001 \\
71.627 & \quad 7.0565 \\
-66.505 \, \text{kN} & \quad -57.004 \, \text{kN} & \quad -38.003 \, \text{kN}
\end{align*} \]

Deflection of frame under applied loading \( 0.01444 \, \text{m} \)
Location: Wall Panel Grid Line A/2

Panel assumed to be supported along full length of base sole plate and laterally restrained perpendicular to plane of racking.

Height of panel: h=2500 mm
Total width of panel: w=3000 mm
Applied load at top of panel: RF=4 kN
Applied vertical load: P=5.01 kN
Wall panel comprises C16 stress grade studs with Canadian Douglas Fir plywood sheathing.
Ply sheathing thickness: pst=9.5 mm

Racking resistance

Nail diameter: Dn=3 mm
Nail spacing: Sp=150 mm

Permissible racking shear load taking into account all modification factors of BS5268:Section 6.1:1996 for ply and OSB sheathing is given by the following equation:

PRS=1680*K101*K102*K103*K104*K105*K106*K107*K108=2198.9 N/m

Permissible racking shear load per metre for 9.5 mm sheathing with 3 mm diameter, 50 mm long round wire nails at 150 mm centres along the full perimeter of the panel is 2198.9 N/m.

Since applied shear load (1333.3 N/m) is less than permissible shear load (2198.9 N/m) then panel is adequate.

Over-turning checks

Density of sheathing: mass=5.5 kg/m²
Stud width: b=75 mm
Stud depth: d=100 mm
Stud centres: scrs=400 mm
FOS against overturning: FOS=1.33
Density of stud timber: dstud'=370 kg/m³
Overall weight of panel: panow=stud+ow=1.0798 kN
Combined vertical load: cvl=P+panow=6.0898 kN
Restoring moment due to vert. load $RM = \frac{c\cdot l \cdot w}{2000} = 9.1347$ kNm

Applied over-turning moment 10 kNm

Factor of safety to overturning $OTFOS = \frac{RM}{aotm} = 0.91347$

SUMMARY

Applied overturning moment 8.414 kNm
Restoring moment           9.574 kNm
Reqd uplift strap moment   2.2056 kNm
Sliding load at base       1.5025 kN/m
Location:

Panel assumed to be supported along full length of base sole plate and laterally restrained perpendicular to plane of racking.

Height of panel \( h = 4035 \text{ mm} \)
Total width of panel \( w = 5050 \text{ mm} \)
Applied load at top of panel \( RF = 7.12 \text{ kN} \)
Applied vertical load \( P = 9.15 \text{ kN} \)
Wall panel comprises C16 stress grade studs with American construction plywood (grade C-D or grade C-C) sheathing.
Ply sheathing thickness \( pst = 9 \text{ mm} \)

Racking resistance

Nail diameter \( Dn = 3 \text{ mm} \)
Nail spacing \( Sp = 150 \text{ mm} \)

Permissible racking shear load taking into account all modification factors of BS5268:Section 6.1:1996 for ply and OSB sheathing is given by the following equation:

\[
PRS = 1680 \times K_{101} \times K_{102} \times K_{103} \times K_{104} \times K_{105} \times K_{106} \times K_{107} \times K_{108} = 2314.5 \text{ N/m}
\]

Permissible racking shear load per metre for 9 mm sheathing with 3 mm diameter, 50 mm long round wire nails at 150 mm centres along the full perimeter of the panel is 2314.5 N/m.

Since applied shear load (1409.9 N/m) is less than permissible shear load (2314.5 N/m) then panel is adequate.

Over-turning checks

Density of sheathing \( \text{mass} = 4.9 \text{ kg/m}^2 \)
Stud width \( b = 97 \text{ mm} \)
Stud depth \( d = 147 \text{ mm} \)
Stud centres \( scrs = 600 \text{ mm} \)
FOS against overturning \( \text{FOS} = 1.4 \)
Density of stud timber \( dstud' = 370 \text{ kg/m}^3 \)
Overall weight of panel \( \text{panow} = \text{stud} + \text{ow} = 3.2914 \text{ kN} \)
Combined vertical load \( cvl = P + \text{panow} = 12.441 \text{ kN} \)
Restoring moment due to vert. load \( RM = \frac{cvl \cdot w}{2000} = 31.414 \) kNm

Applied over-turning moment \( 28.729 \) kNm

Factor of safety to overturning \( OTFOS = \frac{RM}{aotm} = 1.0935 \)

Panel assumed to be supported along full length of base sole plate and laterally restrained perpendicular to plane of racking.

- Height of panel, $h = 6000$ mm
- Total width of panel, $w = 6750$ mm
- Applied load at top of panel, $RF = 18.5$ kN
- Applied vertical load, $P = 15.5$ kN
- Wall panel comprises C16 stress grade studs with Swedish Softwood Construction plywood sheathing.
- Ply sheathing thickness, $p_{st} = 12.5$ mm

### Racking resistance

Nail diameter, $D_n = 3$ mm
Nail spacing, $S_p = 150$ mm

Permissible racking shear load taking into account all modification factors of BS5268:Section 6.1:1996 for ply and OSB sheathing is given by the following equation:

$$ PRS = 1680 \times K_{101} \times K_{102} \times K_{103} \times K_{104} \times K_{105} \times K_{106} \times K_{107} \times K_{108} = 2791 \text{ N/m} $$

Permissible racking shear load per metre for 12.5 mm sheathing with 3 mm diameter, 75 mm long round wire nails at 150 mm centres along the full perimeter of the panel is 2791 N/m.

Since applied shear load (2740.7 N/m) is less than permissible shear load (2791 N/m) then panel is adequate.

### Over-turning checks

- Density of sheathing, $\text{mass} = 5.3$ kg/m²

Location: Wall Panel Grid Line A/2

Panel assumed to be supported along full length of base sole plate and laterally restrained perpendicular to plane of racking.

Height of panel \( h = 2500 \text{ mm} \)
Total width of panel \( w = 3000 \text{ mm} \)
Design side PL on panel \( F_{vEd} = 5.4 \text{ kN} \)
Design vertical load (permanent) \( gd = 2.2545 \text{ kN/m} \)
Wall panel comprises C16 stress grade studs with Canadian Douglas Fir plywood sheathing.
Ply sheathing thickness \( pst = 9.5 \text{ mm} \)

Design racking resistance

The design (racking) shear resistance \( F_{vRd} \) will be evaluated in accordance with EC5, Section 9.2.4.3.2 for ply and OSB sheathing.

Nail diameter \( dn = 3 \text{ mm} \)
Nail spacing along perimeter \( sf = 150 \text{ mm} \)
Lateral design capac of fastener \( F_{fRd} = 370 \text{ N} \)
Density of stud timber \( pk1 = 370 \text{ kg/m}^3 \)
Basic fastener spacing \( so = 9.7*dn/pk1 = 0.078649 \text{ m} \)
Panel dimension factor \( kd = (w/h)^0.4 = 1.0757 \)
Uniformly distributed load factor \( kq = 1 + (0.083*gd - 0.0008*gd^2)*(2400/w)^0.4 = 1.1674 \)
Fastener spacing factor \( ks = 1/(0.86*sf/(so*1000) + 0.57) = 0.45245 \)
Sheathing is assumed to be on one side of the panel only.
Sheathing material factor \( kn = 1.0 \)

Design racking strength of wall \( F_{vRd} = F_{fRd} * kd * kq * ks * kn / so = 2672.9 \text{ N/m} \)

Design racking shear resistance per metre for 9.5 mm sheathing with 3 mm diameter, 50 mm long round wire nails at 150 mm centres along the full perimeter of the panel is 2672.9 N/m.

Since the base design shear load (1800 N/m) is less than the design shear resistance (2672.9 N/m) the panel is adequate.
Over-turning checks

Density of sheathing                   \( mass = 5.5 \, \text{kg/m}^2 \)  
Stud width                        \( b = 75 \, \text{mm} \)  
Stud depth                        \( d = 100 \, \text{mm} \)  
Stud centres                      \( scrs = 400 \, \text{mm} \)  
FOS against overturning           \( FOS = 1.33 \)  
Overall weight of panel            \( panow = \text{stud+ow} = 1.0798 \, \text{kN} \)  
Permanent actions factor          \( \text{gamG} = 1.35 \)  
Combined design vertical load      \( cvl = gd' + panow\cdot\text{gamG} = 8.2212 \, \text{kN} \)  
Restoring moment due to vert. load \( RM = cvl\cdot w / 2000 = 12.332 \, \text{kNm} \)  
Design over-turning moment        \( Mdot = 13.5 \, \text{kNm} \)  
Factor of safety to overturning    \( OTFOS = RM / Mdot = 0.91347 \)  
Strap design uplift moment        \( Mdstr = Mdot \cdot FOS - RM = 5.6232 \, \text{kNm} \)

Buckling strength of the sheathing

The buckling of the sheets under the action of shear force \( FvEd \) may be disregarded provided EC5 expression 9.33 is satisfied.

Expression 9.33
\[ \text{ratio} = \frac{scrs - b}{pst} = 34.211 \]

The ratio of clear distance between studs and thickness of sheathing is less than the upper limit ratio of 100. Hence OK.

Timber design to BS5268 and Eurocode 5
Made by: IFB
Date: 02/12/19

Location:

---

Location:

Panel assumed to be supported along full length of base sole plate and laterally restrained perpendicular to plane of racking.

- **Height of panel**: h=2800 mm
- **Total width of panel**: w=4000 mm
- **Design side UDL on panel**: FvEd=8.414 kN
- **Design vertical load (permanent)**: gd=1.0969 kN/m
- **Wall panel comprises C16 stress grade studs with British Hardwood plywood sheathing.**
- **Ply sheathing thickness**: pst=12 mm

### Design racking resistance

The design (racking) shear resistance FvRd will be evaluated in accordance with EC5, Section 9.2.4.3.2 for ply and OSB sheathing.

- **Nail diameter**: dn=3 mm
- **Nail spacing along perimeter**: sf=150 mm
- **Lateral design capac of fastener**: FfRd=370 N
- **Density of stud timber**: pk1=370 kg/m³
- **Basic fastener spacing**: so=9.7*dn/pk1=0.078649 m
- **Panel dimension factor**: kd=(w/h)^0.4=1.1533
- **Uniformly distributed load factor**: kg=1+(0.083*gd-0.0008*gd^2)*(2400/w)^0.4=1.0734
- **Fastener spacing factor**: ks=1/(0.86*sf/(so*1000)+0.57)=0.45245
- **Sheathing is assumed to be on one side of the panel only.**
- **Sheathing material factor**: kn=1.0

- **Design racking strength of wall**: FvRd=FfRd*kd*kq*ks*kn/so=2635.2 N/m

- **Design racking shear resistance per metre for 12 mm sheathing with 3 mm diameter, 65 mm long round wire nails at 150 mm centres along the full perimeter of the panel is 2635.2 N/m.**

Since the base design shear load (2103.5 N/m) is less than the design shear resistance (2635.2 N/m) the panel is adequate.
Over-turning checks

Density of sheathing      mass = 7.32 kg/m²
Stud width               \( b = 50 \text{ mm} \)
Stud depth               \( d = 125 \text{ mm} \)
Stud centres             \( \text{scrs} = 450 \text{ mm} \)
FOS against overturning  \( \text{FOS} = 1.4 \)
Overall weight of panel  \( \text{panow} = \text{stud+ow} = 1.537 \text{ kN} \)
Permanent actions factor \( \text{gamG} = 1.35 \)
Combined design vertical load \( \text{cvl} = gd' + \text{panow} \times \text{gamG} = 6.4626 \text{ kN} \)
Restoring moment due to vert.load \( \text{RM} = \frac{\text{cvl} \times w}{2000} = 12.925 \text{ kNm} \)
Design over-turning moment \( \text{Mdot} = 11.78 \text{ kNm} \)
Factor of safety to overturning \( \text{OTFOS} = \frac{\text{RM}}{\text{Mdot}} = 1.0972 \)
Strap design uplift moment \( \text{Mdstr} = \text{Mdot} \times \text{FOS} - \text{RM} = 3.5669 \text{ kNm} \)

Buckling strength of the sheathing

The buckling of the sheets under the action of shear force \( FvEd \) may be disregarded provided EC5 expression 9.33 is satisfied.

Expression 9.33  \( \text{ratio} = \frac{\text{scrs} - b}{p} = 33.333 \)

The ratio of clear distance between studs and thickness of sheathing is less than the upper limit ratio of 100. Hence OK.

</table>
Panel assumed to be supported along full length of base sole plate and laterally restrained perpendicular to plane of racking.

Height of panel: h=4035 mm
Total width of panel: w=5050 mm
Design side PL on panel: FvEd=9.968 kN
Design vertical load (permanent): gd=2.446 kN/m
Wall panel comprises C16 stress grade studs with American construction plywood (grade C-D or grade C-C) sheathing.
Ply sheathing thickness: pst=9 mm

Design racking resistance

The design (racking) shear resistance FvRd will be evaluated in accordance with EC5, Section 9.2.4.3.2 for ply and OSB sheathing.

Nail diameter: dn=3 mm
Nail spacing along perimeter: sf=150 mm
Lateral design capacity of fastener: FfRd=370 N
Density of stud timber: pk1=370 kg/m³
Basic fastener spacing: so=9.7*dn/pk1=0.078649 m
Panel dimension factor: kd=(4800/h)^0.4=1.0719
Uniformly distributed load factor: kq=1+(0.083*gd-0.0008*gd^2)*(2400/w)^0.4=1.1472
Fastener spacing factor: ks=1/(0.86*sf/(so*1000)+0.57)=0.45245
Sheathing is assumed to be on one side of the panel only.
Sheathing material factor: kn=1.0

Design racking strength of wall: FvRd=FfRd*kd*kq*ks*kn/so=2617.5 N/m

Design racking shear resistance per metre for 9 mm sheathing with 3 mm diameter, 50 mm long round wire nails at 150 mm centres along the full perimeter of the panel is 2617.5 N/m.

Since the base design shear load (1973.9 N/m) is less than the design shear resistance (2617.5 N/m) the panel is adequate.
Over-turning checks

Density of sheathing  mass = 4.9 kg/m²
Stud width  b = 97 mm
Stud depth  d = 147 mm
Stud centres  scrs = 600 mm
FOS against overturning  FOS = 1.4
Overall weight of panel  panow = stud + ow = 3.2914 kN
Permanent actions factor  gamG = 1.35
Combined design vertical load  cvl = gd' + panow * gamG = 16.796 kN
Restoring moment due to vert.load  RM = cvl * w / 2000 = 42.409 kNm
Design over-turning moment  Mdot = 40.221 kNm
Factor of safety to overturning  OTFOS = RM / Mdot = 1.0544
Strap design uplift moment  Mdstr = Mdot * FOS - RM = 13.9 kNm

Buckling strength of the sheathing

The buckling of the sheets under the action of shear force FvEd may be disregarded provided EC5 expression 9.33 is satisfied.

Expression 9.33  ratio = (scrs - b) / pst = 55.889
The ratio of clear distance between studs and thickness of sheathing is less than the upper limit ratio of 100. Hence OK.

SUMMARY

Design shear strength  2.6175 kN/m
Design overturning moment  40.221 kNm
Design restoring moment  42.409 kNm
Strap design uplift moment  13.9 kNm
Sliding load at base  1.9739 kN/m
Nail diameter  3 mm
Nail Length  50 mm
Perimeter nail crs  150 mm
Intermediate nail crs  300 mm
Fly thickness  9 mm
Location:

Panel assumed to be supported along full length of base sole plate and laterally restrained perpendicular to plane of racking.

Height of panel  \( h = 2150 \) mm  
Total width of panel  \( w = 1800 \) mm  
Design side UDL on panel  \( F_{vEd} \) = 2.198 kN  
Design vertical load (permanent)  \( g_d \) = 1.1625 kN/m  
Wall panel comprises C16 stress grade studs with Finnish Birch plywood sheathing.  
Ply sheathing thickness  \( p_{st} \) = 9 mm

Design racking resistance

The design (racking) shear resistance \( F_{vRd} \) will be evaluated in accordance with EC5, Section 9.2.4.3.2 for ply and OSB sheathing.

Nail diameter  \( d_n = 3 \) mm  
Nail spacing along perimeter  \( s_f = 150 \) mm  
Lateral design capac of fastener  \( F_{fRd} = 370 \) N  
Density of stud timber  \( p_{kl} = 370 \) kg/m³  
Basic fastener spacing  \( s_o = 9.7 \times d_n / p_{kl} = 0.078649 \) m  
Panel dimension factor  \( k_d = w / h = 0.83721 \)  
Uniformly distributed load factor  \( k_q = 1 + (0.083 \times g_d - 0.0008 \times g_d^2) \times (2400 / w)^{0.4} = 1.107 \)  
Fastener spacing factor  \( k_s = 1 / (0.86 \times s_f / (s_o \times 1000) + 0.57) = 0.45245 \)  
Sheathing is assumed to be on one side of the panel only.  
Sheathing material factor  \( k_n = 1.0 \)  
Design racking strength of wall  \( F_{vRd} = F_{fRd} \times k_d \times k_q \times k_s \times k_n / s_o = 1972.8 \) N/m

Design racking shear resistance per metre for 9 mm sheathing with 3 mm diameter, 50 mm long round wire nails at 150 mm centres along the full perimeter of the panel is 1972.8 N/m.

Since the base design shear load (1221.1 N/m) is less than the design shear resistance (1972.8 N/m) the panel is adequate.
Over-turning checks

Density of sheathing \( \text{mass}=6.2 \text{ kg/m}^2 \)
Stud width \( b=47 \text{ mm} \)
Stud depth \( d=97 \text{ mm} \)
Stud centres \( \text{scrs}=450 \text{ mm} \)
FOS against overturning \( \text{FOS}=1.4 \)
Overall weight of panel \( \text{panow}=\text{stud+ow}=0.46506 \text{ kN} \)
Permanent actions factor \( \text{gamG}=1.35 \)
Combined design vertical load \( \text{cvl}=gd'+\text{panow}\cdot\text{gamG}=2.7203 \text{ kN} \)
Restoring moment due to vert.load \( \text{RM}=\text{cvl}\cdot w/2000=2.4483 \text{ kNm} \)
Design over-turning moment \( \text{Mdot}=2.3629 \text{ kNm} \)
Factor of safety to overturning \( \text{OTFOS}=\text{RM}/\text{Mdot}=1.0361 \)
Strap design uplift moment \( \text{Mdstr}=\text{Mdot}\cdot\text{FOS}-\text{RM}=0.85976 \text{ kNm} \)

Buckling strength of the sheathing

The buckling of the sheets under the action of shear force \( FvEd \) may be disregarded provided EC5 expression 9.33 is satisfied.

Expression 9.33 \( \text{ratio}=(\text{scrs}-b)/\text{pst}=44.778 \)
The ratio of clear distance between studs and thickness of sheathing is less than the upper limit ratio of 100. Hence OK.

Location:

Panel assumed to be supported along full length of base sole plate and laterally restrained perpendicular to plane of racking.

Height of panel \( h = 6000 \text{ mm} \)
Total width of panel \( w = 6750 \text{ mm} \)
Design side PL on panel \( FvEd = 22.2 \text{ kN} \)
Design vertical load (permanent) \( gd = 3.1 \text{ kN/m} \)
Wall panel comprises C16 stress grade studs with Swedish Softwood Construction plywood sheathing.
Ply sheathing thickness \( pst = 12.5 \text{ mm} \)

Design racking resistance

The design (racking) shear resistance \( FvRd \) will be evaluated in accordance with EC5, Section 9.2.4.3.2 for ply and OSB sheathing.

Nail diameter \( dn = 3 \text{ mm} \)
Nail spacing along perimeter \( sf = 150 \text{ mm} \)
Lateral design capac of fastener \( FfRd = 570 \text{ N} \)
Density of stud timber \( pk1 = 370 \text{ kg/m}^3 \)
Basic fastener spacing \( so = 9.7 \times \frac{dn}{pk1} = 0.078649 \text{ m} \)
Panel dimension factor \( kd = (4800/h)^{0.4} = 0.91461 \)
Uniformly distributed load factor \( kq = 1 + (0.083 \times gd - 0.0008 \times gd^2) \times (2400/w)^{0.4} = 1.1651 \)
Fastener spacing factor \( ks = 1 / (0.86 \times sf / (so \times 1000) + 0.57) = 0.45245 \)
Sheathing is assumed to be on one side of the panel only.
Sheathing material factor \( kn = 1.0 \)

Design racking strength of wall \( FvRd = FfRd \times kd \times kq \times ks \times kn / so = 3494.1 \text{ N/m} \)

Design racking shear resistance per metre for 12.5 mm sheathing with 3 mm diameter, 75 mm long round wire nails at 150 mm centres along the full perimeter of the panel is 3494.1 N/m.

Since the base design shear load (3288.9 N/m) is less than the design shear resistance (3494.1 N/m) the panel is adequate.
Over-turning checks

Density of sheathing mass=5.3 kg/m²
Stud width b=63 mm
Stud depth d=197 mm

Panel assumed to be supported along full length of base sole plate and laterally restrained perpendicular to plane of racking.

Height of panel $h=5200$ mm
Total width of panel $w=14600$ mm
Design side UDL on panel $F_{vEd}=25.939$ kN
Design vertical load (permanent) $g_d=0.35803$ kN/m
Wall panel comprises C16 stress grade studs with Finnish Birch faced plywood sheathing.
Ply sheathing thickness $p_s=8$ mm

**Design racking resistance**

The design (racking) shear resistance $F_{vRd}$ will be evaluated in accordance with EC5, Section 9.2.4.3.2 for ply and OSB sheathing.

Nail diameter $d_n=3$ mm
Nail spacing along perimeter $s_f=150$ mm
Lateral design capac of fastener $F_{fRd}=370$ N
Density of stud timber $p_{k1}=370$ kg/m$^3$
Basic fastener spacing $s_o=9.7\cdot d_n/p_{k1}=0.078649$ m
Panel dimension factor $k_d=(4800/h)^{0.4}=0.96849$
Uniformly distributed load factor $k_q=1+(0.083\cdot g_d-0.0008\cdot g_d^2)\cdot (2400/w)^{0.4}=1.0144$
Fastener spacing factor $k_s=1/(0.86\cdot s_f/(s_o\cdot 1000)+0.57)=0.45245$
Sheathing is assumed to be on one side of the panel only.
Sheathing material factor $k_n=1.0$
Design racking strength of wall $F_{vRd}=F_{fRd}\cdot k_d\cdot k_q\cdot k_s\cdot k_n/s_o=2091.1$ N/m

Design racking shear resistance per metre for 8 mm sheathing with 3 mm diameter, 50 mm long round wire nails at 150 mm centres along the full perimeter of the panel is 2091.1 N/m.

Since the base design shear load (1776.6 N/m) is less than the design shear resistance (2091.1 N/m) the panel is adequate.
Over-turning checks

Density of sheathing \( \text{mass}=4.9 \, \text{kg/m}^2 \)
Stud width \( b=47 \, \text{mm} \)
Stud depth \( d=175 \, \text{mm} \)

Total width of panel \( w = 4100 \text{ mm} \)
Design side UDL on panel \( FvEd = 6.8768 \text{ kN} \)
Design vertical load (permanent) \( gd = 1.1268 \text{ kN/m} \)

**WARNING:**
Plasterboard alone should not be relied upon to provide the racking resistance of a dwelling; however plasterboard will contribute to the racking resistance if used with ply or OSB sheathing. This is outside the scope of this proforma.
Location:

Panel assumed to be supported along full length of base sole plate and laterally restrained perpendicular to plane of racking.

Height of panel \( h = 3000 \text{ mm} \)

Total width of panel \( w = 4100 \text{ mm} \)

Design side UDL on panel \( F_v Ed = 6.8768 \text{ kN} \)

Design vertical load (permanent) \( g_d = 1.35 \text{ kN/m} \)

Wall panel comprises C16 stress grade studs with Swedish Softwood Construction OSB sheathing.

OSB sheathing thickness \( p_{st} = 8 \text{ mm} \)

**Design racking resistance**

The design (racking) shear resistance \( F_v Rd \) will be evaluated in accordance with EC5, Section 9.2.4.3.2 for ply and OSB sheathing.

Nail diameter \( d_n = 3 \text{ mm} \)

Nail spacing along perimeter \( s_f = 150 \text{ mm} \)

Lateral design capacity of fastener \( F_{f Rd} = 370 \text{ N} \)

Density of stud timber \( p_{kl} = 370 \text{ kg/m}^3 \)

Basic fastener spacing \( s_o = 9.7 \times d_n / p_{kl} = 0.078649 \text{ m} \)

Panel dimension factor \( k_d = (w / h)^{0.4} = 1.1331 \)

Uniformly distributed load factor \( k_q = 1 + (0.083 \times g_d - 0.0008 \times g_d^2) \times (2400 / w)^{0.4} = 1.0893 \)

Fastener spacing factor \( k_s = 1 / (0.86 \times s_f / (s_o \times 1000) + 0.57) = 0.45245 \)

Sheathing material factor \( k_n = 1.0 \)

Design racking strength of wall \( F_v Rd = F_{f Rd} \times k_d \times k_q \times k_s \times k_n / s_o = 2627.1 \text{ N/m} \)

Design racking shear resistance per metre for 8 mm sheathing with 3 mm diameter, 50 mm long round wire nails at 150 mm centres along the full perimeter of the panel is 2627.1 N/m.

Since the base design shear load (1677.3 N/m) is less than the design shear resistance (2627.1 N/m) the panel is adequate.
Over-turning checks

Density of sheathing mass=5 kg/m²
Stud width b=47 mm
Stud depth d=97 mm
Stud centres scrs=600 mm
FOS against overturning FOS=1.33
Overall weight of panel panow=stud+ow=1.0756 kN
Permanent actions factor gamG=1.35
Combined design vertical load cvl=gd’+panow*gamG=6.9871 kN
Restoring moment due to vert.load RM=cvl*w/2000=14.324 kNm
Design over-turning moment Mdot=10.315 kNm
Factor of safety to overturning OTFOS=RM/Mdot=1.3886

Buckling strength of the sheathing

The buckling of the sheets under the action of shear force FvEd may be disregarded provided EC5 expression 9.33 is satisfied.

Expression 9.33 ratio=(scrs-b)/pst=69.125
The ratio of clear distance between studs and thickness of sheathing is less than the upper limit ratio of 100. Hence OK.

Location: Timber beam with udl & point loads

Structural design of a timber member for fire resistance

BS5268 Part 4 Section 4.1: 1978 sets out a method for calculating the fire resistance of timber members. Fire resistance of a member is the period of time which the member is required to support the design load without failure whilst subjected to the fire. The method assumes that a depth of charring occurs around the exposed face of the section, and the corners of the beam become rounded. The residual section is checked for stability strength and the beam deflection is limited to Span/20 (1990 revision).

Basic fire exposure period period=30 min
Timber is Western red cedar

Charring depth char=25 mm
Original depth of section od=297 mm
Original width of section ob=147 mm

Residual depth of beam d=od-char=272 mm
Residual width of beam b=ob-2*char=97 mm

Simply supported beam subjected to vertical loads.

Beam span \(L=7.2\ m\)
Dist. from left support to start \(L_{au}(1)=0\ m\)
Distance from left support to end \(L_{bu}(1)=7.2\ m\)
Dead load (unfactored) \(G_{k\mu}(1)=0.25\ kN/m\)
Imposed load (unfactored) \(Q_{k\mu}(1)=1.2\ kN/m\)
Maximum span bending moment 9.396 kNm
Design shear force \(F_{ve}'=5.22\)
Eff. length for bending about xx \( \text{Lex} = 7200 \text{ mm} \)
Eff. length for bending about yy \( \text{Ley} = 0 \text{ mm} \)
Length of bearing \( \text{lb} = 147 \text{ mm} \)

From BS5268 Part 2 Table 18 and bearing is < 75 mm from joist end

Bearing Modification factor \( K_4 = 1.0 \)
Strength class C16 to Table 8.

Depth factor \( K_7 = (300/d)^{0.11} = 1.0108 \)
Load-sharing modification factor \( K_8 = 1.1 \)
No notches exist at the support. \( K_5 = 1.0 \)

**Permissible stresses**

BS 5268 Part 4 Section 4.1 does not give any guidance on the enhancement to the shear stress or for compression perpendicular to the grain using the residual section method.

Shear enhancement factor adopted \( \text{Shefac} = 2 \)
Shear parallel to grain \( \text{torad} = \text{Shefac} \times K_2 \times \text{shr} \times K_3 \times K_5 \times K_8 \times \text{torad} = 1.474 \text{ N/mm}^2 \)
Compress perp to grain enhancement factor adopted \( \text{Cpgfac} = 2 \)
Compress perp to grain (no wane) \( \text{sigbad} = \text{Cpgfac} \times K_2 \times \text{per} \times K_3 \times K_4 \times K_8 \times \text{sigbad} = 4.84 \text{ N/mm}^2 \)

### DESIGN

Structural design of a timber member for fire resistance

BS EN 1995-1-2:2004 sets out a method for calculating the fire resistance of timber members. Fire resistance of a member is the period of time which the member is required to support the design load without failure whilst subjected to the fire. The method assumes that a depth of charring occurs around the exposed face of the section, and the corners of the beam become rounded. The residual section is checked for strength and the beam deflection is limited to Span/20 which is the recommended vertical deflection limit given in the EC5 Manual.

Basic fire exposure period
Enter the charring rate $\beta_n$
Effective charring depth
Original depth of section
Original width of section

Timber beam exposed on all four sides.

Residual depth of beam
Residual width of beam

Timber beam to EC5

Simply supported beam subject to vertical loads.

SUMMARY

SCALE 5.48 Office 1007 Proforma 268
**Location: Timber beam with udl & point loads (4)**

**Structural design of a timber member for fire resistance**

BS EN 1995-1-2:2004 sets out a method for calculating the fire resistance of timber members. Fire resistance of a member is the period of time which the member is required to support the design load without failure whilst subjected to the fire. The method assumes that a depth of charring occurs around the exposed face of the section, and the corners of the beam become rounded. The residual section is checked for strength and the beam deflection is limited to Span/20 which is the recommended vertical deflection limit given in the EC5 Manual.

Basic fire exposure period \( \text{period} = 60 \text{ min} \)
Enter the charring rate \( \beta_n \) \( \beta_n = 0.55 \)

Effective charring depth \( \text{char} = \beta_n \times \text{period} + k_0 \times d_0 = 40 \text{ mm} \)
Original depth of section \( \text{oh} = 247 \text{ mm} \)
Original width of section \( \text{ob} = 97 \text{ mm} \)

Timber beam exposed on all four sides.

Residual depth of beam \( h = \text{oh} - 2 \times \text{char} = 167 \text{ mm} \)
Residual width of beam \( b = \text{ob} - 2 \times \text{char} = 17 \text{ mm} \)
Residual width is less than 2 x char depth so depth of charred corners overlap. Neglect contribution from remaining section below char rounding. Reduced depth of section \( h = h - 2 \times \text{char} = 87 \text{ mm} \).

**Timber beam to EC5**

Simply supported beam subject to vertical loads.

Beam span \( L = 2.4 \text{ m} \)
Distance from left support \( L_c(1) = 1.2 \text{ m} \)
Permanent load (unfactored) \( G_{kc}(1) = 0.3 \text{ kN} \)
Variable load 1 (unfactored) \( Q_{ca}(1) = 0.35 \text{ kN} \)
Characteristic values of actions

Permanent:
- Reaction at left hand end: 0.15 kN
- Reaction at right hand end: 0.15 kN
- Maximum span moment: Mkp=0.18 kNm
- Maximum shear force: Fkp=0.15 kN

Variable 1:
- Reaction at left hand end: 0.175 kN
- Reaction at right hand end: 0.175 kN
- Maximum span moment: Mkv1=0.21 kNm
- Maximum shear force: Fkv1=0.175 kN

Design axial load (+ve compress): Nd=0 kN

Section design parameters

Eff. length for bending about yy: Ley'=0 mm
Eff. length for bending about zz: Lez=0 mm
Length of bearing: lb=75 mm
Bearing modification factor: kc90=1.5
Timber strength class: C24

Depth factor (Clause 3.2): kh=(150/h)^0.2=1.1151
Load-sharing modification factor: ksys=1.0
No notches exist at the support: kv=1.0

Design bending stress: 18.186 N/mm²
Design bending strength: 33.453 N/mm²
Design deflection: 18.703 mm
Limiting deflection: 120 mm
Design shear stress: 0.32961 N/mm²
Design shear strength: 5 N/mm²
Design bearing stress: 0.2549 N/mm²
Design bearing strength: 4.6875 N/mm²
Location: Ex1 - Solid timber joists & OSB/3 boarding

The design requirements in EC5 relate solely to residential floors and the following vibration verifications will need to be considered:

- fundamental frequency check
- static deflection under a point load check
- unit impulse velocity response check.

Effective span of joist \( L = 3.75 \text{ m} \)
Width of floor structure \( B = 4 \text{ m} \)
Joist spacing \( s = 400 \text{ mm} \)
Mass of the floor \( m_f = 35 \text{ kg/m}^2 \)
Depth of section \( h = 200 \text{ mm} \)
Width of section \( b = 47 \text{ mm} \)
Flooring thickness \( t = 18 \text{ mm} \)

Floor joist properties

Floor joist selected are solid timber joists.
Timber strength class C18.
Mean modulus of elasticity \( E_0\text{mean}=9000 \text{ N/mm}^2 \)

Flooring properties

Oriented strand board (OSB/3), service class 1 or 2 to BS EN 12369-1.
Mean modulus of elasticity \( E_f\text{mean}=4930 \text{ N/mm}^2 \)
Function value \( k\text{strut}=1 \)

Thickness of pointside timber \( t_p = 75 \text{ mm} \)
Timber characteristic density \( p_k^2 = 340 \text{ kg/m}^3 \)
Diameter of nails \( d = 3.4 \text{ mm} \)
Pointside embedment of nail \( p_{en} = 65 \text{ mm} \)
Improved nail modification factor \( K_{45} = 1 \)
Basic withdrawal load \( W_{\text{basic}} = 1.93 \text{ N/mm penetration} \)
Mod factor for duration of load \( K_{48} = 1.25 \)
Mod factor for number of nails \( K_{50} = 1 \)
Permissible nail load \( p_{nl} = W_{\text{basic}} \times p_{en} \times K_{48} \times K_{49} \times K_{50} = 156.81 \text{ N} \)
Number of nails required \( n = \text{INT}(F \times 1000/p_{nl}) + 1 = 4 \)

Minimum nail spacings

Edge dist perpend to timber grain 17 mm
Timber is a softwood except Douglas fir therefore the spacings given in Table 60 for timber-to-timber joints are multiplied by 0.8.
Edge dist perpend to timber grain 17 mm
End distance parallel to grain 55 mm
Loaded edge distance in timber 17 mm
Distance between lines of nails perpendicular to grain 28 mm
Distance between adjacent nails in any one line, parallel to grain 55 mm
Location: Timber connection default case 4

Plywood to timber joint to BS5268-2:2002 Nails driven into side grain

Axial load to be carried by joint F=1.5 kN

Plywood group 2 (see Clause 6.1) comprising:
(a) Finnish birch-faced plywood
(b) Finnish birch plywood

Thickness of headside member       th=9 mm
Timber characteristic density      pk1=641 kg/m³
Strength class C14 to Table 8.
Thickness of pointside timber      tp=50 mm
Timber characteristic density      pk2=290 kg/m³
Diameter of nails                  d=2.7 mm
Length of nails                    l=50 mm

Basic loads in N will be derived from formula given in Annex G.2 Equations G1 to G6 in annex G in BS5268-2:2002.

Basic nail shear capacity          basic=1*Gmin/(Fd*Kd)=195.99 N

Mod factor for duration of load    K48=1.12
Mod factor for number of nails     K50=1

Minimum nail spacings

End distance parallel to grain     38 mm
Edge distance in the plywood      9 mm
Loaded edge distance in timber    14 mm
Distance between lines of nails
perpendicular to grain            19 mm
Distance between adjacent nails in any one line, parallel to grain 38 mm
Location: Timber connection default case 2

Timber to timber joint with pre-drilled holes to BS5268-2:2002

Holes not greater than 0.8 of the nail diameter

Axial load to be carried by joint $F=4$ kN
Thickness of headside member $th=60$ mm
Strength class C30 to Table 8.
Timber characteristic density $pk1=380$ kg/m³
Strength class C30 to Table 8.
Thickness of pointside timber $tp=75$ mm
Timber characteristic density $pk2=380$ kg/m³
End grain modification factor $K43=1$
Diameter of nails $d=5$ mm
Length of nails $l=120$ mm
Improved nail modification factor $K44=1.2$
Basic nail shear capacity $basich=778$ N
Basic nail shear capacity $basicp=778$ N
Pointside basic load is critical $basic=basicp=933.6$ N
Mod factor for duration of load $K48=1$
Mod factor for number of nails $K50=0.9$

Minimum nail spacings

Edge distance $\perp$ to timber grain 25 mm
Timber is a softwood except Douglas fir therefore the spacings given in Table 60 for timber-to-timber joints are multiplied by 0.8.
Edge distance $\perp$ to timber grain 25 mm
End distance parallel to grain 56 mm

Joint slip check

Slip per shear plane $U=F*1000/Kser=2.16$ mm
Slip per fastener per shear plane $Uf=U/n=0.43199$ mm
Location: Timber connection default case 3

Steel plate-to-timber joint to BS5268-2:2002

Axial load to be carried by joint $F=8$ kN
Thickness of headside steel plate $t_h=10$ mm
Strength class C24 to Table 8.
Thickness of pointside timber $t_p=125$ mm
Timber characteristic density $p_k^2=350$ kg/m$^3$
Diameter of nails $d=8$ mm
Length of nails $l=106$ mm
Improved nail modification factor $K_{44}=1.2$
Basic loads in N will be derived from formula given in Annex G.2.
Equations G1 to G6 in annex G in BS5268-2:2002.

Basic nail shear capacity $\text{basic}=1*G_{\min}/(F_d*K_d)=1642.9$ N

Mod factor for duration of load $K_{48}=1.25$
Mod factor for number of nails $K_{50}=1$

Minimum nail spacings

Nails are driven at right angles to the glued surface of pre-glued laminated members, therefore the spacings are multiplied by 0.9.
Edge distance $\perp$ to timber grain 40 mm
End distance parallel to grain 101 mm
Location: Timber connection default case 4

Plywood to timber joint to BS5268-2:2002 Nails driven into side grain

Axial load to be carried by joint \( F = 5 \text{ kN} \)

Plywood group 1 (see Clause 6.1) comprising:
(a) American construction and industrial plywood
(b) Canadian Douglas fir plywood
(c) Canadian softwood plywood
(d) Swedish softwood plywood
(e) Finnish conifer plywood

Thickness of headside member \( t_h = 15 \text{ mm} \)
Timber characteristic density \( p_{k1} = 505 \text{ kg/m}^3 \)
Strength class C14 to Table 8.

Thickness of pointside timber \( t_p = 63 \text{ mm} \)
Timber characteristic density \( p_{k2} = 290 \text{ kg/m}^3 \)

Diameter of nails \( d = 3.4 \text{ mm} \)
Length of nails \( l = 65 \text{ mm} \)

Basic loads in N will be derived from formula given in Annex G.2 Equations G1 to G6 in annex G in BS5268-2:2002.

Basic nail shear capacity \( \text{basic} = 1 \times G_{\text{min}} / (F_d \times K_d) = 215.24 \text{ N} \)

Mod factor for duration of load \( K_{48} = 1.12 \)
Mod factor for number of nails \( K_{50} = 1 \)

Minimum nail spacings

End distance parallel to grain \( 48 \text{ mm} \)
Edge distance in the plywood \( 11 \text{ mm} \)
Loaded edge distance in timber \( 17 \text{ mm} \)
Distance between lines of nails perpendicular to grain \( 24 \text{ mm} \)
Distance between adjacent nails in any one line, parallel to grain \( 48 \text{ mm} \)

Joint slip check

\( U = F \times 1000 / K_{\text{ser}} = 9.5089 \text{ mm} \)
\( U_f = U / n = 0.4528 \text{ mm} \)
Location: Timber connection default case 1

Timber to timber joint without pre-drilled holes to BS5268-2:2002

Axial load to be carried by joint $F=6\text{ kN}$
Thickness of headside member $th=50\text{ mm}$
Strength class C22 to Table 8.
Timber characteristic density $p_{k1}=340\text{ kg/m}^3$
Strength class C24 to Table 8.
Thickness of pointside timber $tp=50\text{ mm}$
Timber characteristic density $p_{k2}=350\text{ kg/m}^3$
End grain modification factor $K_{43}=1$
Diameter of nails $d=4.2\text{ mm}$
Length of nails $l=90\text{ mm}$
Improved nail modification factor $K_{44}=1$
Basic loads in N will be derived from formula given in Annex G.2.
Equations G1 to G6 in annex G in BS5268-2:2002.

Basic nail shear capacity $basic=1\times\frac{G_{\text{min}}}{(Fd\times K_{4d})}=563.24\text{ N}$
Mod factor for duration of load $K_{48}=1.12$
Mod factor for number of nails $K_{50}=1$

Minimum nail spacings

Edge distance $\perp$ to timber grain 21 mm
Timber is a softwood except Douglas fir therefore the spacings given in Table 60 for timber-to-timber joints are multiplied by 0.8.
Edge distance $\perp$ to timber grain 21 mm
End distance parallel to grain 68 mm

Joint slip check

Slip per shear plane $U=F\times1000/K_{\text{ser}}=7.5906\text{ mm}$
Slip per fastener per shear plane $Uf=U/n=0.75906\text{ mm}$

Actual spacing of nails within one row parallel to grain \( a_1 = 34 \) mm
Spacing of rows of nails perpendicular to grain \( a_2 = 5 \times d = 17 \) mm
End distance (loaded) \( a_{3t} = (10 + 5 \times \text{COS}(\alpha)) \times d = 51 \) mm
End distance (unloaded) \( a_{3c} = 10 \times d = 34 \) mm
Edge distance (loaded) \( a_{4t} = (5 + 2 \times \text{SIN}(\alpha)) \times d = 17 \) mm
Edge distance (unloaded) \( a_{4c} = (5 + 2 \times \text{SIN}(\alpha)) \times d = 17 \) mm
Joint slip check - EC5 Section 7

Total instantaneous slip SLS \( u_{SLS} = 2 * u_{user} = 1.5544 \text{ mm} \)

Total instantaneous slip ULS \( u_{ULS} = 2 * u_{ult} = 2.215 \text{ mm} \)

Psi 2 factor (variable action) \( \psi_2v = 0.3 \)

\[
u_{SLS} = 2 \left( u_{user} \frac{G_k'}{F_{dser}} (1 + \psi_2p \times k_{def}) + u_{user} \frac{Q_k'}{F_{dser}} (1 + \psi_2v \times k_{def}) \right) = 2.1606 \text{ mm}
\]

\[
u_{ULS} = 2 \left( u_{ult} \frac{G_k'}{F_{dser}} (1 + \psi_2p \times k_{def}) + u_{ult} \frac{Q_k'}{F_{dser}} (1 + \psi_2v \times k_{def}) \right) = 3.0788 \text{ mm}
\]

**DESIGN SUMMARY**

Design axial load 21.375 kN

Headside member thickness 19 mm

Pointside member thickness 63 mm

Number of nails required 38

Diameter of nails 3.4 mm

Length of smooth nails 75 mm

Nails should comply with BS EN 14592 and should have a minimum ultimate tensile strength of 600 N/mm². Pre-drilled holes are not required.

In order to eliminate the effect of number of nails in a row the minimum spacing of nails in a row parallel to grain needs to be 47.6 mm.
Particleboard to timber joint in accordance with EC5

Headside is particleboard without pre-drilled holes and nails are driven into side grain of timber.
Characteristic permanent load $G_k=1.25$ kN
Characteristic variable load $Q_k=1.25$ kN

Plan

Thickness of headside member $th=18$ mm
Particleboard char density $p_{k1}=400$ kg/m³
Timber strength class C30.
Thickness of pointside timber $tp=47$ mm
Timber characteristic density $p_{k2}=380$ kg/m³
Diameter of nails $d=3.8$ mm
Length of nails $l=50$ mm

Basic loads in N will be derived from expressions given in Section 8 assuming round nails.
Expressions (a)-(f) for fasteners in single shear refer to section 8.2.2 in EC5. Zero contribution from rope effect will be considered.

Min value of equations (a)-(f) $G_{\text{min}}=1010.3$ N

Char nail shear capacity $G_{\text{basic}}=G_{\text{min}}=1010.3$ N
Material factor for connections $\Gamma_{\text{M}}=1.3$

Design resistance per nail $p_{\text{n1}}=k_{\text{mod}}*G_{\text{basic}}/\Gamma_{\text{M}}=621.75$ N
Number of nails required $n=\text{INT}(F_d*1000/p_{\text{n1}})+1=6$

Minimum nail spacings - EC5 Table 8.2 & Figure 8.7

Minimum spacing of nails within one row parallel to grain $a_1=(5+5*\text{COS}(\alpha))*d=38$ mm
Actual spacing of nails within one row parallel to grain $a_1=38$ mm
Spacing of rows of nails perpendicular to grain $a_2=5*d=19$ mm
End distance (loaded) $a_3=(10+5*\text{COS}(\alpha))*d=57$ mm
End distance (unloaded) $a_3c=10*d=38$ mm
Edge distance (loaded) $a_4=(5+2*\text{SIN}(\alpha))*d=19$ mm
Edge distance (unloaded) $a_4c=(5+5*\text{SIN}(\alpha))*d=19$ mm

Joint slip check - EC5 Section 7

Total instantaneous slip SLS $u_{\text{user}}=2*u_{\text{isuer}}=1.1599$ mm
Total instantaneous slip ULS $u_{\text{ult}}=2*u_{\text{isuer}}=1.6529$ mm
Psi 2 factor (variable action) $\psi_{2v}=0.3$

$u_{\text{user}}=2*(u_{\text{isuer}}*G_k/F_d*1+p_{\text{isuer}}*k_{\text{def}})+u_{\text{isuer}}*Q_k/F_d*1+p_{\text{isuer}}*k_{\text{def}})=1.7631$ mm
ufult=2*(uiult*Gk'/Fdser*(1+psi2p*kdef)+uiult*Qk'/Fdser*(1+psi2v *kdef))=2.5124 mm

Nails should comply with BS EN 14592 and should have a minimum ultimate tensile strength of 600 N/mm². Pre-drilled holes are not required.

In order to eliminate the effect of number of nails in a row the minimum spacing of nails in a row parallel to grain needs to be 58.8 mm.
**Location:** Ex 10.13.1 Jack Porteous book p.417

**Timber-to-timber joint without pre-drilled holes to EC5**

Characteristic permanent load \( G_k = 2.5 \text{ kN} \)
Characteristic variable load \( Q_k = 3.5 \text{ kN} \)

**PLAN**

Thickness of headside member \( th = 36 \text{ mm} \)
Timber strength class C22.
Timber characteristic density \( p_{k1} = 340 \text{ kg/m}^3 \)
Timber strength class C22.
Thickness of pointside timber \( tp = 50 \text{ mm} \)
Timber characteristic density \( p_{k2} = 340 \text{ kg/m}^3 \)
Diameter of nails \( d = 3.35 \text{ mm} \)
Length of nails \( l = 65 \text{ mm} \)

Basic loads will be derived from expressions given in Section 8 assuming round nails.

**Minimum nail spacings - EC5 Table 8.2 & Figure 8.7**

Minimum spacing of nails within
one row parallel to grain \( a_1 = (5+5*\cos(\alpha))*d = 33.5 \text{ mm} \)
Actual spacing of nails within
one row parallel to grain \( a_1 = 33.5 \text{ mm} \)
Spacing of rows of nails perpendicular to grain \( a_2 = 5*d = 16.75 \text{ mm} \)
End distance (loaded) \( a_3t = (10+5*\cos(\alpha))*d = 50.25 \text{ mm} \)
End distance (unloaded) \( a_3c = 10*d = 33.5 \text{ mm} \)
Edge distance (loaded) \( a_4t = (5+2*\sin(\alpha))*d = 16.75 \text{ mm} \)
Edge distance (unloaded) \( a_4c = (5+5*\sin(\alpha))*d = 16.75 \text{ mm} \)

**Joint slip check - EC5 Section 7**

Total instantaneous slip ULS \( u_{ult} = 2*u_{iult} = 3.4867 \text{ mm} \)
Psi 2 factor (variable action) \( \psi_{2v} = 0.3 \)

\[
uf_{ser} = 2*(u_{iser} * G_k/Fd_{ser}*(1+\psi_{2p} k_{def})+u_{iser} * Q_k/Fd_{ser}*(1+\psi_{2v} k_{def})) = 3.5736 \text{ mm}
\]

\[
uf_{ult} = 2*(u_{iult} * G_k/Fd_{ser}*(1+\psi_{2p} k_{def})+u_{iult} * Q_k/Fd_{ser}*(1+\psi_{2v} k_{def})) = 5.1371 \text{ mm}
\]
DESIGN SUMMARY

Design axial load 8.625 kN
Headside member thickness 36 mm
Pointside member thickness 50 mm
Nail details between A-B:
Number of nails per side 9
Total number of nails 18
Nail details between B-C:
Number of nails per side 9
Total number of nails 18
Diameter of nails 3.35 mm
Length of smooth nails 65 mm

Nails should comply with BS EN 14592 and should have a minimum ultimate tensile strength of 600 N/mm². Pre-drilled holes are not required.

In order to eliminate the effect of number of nails in a row the minimum spacing of nails in a row parallel to grain needs to be 46.9 mm.
**Location:** Screwed timber-to-timber joint connection

**Timber to timber screwed joint - BS5268-2:2002**

Axial load to be carried by joint $F=5.5$ kN  
Thickness of headside member $th=38$ mm  
Thickness of pointside timber $tp=76$ mm  
End grain modification factor $K_43=0.7$  
Diameter of screw shank $d=4$ mm  
Length of screws $l=90$ mm  
Basic screw shear headside capacity $basich=361$ N  
Basic screw shear pointside capacity $basicp=361$ N  
Mod factor for duration of load $K_52=1.12$  
Mod factor for number of screws $K_54=0.9$  
Permissible screw load $psl=basic*K_52*K_53*K_54=363.89$ N  
Number of screws required $n=\text{INT}(F*1000/psl)+1=16$

Characteristic variable load \( Q_k = 2.4 \text{ kN} \)
Design axial load at joint \( F_d = 1.35 \times G_k + 1.5 \times Q_k = 6.84 \text{ kN} \)
Thickness of headside steel plate \( t_h = 4 \text{ mm} \)
Timber strength class C22.
Thickness of pointside timber \( t_p = 38 \text{ mm} \)
Diameter of screw shank \( d = 4 \text{ mm} \)
Length of screws \( l = 36 \text{ mm} \)
Basic loads in N will be derived from expressions given in Section 8 assuming smooth shank screws.
Expressions (a) to (e) for fasteners in single shear refer to section 8.2.3 in EC5. Zero contribution from rope effect will be considered.
Min value of equations (a)-(e) \( G_{\text{min}} = 1255.8 \text{ N} \)
Char screw shear capacity \( k_{\text{mod}} \times G_{\text{min}} = 1255.8 \text{ N} \)
Material factor for connections \( \gamma_M = 1.3 \)
Design resistance per screw \( p_{nl} = k_{\text{mod}} \times G_{\text{min}} / \gamma_M = 772.81 \text{ N} \)
Number of screws required \( n = \text{INT}(F_d \times 1000 / p_{nl}) + 1 = 9 \)

Minimum screw spacings - EC5 Table 8.2

Minimum spacing of screws within
one row parallel to grain \( a_1 = (5 + 5 \times \cos(\alpha)) \times d = 40 \text{ mm} \)
Actual spacing of screws within
one row parallel to grain \( a_1 = 40 \text{ mm} \)
Spacing of rows of screws perpendicular to grain \( a_2 = 5 \times d = 20 \text{ mm} \)
End distance (loaded) \( a_3t = (10 + 5 \times \cos(\alpha)) \times d = 60 \text{ mm} \)
End distance (unloaded) \( a_3c = 10 \times d = 40 \text{ mm} \)
Edge distance (loaded) \( a_4t = (5 + 2 \times \sin(\alpha)) \times d = 20 \text{ mm} \)
Edge distance (unloaded) \( a_4c = (5 + 5 \times \sin(\alpha)) \times d = 20 \text{ mm} \)

Joint slip check - EC5 Section 7

Total instantaneous slip SLS \( u_{\text{ser}} = 2 \times u_{\text{ser}} = 0.84189 \text{ mm} \)
Total instantaneous slip ULS \( u_{\text{ult}} = 2 \times u_{\text{ult}} = 1.1997 \text{ mm} \)
Psi 2 factor (variable action) \( \psi_{2v} = 0.3 \)
\( u_{\text{ser}} = 2 \times (u_{\text{ser}} \times G_k / F_d \times (1 + \psi_{2v} \times k_{\text{def}}) + u_{\text{ser}} \times Q_k / F_d \times (1 + \psi_{2v} \times k_{\text{def}})) = 1.1702 \text{ mm} \)
\( u_{\text{ult}} = 2 \times (u_{\text{ult}} \times G_k / F_d \times (1 + \psi_{2v} \times k_{\text{def}}) + u_{\text{ult}} \times Q_k / F_d \times (1 + \psi_{2v} \times k_{\text{def}})) = 1.6676 \text{ mm} \)
**Design Summary**

- **Design axial load**: 6.84 kN
- **Headside member thickness**: 4 mm
- **Pointside member thickness**: 38 mm
- **Number of screws required**: 9
- **Diameter of screws**: 4 mm
- **Length of screws**: 36 mm

Provide smooth shank screws to EN 14592 of min ultimate tensile strength of 540 N/mm². Pre-drilled holes are not required. In order to eliminate the effect of number of screws in a row the min spacing of screws in a row parallel to grain needs to be 56 mm.
Location: Screwed metal plate-to-timber joint connection

Metal plate-to-timber screwed joint to EC5

DESIGN SUMMARY

- Design axial load: 6.84 kN
- Headside member thickness: 4 mm
- Pointside member thickness: 38 mm
- Number of screws required: 9
- Diameter of screws: 4 mm
- Length of screws: 38 mm

Provide smooth shank screws to EN 14592 of min ultimate tensile strength of 540 N/mm². Pre-drilled holes are not required.
In order to eliminate the effect of number of screws in a row the min spacing of screws in a row parallel to grain needs to be 56 mm.
Location: Bolt design

Axial load to be carried by joint $F=4.55$ kN

| $F$ (2) | : | (1) | $F$ |

**ELEVATION**

In line connection

$\alpha_1'=0^\circ$ & $\alpha_2'=0^\circ$

(1) = member 1
(2) = member 2

**PLAN**

Thickness of thinner member $t_1=47$ mm
Strength class C24 to Table 8.

Thickness of other member $t_2=47$ mm
Strength class C24 to Table 8.

Joint to be connected by bolts $K_{2b}=1.33$

Fixing diameter (8 to 36 mm) $b_d=16$ mm

Basic loads in kN will be derived from formula given in Annex G.3

Load duration for bolt/dowel connection = Medium term.

Fixing spacing parallel to the grain $\alpha_{par}=64$ mm

Basic bolt shear capacity $\text{basic}=1\times\min(G_{min}/(F_d\times K_d))=3.2882$ kN

Mod factor for moisture content $K_{56}=1$

Mod factor for number of bolts $K_{57}=1$

Permissible bolt load $p_{bl}=\text{basic}\times K_{56}\times K_{57}=3.2882$ kN

Number of bolts required $n=\lfloor F/p_{bl}\rfloor+1=2$

**Minimum bolt/dowel spacing**

The fixing spacing in the direction of load should be not less than 64 mm. For loading parallel to the grain, the spacing across the grain between fixings or rows of fixings should be not less than 64 mm.

For loading perpendicular to the grain, the spacing parallel to the grain between fixings or rows of fixings should be not less than 79 mm.

When two timber members are fixed together at right-angles to each other, the minimum bolt/dowel spacing should be 80 mm.

The distance from the end of the timber to the centre of the nearest bolt/dowel hole for parallel to the grain loading should be not less than 64 mm where the bolts/dowels are bearing away from the end of the member, or 112 mm where bolts/dowels are bearing towards the end of the member.
The distance from the edge of the timber to the centre of the nearest bolt/dowel hole should be not less than 24 mm except when loading is perpendicular to the grain and then the distance from the edge of the timber towards which the fixings are bearing and the centre of the nearest fixing hole, should be not less than 64 mm.

**DESIGN**
- Axial load to be carried by joint: 4.55 kN

**SUMMARY**
- Permissible load on each bolt: 3.2882 kN
- Number of bolts required per joint: 2
- Load capacity of the joint: 6.5765 kN
Location: Default case 2

Axial load to be carried by joint $F=6.5\text{ kN}$

**ELEVATION**

- Members with grain at $90^\circ$ to one another
  - $\alpha_1'=90^\circ$ (member 1)
  - $\alpha_2'=0^\circ$ (member 2)

**PLAN**

- $(1) = \text{member 1}$
- $(2) = \text{member 2}$

**Thickness of member 1** $t_1=35\text{ mm}$
- Default case with $\text{scr}=0$

**Characteristic density timber 1** $p_{k1}=310\text{ kg/m}^3$

**Angle between grain and load** $\alpha_1'=90$ degrees

**Thickness of member 2** $t_2=35\text{ mm}$
- Default case with $\text{scr}=0$

**Characteristic density timber 2** $p_{k2}=310\text{ kg/m}^3$

**Angle between grain and load** $\alpha_2'=0$ degrees

**Joint to be connected by bolts** $K_{2b}=1.33$

**Fixing diameter (8 to 36 mm)** $b_d=12\text{ mm}$

**Basic loads in kN will be derived from formula given in Annex G.3**

**Load duration for bolt/dowel connection** = Medium term.

**Fixing spacing parallel to the grain** $\alpha_{\text{par}}=48\text{ mm}$

**Basic bolt shear capacity** $\text{basic}=1\times G_{\text{min}}/(F_d\times K_d)=1.5875\text{ kN}$

**Mod factor for moisture content** $K_{56}=1$

**Mod factor for number of bolts** $K_{57}=1$

**Permissible bolt load** $p_{bl}=\text{basic}\times K_{56}\times K_{57}=1.5875\text{ kN}$

**Number of bolts required** $n=\text{INT}(F/p_{bl})+1=5$

### DESIGN
- **Axial load to be carried by joint** 6.5 kN

### SUMMARY
- **Permissible load on each bolt** 1.5875 kN
- **Number of bolts required per joint** 5
- **Load capacity of the joint** 7.9376 kN
Location: Default case 3

Axial load to be carried by joint \( F = 8.5 \) kN

Joint to be connected by bolts \( K_{2b} = 1.33 \)  
Fixing diameter (8 to 36 mm) \( b_d = 20 \) mm  
Basic loads in kN will be derived from formula given in Annex G.3  
Constant \( K_d = 1 \)  
Load duration for bolt/dowel connection = Long term.  
Fixing spacing parallel to the grain \( \alpha_{par} = 80 \) mm  
Equations G7 G8 G9 G10  
6910.2 6910.2 8140.9 11507  
Min value of equations G7 to G10 \( G_{min} = 6910.2 \)

Basic bolt shear capacity \( \text{basic} = 1 \times G_{min} / (F_d \times K_d) = 5.1186 \) kN  
Mod factor for moisture content \( K_{36} = 1 \)  
Mod factor for number of bolts \( K_{57} = 1 \)  
Permissible bolt load \( p_{bl} = \text{basic} \times K_{36} \times K_{57} = 5.1186 \) kN  
Number of bolts required \( n = \text{INT}(F/p_{bl}) + 1 = 2 \)

---

**DESIGN**  
Axial load to be carried by joint 8.5 kN

**SUMMARY**  
Permissible load on each bolt 5.1186 kN  
Number of bolts required per joint 2  
Load capacity of the joint 10.237 kN
Location: Default case 6

Axial load to be carried by joint $F = 4.55$ kN

![Diagram](location_diagram.png)

Thickness of timber member $t_1 = 47$ mm
Strength class C24 to Table 8.
Timber characteristic density $p_{k1} = 350$ kg/m³
Angle between grain and load $\alpha'_{L1} = 45°$
Thickness of steel plate $t_3 = 15$ mm
Load is inclined at an angle to the grain of the timber thus:
Modification factor $K_{46} = 1.0$
Joint to be connected by bolts $K_{2b} = 1.33$
Fixing diameter (8 to 36 mm) $b_d = 12$ mm

**Bolt shear capacities**

Basic loads in kN will be derived from formula given in Annex G.3
Load duration for bolt/dowel connection = Medium term.
Fixing spacing parallel to the grain $\alpha_{par} = 48$ mm
Embedded strength for timber 1
Embedding strength $f_{ hod } = 0.050 \times (1 - 0.01 \times b_d) \times p_{k1} \times K_a = 12.449$
Embedding strength (Timb 1) $f_{hd1} = f_{hod} / ((K_{90} \times \sin(\alpha'_{L1})^2) + \cos(\alpha'_{L1})^2) = 9.8409$
$\beta = 1$
Basic bolt shear capacity $\text{basic} = 1 \times G_{\min} / (F_d \times K_d) = 2.184$ kN
Mod factor for moisture content $K_{56} = 1$
Mod factor for number of bolts $K_{57} = 1$
Permissible bolt load $p_{bl} = \text{basic} \times K_{46} \times K_{56} \times K_{57} = 2.184$ kN
Number of bolts required $n = \text{INT}(F/p_{bl}) + 1 = 3$

**Minimum bolt/dowel spacing**

The fixing spacing in the direction of load should be not less than 48 mm. For loading parallel to the grain, the spacing across the grain between fixings or rows of fixings should be not less than 48 mm.

For loading perpendicular to the grain, the spacing parallel to the grain between fixings or rows of fixings should be not less than 60 mm.
When two timber members are fixed together at right-angles to each other, the minimum bolt/dowel spacing should be 60 mm.

The distance from the end of the timber to the centre of the nearest bolt/dowel hole for parallel to the grain loading should be not less than 48 mm where the bolts/dowels are bearing away from the end of the member, or 84 mm where bolts/dowels are bearing towards the end of the member.

The distance from the edge of the timber to the centre of the nearest bolt/dowel hole should be not less than 18 mm except when loading is perpendicular to the grain and then the distance from the edge of the timber towards which the fixings are bearing and the centre of the nearest fixing hole, should be not less than 48 mm.

**DESIGN**  
Axial load to be carried by joint 4.55 kN

**SUMMARY**  
Permissible load on each bolt 2.184 kN  
Number of bolts required per joint 3  
Load capacity of the joint 6.5521 kN
**Location: Default case 7**

Axial load to be carried by joint $F=9.7$ kN

- Number of bolts required per joint $2$
- Load capacity of the joint $13.375$ kN
Location: Bolt design

Joint comprising 2 members (fasteners in single shear)

Design axial load at joint \( F_d' = 5.8 \text{ kN} \)

---

### ELEVATION

- \( t_1 = 47 \text{ mm} \) (1)
- \( t_2 = 47 \text{ mm} \) (2)

### PLAN

- Member 1 (1)
- Member 2 (2)

Thickness of thinner member \( t_1 = 47 \text{ mm} \)
Thickness of other member \( t_2 = 47 \text{ mm} \)
Bolt/dowel diameter (8 to 30 mm) \( b_d = 16 \text{ mm} \)
Timber strength class C24.

Basic loads are in kN and will be derived from EC5 Section 8.

Charact fastener yield moment \( M_y R_k = 0.3 \times 400 \times b_d^2.6 = 162141 \text{ Nmm} \)

Charact.embedment strength \( f_{h1k} = 0.082 \times (1 - 0.01 \times b_d) \times p_k \)
\[ = 24.108 \frac{\text{N}}{\text{mm}^2} \]

Denominator (expression 8.31) \( \text{denom}_1 = ((K_90 \times \text{SIN}(\alpha_1)^2) + \text{COS}(\alpha_1)^2) = 1 \)

Embedment strength (Timber 1) \( f_{h1k} = f_{h1k} / \text{denom}_1 = 24.108 \frac{\text{N}}{\text{mm}^2} \)

Charact.embedment strength \( f_{h2k} = 0.082 \times (1 - 0.01 \times b_d) \times p_k \)
\[ = 24.108 \frac{\text{N}}{\text{mm}^2} \]

Denominator (expression 8.31) \( \text{denom}_2 = ((K_90 \times \text{SIN}(\alpha_2)^2) + \text{COS}(\alpha_2)^2) = 1 \)

Embedment strength (Timber 2) \( f_{h2k} = f_{h2k} / \text{denom}_2 = 24.108 \frac{\text{N}}{\text{mm}^2} \)

Factor \( \beta = f_{h2k} / f_{h1k} = 1 \)

Min value of equations (a)-(f) \( G_{min} = 7509.4 \)

Char fastener shear resistance basic \( G_{min} / 1000 = 7.5094 \text{ kN} \)

Design resistance per fastener \( p_{bl} = k_{mod} \times \text{basic} / \gamma_{M} = 4.0435 \text{ kN} \)

Number of fasteners required \( n = \text{INT}(F_d' / p_{bl}) + 1 = 2 \)

Total No of fasteners at joint \( n = 2 \)

Number of fasteners per row \( n_{fpr} = 2 \)
Lines of fasteners to be adopted \( r_{pl} = 1 \)
Spacing between fasteners \( a_1 = 80 \text{ mm} \)
Effect No of fasteners per row \( n_{ef} = n_{fpr} \times 0.9 \times (a_1 / (13 \times b_d))^{0.25} = 1.4695 \)
Effective joint design capacity \( F_{vef} = r_{pl} \times n_{ef} \times p_{bl} = 5.9421 \text{ kN} \)

Minimum bolt spacings

- Angle alpha \( \alpha = 0 \text{ radians} \)
- Spacing parallel to grain \( a_1 = (4 + \text{COS}(\alpha)) \times b_d = 80 \text{ mm} \)
- Spacing perpendicular to grain \( a_2 = 4 \times b_d = 64 \text{ mm} \)
- End distance (loaded end) \( a_{3t} = 7 \times b_d = 112 \text{ mm} \)
- End distance (unloaded end) \( a_{3c} = 4 \times b_d = 64 \text{ mm} \)

Location: Default case 2

Joint comprising 2 members (fasteners in single shear)

Design axial load at joint  \( F_{d}' = 9.1 \text{ kN} \)

![Elevation and Plan Diagram]

\( t_1 = 35 \text{ mm} \)

Default case with \( \text{scr}=0 \)

- Bending parallel to the grain:  \( f_{mk} = 22 \text{ N/mm}^2 \)
- Compress parallel to the grain:  \( f_{c0k} = 20 \text{ N/mm}^2 \)
- Compress perp to the grain:  \( f_{c90k} = 2.4 \text{ N/mm}^2 \)
- Tension parallel to the grain:  \( f_{t0k} = 13 \text{ N/mm}^2 \)
- Shear parallel to the grain:  \( f_{vk} = 2.4 \text{ N/mm}^2 \)
- Mean modulus of elasticity:  \( E_{0\text{mean}} = 10000 \text{ N/mm}^2 \)
- 5th percentile MOE:  \( E_{005} = 6700 \text{ N/mm}^2 \)
- Characteristic density timber 1:  \( p_{k1} = 310 \text{ kg/m}^3 \)
- Angle between grain and load:  \( \alpha_{l1}' = 90 \text{ degrees} \)
- Thickness of member 2:  \( t_2 = 35 \text{ mm} \)

Default case with \( \text{scr}=0 \)

- Bending parallel to the grain:  \( f_{mk} = 22 \text{ N/mm}^2 \)
- Compress parallel to the grain:  \( f_{c0k} = 20 \text{ N/mm}^2 \)
- Compress perp to the grain:  \( f_{c90k} = 2.4 \text{ N/mm}^2 \)
- Tension parallel to the grain:  \( f_{t0k} = 13 \text{ N/mm}^2 \)
- Shear parallel to the grain:  \( f_{vk} = 2.4 \text{ N/mm}^2 \)
- Mean modulus of elasticity:  \( E_{0\text{mean}} = 10000 \text{ N/mm}^2 \)
- 5th percentile MOE:  \( E_{005} = 6700 \text{ N/mm}^2 \)
- Characteristic density timber 2:  \( p_{k2} = 310 \text{ kg/m}^3 \)
- Angle between grain and load:  \( \alpha_{l2}' = 0 \text{ degrees} \)
- Bolt/dowel diameter (8 to 30 mm):  \( b_{d} = 12 \text{ mm} \)

Basic loads are in kN and will be derived from EC5 Section 8.

Charact fastener yield moment:  \( M_{yRk} = 0.3 \times 400 \times b_{d} \times 2.6 = 76745 \text{ Nmm} \)

Charact.embedment strength:

\[
\begin{align*}
\text{fhok1} &= 0.082 \times (1 - 0.01 \times b_{d}) \times p_{k1} \\
&= 22.37 \text{ N/mm}^2 \\
\text{denom1} &= ((K_{90} \times \sin(\alpha_{l1})^2) + \cos(\alpha_{l1})^2) = 1.53
\end{align*}
\]

Embedment strength (Timber 1):

\[
\begin{align*}
\text{fh1k} &= \frac{\text{fhok1}}{\text{denom1}} = 14.621 \text{ N/mm}^2 \\
\text{fhok2} &= 0.082 \times (1 - 0.01 \times b_{d}) \times p_{k2} \\
&= 22.37 \text{ N/mm}^2 \\
\text{denom2} &= ((K_{90} \times \sin(\alpha_{l2})^2) + \cos(\alpha_{l2})^2) = 1
\end{align*}
\]
Embedment strength (Timber 2) \( fh_2k = \frac{fh_0k2}{denom2} = 22.37 \text{ N/mm}^2 \)

Factor \( \beta = \frac{fh_2k}{fh_1k} = 1.53 \)

Min value of equations (a)-(f) \( G_{\text{min}} = 3196.2 \)

Char fastener shear resistance \( \text{basic} = \frac{G_{\text{min}}}{1000} = 3.1962 \text{ kN} \)

Design resistance per fastener \( p_{bl} = k_{\text{mod}} \times \text{basic} / \gamma_M = 1.4752 \text{ kN} \)

Number of fasteners required \( n = \text{INT}(F_d' / p_{bl}) + 1) = 7 \)

Total No of fasteners at joint \( n = 7 \)

Shear force on LHS of joint \( F_{vEd1} = 4.55 \text{ kN} \)

Shear force on RHS of joint \( F_{vEd2} = 4.55 \text{ kN} \)

Height of member (2) \( h = 225 \text{ mm} \)

Loaded edge distance \( h_e = 175 \text{ mm} \)

**DESIGN**

- Design axial load at joint \( 9.1 \text{ kN} \)

**SUMMARY**

- Number of fasteners per joint \( 7 \)
- Design joint resistance \( 10.326 \text{ kN} \)
Location: Default case 3

Joint comprising 2 members (fasteners in single shear)

Design axial load at joint \( Fd' = 11.9 \text{ kN} \)

Member inclined at an angle \( \alpha' \) degrees

ELEVATION

(1) = member 1
(2) = member 2

Thickness of member 1 \( t1 = 72 \text{ mm} \)
Timber strength class C16.
Timber characteristic density \( pkl = 310 \text{ kg/m}^3 \)
Angle between grain and load \( \alpha1' = 0^\circ \)

Thickness of member 2 \( t2 = 72 \text{ mm} \)
Timber strength class C16.
Timber characteristic density \( pkl = 310 \text{ kg/m}^3 \)
Angle between grain and load \( \alpha2' = 45^\circ \)
Bolt/dowel diameter (8 to 30 mm) \( bd = 16 \text{ mm} \)

Basic loads are in kN and will be derived from EC5 Section 8.
Charact fastener yield moment \( MyRk = 0.3 \times 400 \times bd^2 \times 1.62141 = 162141 \text{ Nmm} \)
Charact.embedment strength \( fhok1 = 0.082 \times (1 - 0.01 \times bd) \times pkl \)
\( = 21.353 \text{ N/mm}^2 \)
Denominator (expression 8.31) \( denom1 = ((K90 \times \sin(\alpha1'))^2) + \cos(\alpha1')^2 = 1 \)
Embedment strength (Timber 1) \( fh1k = fhok1 / denom1 = 21.353 \text{ N/mm}^2 \)
Charact.embedment strength \( fhok2 = 0.082 \times (1 - 0.01 \times bd) \times pkl \)
\( = 21.353 \text{ N/mm}^2 \)
Denominator (expression 8.31) \( denom2 = ((K90 \times \sin(\alpha2'))^2) + \cos(\alpha2')^2 = 1.295 \)
Embedment strength (Timber 2) \( fh2k = fhok2 / denom2 = 16.489 \text{ N/mm}^2 \)
Factor \( \beta = fh2k / fh1k = 0.7722 \)
Min value of equations (a)-(f) \( Gmin = 9006.4 \)
Char fastener shear resistance \( basic = Gmin / 1000 = 9.0064 \text{ kN} \)

Design resistance per fastener \( pbl = kmod \times basic / \gammaM = 4.8496 \text{ kN} \)
Number of fasteners required \( n = \text{INT}(Fd' / pbl) + 1 = 3 \)
Total No of fasteners at joint \( n = 3 \)

Thickness of other member \( t_2 = 97 \text{ mm} \)
Timber characteristic density \( p_k_2 = 540 \text{ kg/m}^3 \)
Angle between grain and load \( \text{alp}_2^\prime = 0 \text{ degrees} \)
Bolt/dowel diameter (8 to 30 mm) \( b_d = 16 \text{ mm} \)

Basic loads are in kN and will be derived from EC5 Section 8.

Charact fastener yield moment \( M_{yRk} = 0.3 \times 400 \times b_d \times \sqrt{2.6} = 162141 \text{ Nmm} \)
Charact. embedment strength \( f_{hok1} = 0.082 \times (1 - 0.01 \times b_d) \times p_k_1 \)
\[ = 37.195 \text{ N/mm}^2 \]

Denominator (expression 8.31) \( \text{denom}_1 = ((K90 \times \sin(\text{alp}_1)^2) + \cos(\text{alp}_1)^2) = 1 \)
Embedment strength (Timber 1) \( f_{h1k} = f_{hok1} / \text{denom}_1 = 37.195 \text{ N/mm}^2 \)
Charact. embedment strength \( f_{hok2} = 0.082 \times (1 - 0.01 \times b_d) \times p_k_2 \)
\[ = 37.195 \text{ N/mm}^2 \]
Denominator (expression 8.31) \( \text{denom}_2 = ((K90 \times \sin(\text{alp}_2)^2) + \cos(\text{alp}_2)^2) = 1 \)
Embedment strength (Timber 2) \( f_{h2k} = f_{hok2} / \text{denom}_2 = 37.195 \text{ N/mm}^2 \)
Factor \( \beta = f_{h2k} / f_{h1k} = 1 \)

Expressions (g)-(k) for fasteners in double shear, refer to section 8.2.2 in EC5. Zero contribution from rope effect will be considered.

Equations \( g \quad h \quad j \quad k \)
\[ 28863 \quad 28863 \quad 13351 \quad 15976 \]
Min value of equations (g)-(k) \( G_{\text{min}} = 13351 \)
Char fastener shear resistance \( \text{basic} = G_{\text{min}} / 1000 = 13.351 \text{ kN} \)

Design resistance per fastener \( p_{bl} = k_{\text{mod}} \times 2 \times \text{basic} / \gamma_{M} = 14.378 \text{ kN} \)
Number of fasteners required \( n = \text{INT}(F_d^\prime / p_{bl}) + 1 = 2 \)
Total No of fasteners at joint \( n = 2 \)
Number of fasteners per row \( n_{fpr} = 1 \)
Lines of fasteners to be adopted \( r_{pl} = 2 \)
Spacing between fasteners \( a_1 = 112 \text{ mm} \)
Effect No of fasteners per row  \( n_{ef} = n_f \times r_{pl} \times a_1 \times (13 \times b_d)^{0.25} = 0.85662 \)

Effective joint design capacity  \( F_{vef} = r_{pl} \times n_{ef} \times p_{bl} = 24.633 \, \text{kN} \)

### Minimum bolt spacings

- **Angle alpha**: \( \alpha = 0 \) radians
- **Spacing parallel to grain**: \( a_1 = (4 + \cos(\alpha)) \times b_d = 80 \, \text{mm} \)
- **Spacing perpendicular to grain**: \( a_2 = 4 \times b_d = 64 \, \text{mm} \)
- **End distance (loaded end)**: \( a_3t = 7 \times b_d = 112 \, \text{mm} \)
- **End distance (unloaded end)**: \( a_3c = 4 \times b_d = 64 \, \text{mm} \)
- **Edge distance (loaded edge)**: \( a_4t = 3 \times b_d = 48 \, \text{mm} \)
- **Edge distance (unloaded edge)**: \( a_4c = 3 \times b_d = 48 \, \text{mm} \)

### Design
- **Design axial load at joint**: 22 kN

### Summary
- **Number of fasteners per joint**: 2
- **Effective joint design capacity**: 24.633 kN
Location: Bolted timber connection with axial load and moment

---

Two bolt symmetrical joint with in line splice plate to EC5

Design shear to be resisted: $F_d' = 0.49 \text{ kN}$
Design moment to be resisted: $M_d = 0.21 \text{ kNm}$
Depth of timber section: $h = 200 \text{ mm}$
Thickness of member 1: $t_1 = 47 \text{ mm}$
Timber strength class C22.
Timber characteristic density: $p_k = 340 \text{ kg/m}^3$
Thickness of steel splice plate: $s_t = 10 \text{ mm}$
Gap distance between joists: $g_p = 0 \text{ mm}$
Fixing diameter (8 mm to 30 mm): $b_d = 16 \text{ mm}$
Depth factor (Clause 3.2): $k_h = 1.0$
Actual edge distance to bolt ctr: $e_d = 64 \text{ mm}$
Actual end distance: $e_l = 112 \text{ mm}$

Basic loads in kN will be derived from the expressions in Section 8 of Eurocode 5.

Char fastener yield moment: $M_{yRk} = 0.3 \times 400 \times b_d^2 \times 2.6 = 162141 \text{ Nmm}$
Char embedment strength: $f_{ho1} = 0.082 \times (1 - 0.01 \times b_d) \times p_k = 23.419$
Embedding strength (Timb 1): $f_{hl1} = f_{ho1} / \text{denom1} = 23.323 \text{ N/mm}^2$
Min value of equations (a)-(e): $G_{\text{min}} = 8196.6$
Char bolt shear resistance: $\text{basic} = G_{\text{min}} / 1000 = 8.1966 \text{ kN}$
Design resistance per bolt: $p_{bl} = k_{mod} / g_m * \text{basic} = 5.0441 \text{ kN}$

Three bolt overlapped timber joint designed to Eurocode 5

Design shear to be resisted: \( F_d' = 2.8 \text{ kN} \)
Design moment to be resisted: \( M_d = 0.35 \text{ kNm} \)
Depth of timber section: \( h = 200 \text{ mm} \)
Thickness of member 1: \( t_1 = 75 \text{ mm} \)
Timber strength class C22.
Timber characteristic density: \( p_{k1} = 340 \text{ kg/m}^3 \)
Timber strength class C22.
Thickness of member 2: \( t_2 = 75 \text{ mm} \)
Timber characteristic density: \( p_{k2} = 340 \text{ kg/m}^3 \)
Fixing diameter (8 mm to 30 mm): \( b_d = 16 \text{ mm} \)
Depth factor (Clause 3.2): \( k_h = 1.0 \)
Actual end distance: \( e_l = 125 \text{ mm} \)
Actual centres of bolts // grain: \( c_a g = 150 \text{ mm} \)

Basic loads in kN will be derived from the expressions in Section 8 of Eurocode 5.

Char fastener yield moment: \( M_yR_k = 0.3 \times 400 \times b_d^2 \times 2.6 = 162141 \text{ Nmm} \)
Fixing spacing // to the grain: \( \alpha_{par} = 100 \text{ mm} \)
Char embedment strength (Timb 1): \( f_{h1k} = 0.082 \times (1 - 0.01 \times b_d) \times p_{k1} = 23.419 \text{ N/mm}^2 \)
Embedding strength (Timb 1): \( f_{h1k} = f_{h1k} / \text{denom1} = 14.729 \text{ N/mm}^2 \)
Char embedment strength (Timb 2): \( f_{h2k} = 0.082 \times (1 - 0.01 \times b_d) \times p_{k2} = 23.419 \text{ N/mm}^2 \)
Embedding strength (Timb 2): \( f_{h2k} = f_{h2k} / \text{denom2} = 14.729 \text{ N/mm}^2 \)
Factor: \( \beta = f_{h2k} / f_{h1k} = 1 \)

Expressions (a)-(f) for fasteners in single shear refer to section 8.2.2 in EC5. Zero contribution from rope effect will be considered.

Min value of equations (a)-(f): \( G_{min} = 7321.2 \text{ kN} \)
Char bolt shear resistance: \( \text{basic} = G_{min} / 1000 = 7.3212 \text{ kN} \)
Design resistance per bolt: \( p_{bl} = k_{mod} / \gamma_{M} \times \text{basic} = 4.5053 \text{ kN} \)

Check splitting capacity of the connection

Design resultant force: \( R_F = 2.1 \text{ kN} \)
Tension force component \( \perp \) grain: \( F_{vEd} = R_F \times \text{SIN}(\alpha) = 2.1 \text{ kN} \)
Loaded edge distance: \( h_e = 150 \text{ mm} \)
Design splitting capacity: \( F_{90Rd} = F_{90Rk} \times k_{mod} / \gamma_{M} = 15.827 \text{ kN} \)

Char embedment strength $f_{h_k 2} = 0.082*(1-0.01*b_d)*p_k_2 = 24.534$
Embedding strength (Timb 2) $f_{h_k 2} = f_{h_k 2}/denom_2 = 18.534 \text{ N/mm}^2$
Factor $\beta = f_{h_k 2}/f_{h_k 1} = 1$
Min value of equations (a)-(f) $G_{m i n} = 4329.8$
Char bolt shear resistance $basic = G_{m i n}/1000 = 4.3298 \text{ kN}$
Design resistance per bolt $p_b l = k_{mod}/\gamma_{M}basic = 2.6645 \text{ kN}$

Total No of bolts at joint $n = 4$
Number of bolts per row $n_f p r = 2$
Spacing between bolts // grain $a_l = 100 \text{ mm}$
EC5 effect No fasteners per row $n_e f = n_f p r^0.9*(a_l/(13*b_d))^0.25 = 1.6697$
TRADA effect No of bolts per row $n_e f = (n_f p r)^0.8 = 1.7411$
Effective No of bolts to be adopted \( \text{nef}=1.7411 \)
Effective bolt design capacity \( \text{Fvef}=pbl*\text{nef}/\text{nfpr}=2.3196 \text{ kN} \)

**Toothed-plate connector assembly**

Toothed-plate connectors should comply with BS EN 912 and BS EN 14545.
Connector nominal diameter \( \text{dc}=50 \text{ mm} \)

**Design shear capacity for one toothed-plate connector unit**

- Thickness of metal in connector \( \text{tmet}=0.9 \text{ mm} \)
- Toothed-plate connector height \( \text{hc}=15 \text{ mm} \)
- Material factor for connection \( \text{gamM}=1.3 \)
- Design capacity of one TPC unit
  \[ \text{FvRd}=\text{interf}*\text{kmod}*[\text{FvRk}/(1000*\text{gamM})]=3.8044 \text{ kN} \]

**Combined design resistance per fixing**

Combined design resistance \( \text{pbl}=pbl1+pbl2=6.124 \text{ kN} \)

**Check splitting capacity of the connection**

- Design resultant force \( \text{RF}=2.5215 \text{ kN} \)
- Tension force component \( \text{FvEd}=\text{RF}*[\text{SIN}(\text{alpha})]=1.9707 \text{ kN} \)
- Loaded edge distance \( \text{he}=175 \text{ mm} \)
- Design splitting capacity \( \text{F90Rd}=\text{F90Rk}*\text{kmod}/\text{gamM}=11.363 \text{ kN} \)

**Minimum spacings for toothed-plate connectors - to EC5 Table 8.8**

- Spacing within one row parallel to grain:
  \[ a1=(1.2+0.3*\text{COS}(\text{alpha}))*\text{dc}=69.357 \text{ mm} \]
- Spacing between connector rows perpendicular to grain:
  \[ a2=1.2*\text{dc}=60 \text{ mm} \]
- End distance (loaded) \( a3t=1.5*\text{dc}=75 \text{ mm} \)
- End distance (unloaded) \( a3c=(0.9+0.6*\text{SIN}(\text{alpha}))*\text{dc}=68.447 \text{ mm} \)
- Edge distance (loaded) \( a4t=(0.6+0.2*\text{SIN}(\text{alpha}))*\text{dc}=37.816 \text{ mm} \)
- Edge distance (unloaded) \( a4c=0.6*\text{dc}=30 \text{ mm} \)

**Joint slip check - to EC5 Section 7**

- Stiffness of joint final condition at the SLS:
  \( \text{Kserfj}=\text{Kserj}/(1+2*\text{kdef})=2897.7 \text{ N} \)
- Final deflection of the joint at SLS:
  \( \text{utser}=\text{Fdsls}/\text{Kserfj}+2=2.3041 \text{ mm} \)

TRADA effect No of bolts per row  nef=(nfpr)^0.8=1.7411
Effective No of bolts to be adopted  nef=1.7411
Effective bolt design capacity  Fvef=pbl*nef/nfpr=3.3366 kN

Load-sharing modification factor  ksys=1.1
Design bending strength  fmd=kh*ksys*fmk*kmod/gamM=14.892 N/mm²
Design shear strength  fvd=ksys*fvk*kmod/gamM=2.5723 N/mm²

Check splitting capacity of the connection

Design resultant force  RF=3.2051 kN
Tension force component  \( FvEd = RF \cdot \sin(\alpha) = 2.0696 \ \text{kN} \)
Loaded edge distance  he=250 mm
Design splitting capacity  F90Rd=F90Rk*kmod/gamM=16.684 kN

Bolt summary:
- **DESIGN**
  - Max resultant force  3.2051 kN
  - Angle to grain  40.22 degrees
  - Effect bolt design capacity  3.8328 kN

- **SUMMARY**
  - Combined bend moment  1.6713 kNm
  - Design bend stress  2.2283 N/mm²
  - Design bend strength  14.892 N/mm²
  - Design shear stress  0.35526 N/mm²
  - Design shear strength  2.5723 N/mm²
Location: Test case 1

Toothed-plate connector joint design to BS5268-2:2002

Toothed-plate connectors should comply with BS 1579. Bolts should comply with BS EN 20898-2 and washers with BS4320.

Axial load at joint \( F = 2.15 \) kN

Number of connectors in joint \( ncj = 2 \)

Angle between grain and load \( \alpha' = 45^\circ \)

Thickness of thinner member \( t = 22 \) mm

Strength class C14 to Table 8.

Mod factor for duration of load \( K58 = 1.25 \)

Angle of connector axis to grain \( acag = 30^\circ \)

Actual spacing of connectors \( aspace = 56 \) mm

End grain is loaded by connector.

Actual loaded end distance to Figure 7 BS5268-2:2002 \( alend = 60 \) mm

Actual edge distance to figure 7 BS5268-2:2002 \( aedge = 30 \) mm

Mod factor for No. of connectors \( K61 = 0.97 \)

Permissible connector load \( pcl = \text{basic} \times K58 \times K59 \times K60 \times K61 = 1.6643 \) kN

Actual load per connector \( Fa = F / (ncj \times interf) = 1.075 \) kN

Since \( pcl > Fa \ (1.6643 \) kN > 1.075 \) kN \) then connector capacity exceeds the applied load and the joint is satisfactory.

Toothed-plate connector joint design to BS5268-2:2002

Toothed-plate connectors should comply with BS 1579. Bolts should comply with BS EN 20898-2 and washers with BS4320.

Axial load at joint \( F=5.25 \text{ kN} \)

Number of connectors in joint \( ncj=2 \)

Angle between grain and load \( \alpha'=45^\circ \)

Thickness of thinner member \( t=63 \text{ mm} \)

Strength class C40 to Table 8.

Mod factor for duration of load \( K58=1 \)

Angle of connector axis to grain \( acag=0^\circ \)

Actual spacing of connectors \( a_{\text{space}}=95 \text{ mm} \)

End grain is loaded by connector.

Actual loaded end distance to Figure 7 BS5268-2:2002 \( a_{\text{end}}=80 \text{ mm} \)

Actual edge distance to figure 7 BS5268-2:2002 \( a_{\text{edge}}=45 \text{ mm} \)

Mod factor for No. of connectors \( K61=0.97 \)

Permissible connector load \( pcl=\text{basic}\times K58\times K59\times K60\times K61=2.8165 \text{ kN} \)

Actual load per connector \( F_a=F/(ncj*\text{interf})=1.3125 \text{ kN} \)

Since \( pcl > F_a \) (2.8165 kN > 1.3125 kN) then connector capacity exceeds the applied load and the joint is satisfactory.

| DESIGN | Permissible connector load | 2.8165 kN |
| SUMMARY | Number of connectors in joint | 2 |
| | Number of bolts in joint | 2 |
| | Provide toothed-plate connectors on both sides of timber & on same bolt | |
Location: Test case 5

Toothed-plate connector joint design to BS5268-2:2002

Toothed-plate connectors should comply with BS 1579. Bolts should comply with BS EN 20898-2 and washers with BS4320.

Axial load at joint \( F = 4.95 \) kN

Number of connectors in joint \( n_{cj} = 5 \)

Angle between grain and load \( \alpha' = 37.5^\circ \)

Thickness of thinner member \( t = 47 \) mm

Strength class C22 to Table 8.

Mod factor for duration of load \( K_{58} = 1 \)

Angle of connector axis to grain \( \alpha_{cag} = 12^\circ \)

Actual spacing of connectors \( a_{space} = 62.533 \) mm

End grain is loaded by connector.

Actual loaded end distance to Figure 7 BS5268-2:2002 \( a_{end} = 60 \) mm

Actual edge distance to figure 7 BS5268-2:2002 \( a_{edge} = 35 \) mm

Mod factor for No. of connectors \( K_{61} = 0.88 \)

Permissible connector load \( p_{cl} = \text{basic} \times K_{58} \times K_{59} \times K_{60} \times K_{61} = 0.99632 \) kN

Actual load per connector \( F_a = F / (n_{cj} \times \text{interf}) = 0.99 \) kN

Since \( p_{cl} > F_a \) (0.99632 kN > 0.99 kN) then connector capacity exceeds the applied load and the joint is satisfactory.

| Provide toothed-plate connectors on both sides of timber & on same bolt | }
Location: Test case 1

Toothed-plate connector joint design to EC5

Toothed-plate connectors should comply with BS EN 912 & BS EN 14545 and be used in conjunction with connector bolts having a min tensile strength of 400 N/mm². Bolts should comply with BS EN 20898-2. Washers should have a minimum thickness of 0.3d and a minimum diameter or side length of 3d, where d is the bolt diameter. Washers need to be used under both the head and nut. Bolt holes in timber should have a diameter not more than 1.0 mm larger than the bolt diameter.

Characteristic permanent load \( G_k = 1.075 \) kN
Characteristic variable load \( Q_k = 1.075 \) kN
Design axial load at joint \( F_d = 1.35 \times G_k + 1.5 \times Q_k = 3.0638 \) kN
Number of bolts to be used \( n_bolt = 2 \)
Angle between grain and load \( \alpha' = 45^\circ \)
Connector nominal diameter \( d_c = 38 \) mm
Timber strength class C14.
Thickness of thinner member \( t_1 = 22 \) mm
Thickness of other member \( t_2 = 22 \) mm
Thickness of metal in connector \( t_{met} = 0.9 \) mm
Height of toothed-plate connector \( h_c = 12 \) mm
Material factor for connection \( \gamma_M = 1.3 \)
Design capacity of joint \( F_{vRd} = \frac{\text{interf} \times n_{cj} \times k_{mod} \times F_{vRk}}{1000 \times \gamma_M} = 3.835 \) kN
Design load at joint \( F_d = 3.0638 \) kN

Since \( F_{vRd} \geq F_d (3.835 \text{ kN} \geq 3.0638 \text{ kN}) \) design capacity of joint exceeds the design load at joint hence connection is satisfactory.

Minimum toothed-plate connector spacings - EC5 Table 8.8

Spacing within one row parallel to grain:
\( a_1 = (1.2 + 0.3 \times \cos(\alpha)) \times d_c = 53.661 \) mm

Spacing between connector rows perpendicular to grain:
\( a_2 = 1.2 \times d_c = 45.6 \) mm

End distance (loaded)
\( a_3t = 1.5 \times d_c = 57 \) mm
End distance (unloaded)
\( a_3c = (0.9 + 0.6 \times \sin(\alpha)) \times d_c = 50.322 \) mm
Edge distance (loaded)
\( a_4t = (0.6 + 0.2 \times \sin(\alpha)) \times d_c = 28.174 \) mm
Edge distance (unloaded)
\( a_4c = 0.6 \times d_c = 22.8 \) mm
Reduction factors for distance \( a_1 \) \( k_{a1} = 0.75 \)
Reduction factors for distance \( a_2 \) \( k_{a2} = 0.75 \)

Joint slip check - EC5 Section 7

Stiffness of joint final condition at the SLS:
\( K_{serfj} = K_{serj} / (1 + 2 \times k_{def}) = 3756.8 \) N
Final deflection of the joint at SLS:
\( u_{tser} = F_{dsls} / (K_{serfj} + 2) = 2.5723 \) mm
The connector bolts hold the members together and are assumed not to contribute to the load-carrying capacity of the connection. Use proformas 273 and 274 to evaluate the bolt contribution.
Location: Test case 2

Toothed-plate connector joint design to EC5

Toothed-plate connectors should comply with BS EN 912 & BS EN 14545 and be used in conjunction with connector bolts having a min tensile strength of 400 N/mm². Bolts should comply with BS EN 20898-2. Washers should have a minimum thickness of 0.3d and a minimum diameter or side length of 3d, where d is the bolt diameter. Washers need to be used under both the head and nut. Bolt holes in timber should have a diameter not more than 1.0 mm larger than the bolt diameter.

Characteristic permanent load \( G_k = 0.775 \) kN
Characteristic variable load \( Q_k = 0.775 \) kN
Design axial load at joint \( F_d = 1.35*G_k + 1.5*Q_k = 2.2088 \) kN
Number of bolts to be used \( n_{bolt} = 2 \)
Angle between grain and load \( \alpha' = 90^\circ \)
Connector nominal diameter \( d_c = 50 \) mm
Timber strength class C16.
Thickness of thinner member \( t_1 = 60 \) mm
Thickness of other member \( t_2 = 60 \) mm
Thickness of metal in connector \( t_{met} = 0.9 \) mm
Height of toothed-plate connector \( h_c = 15 \) mm
Material factor for connection \( \gamma_M = 1.3 \)
Design capacity of joint \( F_vR_d = \text{interf} * n_{cj} * \kappa_{mod} * F_vR_k / (1000 * \gamma_M) = 5.6367 \) kN
Design load at joint \( F_d = 2.2088 \) kN

Since \( F_vR_d \geq F_d \) \( (5.6367 \text{ kN} \geq 2.2088 \text{ kN}) \) design capacity of joint exceeds the design load at joint hence connection is satisfactory.

Minimum toothed-plate connector spacings - EC5 Table 8.8

Spacing within one row parallel to grain:
\[ a_1 = (1.2 + 0.3 \cos(\alpha')) \times d_c = 60 \text{ mm} \]

Spacing between connector rows perpendicular to grain:
\[ a_2 = 1.2 \times d_c = 60 \text{ mm} \]

End distance (loaded):
\[ a_{3t} = 1.5 \times d_c = 75 \text{ mm} \]

End distance (unloaded):
\[ a_{3c} = (0.9 + 0.6 \sin(\alpha')) \times d_c = 75 \text{ mm} \]

Edge distance (loaded):
\[ a_{4t} = (0.6 + 0.2 \sin(\alpha')) \times d_c = 40 \text{ mm} \]

Edge distance (unloaded):
\[ a_{4c} = 0.6 \times d_c = 30 \text{ mm} \]

Joint slip check - EC5 Section 7

Stiffness of joint final condition at the SLS:
\[ K_{serfj} = K_{serj} / (1 + 2 \kappa_{def}) = 2325 \text{ N} \]

Final deflection of the joint at SLS:
\[ u_{ser} = F_d \times s_l / K_{serfj} + 2 = 2.6667 \text{ mm} \]
The connector bolts hold the members together and are assumed not to contribute to the load-carrying capacity of the connection. Use proformas 273 and 274 to evaluate the bolt contribution.
Location: Test case 3

Toothed-plate connector joint design to EC5

Toothed-plate connectors should comply with BS EN 912 & BS EN 14545 and be used in conjunction with connector bolts having a min tensile strength of 400 N/mm². Bolts should comply with BS EN 20898-2. Washers should have a minimum thickness of 0.3d and a minimum diameter or side length of 3d, where d is the bolt diameter. Washers need to be used under both the head and nut. Bolt holes in timber should have a diameter not more than 1.0 mm larger than the bolt diameter.

Characteristic permanent load \( G_k = 3 \text{ kN} \)

Characteristic variable load \( Q_k = 0.55 \text{ kN} \)

Design axial load at joint \( F_d = 1.35 \times G_k + 1.5 \times Q_k = 4.875 \text{ kN} \)

Number of bolts to be used \( n_{bolt} = 1 \)

Angle between grain and load \( \alpha' = 0^\circ \)

Connector nominal diameter \( d_c = 63 \text{ mm} \)

Timber strength class C24.

Thickness of thinner member \( t_1 = 29 \text{ mm} \)

Thickness of other member \( t_2 = 29 \text{ mm} \)

Thickness of metal in connector \( t_{met} = 1.2 \text{ mm} \)

Height of toothed-plate connector \( h_c = 10 \text{ mm} \)

Material factor for connection \( \gamma_{M} = 1.3 \)

Design capacity of joint \( F_{V,Rd} = \text{interf} \times n_{cj} \times k_{mod} \times F_{V,Rk} / (1000 \times \gamma_{M}) = 5.539 \text{ kN} \)

Design load at joint \( F_d = 4.875 \text{ kN} \)

Since \( F_{V,Rd} \geq F_d \) \( (5.539 \text{ kN} \geq 4.875 \text{ kN}) \) design capacity of joint exceeds the design load at joint hence connection is satisfactory.

Minimum toothed-plate connector spacings - EC5 Table 8.8

Spacing within one row parallel to grain:
\[ a_1 = (1.2 + 0.3 \times \cos(\alpha)) \times d_c = 94.5 \text{ mm} \]

Spacing between connector rows perpendicular to grain:
\[ a_2 = 1.2 \times d_c = 75.6 \text{ mm} \]

End distance (loaded) \( a_{3t} = 1.5 \times d_c = 94.5 \text{ mm} \)

End distance (unloaded) \( a_{3c} = 1.2 \times d_c = 75.6 \text{ mm} \)

Edge distance (loaded) \( a_{4t} = (0.6 + 0.2 \times \sin(\alpha)) \times d_c = 37.8 \text{ mm} \)

Edge distance (unloaded) \( a_{4c} = 0.6 \times d_c = 37.8 \text{ mm} \)

Joint slip check - EC5 Section 7

Stiffness of joint final condition at the SLS:
\[ K_{serfj} = K_{serj} / (1 + 2 \times k_{def}) = 3180.3 \text{ N} \]

Final deflection of the joint at SLS:
\[ u_{ser} = F_{dsls} / K_{serfj} + 2 = 3.1163 \text{ mm} \]
### DESIGN
- Design load at joint: 4.875 kN
- Design capacity of joint: 5.539 kN

### SUMMARY
- Number of connectors in joint: 1
- Number of bolts in joint: 1
- Toothed-plate connector type: C6
- Provide a toothed-plate connector on one side of timber only

The connector bolts hold the members together and are assumed not to contribute to the load-carrying capacity of the connection. Use proformas 273 and 274 to evaluate the bolt contribution.
**Location: Test case 4**

### Toothed-plate connector joint design to EC5

Toothed-plate connectors should comply with BS EN 912 & BS EN 14545 and be used in conjunction with connector bolts having a min tensile strength of 400 N/mm². Bolts should comply with BS EN 20898-2. Washers should have a minimum thickness of 0.3d and a minimum diameter or side length of 3d, where d is the bolt diameter. Washers need to be used under both the head and nut. Bolt holes in timber should have a diameter not more than 1.0 mm larger than the bolt diameter.

- **Characteristic permanent load** $G_k = 2.625$ kN
- **Characteristic variable load** $Q_k = 2.625$ kN
- **Design axial load at joint** $F_d = 1.35 \times G_k + 1.5 \times Q_k = 7.4813$ kN
- **Number of bolts to be used** $n_{bolt} = 2$
- **Angle between grain and load** $\alpha' = 45^\circ$
- **Connector nominal diameter** $d_c = 63$ mm
- **Timber strength class** C40
- **Thickness of thinner member** $t_1 = 63$ mm
- **Thickness of other member** $t_2 = 63$ mm
- **Thickness of metal in connector** $t_{met} = 1.2$ mm
- **Height of toothed-plate connector** $h_c = 8.7$ mm
- **Material factor for connection** $\gamma_{M} = 1.3$
- **Design capacity of joint** $F_v R_d = \text{interf} \times n_{cj} \times k_{mod} \times F_v R_k / (1000 \times \gamma_{M}) = 7.737$ kN
- **Design load at joint** $F_d = 7.4813$ kN

Since $F_v R_d \geq F_d$ ($7.737$ kN $\geq 7.4813$ kN ) design capacity of joint exceeds the design load at joint hence connection is satisfactory.

### Minimum toothed-plate connector spacings - EC5 Table 8.8

- **Spacing within one row parallel to grain:**
  \[ a_1 = (1.2 + 0.3 \times \cos(\alpha')) \times d_c = 88.964 \text{ mm} \]
- **Spacing between connector rows perpendicular to grain:**
  \[ a_2 = 1.2 \times d_c = 75.6 \text{ mm} \]
- **End distance (loaded)**
  \[ a_{3t} = 1.5 \times d_c = 94.5 \text{ mm} \]
- **End distance (unloaded)**
  \[ a_{3c} = (0.9 + 0.6 \times \sin(\alpha')) \times d_c = 83.429 \text{ mm} \]
- **Edge distance (loaded)**
  \[ a_{4t} = (0.6 + 0.2 \times \sin(\alpha')) \times d_c = 46.71 \text{ mm} \]
- **Edge distance (unloaded)**
  \[ a_{4c} = 0.6 \times d_c = 37.8 \text{ mm} \]

### Joint slip check - EC5 Section 7

- **Stiffness of joint final condition at the SLS:**
  \[ K_{serfj} = K_{serj} / (1 + 2 \times k_{def}) = 3780 \text{ N} \]
- **Final deflection of the joint at SLS:**
  \[ u_{ser} = F_{d_{sls}} / K_{serfj} + 2 = 3.3889 \text{ mm} \]
The connector bolts hold the members together and are assumed not to contribute to the load-carrying capacity of the connection. Use proformas 273 and 274 to evaluate the bolt contribution.
Toothed-plate connector joint design to EC5

Toothed-plate connectors should comply with BS EN 912 & BS EN 14545 and be used in conjunction with connector bolts having a min tensile strength of 400 N/mm². Bolts should comply with BS EN 20898-2. Washers should have a minimum thickness of 0.3d and a minimum diameter or side length of 3d, where d is the bolt diameter. Washers need to be used under both the head and nut. Bolt holes in timber should have a diameter not more than 1.0 mm larger than the bolt diameter.

Characteristic permanent load \( G_k = 2.475 \, \text{kN} \)
Characteristic variable load \( Q_k = 2.475 \, \text{kN} \)
Design axial load at joint \( F_d = 1.35 \times G_k + 1.5 \times Q_k = 7.0538 \, \text{kN} \)
Number of bolts to be used \( n_{bolt} = 5 \)
Angle between grain and load \( \alpha' = 37.5^\circ \)
Connector side length \( d_c = 38 \, \text{mm} \)
Timber strength class C22.
Thickness of thinner member \( t_1 = 47 \, \text{mm} \)
Thickness of other member \( t_2 = 47 \, \text{mm} \)
Thickness of metal in connector \( t_{met} = 1 \, \text{mm} \)
Height of toothed-plate connector \( h_c = 11 \, \text{mm} \)
Material factor for connection \( \gamma_M = 1.3 \)
Design capacity of joint \( F_{vRd} = \text{interf} \times n_{cj} \times k_{mod} \times F_{vRk} / (1000 \times \gamma_M) = 7.8769 \, \text{kN} \)
Design load at joint \( F_d = 7.0538 \, \text{kN} \)

Since \( F_{vRd} \geq F_d \ (7.8769 \, \text{kN} \geq 7.0538 \, \text{kN}) \) design capacity of joint exceeds the design load at joint hence connection is satisfactory.

Minimum toothed-plate connector spacings - EC5 Table 8.8

Spacing within one row parallel to grain:
\[ a_1 = (1.2 + 0.3 \times \cos(\alpha')) \times d_c = 54.644 \, \text{mm} \]
Spacing between connector rows perpendicular to grain:
\[ a_2 = 1.2 \times d_c = 45.6 \, \text{mm} \]
End distance (loaded)
\[ a_{3t} = 1.5 \times d_c = 57 \, \text{mm} \]
End distance (unloaded)
\[ a_{3c} = (0.9 + 0.6 \times \sin(\alpha')) \times d_c = 48.08 \, \text{mm} \]
Edge distance (loaded)
\[ a_{4t} = (0.6 + 0.2 \times \sin(\alpha')) \times d_c = 27.427 \, \text{mm} \]
Edge distance (unloaded)
\[ a_{4c} = 0.6 \times d_c = 22.8 \, \text{mm} \]

Joint slip check - EC5 Section 7

Stiffness of joint final condition at the SLS:
\[ K_{serfj} = K_{serj} / (1 + 2 \times k_{def}) = 4845 \, \text{N} \]
Final deflection of the joint at SLS:
\[ u_{ser} = F_{d_{sls}} / K_{serfj} + 2 = 3.0217 \, \text{mm} \]
Design load at joint: 7.0538 kN
Design capacity of joint: 7.8769 kN

**SUMMARY**
- Number of connectors in joint: 5
- Number of bolts in joint: 5
- Toothed-plate connector type: C8
- Provide a toothed-plate connector on one side of timber only

The connector bolts hold the members together and are assumed not to contribute to the load-carrying capacity of the connection. Use proformas 273 and 274 to evaluate the bolt contribution.
Location: Test case 6

Toothed-plate connector joint design to EC5

Toothed-plate connectors should comply with BS EN 912 & BS EN 14545 and be used in conjunction with connector bolts having a min tensile strength of 400 N/mm². Bolts should comply with BS EN 20898-2. Characteristic permanent load \( G_k = 1.6 \text{ kN} \)

Characteristic variable load \( Q_k = 1.6 \text{ kN} \)

Design axial load at joint \( F_d = 1.35 \times G_k + 1.5 \times Q_k = 4.56 \text{ kN} \)

Number of bolts to be used \( n_{bolt} = 1 \)

Angle between grain and load \( \alpha' = 90^\circ \)

Connector nominal diameter \( d_c = 75 \text{ mm} \)

Timber strength class C16.

Outer member thickness \( t_1 = 50 \text{ mm} \)

Inner member thickness \( t_2 = 50 \text{ mm} \)

Thickness of metal in connector \( t_{met} = 1.25 \text{ mm} \)

Height of toothed-plate connector \( h_c = 10.4 \text{ mm} \)

Material factor for connection \( \gamma_{M} = 1.3 \)

Design capacity of joint \( F_{vRd} = \frac{\text{interf} \times n_{cj} \times k_{mod} \times F_{vRk}}{1000 \times \gamma_{M}} = 10.706 \text{ kN} \)

Design load at joint \( F_d = 4.56 \text{ kN} \)

Since \( F_{vRd} \geq F_d \geq 4.56 \text{ kN} \), design capacity of joint exceeds the design load at joint hence connection is satisfactory.

Minimum toothed-plate connector spacings - EC5 Table 8.8

Spacing within one row parallel to grain: \( a_1 = (1.2 + 0.3 \times \cos(\alpha')) \times d_c = 90 \text{ mm} \)

Spacing between connector rows perpendicular to grain: \( a_2 = 1.2 \times d_c = 90 \text{ mm} \)

End distance (loaded) \( a_3t = 1.5 \times d_c = 112.5 \text{ mm} \)

End distance (unloaded) \( a_3c = (0.9 + 0.6 \times \sin(\alpha')) \times d_c = 112.5 \text{ mm} \)

Edge distance (loaded) \( a_4t = (0.6 + 0.2 \times \sin(\alpha')) \times d_c = 60 \text{ mm} \)

Edge distance (unloaded) \( a_4c = 0.6 \times d_c = 45 \text{ mm} \)

Joint slip check - EC5 Section 7

Stiffness of joint final condition at the SLS: \( K_{serfj} = K_{serj} / (1 + 2 \times k_{def}) = 3963.1 \text{ N} \)

Final deflection of the joint at SLS: \( u_{ser} = F_{dls} / K_{serfj} + 2 = 2.8075 \text{ mm} \)

Provide toothed-plate connectors on both sides of timber & on same bolt

The connector bolts hold the members together and are assumed not to contribute to the load-carrying capacity of the connection. Use proformas 273 and 274 to evaluate the bolt contribution.
**Location: Forces in rafter 1**

- Top of rafter is pinned and restrained against horizontal movement, but unrestrained against vertical movement.
- Bottom of rafter is pinned and restrained against horizontal movement.

**Rafter projection onto horizontal** \( b = 3 \, \text{m} \)

- Deflection/span ratio \( d' = D_1 / r = 0.0061726 \)
- Horizontal react at 1 (+ve right) \( H_1 = W \times b / (2 \times c) = 9.4868 \, \text{kN} \)
- Horizontal react at 2 (+ve left) \( H_2 = 9.4868 \, \text{kN} \)
- Axial force at 1 (+ve compressn) \( F_1 = V_1 \times \sin(\alpha) + H_1 \times \cos(\alpha) = 11 \, \text{kN} \)
- Shear force at 1 \( S_1 = V_1 \times \cos(\alpha) - H_1 \times \sin(\alpha) = 3 \, \text{kN} \)
Location: Forces in rafter 2

Top of rafter is pinned and restrained against vertical and horizontal movement.

Bottom of rafter is pinned and unrestrained against horizontal movement.

Rafter projection onto horizontal \( b = 3 \text{ m} \)
Rafter projection onto vertical \( c = 1 \text{ m} \)
Elastic modulus \( E = 9E6 \text{ kN/m}^2 \)
Moment of inertia of rafter \( I = 14.063E-6 \text{ m}^4 \)
Slope of roof \( \alpha = \text{ATN}(c/b) = 0.32175 \text{ radians} \)
\( \alpha' = \text{DEG}(\alpha) = 18.435 \text{ degrees} \)
Length of rafter \( r = \text{SQR}(b^2+c^2) = 3.1623 \text{ m} \)

Loads and reactions are positive in the directions shown.

Load is UDL applied vertically per unit length of rafter.

Vertical load per unit length \( w_1 = 2 \text{ kN/m} \)
Total load on rafter \( W = w_1 \times r = 6.3246 \text{ kN} \)
Maximum moment (+ve sagging) \( M = W \times \cos(\alpha) \times r/8 = 2.3717 \text{ kNm} \)
Max defln in rafter (+ve is sag) \( D_1 = 5 \times W \times \cos(\alpha) \times r^3/(384 \times E \times I) = 0.01952 \text{ m} \)
Span/deflection ratio \( s' = r/D_1 = 162.01 \)
Deflection/span ratio \( d' = D_1/r = 0.0061726 \)
Horizontal react at 1 (+ve right) \( H_1 = 0 \text{ kN as joint 1 is on rollers} \)
Horizontal react at 2 (+ve left) \( H_2 = 0 \text{ kN resolving horizontally} \)
Vertical reaction at 1 (+ve up) \( V_1 = W/2 = 3.1623 \text{ kN} \)
Vertical reaction at 2 (+ve up) \( V_2 = 3.1623 \text{ kN} \)
Axial force at 1 (+ve compress.) \( F_1 = V_1 \times \sin(\alpha) = 1 \text{ kN} \)
Shear force at 1 \( S_1 = V_1 \times \cos(\alpha) = 3 \text{ kN} \)
Location: Forces in rafter 3

Top of rafter is pinned and restrained against horizontal movement, but unrestrained against vertical movement.

Bottom of rafter is pinned and restrained against horizontal movement.

Rafter projection onto horizontal \( b = 3 \) m
Rafter projection onto vertical \( c = 1 \) m
Elastic modulus \( E = 9E6 \) kN/m²
Moment of inertia of rafter \( I = 14.063E-6 \) m⁴
Slope of roof \( \alpha = \text{ATN}(c/b) = 0.32175 \) radians
\( \alpha' = \text{DEG}(\alpha) = 18.435 \) degrees
Length of rafter \( r = \sqrt{b^2+c^2} = 3.1623 \) m

Loads and reactions are positive in the directions shown.

Load is UDL applied vertically on plan.

Plan load per unit length \( w_2 = 1 \) kN/m
Total load on rafter \( W = w_2 \cdot b = 3 \) kN
Vertical reaction at 1 (+ve up) \( V_1 = W = 3 \) kN
Maximum moment (+ve sagging) \( M = W \cdot \cos(\alpha) \cdot r / 8 = 1.125 \) kNm
Max defln in rafter (+ve is sag) \( D_1 = 5 \cdot W \cdot \cos(\alpha) \cdot r^3 / (384 \cdot E \cdot I) = 0.0092589 \) m

Span/deflection ratio \( s'd = r / D_1 = 341.54 \)
Deflection/span ratio \( d's = D_1 / r = 0.0029279 \)
Horizontal react at 1 (+ve right) \( H_1 = W \cdot b / (2 \cdot c) = 4.5 \) kN
Horizontal react at 2 (+ve left) \( H_2 = 4.5 \) kN
Axial force at 1 (+ve compress.) \( F_1 = V_1 \cdot \sin(\alpha) + H_1 \cdot \cos(\alpha) = 5.2178 \) kN
Shear force at 1 \( S_1 = V_1 \cdot \cos(\alpha) - H_1 \cdot \sin(\alpha) = 1.423 \) kN
**Location: Forces in rafter 4**

Top of rafter is pinned and restrained against vertical and horizontal movement.

Bottom of rafter is pinned and unrestrained against horizontal movement.

Rafter projection onto horizontal $b = 3\, \text{m}$
Rafter projection onto vertical $c = 1\, \text{m}$
Elastic modulus $E = 9 \times 10^6\, \text{kN/m}^2$
Moment of inertia of rafter $I = 14.063 \times 10^{-6}\, \text{m}^4$
Slope of roof
  - $\alpha = \text{ATN}(c/b) = 0.32175\, \text{radians}$
  - $\alpha' = \text{DEG}(\alpha) = 18.435\, \text{degrees}$
Length of rafter $r = \sqrt{b^2 + c^2} = 3.1623\, \text{m}$

Loads and reactions are positive in the directions shown.

- Plan load per unit length $w_2 = 2\, \text{kN/m}$
- Total load on rafter $W = w_2 \times b = 6\, \text{kN}$
- Maximum moment (+ve sagging) $M = W \times \cos(\alpha) \times r^3 / (384 \times E \times I)$
  - $= 0.018518\, \text{m}$
- Span/deflection ratio $s'd = r / D_1 = 170.77$
- Deflection/span ratio $d's = D_1 / r = 0.0058559$
- Horizontal react at 1 (+ve right) $H_1 = 0\, \text{kN}$ as joint 1 is on rollers
- Horizontal react at 2 (+ve left) $H_2 = 0\, \text{kN}$ resolving horizontally
- Vertical reaction at 1 (+ve up) $V_1 = W / 2 = 3\, \text{kN}$
- Vertical reaction at 2 (+ve up) $V_2 = 3\, \text{kN}$
- Axial force at 1 (+ve compress.) $F_1 = V_1 \times \sin(\alpha) = 0.94868\, \text{kN}$
- Shear force at 1 $S_1 = V_1 \times \cos(\alpha) = 2.846\, \text{kN}$

Load is UDL applied vertically on plan.
Location: Forces in rafter 5

Top of rafter is pinned and restrained against horizontal movement, but unrestrained against vertical movement.

Bottom of rafter is pinned and restrained against horizontal movement.

Rafter projection onto horizontal $b=3\,\text{m}$
Rafter projection onto vertical $c=1\,\text{m}$
Elastic modulus $E=9\times 10^6\,\text{kN/m}^2$
Moment of inertia of rafter $I=1.4063\times 10^{-4}\,\text{m}^4$
Slope of roof $\alpha=\text{ATN}(c/b)=0.32175\,\text{radians}$
$\alpha'=\text{DEG}(\alpha)=18.435\,\text{degrees}$
Length of rafter $r=\sqrt{b^2+c^2}=3.1623\,\text{m}$

Loads and reactions are positive in the directions shown.

Suction load per unit length $w_3=2\,\text{kN/m}$
Total load on rafter $W=w_3\times r=6.3246\,\text{kN}$
Maximum moment (+ve sagging) $M=-W\times r/8=-2.5\,\text{kNm}$
Max defln in rafter (+ve is sag) $D_1=-5\times W\times r^3/(384\times E\times I)=-0.020575\,\text{m}$
Span/deflection ratio $s'd=r/\text{ABS}(D_1)=153.69$
Deflection/span ratio $d'=\text{ABS}(D_1)/r=0.0065065$
Horizontal react at 2 (+ve left) $H_2=-W\times r/(2\times c)=-10\,\text{kN}$
Horizontal react at 1 (+ve right) $H_1=W\times \text{SIN}(\alpha)+H_2=-8\,\text{kN}$
Vertical reaction at 1 (+ve up) $V_1=-W\times \text{COS}(\alpha)=-6\,\text{kN}$
Axial force at 1 (+ve compress.) $F_1=V_1\times \text{SIN}(\alpha)+H_1\times \text{COS}(\alpha)=-9.4868\,\text{kN}$

Location: Forces in rafter 2

Top of rafter is pinned and restrained against vertical and horizontal movement.

Bottom of rafter is pinned and unrestrained against horizontal movement.

Rafter projection onto horizontal \( b = 3 \) m
Rafter projection onto vertical \( c = 1 \) m
Elastic modulus \( E = 9E6 \) kN/m²
Moment of inertia of rafter \( I = 14.063E-6 \) m⁴
Slope of roof \( \alpha = \text{ATN}(c/b) = 0.32175 \) radians
\( \alpha' = \text{DEG}(\alpha) = 18.435 \) degrees
Length of rafter \( r = \text{SQR}(b^2+c^2) = 3.1623 \) m

Loads and reactions are positive in the directions shown.

Suction (+ve) per unit length \( w_3 = 2 \) kN/m
Total load on rafter \( W = w_3 * r = 6.3246 \) kN
Maximum moment (+ve sagging) \( M = -W * r / 8 = -2.5 \) kNm
Max defln in rafter (+ve is sag) \( D_1 = -5 * W * r^3 / (384 * E * I) = -0.020575 \) m
Span/deflection ratio \( s'd = r / \text{ABS}(D_1) = 153.69 \)
Deflection/span ratio \( d's = \text{ABS}(D_1) / r = 0.0065065 \)
Horizontal react at 1 (+ve right) \( H_1 = 0 \) kN as joint 1 is on rollers
Horizontal react at 2 (+ve left) \( H_2 = -W * \text{SIN}(\alpha) = -2 \) kN
Vertical reaction at 2 (+ve up) \( V_2 = (-W * r / 2 - H_2 * c) / b = -2.6667 \) kN
Vertical reaction at 1 (+ve up) \( V_1 = -W * \text{COS}(\alpha) - V_2 = -3.3333 \) kN
Axial force at 1 (+ve compress.) \( F_1 = V_1 * \text{SIN}(\alpha) = -1.0541 \) kN
Shear force at 1 \( S_1 = V_1 * \text{COS}(\alpha) = -3.1623 \) kN
Shear force at 2 \( S_2 = V_2 * \text{COS}(\alpha) + H_2 * \text{SIN}(\alpha) = -3.1623 \) kN
Location: Forces in couple roof

NOTE: At joints 1 and 3 there must be either two horizontal restraints, or a tie between joints 1 and 3, to prevent the formation of a mechanism.

Span of couple: \( a = 3 \text{ m} \)
Height of couple: \( c = 1 \text{ m} \)
Elastic modulus: \( E = 9 \times 10^6 \text{ kN/m}^2 \)
Moment of inertia of rafters: \( I = 1 \text{ m}^4 \)

Vertical load per unit length: \( w_1 = 2 \text{ kN/m} \)
Total load on truss: \( W = w_1 \times 2 \times r = 7.2111 \text{ kN} \)
Vertical reaction at 1 (+ve up): \( V_1 = W / 2 = 3.6056 \text{ kN} \)
Vertical reaction at 3 (+ve up): \( V_3 = 3.6056 \text{ kN} \)
Horizontal react at 1 (+ve right): \( H_1 = V_1 \times a / (4 \times c) = 2.7042 \text{ kN} \)
Horizontal react at 3 (+ve left): \( H_3 = 2.7042 \text{ kN} \)
Max moment in 1-2 (+ve sagging): \( M = V_1 \times \cos(\alpha) \times r / 8 = 0.67604 \text{ kNm} \)
Max defln in 1-2 (+ve sagging): \( D_1 = 5 \times V_1 \times \cos(\alpha) \times r^3 / (384 \times E \times I) = 25.43 \times 10^{-9} \text{ m} \)
Span/deflection ratio: \( s \cdot d / r = D_1 / L = 70.892 \times 10^6 \)
Deflection/span ratio: \( d \cdot s / L = 14.106 \times 10^6 \)
Axial force at 1 (+ve compress.): \( F_1 = V_1 \sin(\alpha) + H_1 \cos(\alpha) = 4.25 \text{ kN} \)
Shear force at 1: \( S_1 = V_1 \cos(\alpha) - H_1 \sin(\alpha) = 1.5 \text{ kN} \)
Location: Forces in collar tie roof

Span of truss \( a = 3 \text{ m} \)
Height of truss \( c = 1 \text{ m} \)
Height to tie \( d = 0.3 \text{ m} \)
Elastic modulus \( E = 9 \times 10^6 \text{ kN/m}^2 \)
Moment of inertia of rafters \( I = 1 \text{ m}^4 \)

Vertical load per unit length \( w_1 = 2 \text{ kN/m} \)
Total load on truss \( W = w_1 \times 2 \times r = 7.2111 \text{ kN} \)
Vertical reaction at 1 (+ve up) \( V_1 = W/2 = 3.6056 \text{ kN} \)
Vertical reaction at 5 (+ve up) \( V_5 = 3.6056 \text{ kN} \)
Horizontal react at 1 (+ve right) \( H_1 = 0 \text{ kN} \)
Axial force 1->2 (+ve compress.) \( F_1 = V_1 \times \sin(\alpha) = 2 \text{ kN} \)
Shear force at 1 (or 5) \( S_1 = V_1 \times \cos(\alpha) = 3 \text{ kN} \)
Force in tie (-ve tension) \( T = -(V_1 \times a/2 - w_1 \times r \times a/4) / (c-d) = -3.8631 \text{ kN} \)
Axial force 2->3 (+ve compress.) \( F_2 = F_1 - e \times w_1 \times \sin(\alpha) - T \times \cos(\alpha) = 4.6143 \text{ kN} \)
Mmt at 2 (+ve sagging) \( M_2 = V_1 \times f - w_1 \times e \times f/2 = 1.3791 \text{ kNm} \)
Constant \( n = N/L = 0.42857 \)
Magnitude of udl normal to rafter \( w = w_1 \times \cos(\alpha) = 1.6641 \text{ kN/m} \)
The deflection due to spreading is calculated from bending strain energy only, i.e. axial shortening and shear deformation are ignored.
Normal defln at 5 due to UDL \( D_5u = -w_1 \times L^3 \times N^2 \times (3 \times n^3 + 4 \times n^2 - 1) / (24 \times E \times I) = 0.24413 \times 10^{-9} \text{ m} \)
Normal defln at 5 due to shear \( D_5s = S_1 \times N^2 \times (N+L) / (3 \times E \times I) = 58.59 \times 10^{-9} \text{ m} \)
Defln at 5 (+ve is rightwards) \( D_5 = 2 \times (D_5u + D_5s) \times \sin(\alpha) = 65.27 \times 10^{-9} \text{ m} \)
Location: Forces and moments in lean-to: Mark A7

- Height of post: a = 2.4 m

- Vertical reaction at 3 (+ve up): \( V_3 = 2.3259 \) kN
- Axial force 1->2 (+ve compress.): \( F_1 = V_1 = 2.3259 \) kN
- Axial force 2->3 (+ve compress.): \( F_2 = V_1 \sin(\alpha) = 1 \) kN
- Shear force 2->3: \( S_2 = V_1 \cos(\alpha) = 2.1 \) kN
Location: Trussed beam: support in main room

Length of beam AB  \( l_4 = 6.096 \text{ m} \)
UDL on beam  \( w = 13.076 \text{ kN/m} \)
Point load on beam  \( W = 0 \text{ kN} \)
Distance to point load  \( a = 0 \text{ m} \)
Width of beam AB  \( b = 0.2286 \text{ m} \)
Depth of beam AB  \( d = 0.2286 \text{ m} \)
Elastic modulus for beam AB  \( E_4 = 9.2666 \times 10^6 \text{ kN/m}^2 \)
Length of strut CD  \( l_3 = 0.6096 \text{ m} \)
Area of strut CD  \( A_3 = 0.015484 \text{ m}^2 \)
Elastic modulus for strut CD  \( E_3 = 92.666 \times 10^6 \text{ kN/m}^2 \)
Area of ties AD and BD  \( A_1 = 0.50671 \times 10^{-3} \text{ m}^2 \)
Elastic modulus for ties AD & BD  \( E_1 = 185.33 \times 10^6 \text{ kN/m}^2 \)

Trussed beam properties

Area of beam cross-section  \( A_4 = b \times d = 0.052258 \text{ m}^2 \)
Section modulus of beam  \( z_b = b \times d^2 / 6 = 0.001991 \text{ m}^3 \)
Inertia of beam  \( I_4 = b \times d^3 / 12 = 0.22757 \times 10^{-3} \text{ m}^4 \)
Length of ties AD and BD  \( l_1 = \sqrt{(l_4/2 \times l_4/2 + l_3 \times l_3)} = 3.1084 \text{ m} \)
Elasticity for strut  \( e_3 = l_3 / (E_3 \times A_3) = 0.42486 \times 10^{-6} \text{ m/kN} \)
Elasticity for two ties  \( e_1 = l_1^3 / (2 \times l_3^2 \times E_1 \times A_1) = 0.4303 \times 10^{-3} \text{ m/kN} \)
Elasticity for beam in compress.  \( e_4 = l_4^3 / (16 \times l_3^2 \times A_4 \times E_4) = 78.678 \times 10^{-6} \text{ m/kN} \)
Elasticity for beam in bending  \( e_4' = l_4^3 / (48 \times E_4 \times I_4) = 0.0022379 \text{ m/kN} \)
Total elasticity  \( t_e = e_1 + e_3 + e_4 + e_4' = 0.0027473 \text{ m/kN} \)

Forces due to UDL

Deflection at C for unbraced beam  \( \delta_{C} = 5 \times w \times l_4^4 / (384 \times E_4 \times I_4) = 0.11149 \text{ m} \)
Hence thrust in the strut  \( F_s = \delta_{C} / t_e = 40.582 \text{ kN} \)
Pull in each tie-rod  \( F_t = F_s \times 0.5 \times 11 / 13 = 103.46 \text{ kN} \)
Thrust in beam  \( F_b = 0.5 \times F_s \times (l_4 / 13) = 101.46 \text{ kN} \)
End reactions  \( R = w \times l_4 / 2 = 39.856 \text{ kN} \)
Position for zero shear  \( x = 0.5 \times (2 \times R - F_s) / w = 1.4962 \text{ m} \)
Shear in beam at ends  \( s_B = R - F_t \times 13 / 11 = 19.565 \text{ kN} \)
Shear in beam at centre  \( s_C = s_B - (l_4 / 2) \times w = -20.291 \text{ kN} \)
Maximum sagging bending moment  \( M = s_b \times x = 0.5 \times w \times x^2 = 14.636 \text{ kNm} \)
Bending moment in beam at C  \( M_c = s_b \times l_4 / 2 - R \times l_4 / 4 = -1.1073 \text{ kNm} \)
Maximum bending moment in beam  \( M_m = A_B \times x = 14.636 \text{ kNm} \)
Extreme fibre bending stress  \( f_b = M_m / z_b = 7351.2 \text{ kN/m}^2 \)
Axial stress in beam  \( f_a = F_b / A_4 = 1941.4 \text{ kN/m}^2 \)
Maximum compressive stress  \( f_{mc} = f_a + f_b = 9232.6 \text{ kN/m}^2 \)
Maximum tensile stress  \( f_{mt} = f_b - f_a = 5409.7 \text{ kN/m}^2 \)

 SCALE 5.48  Office 1007  Proforma 290
Location: Forces in braced shed type GH-4

Members AB and CD are similar and represent vertical columns connected by a cross-beam BC having pinned ends. Members KG and EF are braces with pinned ends.

Column feet are pinned.

Span of frame \( l = 2.4 \) m
Height of frame \( L = 3 \) m
Height to knee brace \( h = 2.4 \) m
Distance B to G (also E to C) \( d = 0.8 \) m
Horizontal force at B \( W = 2.5 \) kN
Horizontal reactions at A & D \( H = W/2 = 1.25 \) kN
Vertical reaction at D \( V = W \times L / l = 3.125 \) kN
Moments at K and F are equal \( \text{Mk} = H \times h = 3 \) kNm
Moments at G and E are equal \( \text{Mg} = W \times L \times (0.5 - d/l) = 1.25 \) kNm
Slope of knee brace with horiz. \( \theta = \text{ATN}((L-h)/d) = 0.6435 \) radians
Tension in KG \( T = 0.5 \times W \times L / ((L-h) \times \text{COS}(\theta)) = 7.8125 \) kN
Thrust in EF \( T' = T = 7.8125 \) kN
Thrust in BG \( t = 0.5 \times W \times (2 \times L - h) / (L-h) = 7.5 \) kN
Tension in EC \( t' = t = 7.5 \) kN
Thrust in GE \( t_g = 0.5 \times W = 1.25 \) kN
Shearing force from B to G \( v_{bg} = W \times L \times (1/l - 1/(2 \times d)) = -1.5625 \) kN
Shearing force from G to E \( v_{ge} = W \times L / l = 3.125 \) kN

Design objectives and partial safety factors

The proforma is in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.
Values of partial safety factors (Clause 4.3.3 and Table 2)

gfL - the values of gfL are given in Departmental Standard BD 37/01 for each type and combination of loading.

gf3 - the factor gf3 in this part of BS 5400 shall be taken as 1.1 for the ultimate limit state and 1.0 for the serviceability limit state.

a) Ultimate limit state

Where explicitly expressed in a strength requirement in this part of BS5400 gm shall be taken as 1.05 except in the following Clauses:

<table>
<thead>
<tr>
<th>Structural component and behaviour</th>
<th>Clauses</th>
<th>gm</th>
</tr>

Location: BS5400:Part 3:2000

The proforma is in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

For steel conforming to the standards in Clause 6.1.2, and supplied within the specified tolerances, the nominal yield stress, $\sigma_y$, should be the minimum yield strength specified for the appropriate thickness.

Clause 6.3 states the specified minimum ultimate tensile stress of steel plates and sections of steel should not be less than $1.2\sigma_y$ where $\sigma_y$ is the nominal yield stress defined in Clause 6.2.
Location: BS EN 1993-2:2006

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges".

Steel conforming to Cl. 3.1 and Table 3.1 of EN 1993-1-1 and supplied within the specified tolerances, the nominal yield stress, \( f_y \), should be the minimum yield strength specified for the appropriate thickness.

The ultimate tensile strength \( f_u \) for hot rolled structural steel should be in accordance with Table 3.1 of BS EN 1993-1-1:2005. Steel grades in Table 3.1 will automatically provide the levels of ductility required by Clause 3.3.2.
Location: Ex1 - Edge beam

Minimum effective bridge temperature  \( U_e = -10 \, ^\circ C \)

Test temperature  \( T_{27J} = -30 \, ^\circ C \)

Factor \( k_d \)  \( k_d = 1 \)

Ratio  \( s_{rat} = 0.4 \)

Factor \( k_{sigma} \)  \( k_{sigma} = 1 \)

Factor \( k_s \)  \( k_s = 1 \)

Nominal yield stress \( \sigma_y \)  \( \sigma_y = 355 \, N/mm^2 \)

Limiting thickness  \[ t = 50 \times k \times (355/\sigma_y)^{1.4} \times 1.2^{((U-T_{27J})/10)} = 65.727 \, mm \]

Limiting thickness for \( k = 1 \)  \[ t_1 = 50 \times (355/\sigma_y)^{1.4} \times 1.2^{((U-T_{27J})/10)} = 72 \, mm \]
Location: Ex1 - Worked example 3.2-2 Designers' Guide to EC3 Part 2

Element thickness t=40 mm
Minimum ambient air temperature Tmd=-12 °C
Radiation loss adjustment dTr=0 °C
Adjustment for stress dTs=0 °C
Safety allowance dTR=0 °C
Impact strain rate e=0.017 /s
Reference strain rate eo=0.4E-3 /s
Adjustment for cold forming dTecf=0 °C

SUMMARY OF RESULTS

Actual element thickness 40 mm
Maximum thickness permitted 43.545 mm
Steel grade S 355 (from Table 2.1)
Steel sub-grade J2 (from Table 2.1)
Steel strength grade required S355J2

NOTE: Further reference should be made to the National Annex to ensure that the grades will also meet any additional guidelines at welded details.
Location: Ex2 - Example 3.2-1 Designers' Guide to EC3 Pt 2 bridge 2

Element thickness \( t = 30 \text{ mm} \)
Minimum ambient air temperature \( T_{md} = -20 \degree C \)
Radiation loss adjustment \( d_T = 0 \degree C \)
Adjustment for stress \( d_T = 0 \degree C \)
Safety allowance \( d_T = 0 \degree C \)
Adjustment for cold forming \( d_{Tecf} = 0 \degree C \)

**SUMMARY OF RESULTS**

Actual element thickness 30 mm
Maximum thickness permitted 35 mm
Steel grade S 355 (from Table 2.1)
Steel sub-grade J0 (from Table 2.1)
Steel strength grade required S355J0

NOTE: Further reference should be made to the National Annex to ensure that the grades will also meet any additional guidelines at welded details.
Location: Ex3 - Example 3.2-1 Designers' Guide to EC3 Pt 2 bridge 6

Element thickness $t=63$ mm
Minimum ambient air temperature $T_{md}=-20$ °C
Radiation loss adjustment $d_{Tr}=0$ °C
Adjustment for stress $d_{Ts}=0$ °C
Safety allowance $d_{TR}=0$ °C
Adjustment for cold forming $d_{Tecf}=0$ °C

SUMMARY OF RESULTS

Actual element thickness $63$ mm
Maximum thickness permitted $90$ mm
Steel grade $S\ 355$ (from Table 2.1)
Steel sub-grade ML or NL (from Table 2.1)
Steel strength grade required S355ML or S355NL

NOTE: Further reference should be made to the National Annex to ensure that the grades will also meet any additional guidelines at welded details.

Location: Ex1 - Internal girder without longitudinal stiffeners

Stress analysis - Allowance for shear lag

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges".

The proforma calculates the effective widths for shear lag for members in bending as per Clause 6.2.2.3.

**Portion 1**

Portion of flange spans between two webs.

Dimension bo = 500 mm
Span of beam between centres of support: L = 2000 mm
Distance below is between points of zero bending moment from Fig. 3.1 of BS EN 1993-1-5:2006.
Effective length: Le = 1400 mm
Effective width at SLS: bes(1) = beta*bo(i) = 275.28 mm
Effective width at ULS: beu(1) = beta^k*bo(i) = 404.02 mm

**Portion 2**

Portion of flange projects beyond an outer web.

Dimension bo = 250 mm
Distance below is between points of zero bending moment from Fig. 3.1 of BS EN 1993-1-5:2006.
Effective length: Le = 1400 mm
Effective width at SLS: bes(2) = beta*bo(i) = 207.63 mm
Effective width at ULS: beu(2) = beta^k*bo(i) = 241.85 mm
Total effective width at SLS: beff = bes(1) + bes(2) = 482.91 mm
Total effective width at ULS: beff = beu(1) + beu(2) = 645.86 mm
Location: Ex2 - Internal girder with longitudinal stiffeners

Stress analysis - Allowance for shear lag

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges".

The proforma calculates the effective widths for shear lag for members in bending as per Clause 6.2.2.3.

Portion 1

Portion of flange spans between two webs.

- Dimension bo: bo(1)=500 mm
- Span of beams between centres of support:
  - Beam span on LHS of support: L1=2000 mm
  - Beam span on RHS of support: L2=2000 mm
- Distance below is between points of zero bending moment from Fig. 3.1 of BS EN 1993-1-5:2006.
- Effective length: Le=1000 mm
- Total area of long.stiffeners: Asl=500 mm²
- Flange plate thickness: t=15 mm
- Effective width at SLS: bes(1)=beta*bo(i)=110.61 mm
- Effective width at ULS: beu(1)=beta^k*bo(i)=229.42 mm

Portion 2

Portion of flange projects beyond an outer web.

- Dimension bo: bo(2)=250 mm
- Distance below is between points of zero bending moment from Fig. 3.1 of BS EN 1993-1-5:2006.
- Effective length: Le=1000 mm
- Effective width at SLS: bes(2)=beta*bo(i)=96.51 mm
- Effective width at ULS: beu(2)=beta^k*bo(i)=197.06 mm
- Total effective width at SLS: beff=bes(1)+bes(2)=207.12 mm
- Total effective width at ULS: beff=beu(1)+beu(2)=426.48 mm
Stress analysis - Allowance for shear lag

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges".

The proforma calculates the effective widths for shear lag for members in bending as per Clause 6.2.2.3.

Portion 1

Portion of flange spans between two webs.

\[
\text{Dimension } bo \quad bo(1) = 500 \text{ mm}
\]

Span of beam between centres of support:

\[
L = 2000 \text{ mm}
\]

Distance below is between points of zero bending moment from Fig. 3.1 of BS EN 1993-1-5:2006.

Effective length

\[
Le = 1400 \text{ mm}
\]

Effective width at SLS

\[
bes(1) = \beta \times bo(1) = 149.69 \text{ mm}
\]

Effective width at ULS

\[
beu(1) = \beta^k \times bo(1) = 325.02 \text{ mm}
\]

Portion 2

Portion of flange projects beyond an outer web.

\[
\text{Dimension } bo \quad bo(2) = 250 \text{ mm}
\]

Distance below is between points of zero bending moment from Fig. 3.1 of BS EN 1993-1-5:2006.

Effective length

\[
Le = 1400 \text{ mm}
\]

Effective width at SLS

\[
bes(2) = \beta \times bo(2) = 118.54 \text{ mm}
\]

Effective width at ULS

\[
beu(2) = \beta^k \times bo(2) = 218.81 \text{ mm}
\]

Total effective width at SLS

\[
beff = bes(1) + bes(2) = 268.23 \text{ mm}

Location: Ex1 - Girder A

BS5400:Part 3:2000 - Shape limitations for flanges

Flanges and webs - Requirements for compact section

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06. The proforma checks flanges for compliance with the shape limitations to Clause 9.3.2 and requirements for a compact section to Clause 9.3.7.3.1 or 9.3.7.3.

Flange outstands in compression (Clause 9.3.2.1).
Flange comprises multiple flange plates welded to web. Clause 9.3.2.2.
Flange plates welded along edges.

Where a flange consists of several flange plates built-up and connected to each other only by welds at their edges, an outer flange plate should not be thicker than an inner plate. For the flange plate connected to the web, bfoc should be taken as the width of the outstand measured from the edge to the surface of the web. For all other plates bfoc should be taken as half the width between the welds connecting it to an inner plate.

Maximum value of bfo/tfo ratio1=bfoc/tfoc=6.0606
Nominal comp yield stress σy syc=345 N/mm²

Flange outstands in tension. Clause 9.3.2.2.
Flange comprises multiple flange plates welded to web. Clause 9.3.2.2.
Flange plates welded along edges.

Where a flange consists of several flange plates built-up and connected to each other only by welds at their edges, an outer flange plate should not be thicker than an inner plate. For the flange plate connected to the web, bfo should be taken as the width of the outstand measured from the edge to the surface of the web. For all other plates bfo should be taken as half the width between the welds connecting it to an inner plate.
Maximum value of $b_f / t_f = \text{ratio} = 6.0606$

Nominal tensile yield stress $\sigma_y = 345 \text{ N/mm}^2$

**RESULTS FROM CALCULATION**

Flange outstands in compression comply with Clause 9.3.2.1 with nominal yield compressive stress of 345 N/mm².

Flange outstands in tension comply with Clause 9.3.2.2 with nominal yield tensile stress of 345 N/mm².

Compact sections. Clause 9.3.7.

Multiple flange plates welded to web:

- Compression flange
- Plastic Neutral Axis
- Depths $c_e$ and $d_w$ should be taken clear of the web to flange welds.

Thickness of web plate $t_w = 12 \text{ mm}$

Dimension $c_e = 620 \text{ mm}$

Depth of web $d_w = 1240 \text{ mm}$

Nominal tensile yield stress $\sigma_y$ $s_{yw} = 355 \text{ N/mm}^2$

Nominal tensile yield stress $\sigma_y$ $s_{yf} = 345 \text{ N/mm}^2$

**RESULTS SUMMARY**

Web does not comply with Clause 9.3.7.2.

Compression flange outstands comply with Clause 9.3.7.3.1.

Section is not compact.
Location: Ex1 - Girder A

Shape limitations for flanges

Flanges and webs - Requirements for compact section

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges" and the NA to BS EN 1993-2:2006

Flange outstands in compression. Flange plates welded to web along edges:

\[
\begin{align*}
2 \times C_f
\end{align*}
\]

Mean thickness \( t_f \) of outer plate

\[
\begin{align*}
C_f
\end{align*}
\]

Mean thickness \( t_f \) of inner plate

Where a flange consists of several flange plates built-up and connected to each other only by welds at their edges, an outer flange plate should not be thicker than an inner plate. For the flange plate connected to the web, \( C_f \) should be taken as the width of the outstand measured from the edge to the toe of root fillet. For all other plates, \( C_f \) should be taken as half the width between the welds connecting it to an inner plate.

- Dimension of outstand: \( C_f = 200 \text{ mm} \)
- Mean thickness of plate: \( t_f = 33 \text{ mm} \)
- Web depth between root fillets: \( C_w = 1240 \text{ mm} \)
- Thickness of web: \( t_w = 12 \text{ mm} \)
- Yield strength: \( f_y = 345 \text{ N/mm}^2 \)
- Design axial load: \( N_{Ed} = 0 \text{ kN} \)

Section classification

Classify outstand element of compression flange:

- Outstand: \( c = C_f = 200 \text{ mm} \)
- Ratio: \( c'/t_f = 6.0606 \)

As \( c/t_f \leq 9 \text{e} (6.0606 \leq 7.4279) \), outstand element of compression flange is classified as Class 1 plastic.

Classify web element of section:

- Ratio: \( C'/t_w = 103.33 \)

As \( C/t_w > 124 \text{e} (103.33 > 102.34) \), web element in bending is classified as Class 4 slender.
Location: Ex2 - Girder A

Shape limitations for flanges

Flanges and webs - Requirements for compact section

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges" and the NA to BS EN 1993-2:2006

Flange outstands in compression. Flange plates bolted to the web:

![Diagram of flange outstand with labels:
- Thickness tf is the mean thickness of the outstand,
- Dimension Cf is the width of the outstand measured from the edge to the nearest line of bolts connecting it to the supporting part of the member.
]

Dimension of outstand: Cf = 200 mm
Mean thickness of plate: tf = 33 mm
Web depth between root fillets: Cw = 1000 mm
Thickness of web: tw = 12 mm
Yield strength: fy = 345 N/mm²
Design axial load: NEd = 0 kN

Section classification

Classify outstanding element of compression flange:
Outstand: c = Cf = 200 mm
Ratio: c' = c/tf = 6.0606
As c/tf ≤ 9e (6.0606 ≤ 7.4279), outstanding element of compression flange is classified as Class 1 plastic.

Classify web element of section:
Ratio: C' = Cw/tw = 83.333
As Cw/tw ≤ 124e (83.333 ≤ 102.34), web element in bending is classified as Class 3 semi-compact.
Location: Ex3 - Girder A

Shape limitations for flanges

Flanges and webs - Requirements for compact section

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges" and the NA to BS EN 1993-2:2006

Flange outstands in compression. Single flange plate welded to web:

- Thickness $t_f$ is the mean thickness of the outstand
- Dimension $C_f$ is the width of the outstand measured from the edge to the toe of root fillet
- Dimension $C_w$ is the web depth between root fillets

Classify outstanding element of compression flange:

- Parameter (Table 5): $e=(235/f_y)^{0.5}=0.82532$
- Outstand: $c=C_f=200$ mm
- Ratio: $c'/t_c=t_f=8$

Classify web element of section:

- Depth between fillets: $d=C_w=600$ mm
- Ratio: $c'/t_w=d/t_w=50$
- Limiting ratio: $c'/t_1=396*e/(13*ad-1)=56.725$

Web is Class 1 plastic.
Location: Ex1 - Girder W

Openings in webs and compression flanges

The calculations are in accordance with BS5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

The proforma outlines the requirements from Clause 9.3.3.

Openings in webs or compression members (Clause 9.3.3)

Clause 9.3.3.1 (General)

Any openings in webs or compression flanges should be framed and the stiffened section designed for local load effects, including secondary bending. Alternatively, openings in webs may be unstiffened provided that they meet the provisions of Clause 9.3.3.2.

All corners should be rounded with a radius of at least one-quarter of the least dimension of the hole.

Openings in webs or compression members (Clause 9.3.3)

Clause 9.3.3.2 (Unstiffened openings in webs)

Openings in a web may be unstiffened provided the following conditions are met:

- the overall greatest internal dimension does not exceed one-tenth of the depth of the web, nor, for longitudinally stiffened webs, one-third of the depth of the panel containing the opening

- the longitudinal distance between the boundaries of adjacent openings is at least three times the maximum internal dimension

- not more than one opening is provided at any cross-section.

Cut outs provided for transverse stiffeners should either have at least one-third of their perimeters welded to stiffeners, or the stiffeners should be cleated to the web with at least two bolts or rivets per side of the connection or by full perimeter welding of the cleat.
Location: Ex1 - Web opening

Openings in beam webs

Openings in beam webs based on "Access Steel" NCCI SN019b-EN-EU

Reinforced openings

Any openings in beam webs should be reinforced and the stiffened section designed for local load effects, including secondary bending. Reinforced openings should satisfy the following conditions:

1. The minimum projection of the stiffeners past the opening should be at least 20 times the thickness of the stiffener.
2. The stiffener projection from the face of the web should not exceed 10 x thickness of the stiffener.
3. The distance between edges of openings should be at least 1.5 times the length of the longer opening.
4. All corners should be rounded with a radius of at least one-quarter of the least dimension of the hole.
5. The length of the opening should not exceed 2.5 x opening depth.
6. The distance of any part of the opening to the nearest point load should not be less than half the depth of the member.

Openings in webs based on "Access Steel" NCCI SN019b-EN-EU

Unreinforced openings

Openings in a web may be unreinforced (unstiffened) provided the following conditions are met:

1. The depth of the opening should not exceed 0.6 x beam depth.
2. The length of the opening should not exceed 1.5 x opening depth.
3. The distance between edges of openings should be at least 1.5 times the length of the longer opening.
4. Not more than one opening is provided at any cross-section.
5. Opening not to be closer than twice the beam depth from support.
6. The distance of any part of the opening to the nearest point load should not be less than the depth of the member.

Cut outs provided for transverse stiffeners should either have at least one-third of their perimeters welded to stiffeners, or the stiffeners should be cleated to the web with at least two bolts or rivets per side of the connection or by full perimeter welding of the cleat.
Location: Ex1 - Internal beam

Shape limitations for flat stiffeners (Clause 9.3.4.1.2)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.
Stiffeners to webs and compression flanges. Clause 9.3.4.

Flat stiffeners (Clause 9.3.4.1.2):

```
hs

|--|<-- ts

b
```

Dimension b is the spacing of stiffeners or distance between stiffener and the beam flange/web boundary, as appropriate. In the case of a non-uniform spacing the average value on the two sides may be taken.

Depth of stiffener
Stiffener thickness
Spacing of stiffeners
Plate thickness (tf or tw)
Nominal yield stress of plate
Nominal yield stress of stiffener
Ratio (b/t) (sy/355)=9.8581 is less than 31.
Ratio (hs/ts) (syy/355)=12.5 is less than limit 19.624.
Stiffener complies with Clause 9.3.4.1.2.
Location: Internal beam

Shape limitations for flat stiffeners (Clause 9.3.4.1.2)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

Stiffeners to webs and compression flanges. Clause 9.3.4.

Flat stiffeners (Clause 9.3.4.1.2):

![Diagram of Geometric Notation Figure 1]

Dimension b is the spacing of stiffeners or distance between stiffener and the beam flange/web boundary, as appropriate. In the case of a non-uniform spacing the average value on the two sides may be taken.

Depth of stiffener \( hs = 100 \text{ mm} \)
Stiffener thickness \( ts = 8 \text{ mm} \)
Spacing of stiffeners \( b = 200 \text{ mm} \)
Plate thickness (tf or tw) \( t = 8 \text{ mm} \)
Nominal yield stress of plate \( sy = 355 \text{ N/mm}^2 \)
Nominal yield stress of stiffener \( sys = 355 \text{ N/mm}^2 \)
Ratio \( (b/t) \ (sy/355) = 25 \) is less than 31.
Ratio \( (hs/ts) \ (sys/355) = 12.5 \) exceeds limit 11.025.
Stiffener does not comply with Clause 9.3.4.1.2.
Location: Internal beam

Shape limitations for flat stiffeners (Clause 9.3.4.1.2)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

Stiffeners to webs and compression flanges. Clause 9.3.4.

Flat stiffeners (Clause 9.3.4.1.2):

\[ b \quad \text{is the thickness of flange (tf) or web (tw)} \]

\[ h_s \]

\[ \rightarrow \quad \text{ts} \quad \leftarrow \]

Geometric Notation Figure 1

Dimension \( b \) is the spacing of stiffeners or distance between stiffener and the beam flange/web boundary, as appropriate. In the case of a non-uniform spacing the average value on the two sides may be taken.

Depth of stiffener \( h_s = 100 \text{ mm} \)

Stiffener thickness \( t_s = 12 \text{ mm} \)

Spacing of stiffeners \( b = 200 \text{ mm} \)

Plate thickness (tf or tw) \( t = 8 \text{ mm} \)

Nominal yield stress of plate \( \sigma_y = 355 \text{ N/mm}^2 \)

Nominal yield stress of stiffener \( \sigma_{ys} = 355 \text{ N/mm}^2 \)

Ratio \( (h_s / t_s) \cdot (\sigma_{ys} / 355) = 8.3333 \) is not greater than limit 10.

Stiffener complies with Clause 9.3.4.1.2.
**Location: Internal beam**

\begin{align*}
\text{tp} & \quad \text{(thickness of flange (tf) or web (tw))} \\
\text{hs} & \quad \text{(depth of stiffener)} \\
\text{ts} & \quad \text{(thickness of stiffener)} \\
a & \quad \text{(spacing of stiffeners)}
\end{align*}
\]

Dimension a is the spacing of stiffeners or distance between stiffener and the beam flange/web boundary, as appropriate. In the case of a non-uniform spacing the average value on the two sides may be taken.

- Depth of stiffener: \( hs = 100 \text{ mm} \)
- Stiffener thickness: \( ts = 10 \text{ mm} \)
- Spacing of stiffeners: \( a = 200 \text{ mm} \)
- Plate thickness (tf or tw): \( tp = 20 \text{ mm} \)
- Plate yield strength: \( f_{yp} = 345 \text{ N/mm}^2 \)
- Stiffener yield strength: \( f_{ys} = 355 \text{ N/mm}^2 \)

**Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)**

- Ratio (hs/ts): \( p = hs/ts = 10 \)
- Limit to ratio \( p = (hs/ts) \) is 13\(r=10.577 \).
- Ratio (hs/ts) = 10 is not greater than limit 13\(r=10.577 \).
- Stiffener complies with Clause 9.2.1(8).

**Stiffness check - Clause 9.3.3(3)**

- Stiffener length/depth: \( hw = 225 \text{ mm} \)
- 2nd moment of area provided: \( I_{pro} = 3.8467E6 \text{ mm}^4 \)
- 2nd moment of area required: \( I_{st} = 1.5*hw^3*tp^3/a^2 = 3.4172E6 \text{ mm}^4 \)
- As \( I_{st} \leq I_{pro} \) \( 3.4172E6 \text{ mm}^4 \leq 3.8467E6 \text{ mm}^4 \), the stiffener is OK.
Location: Internal beam

Shape limitations for flat stiffeners

Stiffeners to webs and compression flanges (Clause 9.2.1).

Flat stiffeners (Clause 9.2.1(8)):

\[ \text{tp is the thickness of flange (tf) or web (tw)} \]
\[ \text{hs = depth of stiffener} \]
\[ \text{ts = thickness of stiffener} \]
\[ \text{a = spacing of stiffeners} \]

Dimension a is the spacing of stiffeners or distance between stiffener and the beam flange/web boundary, as appropriate. In the case of a non-uniform spacing the average value on the two sides may be taken.

Depth of stiffener \( hs=100 \text{ mm} \)
Stiffener thickness \( ts=10 \text{ mm} \)
Spacing of stiffeners \( a=200 \text{ mm} \)
Plate thickness (tf or tw) \( tp=8 \text{ mm} \)
Plate yield strength \( f_{yp}=355 \text{ N/mm}^2 \)
Stiffener yield strength \( f_{ys}=355 \text{ N/mm}^2 \)

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)

Ratio (hs/ts) \( p=\frac{hs}{ts}=10 \)
Limit to ratio p=(hs/ts) is \( 13\pi=10.577 \).
Ratio (hs/ts)=10 is not greater than limit \( 13\pi=10.577 \).
Stiffener complies with Clause 9.2.1(8).

Stiffness check - Clause 9.3.3(3)

Stiffener length/depth \( hw=500 \text{ mm} \)
2nd moment of area provided \( I_{pro}=2.6363E6 \text{ mm}^4 \)
2nd moment of area required \( I_{st}=1.5\times hw^3\times tp^3/a^2=2.4E6 \text{ mm}^4 \)
As \( I_{st} \leq I_{pro} \ (2.4E6 \text{ mm}^4 \leq 2.6363E6 \text{ mm}^4) \), the stiffener is OK.
**Location: Internal beam**

**Shape limitations for flat stiffeners**

Stiffeners to webs and compression flanges (Clause 9.2.1).

Flat stiffeners (Clause 9.2.1(8)):

```
  a
hs
  ts
```

*tp is the thickness of flange (tf) or web (tw)*

*hs = depth of stiffener*

*ts = thickness of stiffener*

*a = spacing of stiffeners*

Geometric Notation Figure 1

Dimension a is the spacing of stiffeners or distance between stiffener and the beam flange/web boundary, as appropriate. In the case of a non-uniform spacing the average value on the two sides may be taken.

- Depth of stiffener: $hs=100$ mm
- Stiffener thickness: $ts=10$ mm
- Spacing of stiffeners: $a=200$ mm
- Plate thickness (tf or tw): $tp=8$ mm
- Plate yield strength: $f_{yp}=355$ N/mm$^2$
- Stiffener yield strength: $f_{ys}=355$ N/mm$^2$

**Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)**

- Ratio (hs/ts): $p=hs/ts=10$
- Limit to ratio $p=hs/ts$ is 13ε=10.577.
- Ratio (hs/ts)=10 is not greater than limit 13ε=10.577.
- Stiffener complies with Clause 9.2.1(8).

**Stiffness check - Clause 9.3.3(3)**

- Stiffener length/depth: $hw=400$ mm
- 2nd moment of area provided: $I_{pro}=2.6363E6$ mm$^4$
- 2nd moment of area required: $I_{st}=1.5*hw^3*tp^3/a^2=1.2288E6$ mm$^4$
- As $I_{st} \leq I_{pro}$ (1.2288E6 mm$^4 \leq 2.6363E6$ mm$^4$), the stiffener is OK.
Location: Internal beam

Shape limitations for flat stiffeners

Stiffeners to webs and compression flanges (Clause 9.2.1).

Flat stiffeners (Clause 9.2.1(8)):

<table>
<thead>
<tr>
<th>hs</th>
<th>ts</th>
</tr>
</thead>
<tbody>
<tr>
<td>a</td>
<td>tp</td>
</tr>
</tbody>
</table>

tp is the thickness of flange (tf) or web (tw)
hs = depth of stiffener
ts = thickness of stiffener
a = spacing of stiffeners

Geometric Notation Figure 1

Dimension a is the spacing of stiffeners or distance between stiffener and the beam flange/web boundary, as appropriate. In the case of a non-uniform spacing the average value on the two sides may be taken.

Depth of stiffener hs=120 mm
Stiffener thickness ts=12 mm
Spacing of stiffeners a=200 mm
Plate thickness (tf or tw) tp=5 mm
Plate yield strength fyp=355 N/mm²
Stiffener yield strength fys=355 N/mm²

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)

Ratio (hs/ts) p=hs/ts=10
Limit to ratio p=(hs/ts) is 13ε=10.577.
Ratio (hs/ts)=10 is not greater than limit 13ε=10.577.
Stiffener complies with Clause 9.2.1(8).

Stiffness check - Clause 9.3.3(3)

Stiffener length/depth hw=600 mm
2nd moment of area provided Ipro=3.5159E6 mm⁴
2nd moment of area required Ist=1.5*hw³*tp³/a²=1.0125E6 mm⁴
As Ist ≤ Ipro (1.0125E6 mm⁴ ≤ 3.5159E6 mm⁴), the stiffener is OK.
Shape limitations for flat stiffeners

Stiffeners to webs and compression flanges (Clause 9.2.1).

Flat stiffeners (Clause 9.2.1(8)):

\[ \text{tp is the thickness of flange (tf) or web (tw)} \]

\[ \text{hs} = \text{depth of stiffener} \]

\[ \text{ts} = \text{thickness of stiffener} \]

\[ \text{a} = \text{spacing of stiffeners} \]

Geometric Notation Figure 1

Dimension a is the spacing of stiffeners or distance between stiffener and the beam flange/web boundary, as appropriate. In the case of a non-uniform spacing the average value on the two sides may be taken.

Depth of stiffener \( hs = 100 \text{ mm} \)
Stiffener thickness \( ts = 10 \text{ mm} \)
Spacing of stiffeners \( a = 20 \text{ mm} \)
Plate thickness (tf or tw) \( tp = 2 \text{ mm} \)
Plate yield strength \( f_{yp} = 355 \text{ N/mm}^2 \)
Stiffener yield strength \( f_{ys} = 355 \text{ N/mm}^2 \)

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)

Ratio (hs/ts) \( p = \frac{hs}{ts} = 10 \)
Limit to ratio \( p = (hs/ts) \) is \( 13\pi = 10.577 \).
Ratio (hs/ts) = 10 is not greater than limit \( 13\pi = 10.577 \).
Stiffener complies with Clause 9.2.1(8).

Stiffness check - Clause 9.3.3(3)

Stiffener length/depth \( hw = 300 \text{ mm} \)
2nd moment of area provided \( I_{pro} = 933385 \text{ mm}^4 \)
2nd moment of area required \( I_{st} = 1.5 \times hw^3 \times tp \times a^2 = 810000 \text{ mm}^4 \)
As \( I_{st} \leq I_{pro} \) ( \( 810000 \text{ mm}^4 \leq 933385 \text{ mm}^4 \) ), the stiffener is OK.
Location: Internal beam

Shape limitations for flat stiffeners

Stiffeners to webs and compression flanges (Clause 9.2.1).

Flat stiffeners (Clause 9.2.1(8)):

+-----------------+     +-----------------+
|                 |     |                 |
|                 |     |                 |
| b               |     |                   |
|                 |     |                   |
|                 |     |                   |
|                 |     |                   |
```

Dimension b is the spacing of stiffeners or distance between the stiffener and beam flange/web boundary, as appropriate. In the case of non-uniform spacing the average value on the two sides may be taken.

Plate yield strength \( f_{yp} = 355 \text{ N/mm}^2 \)

Stiffener yield strength \( f_{ys} = 355 \text{ N/mm}^2 \)

**Stiffness check - Clause 9.3.3(3)**

- Stiffener length/depth \( h_w = 450 \text{ mm} \)
- Second moment of area provided \( I_{pro} = 6.2152E6 \text{ mm}^4 \)
- Second moment of area required \( I_{st} = 1.5 \ast h_w^3 \ast t_p^3 / a^2 = 1.4762E6 \text{ mm}^4 \)

As \( I_{st} \leq I_{pro} \) \((1.4762E6 \text{ mm}^4 \leq 6.2152E6 \text{ mm}^4)\), the stiffener is OK.
Shape limitations for angle stiffeners

Stiffeners to webs and compression flanges (Clause 9.2.1).

Angle stiffeners:

\[
\begin{align*}
\text{Dimension } b & \text{ is the spacing of stiffeners or distance between the stiffener and beam flange/web boundary, as appropriate. In the case of non-uniform spacing the average value on the two sides may be taken.} \\
\text{Plate yield strength} & = f_{yp} = 355 \text{ N/mm}^2 \\
\text{Stiffener yield strength} & = f_{ys} = 355 \text{ N/mm}^2 \\
\text{Stiffness check - Clause 9.3.3(3)} \\
\text{Stiffener length/depth} & = hw = 450 \text{ mm} \\
\text{Second moment of area provided} & = I_{pro} = 6.9785 \times 10^6 \text{ mm}^4 \\
\text{Second moment of area required} & = I_{st} = 1.5 \times hw^3 \times tp^3 / a^2 = 1.4762 \times 10^6 \text{ mm}^4 \\
\text{As } I_{st} & \leq I_{pro} (1.4762 \times 10^6 \text{ mm}^4 \leq 6.9785 \times 10^6 \text{ mm}^4), \text{ the stiffener is OK.}
\end{align*}
\]
Shape limitations for angle stiffeners

Stiffeners to webs and compression flanges (Clause 9.2.1).

Angle stiffeners:

Dimension $b$ is the spacing of stiffeners or distance between the stiffener and beam flange/web boundary, as appropriate. In the case of non-uniform spacing the average value on the two sides may be taken.

Plate yield strength

Stiffener yield strength

Stiffness check - Clause 9.3.3(3)

Stiffener length/depth
Second moment of area provided
Second moment of area required
As $I_{st} \leq I_{pro}$ (5.1258E6 mm$^4 \leq 13.523E6$ mm$^4$), the stiffener is OK.
Location: Ex4 - Angle stiffeners to compression flange

Shape limitations for angle stiffeners

Stiffeners to webs and compression flanges (Clause 9.2.1).

Angle stiffeners:

\[
\text{tp} \quad \text{is the thickness of flange (tf) or web (tw)}
\]

\[
\begin{align*}
\text{hs} & \rightarrow < - \text{ts} \\
\downarrow & \\
\text{bs} & \rightarrow \text{ts}
\end{align*}
\]

Geometric Notation Figure 1

Dimension b is the spacing of stiffeners or distance between the stiffener and beam flange/web boundary, as appropriate. In the case of non-uniform spacing the average value on the two sides may be taken.

Plate yield strength \( f_{yp} = 355 \text{ N/mm}^2 \)
Stiffener yield strength \( f_{ys} = 355 \text{ N/mm}^2 \)

**Stiffness check - Clause 9.3.3(3)**

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stiffener length/depth</td>
<td>( hw = 400 \text{ mm} )</td>
</tr>
<tr>
<td>Second moment of area provided</td>
<td>( I_{pro} = 6.965 \times 10^6 \text{ mm}^4 )</td>
</tr>
<tr>
<td>Second moment of area required</td>
<td>( I_{st} = 1.5 \times hw^3 \times tp^3 / a^2 = 2.6449 \times 10^6 \text{ mm}^4 )</td>
</tr>
</tbody>
</table>

As \( I_{st} \leq I_{pro} \) (\( 2.6449 \times 10^6 \text{ mm}^4 \leq 6.965 \times 10^6 \text{ mm}^4 \)), the stiffener is OK.
Shape limitations for angle stiffeners

Shape limitations for angle stiffeners

Stiffeners to webs and compression flanges (Clause 9.2.1).

Angle stiffeners:

![Diagram of angle stiffener](image)

Geometric Notation Figure 1

Dimension b is the spacing of stiffeners or distance between the stiffener and beam flange/web boundary, as appropriate. In the case of non-uniform spacing the average value on the two sides may be taken.

- Plate yield strength $f_{yp} = 355 \text{ N/mm}^2$
- Stiffener yield strength $f_{ys} = 355 \text{ N/mm}^2$
- $L = 1400 \text{ mm}$

**Stiffness check - Clause 9.3.3(3)**

- Stiffener length/depth $h_w = 600 \text{ mm}$
- Second moment of area provided $I_{pro} = 9.9923E6 \text{ mm}^4$
- Second moment of area required $I_{st} = 1.5 \times h_w^3 \times t_p^3 / a^2 = 3.6E6 \text{ mm}^4$

As $I_{st} \leq I_{pro}$ ($3.6E6 \text{ mm}^4 \leq 9.9923E6 \text{ mm}^4$), the stiffener is OK.
Location: Ex1 - Web stiffener

Shape limitations for tee stiffeners (Clause 9.3.4.1.5)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06. The proforma checks for compliance with the shape limitations to Clause 9.3.4.1.5.

Stiffeners to webs and compression flanges. Clause 9.3.4

Tee stiffeners. Clause 9.3.4.1.5

\[ t \text{ is the thickness of flange (tf) or web (tw)} \]

\[ \text{Dimension } b \text{ is the spacing of stiffeners or distance between the stiffener and beam flange/web boundary, as appropriate. In the case of a non-uniform spacing the average value on the two sides may be taken.} \]

Effective stiffener depth is measured from the underside of the flange plate to the midplane of the equivalent uniform thickness of the flange of the tee stiffener.

Nominal yield stress of plate \( \sigma_y \) \( \text{sy}=355 \text{ N/mm}^2 \)

Nominal yield stress of stiffener \( \text{syst}=355 \text{ N/mm}^2 \)

Factor \( \left( \frac{bso}{tso} \right) \left( \frac{\text{syst}}{355} \right) = 8 \) does not exceed 10

Condition (a) is satisfied.

Factor \( \left( \frac{ds}{ts} \right) \left( \frac{\text{sy}+\text{sa}}{355} \right) = 7.0711 \) does not exceed 41

Condition (b) is satisfied.

Factor \( \left( \frac{ds}{ts} \right) \left( \frac{\text{sy}}{355} \right) = 5 \) does not exceed 7

Condition (c) is satisfied.

Stiffener complies with the requirements of Clause 9.3.4.1.5.
Shape limitations for tee stiffeners (Clause 9.3.4.1.5)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06. The proforma checks for compliance with the shape limitations to Clause 9.3.4.1.5.

Stiffeners to webs and compression flanges. Clause 9.3.4

Tee stiffeners. Clause 9.3.4.1.5

Effective stiffener depth is measured from the underside of the flange plate to the midplane of the equivalent uniform thickness of the flange of the tee stiffener.

Nominal yield stress of plate \( \sigma_y = 355 \text{ N/mm}^2 \)
Nominal yield stress of stiffener \( \sigma_{ys} = 355 \text{ N/mm}^2 \)
Factor (bso/tso) \( (\sigma_{ys}/355) = 12 \) exceeds 10
Condition (a) is not satisfied.
Factor (ds/ts) \( ((\sigma_{ys}+\sigma_a)/355) = 7.0711 \) does not exceed 41
Condition (b) is satisfied.
Factor (ds/ts) \( (\sigma_{ys}/355) = 5 \) does not exceed 7
Condition (c) is satisfied.
Stiffener does not comply with the requirements of Clause 9.3.4.1.5.
Location: Web stiffener

Shape limitations for tee stiffeners (Clause 9.3.4.1.5)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06. The proforma checks for compliance with the shape limitations to Clause 9.3.4.1.5.

Stiffeners to webs and compression flanges. Clause 9.3.4

Tee stiffeners. Clause 9.3.4.1.5

\[
\text{t is the thickness of flange (tf) or web (tw)}
\]

\[
\text{Dimension b is the spacing of stiffeners or distance between the stiffener and beam flange/web boundary, as appropriate. In the case of a non-uniform spacing the average value on the two sides may be taken.}
\]

Effective stiffener depth is measured from the underside of the flange plate to the midplane of the equivalent uniform thickness of the flange of the tee stiffener.

Nominal yield stress of plate \( \sigma_y \) \( sy=355 \text{ N/mm}^2 \)

Nominal yield stress of stiffener \( \sigma_y=355 \text{ N/mm}^2 \)

Factor \( (bso/tso) (\sigma_y/355)=8 \) does not exceed 10

Condition (a) is satisfied

Factor \( (ds/ts) ((\sigma_y+\sigma_a)/355)=38.184 \) does not exceed 41

Condition (b) is satisfied.

Condition (c) (1) is not satisfied.

Factor \( (b/t) (\sigma_y/355)=25 \) does not exceed 32

Factor \( (ds/bs)=3 \) does not exceed 4

Limiting value of factor \( (ds/ts) (\sigma_y/355) \) from Figure 4b is 29.384

Factor \( (ds/ts) (\sigma_y/355)=27 \) does not exceed 29.384

Condition (c) (2) is satisfied.

Stiffener complies with the requirements of Clause 9.3.4.1.5.
Location: Web stiffener

Shape limitations for tee stiffeners (Clause 9.3.4.1.5)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06. The proforma checks for compliance with the shape limitations to Clause 9.3.4.1.5.

Stiffeners to webs and compression flanges. Clause 9.3.4

Tee stiffeners. Clause 9.3.4.1.5

Effective stiffener depth is measured from the underside of the flange plate to the midplane of the equivalent uniform thickness of the flange of the tee stiffener.

Nominal yield stress of plate $\sigma_y$ $\text{sy}=355 \text{ N/mm}^2$

Nominal yield stress of stiffener $\text{sys}=355 \text{ N/mm}^2$

Factor ($bso/tso$) ($\text{sys}/355$)$=8$ does not exceed 10

Condition (a) is satisfied

Factor ($ds/ts$) ($\text{(sys+sa)}/355$)$=10.607$ does not exceed 41

Condition (b) is satisfied.

Factor ($ls/bs$) ($\text{sys}/355$)$=21.778$ is greater than 12 and less than 25

Limiting value of factor ($ds/ts$) ($\text{sys}/355$) from Figure 4a is 7.5472

Factor ($ds/ts$) ($\text{sys}/355$)$=7.5$ does not exceed 7.5472

Condition (c) (1) is satisfied.

Factor ($b/t$) ($\text{sys}/355$)$=25$ does not exceed 32

Factor ($ds/bs$)$=0.83333$ does not exceed 4

Limiting value of factor ($ds/ts$) ($\text{sys}/355$) from Figure 4b is 29.384

Factor ($ds/ts$) ($\text{sys}/355$)$=7.5$ does not exceed 29.384

Condition (c) (2) is satisfied.

Stiffener complies with the requirements of Clause 9.3.4.1.5.
Location: Web stiffener

Shape limitations for tee stiffeners (Clause 9.3.4.1.5)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06. The proforma checks for compliance with the shape limitations to Clause 9.3.4.1.5.

Stiffeners to webs and compression flanges. Clause 9.3.4

Tee stiffeners. Clause 9.3.4.1.5

\[ t \text{ is the thickness of flange (tf) or web (tw)} \]

Dimension b is the spacing of stiffeners or distance between the stiffener and beam flange/web boundary, as appropriate. In the case of a non-uniform spacing the average value on the two sides may be taken.

Effective stiffener depth is measured from the underside of the flange plate to the midplane of the equivalent uniform thickness of the flange of the tee stiffener.

Nominal yield stress of plate \( \sigma_y \) \( sy = 355 \text{ N/mm}^2 \)

Nominal yield stress of stiffener \( sy = 355 \text{ N/mm}^2 \)

Factor \( (bso/tso) (sys/355) = 8 \) does not exceed 10
Condition (a) is satisfied

Factor \( (ds/ts) ((sys+oa)/355) = 10.889 \) does not exceed 41
Condition (b) is satisfied.

Condition (c) (1) is not satisfied.
Factor \( (b/t) (\sigma_y/355) = 25 \) does not exceed 32
Factor \( (ds/bs) = 0.85556 \) does not exceed 4

Limiting value of factor \( (ds/ts) (sys/355) \) from Figure 4b is 29.384
Factor \( (ds/ts) (sys/355) = 7.7 \) does not exceed 29.384
Condition (c) (2) is satisfied.

Stiffener complies with the requirements of Clause 9.3.4.1.5.
Shape Limitations for T-Stiffeners

Stiffeners to webs and compression flanges (Clause 9.2.1).

Tee stiffeners:

\[ b \]

\[ t_p \] is the thickness of flange (tf) or web (tw)

\[ d_s \] \[ \rightarrow \] \[ \leftarrow t_s \]

Dimension \( b \) is the spacing of stiffeners or distance between the stiffener and beam flange/web boundary, as appropriate. In the case of a non-uniform spacing the average value on the two sides may be taken.

Effective stiffener depth is measured from the underside of the flange plate to the midplane of the equivalent uniform thickness of the flange of the tee stiffener.

Plate yield strength \( f_{yp} = 345 \) N/mm\(^2\)

Stiffener yield strength \( f_{ys} = 355 \) N/mm\(^2\)

Stiffness check - Clause 9.3.3(3)

Stiffener length/depth \( h_w = 300 \) mm

Second moment of area provided \( I_{pro} = 2.6239E6 \) mm\(^4\)

Second moment of area required \( I_{st} = 0.75 \times h_w \times t_p^3 = 1.8E6 \) mm\(^4\)

As \( I_{st} \leq I_{pro} \) \( (1.8E6 \text{ mm}^4 \leq 2.6239E6 \text{ mm}^4) \), the stiffener is OK.
Location: Ex2 - Web stiffener

Shape Limitations for T-Stiffeners

Stiffeners to webs and compression flanges (Clause 9.2.1).

Tee stiffeners:

\[ \text{tp is the thickness of flange (tf) or web (tw)} \]

Dimension b is the spacing of stiffeners or distance between the stiffener and beam flange/web boundary, as appropriate. In the case of a non-uniform spacing the average value on the two sides may be taken.

Effective stiffener depth is measured from the underside of the flange plate to the midplane of the equivalent uniform thickness of the flange of the tee stiffener.

Plate yield strength \( f_{yp} = 345 \text{ N/mm}^2 \)
Stiffener yield strength \( f_{ys} = 355 \text{ N/mm}^2 \)
\( L = 3000 \text{ mm} \)
**Shape Limitations for T-Stiffeners**

Stiffeners to webs and compression flanges (Clause 9.2.1).

Tee stiffeners:

![Geometric Notation Figure 1](image)

Dimension b is the spacing of stiffeners or distance between the stiffener and beam flange/web boundary, as appropriate. In the case of a non-uniform spacing the average value on the two sides may be taken.

Effective stiffener depth is measured from the underside of the flange plate to the midplane of the equivalent uniform thickness of the flange of the tee stiffener.

- Plate yield strength \( f_{yp} = 345 \text{ N/mm}^2 \)
- Stiffener yield strength \( f_{ys} = 345 \text{ N/mm}^2 \)
Location: Ex4 - Web stiffener

Shape Limitations for T-Stiffeners

Stiffeners to webs and compression flanges (Clause 9.2.1).

Tee stiffeners:

\[ b \]

\[ t_p \] is the thickness of flange (tf) or web (tw)

\[ d_s \]

\[ t_s \]

\[ t_s \]

\[ b_s \]

Dimension b is the spacing of stiffeners or distance between the stiffener and beam flange/web boundary, as appropriate.

In the case of a non-uniform spacing the average value on the two sides may be taken.

Effective stiffener depth is measured from the underside of the flange plate to the midplane of the equivalent uniform thickness of the flange of the tee stiffener.

Plate yield strength \( f_{yp} = 345 \text{ N/mm}^2 \)

Stiffener yield strength \( f_{ys} = 355 \text{ N/mm}^2 \)

Stiffness check - Clause 9.3.3(3)

Stiffener length/depth \( h_w = 600 \text{ mm} \)

Second moment of area provided \( I_{pro} = 11.84E6 \text{ mm}^4 \)

Second moment of area required \( I_{st} = 1.5 \times h_w^3 \times t_p^2 / a^2 = 10.368E6 \text{ mm}^4 \)

As \( I_{st} \leq I_{pro} \) (10.368E6 mm\(^4\) \leq 11.84E6 mm\(^4\)), the stiffener is OK.
Location: Ex5 - Web stiffener

Shape Limitations for T-Stiffeners

Stiffeners towebs and compression flanges (Clause 9.2.1).

Tee stiffeners:

\[
\begin{align*}
\text{ds} & \rightarrow \text{ts} \\
tso & \rightarrow \text{bs}
\end{align*}
\]

Effective stiffener depth is measured from the underside of the flange plate to the midplane of the equivalent uniform thickness of the flange of the tee stiffener.

Plate yield strength \( f_{yp} = 345 \text{ N/mm}^2 \)
Stiffener yield strength \( f_{ys} = 355 \text{ N/mm}^2 \)
\( L = 1500 \text{ mm} \)

Stiffness check - Clause 9.3.3(3)

Stiffener length/depth \( hw = 450 \text{ mm} \)
Second moment of area provided \( I_{pro} = 5.5936E6 \text{ mm}^4 \)
Second moment of area required \( I_{st} = 1.5 \times hw^3 \times tp^3 / a^2 = 4.374E6 \text{ mm}^4 \)
As \( I_{st} \leq I_{pro} \) ( \( 4.374E6 \text{ mm}^4 \leq 5.5936E6 \text{ mm}^4 \)), the stiffener is OK.
Shape limitations for closed stiffeners (Clause 9.3.4.1.5)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

Stiffeners to webs and compression flanges (Clause 9.3.4).

Closed stiffeners (Clause 9.3.4.2):

Width of wall ds1=75 mm
Width of wall ds2=75 mm
Thickness of stiffener ts=3 mm

Stiffener:
Nominal yield stress of stiffener sys=355 N/mm²
Stress at centroid of section sa=sys=355 N/mm²
Factor (ds1/ts) (sys/355)=25 does not exceed 29.0
Clause 9.3.4.2 Condition (a) is satisfied.
Factor (ds2/ts) ((sys+oa)/355)=35.355 does not exceed 41.0
Clause 9.3.4.2 Condition (b) is satisfied.
Stiffener complies with Clause 9.3.4.2.
Location: Stiffened compression flange

Shape limitations for closed stiffeners (Clause 9.3.4.1.5)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

Stiffeners to webs and compression flanges (Clause 9.3.4).

Closed stiffeners (Clause 9.3.4.2):

\[ b_1 \] \[ b_2 \] \[ b_1 \]

\[ \text{Geometric Notation Figure 1} \]

Width of wall \( ds_1 = 100 \text{ mm} \)
Width of wall \( ds_2 = 75 \text{ mm} \)
Thickness of stiffener \( ts = 3 \text{ mm} \)

Stiffener:

Nominal yield stress of stiffener \( sys = 355 \text{ N/mm}^2 \)
Stress \( sa \) at centroid of section \( sa = sys = 355 \text{ N/mm}^2 \)
Factor (\( ds_1/ ts \)) \((sys/355) = 33.333 \) is greater than 29.0
Stiffener does not comply with Clause 9.3.4.2 Condition (a).

Factor (\( ds_2/ ts \)) \(((sys+oa)/355) = 35.355 \) does not exceed 41.0
Clause 9.3.4.2 Condition (b) is satisfied.
Stiffener does not comply with Clause 9.3.4.2.
Location: Stiffened compression flange

Shape limitations for closed stiffeners (Clause 9.3.4.1.5)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

Stiffeners to webs and compression flanges (Clause 9.3.4).

Closed stiffeners (Clause 9.3.4.2):

![Geometric Notation Figure 1]

Width of wall
- $d_{s1}=75$ mm
- $d_{s2}=95$ mm

Thickness of stiffener
- $t_{s}=3$ mm

Stiffener:
Nominal yield stress of stiffener $s_{ys}=355$ N/mm$^2$
Stress at centroid of section $s_a=s_{ys}=355$ N/mm$^2$
Factor $(d_{s1}/t_{s}) (s_{ys}/355)=25$ does not exceed 29.0
Clause 9.3.4.2 Condition (a) is satisfied.
Factor $(d_{s2}/t_{s}) ((s_{ys}+s_a)/355)=44.783$ is greater than 41.0
Stiffener does not comply with Clause 9.3.4.2 Condition (b).
Stiffener does not comply with Clause 9.3.4.2.
Location: Ex1 - Stiffened compression flange

Shape limitations for closed stiffeners

Stiffeners to webs and compression flanges (Clause 9.3.3).

Closed stiffeners:

\[
\begin{array}{c|c|c|c}
\hline
& b1 & b2 & b1 \\
\hline
ds & / & / & /
\hline
ds2 & / & / & /
\hline
ds1 & is ts and & measures on & centreline
\hline
tp & be constant & & \\
\hline
\end{array}
\]

Geometric Notation

Width of wall \( ds1 = 100 \text{ mm} \)
Width of wall \( ds2 = 100 \text{ mm} \)
Distance \( b1 = 200 \text{ mm} \)
Distance \( b2 = 200 \text{ mm} \)
Distance \( ds = 80 \text{ mm} \)
Plate thickness \( tp = 15 \text{ mm} \)
Thickness of stiffener \( ts = 10 \text{ mm} \)
Plate yield strength \( f_{yp} = 355 \text{ N/mm}^2 \)
Stiffener yield strength \( f_{ys} = 355 \text{ N/mm}^2 \)

Stiffness check - Clause 9.3.3(3)

Stiffener length/depth \( hw = 600 \text{ mm} \)
compute \( \text{comp1} = A1 \cdot y1^2 + 2 \cdot A2 \cdot y2^2 + A3 \cdot y3^2 \)
= \( 8.4681 \times 10^6 \)
compute \( \text{comp2} = fw \cdot tp^3 / 12 + 2 \cdot ts \cdot ds^3 / 12 + ds1 \cdot ts^3 / 12 = 974167 \)
Second moment of area provided \( I_{pro} = \text{comp1} + \text{comp2} = 9.4422 \times 10^6 \text{ mm}^4 \)
Second moment of area required \( I_{st} = 1.5 \cdot hw \cdot tp^3 / a^2 = 6.8344 \times 10^6 \text{ mm}^4 \)
As \( I_{st} \leq I_{pro} \) (\( 6.8344 \times 10^6 \text{ mm}^4 \leq 9.4422 \times 10^6 \text{ mm}^4 \)), the stiffener is OK.
Shape limitations for closed stiffeners

Stiffeners to webs and compression flanges (Clause 9.3.3).

Closed stiffeners:

\[
\begin{array}{ccc}
  & b_1 & b_2 & b_1 \\
\hline
ds & 100 & 120 & 340 \\
ds_2 & 80 & 15 & 15 \\
\end{array}
\]

Geometric Notation

- Width of wall: ds1=100 mm
- Width of wall: ds2=120 mm
- Distance: b1=280 mm
- Distance: b2=280 mm
- Distance: ds=80 mm
- Plate thickness: tp=15 mm
- Thickness of stiffener: ts=15 mm
- Plate yield strength: fyp=275 N/mm\(^2\)
- Stiffener yield strength: fys=275 N/mm\(^2\)

Stiffness check - Clause 9.3.3(3)

Stiffener length/depth: hw=900 mm

\[
\begin{align*}
\text{comp1} &= A_1 y_1^2 + A_2 y_2^2 + A_3 y_3^2 \\
&= 12.84E6 \\
\text{comp2} &= f_w t_p^3/12 + 2 t_s d_s^3/12 + d_{s1} t_s^3/12 \\
&= 1.4656E6
\end{align*}
\]

Second moment of area provided: Ipro=comp1+comp2=14.305E6 mm\(^4\)

Second moment of area required: Ist=1.5 * hw \times tp^3/a^2 = 11.768E6 mm\(^4\)

As Ist \leq Ipro (11.768E6 mm\(^4\) \leq 14.305E6 mm\(^4\)), the stiffener is OK.
**Location: Ex1 - Beam F**

**Shape limitations for flanges curved in elevation (Clause 9.3.5)**

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

Flanges curved in elevation (Clause 9.3.5).
Flange outstand:
Section comprises flange plates connected to the web by riveted/bolted connections.

```
  tfo1
  >|< bfo1
```

Case 1: bfo=bfo1, tfo=tfo1
Case 2: bfo=bfo2, tfo=tfo2

Thickness tfo is the mean thickness of the outstand.

Dimension bfo is the width of outstand measured from the edge to the nearest line of rivets or bolts connecting it to the supporting part of the member.

```
  tfo2
  >|< bfo2
```

Dimension of outstand bfo=200 mm
Thickness of plate tfo=10 mm

Radius of curvature of the flange Rf=25000 mm

Factor bfo²/tfo=4000 does not exceed factor Rf/6=4166.7
Flange complies with Clause 9.3.5 Condition (a).
Shape limitations for flanges curved in elevation (Clause 9.3.5)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

Flanges curved in elevation (Clause 9.3.5).
Flange outstand:
Section comprises flange plates welded to web.
Flange is a single plate.

Thickness \( t_{fo} \) is the mean thickness of the outstand

Dimension \( b_{fo} \) is the width of the outstand measured from the edge to the surface of the web.

Dimension of outstand \( b_{fo} = 200 \) mm
Thickness of plate \( t_{fo} = 8 \) mm

Radius of curvature of the flange \( R_f = 25000 \) mm

Factor \( b_{fo}^2/t_{fo} = 5000 \) is greater than factor \( R_f/6 = 4166.7 \)

Flange does not comply with Clause 9.3.5 Condition (a).
Shape limitations for flanges curved in elevation (Clause 9.3.5)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

Flanges curved in elevation (Clause 9.3.5).

Section is the flange of an internal panel.

\[
\begin{align*}
\text{Dimension of plate} & \quad b=200 \text{ mm} \\
\text{Thickness of plate} & \quad t_f=10 \text{ mm} \\
\text{Radius of curvature of the flange} & \quad R_f=25000 \text{ mm} \\
\text{Factor } b^2/t_f & \leq 4000 \text{ does not exceed factor } R_f/2=12500 \\
\text{Flange complies with Clause 9.3.5 Condition (b).}
\end{align*}
\]
Shape limitations for flanges curved in elevation

Flanges are curved in elevation (Clause 8(2)).
Section comprises of flange plates bolted to the web:

Comp flange radius of curvature \( r = 5000 \text{ mm} \)
Clear web depth between flanges \( hw = 800 \text{ mm} \)
Thickness of web \( tw = 16 \text{ mm} \)
Compression flange width \( bcf = 450 \text{ mm} \)
Compression flange thickness \( tcf = 35 \text{ mm} \)
Yield strength of flange \( f_yf = 345 \text{ N/mm}^2 \)

From BS EN 1993-1-5:2006, Clause 8(2):
LHS term of expression 8.2 \( \text{ratio1} = hw/tw = 50 \)
compute \( \text{term1} = \sqrt{Aw/Afc} = 0.9015 \)
compute \( \text{term2} = hw^2E/(3r^2fyf) = 32.464 \)
RHS term of expression 8.2 \( \text{ratio2} = kE/f_yf*\text{term1}/(1+\text{term2})^{0.5} \)
\[ = 52.172 \]

As \( hw/tw \leq \text{ratio2} \ (50 \leq 52.172) \), the criterion of Clause 8(2) has been met. Hence satisfactory.
Shape limitations for flanges curved in elevation

Flanges are curved in elevation (Clause 8(2)).
Section comprises of single flange plates welded to web:

```
 bcf          tcf
  hw
```

Comp flange radius of curvature  \(r=4000 \text{ mm}\)
Clear web depth between flanges  \(hw=900 \text{ mm}\)
Thickness of web  \(tw=15 \text{ mm}\)
Compression flange width  \(bcf=400 \text{ mm}\)
Compression flange thickness  \(tcf=15 \text{ mm}\)
Yield strength of flange  \(fyf=355 \text{ N/mm}^2\)

From BS EN 1993-1-5:2006, Clause 8(2):
LHS term of expression 8.2  \(\text{ratio}_1=hw/tw=60\)
compute  \(\text{term}_1=\sqrt{Aw/A\text{fc}}=1.5\)
compute  \(\text{term}_2=hw*E/(3*r*fyf)=44.366\)
RHS term of expression 8.2  \(\text{ratio}_2=k*E/fyf*\text{term}_1/(1+\text{term}_2)^0.5=72.457\)

As \(hw/tw \leq \text{ratio}_2\) (60 \(\leq 72.457\)), the criterion of Clause 8(2) has been met. Hence satisfactory.
Location: Ex3 - Box girder

Shape limitations for flanges curved in elevation

Flanges are curved in elevation (Clause 8(2)).

Section is the flange of an internal panel:

\[
\begin{align*}
&bcf \quad bcf \\
&\text{tcf} = \text{thickness of panel between box webs} \\
&bcf = \text{half the width of effective flange between box webs} \\
&tw \quad tw
\end{align*}
\]

Comp flange radius of curvature \( r = 4000 \text{ mm} \)
Clear web depth between flanges \( hw = 900 \text{ mm} \)
Thickness of web \( tw = 15 \text{ mm} \)
Compression flange width \( bcf = 450 \text{ mm} \)
Compression flange thickness \( tcf = 15 \text{ mm} \)
Yield strength of flange \( f_yf = 355 \text{ N/mm}^2 \)

From BS EN 1993-1-5:2006, Clause 8(2):

LHS term of expression 8.2 \( \text{ratio1} = hw/tw = 60 \)
compute \( \text{term1} = \sqrt{(Aw/Afc)} = 1.4142 \)
compute \( \text{term2} = hwE/(3*r*fyf) = 44.366 \)
RHS term of expression 8.2 \( \text{ratio2} = k*E/fyf*term1/(1+term2)^{0.5} = 68.313 \)

As \( hw/tw \leq \text{ratio2} \ (60 \leq 68.313) \), the criterion of Clause 8(2) has been met. Hence satisfactory.
Shape limitations for flanges curved in elevation

Flanges are curved in elevation (Clause 8(2)).
Section comprises of flange plates welded to compression web:

\[
\begin{align*}
2*b_{fo} & = \text{width of outstand measured from the edge to the surface of the web.} \\
& \text{For all other plates } "b_{fo}" \text{ should be taken as half the width between the welds connecting it to an inner plate.}
\end{align*}
\]

Comp flange radius of curvature \( r = 5000 \text{ mm} \)
Clear web depth between flanges \( h_w = 400 \text{ mm} \)
Thickness of web \( t_w = 15 \text{ mm} \)
Dimension of outstand \( b_{fo} = 200 \text{ mm} \)
Thickness of inner plate \( t_{cf1} = 20 \text{ mm} \)
Thickness of outer plate \( t_{cf2} = 15 \text{ mm} \)
Yield strength of flange \( f_{yf} = 345 \text{ N/mm}^2 \)

From BS EN 1993-1-5:2006, Clause 8(2):

LHS term of expression 8.2 \( \text{ratio1} = \frac{h_w}{t_w} = 26.667 \)
compute \( \text{term1} = \sqrt{\frac{A_{w}}{A_{fc}}} = 0.64775 \)
compute \( \text{term2} = \frac{h_w E}{3 r f_{yf}} = 16.232 \)
RHS term of expression 8.2
\[
\begin{align*}
\text{ratio2} & = \frac{k E}{f_{yf} \text{term1}/(1+\text{term2})^{0.5}} \\
& = 52.24
\end{align*}
\]

As \( \frac{h_w}{t_w} \leq \text{ratio2} \) (26.667 \leq 52.24), the criterion of Clause 8(2) has been met. Hence satisfactory.
Location: Ex5 - Rolled section

Shape limitations for flanges curved in elevation

Flanges are curved in elevation (Clause 8(2)).
Rolled section:

\[
\begin{align*}
&\text{bcf} \\
&\text{tcf} \\
&\text{hw} \\
&\text{bcf = comp flange width} \\
&\text{tcf = comp flange thickness}
\end{align*}
\]

Comp flange radius of curvature \( r = 5000 \text{ mm} \)
Clear web depth between flanges \( hw = 1000 \text{ mm} \)
Thickness of web \( tw = 15 \text{ mm} \)
Compression flange width \( bcf = 400 \text{ mm} \)
Compression flange thickness \( tcf = 15 \text{ mm} \)
Yield strength of flange \( fyf = 355 \text{ N/mm}^2 \)

From BS EN 1993-1-5:2006, Clause 8(2):

LHS term of expression 8.2 \[ \text{ratio1}=hw/tw=66.667 \]
compute \[ \text{term1}=\sqrt{Aw/Afc}=1.5811 \]
compute \[ \text{term2}=hw*E/(3*r*fyf)=39.437 \]
RHS term of expression 8.2 \[ \text{ratio2}=k*E/fyf*term1/(1+term2)^0.5 = 80.898 \]

As \( hw/tw \leq \text{ratio2} (66.667 \leq 80.898)\), the criterion of Clause 8(2) has been met. Hence satisfactory.
Shape limitations for circular hollow sections (Clause 9.3.6)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06. The proforma checks for compliance with the shape limitations to Clause 9.3.6.

Circular hollow sections. Clause 9.3.6.

The ratio of outside diameter to wall thickness of a circular hollow section should not exceed 60 \((355/\sigma)\).

Nominal yield stress \(\sigma_y\) \(\text{sys}=355 \text{ N/mm}^2\)
Outside diameter of section \(\text{od}=170 \text{ mm}\)
Wall thickness \(\text{wt}=5 \text{ mm}\)
Ratio of outside diameter to wall thickness \(34\) is less than \(60 \ (355/\sigma)=60\)
Section complies with Clause 9.3.6.

Compact sections. Clause 9.3.7.4.
Nominal yield stress \(\sigma_y\) \(\text{syc}=355 \text{ N/mm}^2\)
Ratio of outside diameter to wall thickness \(34\) is less than \(46 \ (355/\sigma)=46\)
Section complies with Clause 9.3.7.4.
Section is compact.
Shape limitations for circular hollow sections (Clause 9.3.6)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06. The proforma checks for compliance with the shape limitations to Clause 9.3.6.

Circular hollow sections. Clause 9.3.6.

The ratio of outside diameter to wall thickness of a circular hollow section should not exceed 60 \((355/\sigma)\).

Nominal yield stress \(\sigma_y\) \(s_{ys}=300\) N/mm\(^2\)
Outside diameter of section \(od=240\) mm
Wall thickness \(wt=5\) mm
Ratio of outside diameter to wall thickness \(48\) is less than \(60 (355/\sigma)=65.269\)
Section complies with Clause 9.3.6.

Compact sections. Clause 9.3.7.4.

Nominal yield stress \(\sigma_y\) \(s_{yc}=355\) N/mm\(^2\)
Ratio of outside diameter to wall thickness \(48\) exceeds \(46 (355/\sigma y)=46\)
Section does not comply with Clause 9.3.7.4.
Section is not compact.
Shape limitations for circular hollow sections (Clause 9.3.6)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06. The proforma checks for compliance with the shape limitations to Clause 9.3.6.

Circular hollow sections. Clause 9.3.6.

The ratio of outside diameter to wall thickness of a circular hollow section should not exceed 60 \( \left( \frac{355}{\sigma} \right) \).

Nominal yield stress \( \sigma_y \) \( \text{sys}=355 \text{ N/mm}^2 \)

Outside diameter of section \( \text{od}=300 \text{ mm} \)

Wall thickness \( \text{wt}=4 \text{ mm} \)

Ratio of outside diameter to wall thickness 75 exceeds 60 \( \left( \frac{355}{\sigma} \right)=60 \)

Section does not comply with Clause 9.3.6.

For compliance \( \sigma_y= \left( \frac{60}{\gamma} \right)^2 \times 355=227.2 \text{ N/mm}^2 \)

Compact sections. Clause 9.3.7.4.

Nominal yield stress \( \sigma_y \) \( \text{syc}=355 \text{ N/mm}^2 \)

Ratio of outside diameter to wall thickness 75 exceeds 46 \( \left( \frac{355}{\sigma_y} \right)=46 \)

Section does not comply with Clause 9.3.7.4.

Section is not compact.
Location: Ex1 - Tube X

Shape limitations for circular hollow sections

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges" and the NA to BS EN 1993-2:2006

The proforma checks the section classification to Clause 5.5.2 of BS EN 1993-2:2006 and Table 5.2 of BS EN 1193-1-1:2005 relating to circular hollow sections.

The ratio of outside diameter of section to wall thickness (D/t) of a circular hollow section should not exceed 90. When d/t > 90 the section classification is "slender". Reference to BS EN 1993-1-6 is made in Table 5.2 of BS EN 1193-1-1:2005 for slender sections.

Properties of circular hollow sections

- Outside diameter of section: D=170 mm
- Wall thickness: t=5 mm
- Yield strength: fy=355 N/mm²
Shape limitations for circular hollow sections

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma checks the section classification to Clause 5.5.2 of BS EN 1993-2:2006 and Table 5.2 of BS EN 1193-1-1:2005 relating to circular hollow sections.

The ratio of outside diameter of section to wall thickness (D/t) of a circular hollow section should not exceed 90. When d/t > 90, the section classification is "slender". Reference to BS EN 1993-1-6 is made in Table 5.2 of BS EN 1193-1-1:2005 for slender sections.

Properties of circular hollow sections

- Outside diameter of section: D=240 mm
- Wall thickness: t=5 mm
- Yield strength: fy=355 N/mm²
Location: X3 - Tube X

Shape limitations for circular hollow sections

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges" and the NA to BS EN 1993-2:2006

The proforma checks the section classification to Clause 5.5.2 of BS EN 1993-2:2006 and Table 5.2 of BS EN 1193-1-1:2005 relating to circular hollow sections.

The ratio of outside diameter of section to wall thickness (D/t) of a circular hollow section should not exceed 90\(\pi\). When d/t > 90\(\pi\) the section classification is "slender". Reference to BS EN 1993-1-6 is made in Table 5.2 of BS EN 1193-1-1:2005 for slender sections.

Properties of circular hollow sections

Outside diameter of section \(D=300\) mm
Wall thickness \(t=4\) mm
Yield strength \(f_y=355\) N/mm\(^2\)

As D/t > 90\(\pi\) ( 75 > 59.577 ), the section classification is "slender" in accordance with Table 5.2 of EC3 Part 1-1. Refer to BS EN 1993-1-6 for further information.
Location: Ex1 - Effective section Panel A

Effective section (Clause 9.4)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06. The proforma calculates the effective sections in accordance with Clause 9.4.

Compression flange is stiffened by three or more open stiffeners.

\[ a = \text{panel dimension in direction of stress considered} \]
\[ b = \text{panel dimension normal to the direction of stress} \]

Panel dimension a: 1500 mm
Breadth between stiffeners: 300 mm
Thickness of flange plate: 12 mm
Nominal yield stress of plate: 355 N/mm²
Buckling coefficient Kc: 0.9798

Effective web (Clause 9.4.2.5)

Thickness of web: 20 mm

Web without effective long. stiffeners in accordance with Cl. 9.11.5.

Depth of web measured in its plane from the elastic neutral axis of the gross section of the beam to the compressive edge of the web. Depth yc.

Depth yc: 750 mm
Nominal yield stress of web: 355 N/mm²
Effective web thickness \( t_{we} = t_w = 20 \text{ mm} \)

The area of longitudinal stiffeners should be included for stress analysis only if they are continuous on either side of the section under consideration over a depth equal to the beam. Clause 9.4.2.6.
Location: Effective section Panel A

Effective section (Clause 9.4)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06. The proforma calculates the effective sections in accordance with Clause 9.4.

Compression flange is stiffened by two open stiffeners.

```
                  tf
<---b--><---b--><---b-->  
```

\[a = \text{panel dimension in direction of stress considered}
\]
\[b = \text{panel dimension normal to the direction of stress}\]

- Panel dimension \(a\) = 1500 mm
- Breadth between stiffeners \(b\) = 300 mm
- Thickness of flange plate \(t_f\) = 12 mm
- Nominal yield stress of plate \(S_{Yf}\) = 355 N/mm²
- Buckling coefficient \(K_c\) = 0.97482

Effective web (Clause 9.4.2.5)

- Thickness of web \(t_w\) = 20 mm

Web without effective long. stiffeners in accordance with Cl. 9.11.5.

```
Compression flange
\[\text{yc}\]
\[---\] Elastic NA
```

Depth of web measured in its plane from the elastic neutral axis of the gross section of the beam to the compressive edge of the web. Depth \(yc\).

For a beam built in stages, \(yc\) should be calculated for the cross section of the beam appropriate to the stage considered.

- Depth \(yc\) = 750 mm
- Nominal yield stress of web \(S_{Yw}\) = 355 N/mm²
Effective web thickness \( t_{we} = t_w = 20 \text{ mm} \)

The area of longitudinal stiffeners should be included for stress analysis only if they are continuous on either side of the section under consideration over a depth equal to the beam. Clause 9.4.2.6.
Location: Effective section Panel A

Effective section (Clause 9.4)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06. The proforma calculates the effective sections in accordance with Clause 9.4.

Compression flange is stiffened by one open stiffener.

\[ \text{Depth of web measured in its plane from the elastic neutral axis of the gross section of the beam to the compressive edge of the web. Depth } \text{yc.} \]

- Panel dimension a = 1500 mm
- Breadth between stiffeners b = 300 mm
- Thickness of flange plate \(tf=12 \text{ mm}\)
- Nominal yield stress of plate \(syf=355 \text{ N/mm}^2\)
- Buckling coefficient Kc = 0.96985

Effective web (Clause 9.4.2.5)

| Thickness of web \(tw=20 \text{ mm}\) |

- Depth yc = 750 mm
- Nominal yield stress of web \(syw=355 \text{ N/mm}^2\)
Effective web thickness \( t_{we} = t_w = 20 \text{ mm} \)

The area of longitudinal stiffeners should be included for stress analysis only if they are continuous on either side of the section under consideration over a depth equal to the beam. Clause 9.4.2.6.
Location: Effective section Panel A

Effective section (Clause 9.4)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06. The proforma calculates the effective sections in accordance with Clause 9.4.

Compression flange is stiffened by two or more closed stiffeners.

\[
\begin{align*}
\text{Dimension } b_1 & = 500 \text{ mm} \\
\text{Dimension } b_2 & = 300 \text{ mm} \\
\text{Thickness of flange plate } & = 12 \text{ mm} \\
\text{Nominal yield stress of plate } & = 355 \text{ N/mm}^2 \\
\end{align*}
\]

Calculate effective area for each panel

For panel width 500

Buckling coefficient \( K_c \) = 0.75895

For panel width 300

Buckling coefficient \( K_c \) = 0.9798

Effective web (Clause 9.4.2.5)

\[
\text{Thickness of web } = 20 \text{ mm}
\]
Web without effective long. stiffeners in accordance with Cl. 9.11.5.

Depth of web measured in its plane from the elastic neutral axis of the gross section of the beam to the compressive edge of the web. Depth \( y_c \).

For a beam built in stages, \( y_c \) should be calculated for the cross section of the beam appropriate to the stage considered.

Depth \( y_c \) \( y_c = 750 \text{ mm} \)
Nominal yield stress of web \( s_yw = 355 \text{ N/mm}^2 \)
Effective web thickness \( t_w = 20 \text{ mm} \)

The area of longitudinal stiffeners should be included for stress analysis only if they are continuous on either side of the section under consideration over a depth equal to the beam. Clause 9.4.2.6.
Effective section

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma calculates the reduction factor $\rho$ for plate buckling which is needed to evaluate the effective area $A_{eff}$ in accordance with Clause 4.4 of BS EN 1193-1-5, where $A_{eff}=\rho A_c$.

Compression flange is stiffened by three or more open stiffeners.

\[ a = \text{panel dimension in direction of stress considered} \]
\[ b = \text{panel dimension normal to the direction of stress} \]

Panel dimension $a$ $= 1500 \text{ mm}$
Breadth between stiffeners $b = 300 \text{ mm}$
Thickness of flange plate $t_f = 12 \text{ mm}$
Yield strength (flange) $f_y = 355 \text{ N/mm}^2$
Buckling factor (Table 4.1) $k_s = 1$

Effective web thickness

Web without effective longitudinal stiffeners.

Depth of web measured in its plane from the elastic neutral axis of the gross section of the beam to the compressive edge of the web. Depth $z_c$.

For a beam built in stages, $z_c$ should be calculated for the cross section of the beam appropriate to the stage considered.

Effective length for lateral torsional buckling (Clause 9.6)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

The proforma calculates the effective length for lateral torsional buckling in accordance with Clause 9.6. Beams (other than cantilevers) without intermediate lateral restraint. Clause 9.6.2.

Single span beams

Span of beam between lateral restraints at supports.
Span $L$ $L=25000$ mm
All beams should be restrained at their supports against rotation

Where there is no intermediate lateral restraint to a compression flange, the effective length $l_e$ should be taken as:

$$l_e = k_1 \cdot k_2 \cdot k_e \cdot L$$

Factor $k_1=1.0$
Factor $k_2=1.2$

Effective length factor $k_e$ :

$$k_e = \frac{1}{0.5} \cdot \frac{60 \cdot E \cdot tf_{\text{max}} \cdot \beta \cdot \delta t \cdot R_v}{1 - \frac{W \cdot (L/ry)^3 \cdot v^4}{W \cdot (L/ry)^3 \cdot v^4}}$$

Consider end 1:
Max thickness of comp. flange in span $tf_{\text{max}}=20$ mm
Vertical reaction at support $R_v1=1500$ kN
Total vertical load on span $W=3500$ kN
Deflection $\delta t$ $\delta t=0.01$ mm
Coefficient $\beta$ $\beta_1=1$
Radius of gyration $ry=100$ mm
Factor $v$ $v=0.9$

Consider end 2:
Vertical reaction at support $R_v2=2000$ kN
Coefficient $\beta$ $\beta_2=1$

Effective length (Cl.9.6.2(a))

$$l_e = k_1 \cdot k_2 \cdot k_e \cdot L = 32296$$ mm
**Location: Edge beam**

**Effective length for lateral torsional buckling (Clause 9.6)**

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

The proforma calculates the effective length for lateral torsional buckling in accordance with Clause 9.6.

Cantilevers without intermediate lateral restraints. Clause 9.6.3.

Length of cantilever $L = 10000$ mm

Factor from Table 8 $q = 1.4$

Effective length $l_e = q \times L = 14000$ mm
Location: Edge beam

Effective length for lateral torsional buckling (Clause 9.6)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

The proforma calculates the effective length for lateral torsional buckling in accordance with Clause 9.6.

Beams with fully effective lateral restraints at the level of the compression flange. Clause 9.6.4.1.1.1.

Number of intermediate restraints nr=2

<table>

Effective length le 15000 mm
Effective length for lateral torsional buckling (Clause 9.6)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

The proforma calculates the effective length for lateral torsional buckling in accordance with Clause 9.6. Beam restrained by discrete U-frame restraints. Clause 9.6.4.1.3. Intermediate restraint to the compression flange is provided only by U-frames in accordance with Clause 9.12.3, le should be calculated in accordance with Clause 9.6.4.1.1.2.

Span \( L = 15000 \) mm

Second moment of area \( I_c \) \( I_c = 360E6 \) mm^4

Young's modulus of steel \( E = 205000 \) N/mm²

Factor \( k_2 = 1.2 \)

U-frame spacing \( l_R = 3000 \) mm

U-frame is symmetrical with cross members and verticals of constant second moment of area throughout their lengths.

Distance \( B = 5000 \) mm

Distance \( d_1 = 1500 \) mm

Distance \( d_2 = 1250 \) mm

Second moment of area \( I_1 = 400E6 \) mm^4

Second moment of area \( I_2 = 500E6 \) mm^4

Factor \( u = 0.5 \)

Factor \( f = 20E-12 \) rd/Nmm

Total lateral deflection \( \Delta R = \Delta_{tav} + \Delta_{tab} + \Delta_{tar} \)

=83.079E-6 mm

Deflection \( \Delta_1 \) \( \Delta_{tav} = 0.21E-3 \) mm

Deflection \( \Delta_2 \) \( \Delta_{tab} = 0.22E-3 \) mm

Effective length from Cl.9.6.2(a) \( l_{ea} = 7450.6 \) mm

Effective length from Cl.9.6.2(b) \( l_{eb} = 5483.4 \) mm

Effective length when \( k_3 \) is 1.0 \( l_e = l_{ea} = 7450.6 \) mm
Effective length for lateral torsional buckling (Clause 9.6)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

The proforma calculates the effective length for lateral torsional buckling in accordance with Clause 9.6.

Deck is connected to an unstiffened web, either directly or via the tension flange, over the length of the beam in accordance with Clause 9.12.4.2. The effect of the restraint should be allowed for by assuming that the deck and webs of the main beams comprise a continuous series of effective U-frames of unit length longitudinally.

The effective length should be calculated in accordance with Clause 9.6.4.1.3 with length lR equal to unity and deflection deltaR equal to the lateral deflection which would occur in an effective U-frame at the level of the centroid of the flange being considered when a unit force acts laterally to the effective U-frame only at this point and simultaneously at each corresponding point on the other flange or flanges connecting to the same effective U-frame.

Effective length should be calculated in accordance with Clause 9.6.4.1.1.2

Span \( L = 15000 \text{ mm} \)
Second moment of area \( I_c = 360E6 \text{ mm}^4 \)
Young's modulus of steel \( E = 205000 \text{ N/mm}^2 \)

Factor \( k_2 = 1.2 \)

The deck and webs of the beam are of constant thickness throughout the span and the beam of constant depth.

Distance \( B = 5000 \text{ mm} \)
Distance \( d_1 = 1500 \text{ mm} \)
Distance \( d_2 = 1250 \text{ mm} \)
Second moment of area $I_1$  
$I_1 = 400 \times 10^6 \text{ mm}^4$

Second moment of area $I_2$  
$I_2 = 500 \times 10^6 \text{ mm}^4$

Factor $u$  
$u = 0.5$

Total lateral deflection  
$\delta_R = \delta_{av} + \delta_{ab} = 51.829 \times 10^{-6} \text{ mm}$

Deflection $\delta_1$  
$\delta_{1} = 0.21 \times 10^{-3} \text{ mm}$

Deflection $\delta_2$  
$\delta_{2} = 0.22 \times 10^{-3} \text{ mm}$

Effective length:

$$le_b = \pi k_2 \sqrt{E I_c (\delta_1 + \delta_2)/L} = 5483.4 \text{ mm}$$

Effective length from Cl.9.6.2(a)  
$le_a = 1073.8 \text{ mm}$

Effective length from Cl.9.6.2(b)  
$le_b = 5483.4 \text{ mm}$

Effective length when $k_3$ is 1.0  
$le = le_b = 5483.4 \text{ mm}$
Effective length for lateral torsional buckling (Clause 9.6)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

The proforma calculates the effective length for lateral torsional buckling in accordance with Clause 9.6.

Beams (other than cantilevers) without intermediate lateral restraint. Clause 9.6.2.

Continuous beams

Span of beam between lateral restraints at supports. For continuous beams it is the larger of the adjacent spans.

Span L = 25000 mm

All beams should be restrained at their supports against rotation.

Where there is no intermediate lateral restraint to a compression flange, the effective length le should be taken as:

\[ le = k_1 \cdot k_2 \cdot k_e \cdot L \]

Factor \( k_1 = 1.0 \)

Factor \( k_2 = 1.2 \)

Effective length factor \( k_e \):

\[ k_e = \left[ \frac{1}{\frac{60 \cdot E \cdot t_{\text{max}} \cdot \beta \cdot \delta \cdot R_v}{W \cdot (L/ry)^3 \cdot v^4}} \right]^{0.5} \]

Consider end 1:

Max thickness of comp. flange in span \( t_{\text{max}} = 20 \text{ mm} \)

Vertical reaction at support \( R_v1 = 1500 \text{ kN} \)

Total vertical load on span \( W = 3500 \text{ kN} \)

Deflection \( \delta \)

Coefficient \( \beta \)

Radius of gyration \( ry = 100 \text{ mm} \)

Factor \( v \)

Consider end 2:

Vertical reaction at support \( R_v2 = 2000 \text{ kN} \)

Coefficient \( \beta \)

Effective length (Cl.9.6.2(a)) \( le = k_1 \cdot k_2 \cdot k_e \cdot L = 32296 \text{ mm} \)

\[ le = \left[ \frac{1}{\frac{2 \cdot (\Sigma L)^3}{\pi^4 \cdot E \cdot I_c \cdot (\delta_i + (\delta_e/2))}} \right]^{0.5} \]
Sum of lengths of adjacent spans \( \text{sumL}=50000 \text{ mm} \)
Second moment of area \( I_c \) \( I_c=360E6 \text{ mm}^4 \)
Deflection \( \delta_i \) \( \delta_i=23 \text{ mm} \)
Deflection \( \delta_e \) \( \delta_e=24 \text{ mm} \)

Effective length:
\[
le_b = k_1 k_2 \times \text{sumL} \times SQR\left(\frac{1}{1 + \left(\frac{2 \times \text{sumL}^3}{\pi^4 \times E \times I_c \times (\delta_i + \delta_e/2)}\right)}\right)
\]
\[
=59970 \text{ mm}
\]

Effective length (\( le_b \) governs) \( le=59970 \text{ mm} \)
Effective length for lateral torsional buckling

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma calculates the effective length for lateral torsional buckling using the same approach used in BS 5400-3:2000.

Beams (other than cantilevers) without intermediate lateral restraint.

Single span beams

Span of beam between lateral restraints at supports. Span L = 25000 mm
All beams should be restrained at their supports against rotation

Where there is no intermediate lateral restraint to a compression flange, the effective length le should be taken as:

\[ le = k_1 \cdot k_2 \cdot k_e \cdot L \]

Factor \( k_1 = 1.0 \)
Factor \( k_2 = 1.2 \)

Effective length factor \( k_e \):

\[ k_e = \left[ \frac{1}{1 - \frac{60 \cdot E \cdot t_{\text{max}} \cdot \beta \cdot \delta_t \cdot R_v}{W \cdot (L/r_z)^3 \cdot v^4}} \right]^{0.5} \]

Consider end 1:
Max thickness of comp. flange in span \( t_{\text{max}} = 20 \text{ mm} \)
Vertical reaction at support \( R_{v1} = 1500 \text{ kN} \)
Total vertical load on span \( W = 3500 \text{ kN} \)
Deflection \( \delta_t \) \( \text{deltat} = 0.01 \text{ mm} \)
Coefficient \( \beta \) \( \beta_{1} = 1 \)
Radius of gyration \( r_z = 100 \text{ mm} \)
Slenderness factor \( v \) \( v = 0.9 \)

Consider end 2:
Vertical reaction at support \( R_{v2} = 2000 \text{ kN} \)
Coefficient \( \beta \) \( \beta_{2} = 1 \)
Value of \( k_e2 \) governs \( k_e = k_e2 = 1.0765 \)
Effective length \( le = k_1 \cdot k_2 \cdot k_e \cdot L = 32296 \text{ mm} \)

Factor \( k_2 = 1.2 \)

U-frame spacing \( l_R = 3000 \text{ mm} \)

U-frame is symmetrical with cross members and verticals of constant second moment of area throughout their lengths.

Distance \( B = 5000 \text{ mm} \)

Distance \( d_1 = 1500 \text{ mm} \)

Distance \( d_2 = 1250 \text{ mm} \)

Second moment of area \( I_1 = 400 \times 10^6 \text{ mm}^4 \)

Second moment of area \( I_2 = 500 \times 10^6 \text{ mm}^4 \)

Factor \( u = 0.5 \)

Factor \( f = 20 \times 10^{-12} \text{ rd/Nmm} \)

Total lateral deflection \( \Delta R = \Delta v + \Delta b + \Delta t = 81.845 \times 10^{-6} \text{ mm} \)

Deflection \( \Delta_1 = 0.21 \times 10^{-3} \text{ mm} \)

Deflection \( \Delta_2 = 0.22 \times 10^{-3} \text{ mm} \)

Effective length (case 1) \( l_a = 7482.2 \text{ mm} \)

Effective length (case 2) \( l_b = 5549.8 \text{ mm} \)

Effective length when \( k_3 \) is 1.0 \( l_e = l_a = 7482.2 \text{ mm} \)
Effective length for lateral torsional buckling

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma calculates the effective length for lateral torsional buckling using the same approach used in BS 5400-3:2000.

Deck is connected to an unstiffened web, either directly or via the tension flange, over the length of the beam. The effect of the restraint should be allowed for by assuming that the deck and webs of the main beams comprise a continuous series of effective U-frames of unit length longitudinally.

The effective length should be calculated with length \( l_R \) equal to unity and deflection \( \delta_R \) equal to the lateral deflection which would occur in an effective U-frame at the level of the centroid of the flange being considered when a unit force acts laterally to the effective U-frame only at this point and simultaneously at each corresponding point on the other flange or flanges connecting to the same effective U-frame.

Span \( L = 15000 \text{ mm} \)

Second moment of area \( I_c \) \( I_c = 360E6 \text{ mm}^4 \)

Young's modulus of steel \( E = 210000 \text{ N/mm}^2 \)

Factor \( k_2 = 1.2 \)

The deck and webs of the beam are of constant thickness throughout the span and the beam of constant depth.

Distance \( B \) \( B = 5000 \text{ mm} \)

Distance \( d_1 \) \( d_1 = 1500 \text{ mm} \)

Distance \( d_2 \) \( d_2 = 1250 \text{ mm} \)
Second moment of area $I_1$ $I_1=400E6$ mm$^4$

Second moment of area $I_2$ $I_2=500E6$ mm$^4$

Factor u $u=0.5$

Total lateral deflection $\delta_R=\delta_{1}+\delta_{2}=50.595E-6$ mm

Deflection $\delta_1$ $\delta_{1}=0.21E-3$ mm

Deflection $\delta_2$ $\delta_{2}=0.22E-3$ mm

Effective length:

$$Ie_b=\pi*k_2*\sqrt{E*Ic*(\delta_{1}+\delta_{2})/L}=5549.8$$ mm

Effective length (case 1) $Ie_a=1073.8$ mm

Effective length (case 2) $Ie_b=5549.8$ mm

Effective length when $k_3$ is 1.0 $Ie=Ie_b=5549.8$ mm
Location: Ex6 - As Ex1 but continuous beam

Effective length for lateral torsional buckling

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma calculates the effective length for lateral torsional buckling using the same approach used in BS 5400-3:2000.

Beams (other than cantilevers) without intermediate lateral restraint.

Continuous beams

Span of beam between lateral restraints at supports.
For continuous beams it is the larger of the adjacent spans.
Span L = 25000 mm
All beams should be restrained at their supports against rotation

Where there is no intermediate lateral restraint to a compression flange, the effective length le should be taken as:

\[ le = k_1 \cdot k_2 \cdot k_e \cdot L \]

Factor \( k_1 = 1.0 \)
Factor \( k_2 = 1.2 \)

Effective length factor \( k_e \):

\[
k_e = \frac{1}{1 - \frac{60 \cdot E \cdot t_{f_{\text{max}}} \cdot \beta \cdot \delta t \cdot R_v}{W \cdot (L/r_z)^3 \cdot v^4}}^{0.5} \]

Consider end 1:
Max thickness of comp. flange in span \( t_{f_{\text{max}}} = 20 \) mm
Vertical reaction at support \( R_v1 = 1500 \) kN
Total vertical load on span \( W = 3500 \) kN
Deflection \( \delta t \) \( \delta t = 0.01 \) mm
Coefficient \( \beta \) \( \beta = 2 \)
Radius of gyration \( r_z = 100 \) mm
Slenderness factor \( v \) \( v = 0.9 \)

Consider end 2:
Vertical reaction at support \( R_v2 = 2000 \) kN
Coefficient \( \beta \) \( \beta = 2 \)
Value of \( k_e2 \) governs \( k_e = k_e2 = 1.1793 \)
Effective length \( le = k_1 \cdot k_2 \cdot k_e \cdot L = 35378 \) mm

\[
le = k_1 \cdot k_2 \cdot \frac{1}{1 + \frac{2 \cdot (\Sigma L)^3}{\pi^4 \cdot E \cdot I_c \cdot (\delta_i + (\delta e/2))}}^{0.5} \]
Effective length:

\[ le_b = k_1 \times k_2 \times \text{sumL} \times SQR\left(\frac{1}{1 + \frac{2 \times \text{sumL}^3}{\pi^4 E I_c (\delta_i + \delta_e/2)}}\right) \]

\[ = 33215 \text{ mm} \]

Effective length (lea governs) \[ le = 35378 \text{ mm} \]
Location: Ex1 - Slenderness, moment and shear resistance

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

**Slenderness lamLT**

The proforma calculates the slenderness parameter lambdaLT in accordance with Clause 9.7.

I, Channel, Tee or Angle sections (Clause 9.7.2).

Half wavelength of buckling \( lw = 10400 \) mm

Effective length to Clause 9.6 \( le = 10400 \) mm

2nd moment of area \( @ \) minor axis \( I_{yy} = 133E6 \) mm\(^4\)

Cross sectional area \( A = 32300 \) mm\(^2\)

Factor \( k4 = 0.9 \)

Simply supported mid-span moment \( M_m = -236.98 \) kNm

Overall depth of section \( D = 918.5 \) mm

Mean flange thickness \( t_f = 27.9 \) mm

For a uniform section

Slenderness parameter \( \lambda_{mLT} = (le/ry)*k4*\eta*v = 119.61 \)

**Limiting moment of resistance**

The proforma calculates the limiting moment of resistance \( MR \) in accordance with Clause 9.8.

Ratio \( le/lw = 1 \)

Section is compact in accordance with Clause 9.3.7

Moment of resistance of section \( \text{Mult} = 3770 \) kNm

Nominal yield stress comp. flange \( sy_c = 345 \) N/mm\(^2\)

Nominal yield stress tens. flange \( sy_t = 345 \) N/mm\(^2\)

Nominal yield stress of web \( sy_w = 345 \) N/mm\(^2\)

Slenderness ratio \( \lambda_{mLT} = 119.61 \)

\( n = 0.008*lw/le*(\beta-30) = 0.7033 \)

\( MR = ((1+(1+n)*5700/\beta^2)-\sqrt{(1+(1+n)*5700/\beta^2)^2-22800/\beta^2})) = 0.5828 \)

Limiting moment of resistance \( MR = \text{Mult} \times 0.5 = 1098.6 \) kNm

**Bending resistance**

The proforma calculates the bending resistance of beams without longitudinal stiffeners in accordance with Clause 9.9.

Partial factor on yield strength \( g_m = 1.05 \)

Partial factor gammaf3 \( g_f3 = 1.1 \)

Bending resistance \( MD = MR/(g_m*gf3) = 951.15 \) kNm

Calculations for the bending resistance ignoring web contribution \( M_f \) from Clause 9.9.3.1.

Area of effective tension flange \( A_{te} = 8523 \) mm\(^2\)

Partial factor on yield strength \( g_{mt} = 1.05 \)

Partial factor gammaf3 \( g_{f3} = 1.1 \)

Area of effective compr. flange \( A_{ce} = 8523 \) mm\(^2\)

Elastic modulus of the section \( Z_{xc} = 9.5E6 \) mm\(^3\)
Limiting stress (comp. flange) \( \sigma_{yc} = \sigma_{yc2} = 115.64 \text{ N/mm}^2 \)
Partial factor on comp. strength \( \gamma_{mc} = 1.05 \)
Partial factor gammaf3 \( \gamma_f3 = 1.1 \)
Force in compression flange \( F_{fc} = \frac{(A*\sigma_{yc})}{(\gamma_{mc}\gamma_{f3}1E3)} = 853.33 \text{ kN} \)
Bending resistance is based on flange with lower value of force.
Bending resistance \( M_f = F_{fc} \times df/1E3 = 759.98 \text{ kNm} \)

Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners

The result is the shear capacity of a web panel under pure shear calculated using Clause 9.9.2 Shear Resistance.
Depth of web \( d_{we} = 862.7 \text{ mm} \)
Clear length of panel \( a = 10400 \text{ mm} \)
Web thickness \( t_w = 17.3 \text{ mm} \)
Half eff. breadth of flanges \( b_{fe} \) is the smaller of the following:
1. The result of the expression \( b_{fe1} = 10*tf*SQRT(355/s_yf) = 283.01 \text{ mm} \)
2. The distance from the mid-plane of the web to the nearer edge of the flange \( b_{fe2} = 152.75 \text{ mm} \)
Non-dimensional value of plastic moment of resistance of flange:
\( m_{fw} = \frac{(s_yf \times b_{fe} \times tf \times tf)}{(2 \times s_yw \times d_{we} \times d_{we} \times t_w)} = 0.0046174 \)

Shear resistance results from analysis

Shear resistance of web panel under pure shear.
Limiting shear stress \( (\tau_l) \) \( 199.19 \text{ N/mm}^2 \)
Resistance \( V_D = \frac{(t_w \times (d_w-h_h) \times \tau_{ul1})}{(\gamma_m \gamma_f3 \times 1000)} = 2740.3 \text{ kN} \)

Shear resistance of web panel under pure shear ignoring flange capacity i.e. taking \( m_{fw} = 0 \).
Limiting shear stress \( (\tau_l) \) \( 199.19 \text{ N/mm}^2 \)
Resistance \( V_R = \frac{(t_w \times (d_w-h_h) \times \tau_{ul2})}{(\gamma_m \gamma_f3 \times 1000)} = 2740.3 \text{ kN} \)

Combined bending and shear in web sections

Web with intermediate transverse stiffeners. Clause 9.9.3.1.
Maximum shear force in panel \( V = 182.3 \text{ kN} \)
Maximum bending moment \( M = 947.9 \text{ kNm} \)
RESULTS FROM ANALYSIS

MD design capacity in bending     VD design capacity in shear
Mf bending capacity ignoring web  VR shear capacity ignoring flanges

MD=951.15 kNm
Mf=759.98 kNm
V=182.3 kN
VD=2740.3 kN
VR=2740.3 kN

Maximum bending moment 947.9 kNm is within interaction curve.
Maximum shear force 182.3 kN is within interaction curve.
Interaction relationship satisfied.
Location: Ex2 - SHS edge beam (500x500x16 SHS)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

**Slenderness lamLT**

The proforma calculates the slenderness parameter lambdaLT in accordance with Clause 9.7.

Rectangular or trapezoidal box sections (Clause 9.7.3.1).

- Half wavelength of buckling \( lw = 9000 \text{ mm} \)
- Effective length to Clause 9.6 \( le = 9000 \text{ mm} \)
- 2nd moment of area @ major axis \( I_{xx} = 1.21 \times 10^9 \text{ mm}^4 \)
- 2nd moment of area @ minor axis \( I_{yy} = 1.21 \times 10^9 \text{ mm}^4 \)
- Cross sectional area \( A = 31000 \text{ mm}^2 \)
- Simply supported mid-span moment \( M_m = -220 \text{ kNm} \)
- Plastic modulus \( Z_{pe} = 5.6 \times 10^6 \text{ mm}^3 \)

- Area \( Ao = 234000 \text{ mm}^2 \)
- Depth of section \( D = 500 \text{ mm} \)
- Width of section \( B = 500 \text{ mm} \)
- Thickness of flange \( t = 16 \text{ mm} \)
- Summation \( B/B/t = 4 \times B/t = 125 \)
- Torsional constant \( J = 4 \times Ao^2/B/Byt = 1.7522 \times 10^9 \text{ mm}^4 \)

For uniform section

- Slenderness parameter \( \lambda_{LT} = 2.25 \times \eta \times \xi \times \sqrt{(Z_{pe} \times le)/(ry \times SQR(A \times J))} = 0 \)

**Limiting moment of resistance**

The proforma calculates the limiting moment of resistance \( MR \) in accordance with Clause 9.8.

- Ratio \( le/lw \) \( \text{rat2} = le/lw = 1 \)
- Section is compact in accordance with Clause 9.3.7
- Moment of resistance of section \( Mult = 1900 \text{ kNm} \)
- \( M_{pe} = Mult = 1900 \text{ kNm} \)
- Nominal yield stress comp.flange \( syc = 355 \text{ N/mm}^2 \)
- Nominal yield stress tens.flange \( syt = 355 \text{ N/mm}^2 \)
- Nominal yield stress of web \( syw = 355 \text{ N/mm}^2 \)
- Slenderness ratio \( \lambda_{adlt} = \lambda_{LT} = 0 \)

\[ n = 0.008 \times lw/le \times (\beta - 30) = -0.24 \]

- \( MR = Mult = 1900 \text{ kNm} \)

**Bending resistance**

The proforma calculates the bending resistance of beams without longitudinal stiffeners in accordance with Clause 9.9.

- Partial factor on yield strength \( gm = 1.05 \)
- Partial factor gammaf3 \( gf3 = 1.1 \)
- Bending resistance \( MD = MR/(gm \times gf3) = 1645 \text{ kNm} \)

Calculations for the bending resistance ignoring web contribution \( M_f \) from Clause 9.9.3.1.

- Area of effective tension flange \( A_{te} = 8000 \text{ mm}^2 \)
- Partial factor on yield strength \( gmt = 1.05 \)
Partial factor $\gamma_{f3}$  $gf3=1.1$

Area of effective compr. flange  $Ace=8000 \text{ mm}^2$

Elastic modulus of the section  $Zxc=4.84E6 \text{ mm}^3$

Limiting stress (comp. flange)  $s_{yc}=355 \text{ N/mm}^2$

Partial factor on comp. strength  $gm=1.05$

Partial factor $\gamma_{f3}$  $gf3=1.1$

Force in compression flange  $F_{fc}=(Ace*s_{yc})/(gmc*gf3*1E3)=2458.9 \text{ kN}$

Bending resistance is based on flange with lower value of force.

Bending resistance  $Mf=Fft*df/1E3=1190.1 \text{ kNm}$

Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners

The result is the shear capacity of a web panel under pure shear calculated using Clause 9.9.2 Shear Resistance.

Depth of web  $dwe=468 \text{ mm}$

Clear length of panel  $a=9000 \text{ mm}$

Web thickness  $tw=16 \text{ mm}$

Half eff.breadth of flanges $b_{fe}$ is the smallest of the following:

1. The result of the expression  $b_{fe1}=10*tf*SQR(355/syf)=160 \text{ mm}$

2. The distance from the mid-plane of the web to the nearer edge of the flange  $b_{fe2}=8 \text{ mm}$

3. Half the clear distance  $b_{fe3}=234 \text{ mm}$

Non-dimensional value of plastic moment of resistance of flange:

$mfw=(syf*b_{fe}*tf*tf)/(2*syw*dwe*dwe*tw)=0.29221E-3$

Shear resistance results from analysis

Shear resistance of web panel under pure shear.

Limiting shear stress ( $\tau_1$ )  $204.96 \text{ N/mm}^2$

Resistance  $VD=(tw*(dwe-hh)*taul1)/(gm*gf3*1000)$

$=1419.6 \text{ kN}$

Shear resistance of web panel under pure shear ignoring flange capacity i.e. taking $mfw=0$.

Limiting shear stress ( $\tau_1$ )  $204.96 \text{ N/mm}^2$

Resistance  $VR=(tw*(dwe-hh)*taul2)/(gm*gf3*1000)$

$=1419.6 \text{ kN}$

Combined bending and shear in web sections

Web with transverse stiffeners at the supports only. Clause 9.9.3.2.

Shear force  $V=182.3 \text{ kN}$

Co-existent bending moment  $M=947.9 \text{ kNm}$
RESULTS FROM ANALYSIS

MD design capacity in bending     VD design capacity in shear
Mf bending capacity ignoring web  VR shear capacity ignoring flanges

Interaction between shear and bending resistances

Maximum bending moment 947.9 kNm is within interaction curve.
Maximum shear force 182.3 kN is within interaction curve.
Interaction relationship satisfied.
Location: Ex3 - Solid rectangular section 100x100

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

Slenderness lamLT

The proforma calculates the slenderness parameter lambdaLT in accordance with Clause 9.7.
Solid rectangular sections (Clause 9.7.3.2).
Half wavelength of buckling \( lw = 2000 \) mm
Effective length to Clause 9.6 \( le = 2000 \) mm
Depth D \( D = 100 \) mm
Width of section \( B = 100 \) mm

Simply supported mid-span moment \( M_m = 30 \) kNm

Slenderness parameter \( \lambda_{lt} = 2.8*\eta SQR(l_e*D)/B = 8.4752 \)

Limiting moment of resistance

The proforma calculates the limiting moment of resistance \( MR \) in accordance with Clause 9.8.

Ratio \( le/lw \) \( \text{rat2}=le/lw=1 \)
Section is compact in accordance with Clause 9.3.7
Moment of resistance of section \( \text{Mult}=78 \) kNm
Mpe as defined in Clause 9.7.1 \( \text{Mpe} = \text{Mult} = 78 \) kNm
Nominal yield stress comp.flange \( \text{syc}=315 \) N/mm²
Nominal yield stress of web \( \text{syw}=315 \) N/mm²
Slenderness ratio \( \lambda_{lt} \) \( \lambda = \lambda_{lt} = 8.4752 \)
\( n=0.008*lw/le*(\beta-30)=-0.17613 \)
MR=Mult=78 kNm

Bending resistance

The proforma calculates the bending resistance of beams without longitudinal stiffeners in accordance with Clause 9.9.
Partial factor on yield strength \( gm=1.05 \)
Partial factor gammaf3 \( gf3=1.1 \)
Bending resistance \( \text{MD}=MR/(gm*gf3)=67.532 \) kNm
Location: Ex4 - Other cases

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

Slenderness lamLT

The proforma calculates the slenderness parameter lambdaLT in accordance with Clause 9.7.

Half wavelength of buckling \( l_w = 9000 \text{ mm} \)
Effective length to Clause 9.6 \( l_e = 9000 \text{ mm} \)
Young's modulus of steel \( E = 210000 \text{ N/mm}^2 \)
Plastic modulus \( Z_{pe} = 5.6E6 \text{ mm}^3 \)

Bending moment \( M_{cr} \)

\[ \text{M}_{cr} = 604E6 \text{ kNm} \]

Slenderness parameter \( \lambda_mL_{T} = \sqrt{\frac{\pi^2 E Z_{pe}}{M_{cr} 1E6}} \)

\[ \lambda_mL_{T} = 0.13862 \]

Limiting moment of resistance

The proforma calculates the limiting moment of resistance \( M_R \) in accordance with Clause 9.8.

Ratio \( l_e/l_w \)

\[ \text{rat}_2 = \frac{l_e}{l_w} = 1 \]

Section is compact in accordance with Clause 9.3.7

Moment of resistance of section \( \text{Mult} = 1900 \text{ kNm} \)

Mpe as defined in Clause 9.7.1 \( \text{M}_{pe} = \text{Mult} = 1900 \text{ kNm} \)
Nominal yield stress comp.flange \( \text{s}_{yc} = 355 \text{ N/mm}^2 \)
Nominal yield stress tens.flange \( \text{s}_{yt} = 355 \text{ N/mm}^2 \)
Nominal yield stress of web \( \text{s}_{yw} = 355 \text{ N/mm}^2 \)

Slenderness ratio \( \lambda_m = \lambda_mL_{T} = 0.13862 \)

\[ n = 0.008 \times l_w / l_e \times (\beta - 30) = -0.23889 \]

\[ M_R = \text{Mult} = 1900 \text{ kNm} \]

Bending resistance

The proforma calculates the bending resistance of beams without longitudinal stiffeners in accordance with Clause 9.9.

Partial factor on yield strength \( g_m = 1.05 \)
Partial factor gammaf3 \( g_f3 = 1.1 \)

Bending resistance \( \text{MD} = \frac{M_R}{(g_m * g_f3)} = 1645 \text{ kNm} \)

Calculations for the bending resistance ignoring web contribution \( M_f \) from Clause 9.9.3.1.

Area of effective tension flange \( A_{te} = 8000 \text{ mm}^2 \)
Partial factor on yield strength \( g_m t = 1.05 \)
Partial factor gammaf3 \( g_f3 = 1.1 \)

Area of effective compr. flange \( A_{ce} = 8000 \text{ mm}^2 \)

Elastic modulus of the section \( Z_{xc} = 4.84E6 \text{ mm}^3 \)
Limiting stress (comp. flange) \( \text{s}_{yc} = \text{s}_{ycl} = 355 \text{ N/mm}^2 \)

Partial factor on comp. strength \( g_m c = 1.05 \)
Partial factor gammaf3 \( g_f3 = 1.1 \)

Force in compression flange \( F_{fc} = (A_{ce} \times \text{s}_{yc}) / (g_m c * g_f3 \times 1E3) = 2458.9 \text{ kN} \)
Distance between centroids \( d_f = 484 \text{ mm} \)

Bending resistance is based on flange with lower value of force.
Bending resistance \[ M_f = F_f t^2 / 1E3 = 1190.1 \text{ kNm} \]
Location: Ex5 - Assessment to Standard BD 56/10 (Equal flanges)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

**Slenderness lamLT**

The proforma calculates the slenderness parameter lambdaLT in accordance with Clause 9.7.

I, Channel, Tee or Angle sections (Clause 9.7.2).

- Half wavelength of buckling $l_w = 15000$ mm
- Effective length to Clause 9.6 $l_e = 15000$ mm

2nd moment of area @ minor axis $I_{yy} = 156E6$ mm$^4$

Cross sectional area $A = 36800$ mm$^2$

Factor $k_4 = 0.9$

Overall depth of section $D = 926.6$ mm

Mean flange thickness $t_f = 32$ mm

For a uniform section

**Slenderness parameter**

$\lambda_{LT} = \left(\frac{l_e}{r_y}\right)k_4\eta_v = 207.35$

**Limiting moment of resistance**

The proforma calculates the limiting moment of resistance $M_R$ in accordance with Clause 9.8.

- Ratio $l_e/l_w$: rat2 = $l_e/l_w = 1$
- Section is non-compact.
- Multiplier for non-compact section $Mult = 4340$ kNm
- $M_{pe}$ as defined in Clause 9.7.1 $M_{pe} = 4000$ kNm

Nominal yield stress comp. flange $s_{yc} = 355$ N/mm$^2$

Nominal yield stress tens. flange $s_{yt} = 355$ N/mm$^2$

Nominal yield stress of web $s_{yw} = 355$ N/mm$^2$

Slenderness ratio $\lambda = \lambda_{LT} = 207.35$

$n = 0.008\frac{l_w}{l_e}(\beta - 30) = 1.4878$

$M_R = \left(1 + (1+n)\frac{5700}{\beta^2}\right) - \sqrt{\left(1 + (1+n)\frac{5700}{\beta^2}\right)^2 - 22800/\beta^2})$

$= 0.20326$

Limiting moment of resistance $M_R = M_R \times Mult \times 0.5 = 441.07$ kNm

**Bending resistance**

The proforma calculates the bending resistance of beams without longitudinal stiffeners in accordance with Clause 9.9.

- Partial factor on yield strength $g_m = 1.05$
- Partial factor gammaf3 $g_f3 = 1.1$
- Bending resistance $M_D = M_R/(g_m g_f3) = 381.88$ kNm

Calculations for the bending resistance ignoring web contribution $M_f$ from Clause 9.9.3.1.

- Area of effective tension flange $A_{te} = 9824$ mm$^2$
- Partial factor on yield strength $g_{mt} = 1.05$
- Partial factor gammaf3 $g_f3 = 1.1$
- Area of effective compr. flange $A_{ce} = 9824$ mm$^2$
- Elastic modulus of the section $E_{xc} = 10.9E6$ mm$^3$
Limiting stress (comp. flange) \( s_{yc} = s_{yc2} = 40.465 \text{ N/mm}^2 \)
Partial factor on comp. strength \( g_{mc} = 1.05 \)
Partial factor gammaf3 \( \gamma_f3 = 1.1 \)
Force in compression flange \( F_{fc} = \frac{A_c e s_{yc}}{g_{mc} \gamma_f3 \times 1E3} = 344.18 \text{ kN} \)

Bending resistance is based on flange with lower value of force.
Bending resistance \( M_f = F_{fc} d_f / 1E3 = 307.9 \text{ kNm} \)

**Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners**

The assessment calculations are in accordance with Standard BD 56/10 "The Assessment of Steel Highway Bridges and Structures". The result is the shear capacity of a web panel under pure shear calculated using Clause 9.9.2 Shear Resistance.

- Depth of web \( d_{we} = 824 \text{ mm} \)
- Clear length of panel \( a = 15000 \text{ mm} \)
- Web thickness \( t_w = 19.5 \text{ mm} \)
- Half eff. breadth of flanges \( b_{fe} \) is the smaller of the following:
  1. The result of the expression \( b_{fe1} = 10 \times t_f \times \sqrt{355/s_yf} = 320 \text{ mm} \)
  2. The distance from the mid-plane of the web to the nearer edge of the flange \( b_{fe2} = 153 \text{ mm} \)

Non-dimensional value of plastic moment of resistance of flange:
\[ m_{fw} = \frac{s_yf b_{fe} t_f t_f}{2 s_yw d_{we} d_{we} t_w} = 0.0059166 \]

**Shear resistance results from analysis**

- Shear resistance of web panel under pure shear.
  - Limiting shear stress \( (\tau_1) \) \( 204.96 \text{ N/mm}^2 \)
  - Resistance \( V_D = \frac{t_w (d_w - h_h) \tau_{aul1}}{g_m \gamma_f3 \times 1000} \)
    \[ = 2984.9 \text{ kN} \]

- Shear resistance of web panel under pure shear ignoring flange capacity i.e. taking \( m_{fw} = 0 \).
  - Limiting shear stress \( (\tau_1) \) \( 204.96 \text{ N/mm}^2 \)
  - Resistance \( V_R = \frac{t_w (d_w - h_h) \tau_{aul2}}{g_m \gamma_f3 \times 1000} \)
    \[ = 2984.9 \text{ kN} \]

**Combined bending and shear in web sections**

Web with transverse stiffeners at the supports only. Clause 9.9.3.2.
- Shear force \( V = 2100 \text{ kN} \)
- Co-existent bending moment \( M = 2300 \text{ kNm} \)
RESULTS FROM ANALYSIS

MD design capacity in bending   VD design capacity in shear
Md bending capacity ignoring web VR shear capacity ignoring flanges

MD=381.88 kNm
Md=307.9 kNm
M=2300 kNm
VD=2984.9 kN
VR=2984.9 kN
V=2100 kN

Interaction between shear and bending resistances

Maximum bending moment 2300 kNm is outside interaction curve.
Maximum shear force 2100 kN is within interaction curve.
Interaction relationship exceeded.
Location: Ex6 - Assessment to Standard BD 56/10) (Unequal flanges)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

**Slenderness lamLT**

The proforma calculates the slenderness parameter lambdaLT in accordance with Clause 9.7.

I, Channel, Tee or Angle sections (Clause 9.7.2).

Half wavelength of buckling $l_w=15000$ mm

Effective length to Clause 9.6 $l_e=15000$ mm

2nd moment of area @ minor axis $I_{yy}=156E6$ mm$^4$

Cross sectional area $A=36800$ mm$^2$

Factor $k_4=0.9$

Overall depth of section $D=926.6$ mm

Mean flange thickness $t_f=27.5$ mm

For a uniform section

Slenderness parameter $\lambda_{LT}=(l_e/\gamma_1)*k_4*\eta_*v=207.35$

**Limiting moment of resistance**

The proforma calculates the limiting moment of resistance MR in accordance with Clause 9.8.

Ratio $l_e/l_w$ $\text{rat}_2=l_e/l_w=1$

Section is non-compact.

Mult for non-compact section $\text{Mult}=4340$ kNm

$M_p$ as defined in Clause 9.7.1 $M_p=4000$ kNm

Nominal yield stress comp.flange $\gamma_{cyc}=355$ N/mm$^2$

Nominal yield stress tens.flange $\gamma_{cyc}=355$ N/mm$^2$

Nominal yield stress of web $\gamma_{cyc}=355$ N/mm$^2$

Slenderness ratio $\lambda_{LT}=207.35$

$n=0.008*l_w/l_e*(\beta-30)=1.4878$

$MR=((1+(1+n)*5700/\beta^2)-(SQR((1+(1+n)*5700/\beta^2)^2-22800/\beta^2)))$

$=0.20326$

Limiting moment of resistance $MR=MR*\text{Mult}*0.5=441.07$ kNm

**Bending resistance**

The proforma calculates the bending resistance of beams without longitudinal stiffeners in accordance with Clause 9.9.

Partial factor on yield strength $\gamma_m=1.05$

Partial factor $\gamma_f3=1.1$

Bending resistance $\text{MD}=MR/(\gamma_m*\gamma_f3)=381.88$ kNm

Calculations for the bending resistance ignoring web contribution $M_f$ from Clause 9.9.3.1.

Area of effective tension flange $A_{te}=9824$ mm$^2$

Partial factor on yield strength $\gamma_{mt}=1.05$

Partial factor $\gamma_f3=1.1$

Area of effective compr. flange $A_{ce}=9824$ mm$^2$

Elastic modulus of the section $Z_{xc}=10.9E6$ mm$^3$
Limiting stress (comp. flange) $syc = syc2 = 40.465 \text{ N/mm}^2$
Partial factor on comp. strength $gmc = 1.05$
Partial factor $\gamma_f3$ $gf3 = 1.1$
Force in compression flange $Ffc = (Ace \times syc)/(gmc \times gf3 \times 1E3) = 344.18 \text{ kN}$
Bending resistance is based on flange with lower value of force.
Bending resistance $Mf = Ffc \times df/1E3 = 309.45 \text{ kNm}$

Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners

The assessment calculations are in accordance with Standard BD 56/10 "The Assessment of Steel Highway Bridges and Structures". The result is the shear capacity of a web panel under pure shear calculated using Clause 9.9.2 Shear Resistance.

Depth of web $dwe = 400 \text{ mm}$
Clear length of panel $a = 15000 \text{ mm}$
Web thickness $tw = 19.5 \text{ mm}$
Thickness of flange plates $tft = 25 \text{ mm}$
Nominal yield stress comp. flange $syf1 = syc = 40.465 \text{ N/mm}^2$
Half eff. breadth of flange $bfet$ is the smaller of the following:
1. The result of the expression $bfet1 = 10 \times tft \times \sqrt{355/syf1} = 740.48 \text{ mm}$
2. The distance from the mid-plane of the web to the nearer edge of the flange $bfet2 = 153 \text{ mm}$

Non-dimensional value plastic moment of resistance of top flange:
$mfwt = \frac{syf1 \times bfet \times tft \times tft}{2 \times syw \times dwe \times dwe \times tw} = 0.0017468$

Thickness of plate $tfb = 30 \text{ mm}$
Nominal yield stress bottom flange $syf2 = syt = 355 \text{ N/mm}^2$
Half eff. breadth of flange $bfeb$ is the smaller of the following:
1. The result of the expression $bfeb1 = 10 \times tfb \times \sqrt{355/2} = 3996.9 \text{ mm}$
2. The distance from the mid-plane of the web to the nearer edge of the flange $bfeb2 = 153 \text{ mm}$

Non-dimensional value of plastic moment of resistance of bottom flange.
Value $mfwb$
$mfwb = \frac{syf2 \times bfeb \times tfb \times tfb}{2 \times syw \times dwe \times dwe \times tw} = 0.022067$

Shear resistance results from analysis

Shear resistance of web panel under pure shear.
Limiting shear stress ($\tau_1$) $204.96 \text{ N/mm}^2$
Resistance $VD = \frac{tw \times (dw-hh) \times taul1}{(gm \times gf3 \times 1000)} = 3016 \text{ kN}$

Shear resistance of web panel under pure shear ignoring flange capacity i.e. taking $mfw=0$.
Limiting shear stress ($\tau_1$) $204.96 \text{ N/mm}^2$
Resistance $VR = \frac{tw \times (dw-hh) \times taul2}{(gm \times gf3 \times 1000)} = 3016 \text{ kN}$

Combined bending and shear in web sections

Web with transverse stiffeners at the supports only. Clause 9.9.3.2.
Shear force $V = 2100 \text{ kN}$
Co-existent bending moment $M = 2300 \text{ kNm}$
RESULTS FROM ANALYSIS

MD design capacity in bending       VD design capacity in shear
Mf bending capacity ignoring web   VR shear capacity ignoring flanges

\[ M_f = 309.45 \text{ kNm} \quad V_f = 3016 \text{ kN} \]

Interaction between shear and bending resistances

Maximum bending moment 2300 kNm is outside interaction curve.
Maximum shear force 2100 kN is within interaction curve.
Interaction relationship exceeded.
Location: Ex7 - Slenderness, moment and shear resistance

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

**Slenderness lamLT**

The proforma calculates the slenderness parameter lambdaLT in accordance with Clause 9.7. 

I, Channel, Tee or Angle sections (Clause 9.7.2).

Half wavelength of buckling \( lw = 10400 \text{ mm} \)

Effective length to Clause 9.6 \( le = 10400 \text{ mm} \)

2nd moment of area @ minor axis \( I_{yy} = 133E6 \text{ mm}^4 \)

Cross sectional area \( A = 32300 \text{ mm}^2 \)

Factor \( k4 = 0.9 \)

Overall depth of section \( D = 918.5 \text{ mm} \)

Mean flange thickness \( tf = 27.9 \text{ mm} \)

For a uniform section

Slenderness parameter \( \lambda_{LT} = (le/ry)*k4*\eta*v = 145.87 \)

**Limiting moment of resistance**

The proforma calculates the limiting moment of resistance MR in accordance with Clause 9.8.

Ratio \( le/lw \)

\( \text{rat}2 = le/lw = 1 \)

Section is compact in accordance with Clause 9.3.7

Moment of resistance of section \( \text{Mult} = 3770 \text{ kNm} \)

Mpe as defined in Clause 9.7.1 \( \text{Mpe} = \text{Mult} = 3770 \text{ kNm} \)

Nominal yield stress comp.flange \( \text{syc} = 345 \text{ N/mm}^2 \)

Nominal yield stress tens.flange \( \text{syt} = 345 \text{ N/mm}^2 \)

Nominal yield stress of web \( \text{syw} = 345 \text{ N/mm}^2 \)

Slenderness ratio \( \lambda = \lambda_{LT} = 145.87 \)

\( n = 0.008*lw/le*(\beta - 30) = 0.91037 \)

\( \text{MR} = ((1+(1+n)*5700/\beta^2)-\text{SQR}((1+(1+n)*5700/\beta^2)^2-22800/\beta^2)) \)

\( = 0.41851 \)

Limiting moment of resistance \( \text{MR} = \text{MR} \times \text{Mult} \times 0.5 = 788.89 \text{ kNm} \)

**Bending resistance**

The proforma calculates the bending resistance of beams without longitudinal stiffeners in accordance with Clause 9.9.

Partial factor on yield strength \( \text{gm} = 1.05 \)

Partial factor gammaf3 \( \text{gf3} = 1.1 \)

Bending resistance \( \text{MD} = \text{MR} / (\text{gm} \times \text{gf3}) = 683.02 \text{ kNm} \)

**Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners**

The result is the shear capacity of a web panel under pure shear calculated using Clause 9.9.2 Shear Resistance.
Depth of web  dwe=862 mm
Clear length of panel  a=10400 mm
Web thickness  tw=18 mm
Half eff breadth of flanges bfe is the smaller of the following:
1. The result of the expression  bfe1=10*tf*SQR(355/syf)=283.01 mm
2. The distance from the mid plane of the web to the nearer edge of the flange  bfe2=152 mm
Non-dimensional value of plastic moment of resistance of flange:  
\[
mfw=\frac{(syf*bfe*tf*tf)}{(2*syw*dwe*dwe*tw)}=0.0044232
\]

Shear resistance results from analysis

Shear resistance of web panel under pure shear.
Limiting shear stress ( \( {t_l} \) )  199.19 N/mm²
Resistance  
\[
VD=(tw*(dw-hh)*taul1)/(gm*gf3*1000)
\]
=2851.2 kN

Shear resistance of web panel under pure shear ignoring flange capacity i.e. taking mfw=0.
Limiting shear stress ( \( {t_l} \) )  199.19 N/mm²
Resistance  
\[
VR=(tw*(dw-hh)*taul2)/(gm*gf3*1000)
\]
=2851.2 kN

Combined bending and shear in web sections

Expression for lamLT (λLT)

The clause references in this section are as per Appendix C of SCI P356. The following are the 2nd moments of area of the compression and tension flanges, respectively, about the z-z axes:
For buckling over a half wavelength Lw the parameter V is as given by the expression below:

\[ V = \left(4*a*(1-a)+0.05*lamF^2+psia^2\right)^{0.5}+psia \]

Parameter from C.4.5
\[ V_{eq}=V=0.70179 \]

The restraint parameter is calculated from the following expression as given in SCI publication P356:

\[ rp = \frac{V_{eq}^4*Lw^3}{E*Izc*\theta_R*d^2*(1-a)} \]

Rotation of restraint \( \theta_R \)
\[ \theta_R=27.06E-12 \text{ rad/Nmm} \]

Restraint parameter:
\[ rp=V_{eq}^4*Lw^3/(E*Izc*\theta_R*d^2*(1-a))=4003.1 \text{ rad/Nmm} \]

Longest unbraced length
\[ L_r=LT=8200 \text{ mm} \]

Plastic section modulus (yy axis)
\[ W_{ply}=23.88E6 \text{ mm}^3 \]
Elastic section modulus (yy axis) \( W_{ely} = 22.87 \times 10^6 \text{ mm}^3 \)

Beta \( \beta_w \) \( \beta_w = W_{ely}/W_{ply} = 0.95771 \)

Section property from C.1 \( U = 1 \)

Non-dimensional slenderness \( \hat{\lambda}_{LT} \):

\[
\hat{\lambda}_{LT} = 1/(C_1)^{0.5} \cdot U \cdot \sqrt{\beta_w} \cdot \sqrt{\lambda} = 0.90719
\]

**Partial factors on strength**

- Partial factor \( \gamma_{M0} \) \( \gamma_{M0} = 1.0 \)
- Partial factor \( \gamma_{M1} \) \( \gamma_{M1} = 1.1 \)

**Lateral torsional buckling**

The design lateral torsional buckling resistance moment \( M_{bRd} \) will be calculated. Section under consideration is a welded section and EC3 Part 1-1 Clause 6.3.2.2 expressions will be adopted.

Limiting slenderness value \( \lambda_{LT0} = 0.2 \)

According to the NA to BS EN 1993-1-1, for welded doubly symmetrical sections the imperfection value is as follows:

- Imperfection value \( a_{LT} = 0.76 \) (curve d)
- Modified chiLT factor \( \chi_{LT} = \chi_{LT}/f = 0.51675 \)

Design buckling resistance moment \( M_{bRd} = \chi_{LT} \cdot W_{ely} \cdot f_y / (\gamma_{M1} \cdot 10^6) \)

\[ = 3706.6 \text{ kNm} \]

**Interaction equation for moments**

The beam is assumed to be without longitudinal stiffeners. The design resistance for bending about the major axis as per Clause 6.2.5(2) of BS EN 1993-2:2006 is as follows:

Design moment resistance \( M_{cRd} = W_{ely} \cdot f_y / (\gamma_{M0} \cdot 10^6) = 7890.2 \text{ kNm} \)

As \( M_{bRd} \leq M_{cRd} \) \( (3706.6 \text{ kNm} \leq 7890.2 \text{ kNm}) \), the lateral torsional buckling resistance will be adopted.

Design moment from analysis \( M_{Ed} = 3132 \text{ kNm} \)

Unity factor \( unity = M_{Ed}/M_{bRd} = 0.84499 \)

As \( M_{Ed} \leq M_{bRd} \) \( (3132 \text{ kNm} \leq 3706.6 \text{ kNm}) \), section chosen is considered to be suitable.

**Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners**

The shear resistance of a web under pure shear will be evaluated. Beam will be stable against shear buckling due to the presence of closely spaced web transverse stiffeners.

**Shear-moment interaction**

Design shear force (coexisting) \( V_{Ed} = 500 \text{ kN} \)

The value of parameter \( \eta \) from Clause 5.1(2) \( \eta = 1 \)

Plastic shear resistance \( V_{plRd} = \eta \cdot A_w \cdot f_y / (\gamma_{M0} \cdot \sqrt{3}) / 1000 \)

\[ = 2031.7 \text{ kN} \]

As \( V_{Ed} \leq 0.5 \cdot V_{plRd} \), the design shear will not reduce the design resistance moment. Hence OK.

Evaluation of non-dimensional slenderness

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma calculates the non-dimensional slenderness parameter \( \lambda_{LT} \) and utilises Appendix C of SCI publication P356 or Clause 6.3.2.2 of BS EN 1993-2:2006.

Compression flange classification will be taken as Class 3.
The web classification will be taken as Class 3.
The overall section classification is Class 3.

Geometrical parameters

- Half wavelength of buckling \( L_w = 28000 \text{ mm} \)
- Eff.length between restraints \( L_T = 8200 \text{ mm} \)
- Depth of section \( h = 1100 \text{ mm} \)
- Flange width \( b = 500 \text{ mm} \)
- Flange thickness \( t_f = 40 \text{ mm} \)
- Web thickness \( t_w = 10 \text{ mm} \)
- Distance between flange centroids \( d_f = 1060 \text{ mm} \)

Design parameters

- Coefficient \( C_1 \) \( C_1 = 1 \)
- Young's modulus \( E = 210000 \text{ N/mm}^2 \)
- Shear modulus \( G = 80768 \text{ N/mm}^2 \)
- Yield strength \( f_y = 345 \text{ N/mm}^2 \)

Expression for \( \lambda_{LT} \) (\( \lambda_{LT} \))

The clause references in this section are as per Appendix C of SCI P356. The following are the 2nd moments of area of the compression and tension flanges, respectively, about the z-z axes:
For buckling over a half wavelength \( L_w \) the parameter \( V \) is as given by the expression below:
\[
V = \left( \frac{(4*a^2*(1-a)+0.05*lamF^2+psia^2)^0.5+psia}{0.5+psia} \right)^{-0.5} = 0.70179
\]
Parameter from C.4.5 \( V = 0.70179 \)
The restraint parameter is calculated from the following expression as given in SCI publication P356:
\[
rp = \left[ \frac{Veq^4*Lw^3}{E*Izc*thetaR*d_f^2*(1-a)} \right]
\]
Rotation of restraint \( \theta_R \) \( \theta_R = 27.06E-12 \text{ rad/Nmm} \)
Restraint parameter:
\[
rp = Veq^4*Lw^3/(E*Izc*thetaR*d_f^2*(1-a)) = 4003.1 \text{ rad/Nmm}
\]
Longest unbraced length \( L_r = 8200 \text{ mm} \)
Plastic section modulus (yy axis) \( W_{ply} = 23.88E6 \text{ mm}^3 \)
Elastic section modulus (yy axis) \( W_{ely} = 22.87 \times 10^6 \text{ mm}^3 \)

Beta \( \beta_w \) 

Section property from C.1 

Non-dimensional slenderness \( \lambda_{LT} \):

\[
\lambda_{LT} = 1 / (C_1)^{0.5} \times U \times V \times D \times \lambda_{LT} \times \text{SQR}(\beta_w) = 0.90719
\]

**Partial factors on strength**

- Partial factor \( \gamma_{M0} \) \( \gamma_{M0} = 1.0 \)
- Partial factor \( \gamma_{M1} \) \( \gamma_{M1} = 1.1 \)

**Lateral torsional buckling**

The design lateral torsional buckling resistance moment \( (M_{bRd}) \) will be calculated. Section under consideration is a welded section and EC3 Part 1-1 Clause 6.3.2.2 expressions will be adopted.

- Limiting slenderness value \( \lambda_{LT0} = 0.2 \)
- According to the NA to BS EN 1993-1-1, for welded doubly symmetrical sections the imperfection value is as follows:
  - Imperfection value \( a_{LT} = 0.76 \) (curve d)
  - Modified \( \chi_{LT} \) factor \( \chi_{LT} = \chi_{LT}/f = 0.51675 \)

Design buckling resistance moment 
\[
M_{bRd} = \chi_{LT} \times W_{ely} \times f_y / (\gamma_{M1} \times 10^6) = 3706.6 \text{ kNm}
\]

**Interaction equation for moments**

The beam is assumed to be without longitudinal stiffeners. The design resistance for bending about the major axis as per Clause 6.2.5(2) of BS EN 1993-2:2006 is as follows:

- Design moment resistance \( M_{cRd} = W_{ely} \times f_y / (\gamma_{M0} \times 10^6) = 7890.2 \text{ kNm} \)
- As \( M_{bRd} \leq M_{cRd} \) (7306.6 \text{ kNm} \leq 7890.2 \text{ kNm}), the lateral torsional buckling resistance will be adopted.

- Design moment from analysis \( M_{Ed} = 3132 \text{ kNm} \)
- Unity factor \( \text{unity} = M_{Ed} / M_{bRd} = 0.84499 \)
- As \( M_{Ed} \leq M_{bRd} \) (3132 \text{ kNm} \leq 3706.6 \text{ kNm}), section chosen is considered to be suitable.

**Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners**

Location: Ex3 - Beam 500x300x20 RHS (Hot Rolled section)

Evaluation of non-dimensional slenderness

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2 : Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma calculates the non-dimensional slenderness parameter \( \lambda_{LT} \) and utilises Clause 6.3.2.2 of BS EN 1993-2:2006.

Expression for \( \lambda_{LT} \) (\( \lambda_{LT} \))

The non-dimensional slenderness \( \lambda_{LT} \) could be derived from the following expression:

\[
\lambda_{LT} = \frac{\frac{f_y W_y}{M_{cr}}}{\frac{1}{10^6}}
\]

where,

- \( M_{cr} \) = Elastic critical buckling moment from the analysis
- \( f_y \) = Yield strength
- \( W_y \) = Plastic modulus of the section about y-y axis

Compression flange classification will be taken as Class 2.
The web classification will be taken as Class 2.
The overall section classification is Class 2.

Partial factors on strength

Partial factor $\gamma_M0$  $\gamma_M0=1.0$
Partial factor $\gamma_M1$  $\gamma_M1=1.1$

Lateral torsional buckling

The design lateral torsional buckling resistance moment ($MbRd$) will be calculated. Section under consideration is a Hot Rolled section and EC3 Part 1-1 Clause 6.3.2.3 expressions will be adopted.

Limiting slenderness value $\lambda_{LT0}=0.4$
As $\lambda_{LT} \leq \lambda_{LT0}$, the segment of the beam is not subject to lateral torsional buckling.

The design buckling resistance $MbRd$ will therefore be the same as the design resistance for bending $McRd$.

Design buckling resistance moment $MbRd=W_{ply}*f_y/(\gamma_M0*10^6)=1687.1$ kNm

Design moment resistance $McRd=MbRd=1687.1$ kNm

Interaction equation for moments

The beam is assumed to be without longitudinal stiffeners. The design resistance for bending about the major axis as per Clause 6.2.5(2) of BS EN 1993-2:2006 is as follows:

Design moment resistance $McRd=W_{ply}*f_y/(\gamma_M0*10^6)=1687.1$ kNm
As $MbRd \leq McRd$ ($1687.1$ kNm $\leq 1687.1$ kNm ), the lateral torsional buckling resistance will be adopted.

Design moment from analysis $MEd=1600$ kNm
Unity factor $unity=MEd/MbRd=0.9484$
As $MEd \geq MbRd$ ($1600$ kNm $\geq 1687.1$ kNm ), section chosen is considered to be suitable.

Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners

The shear resistance of a web under pure shear will be evaluated. As $hw/tw \leq 72\varepsilon/\eta$ (23 $\leq 59.423$ ), the beam is considered to be stable against shear buckling.

Shear-moment interaction

Design shear force (coexisting) $VEd=500$ kN
The value of parameter $\eta$ is as per the NA to BS EN 1993-1-5.
Value of $\eta$ from Clause 5.1(2) $\eta=1$
Plastic shear resistance $V_{plRd}=\eta*A*w*f_y/(\gamma_M0*SQR(3))*1000 =3784.5$ kN
As $VEd \leq 0.5*V_{plRd}$, the design shear will not reduce the design resistance moment. Hence OK.

Evaluation of non-dimensional slenderness

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2 : Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma calculates the non-dimensional slenderness parameter lamLT (ÂLT) from an elastic buckling analysis of the structure.

Expression for lamLT (ÂLT)

The non-dimensional slenderness lamLT (ÂLT) could be derived from the following expression:

\[
\text{ÂLT} = \frac{fy \cdot Wy}{Mcr}
\]

where,

- \(Mcr\) = Elastic critical buckling moment from the analysis
- \(fy\) = Yield strength
- \(Wy\) = Plastic modulus of the section about y-y axis

Geometrical and design parameters

Section is not symmetrical about either axis (Tee section).
Section under consideration is a Hot Rolled section.
Eff.length between restraints \(LT=5000\) mm
Depth of section \(h=317.9\) mm
Width of section \(b=311.4\) mm
Plate thickness \(tf=31.4\) mm
Web thickness \(tw=18.4\) mm
Yield strength \(fy=345\) N/mm²
Section classification \(\text{class}=2\)
The overall section classification will be taken as Class 2.
Plastic section modulus (yy axis) \(Wply=894000\) mm³

Bending moment \(Mcr\)
\(Mcr=2180\) kNm
Non-dimensional slenderness \(\text{ÂLT}\)
\(\text{lamLT}=\text{SQR}(fy \cdot Wply/(Mcr \cdot 1E6))=0.37614\)

Partial factors on strength

Partial factor \(\gamma_M0\) \(\text{gamM0}=1.0\)
Partial factor \(\gamma_M1\) \(\text{gamM1}=1.1\)

Lateral torsional buckling

The design lateral torsional buckling resistance moment (MbRd) will be calculated. Section under consideration is a Hot Rolled section and EC3 Part 1-1 Clause 6.3.2.3 expressions will be adopted.
Limiting slenderness value \(\text{lamLT0}=0.4\)
As \(\text{lamLT} \leq \text{lamLT0}\), the segment of the beam is not subject to lateral torsional buckling.
The design buckling resistance MbRd will therefore be the same as the design resistance for bending McRd.

Design buckling resistance moment MbRd=Wply*fy/(gamM0*10^6)=308.43 kNm
Design moment resistance McRd=MbRd=308.43 kNm

Interaction equation for moments

The beam is assumed to be without longitudinal stiffeners. The design resistance for bending about the major axis as per Clause 6.2.5(2) of BS EN 1993-2:2006 is as follows:

Design moment resistance McRd=Wply*fy/(gamM0*10^6)=308.43 kNm

As MbRd ≤ McRd (308.43 kNm ≤ 308.43 kNm), the lateral torsional buckling resistance will be adopted.

Design moment from analysis MEd=275 kNm
Unity factor unity=MEd/MbRd=0.89161

As MEd ≤ MbRd (275 kNm ≤ 308.43 kNm), section chosen is considered to be suitable.

Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners

The shear resistance of a web under pure shear will be evaluated.

As hw/tw ≤ 72ε/η (15.571 ≤ 59.423), the beam is considered to be stable against shear buckling.

Shear-moment interaction

Design shear force (coexisting) VEd=600 kN

The value of parameter η is as per the NA to BS EN 1993-1-5.
Value of η from Clause 5.1(2) eta=1

Plastic shear resistance VplRd=eta*Aw*fy/(gamM0*SQR(3))/1000 =1050 kN

Plastic moment resistance MyvRd=300 kNm
Design moment resistance McRd=308.43 kNm

Hence the moment resistance of the section reduces from 308.43 kNm to 300 kNm with coexistent shear of 600 kN.
As MEd ≤ MyvRd (275 kNm ≤ 300 kNm), the design moment is less than the design moment resistance. Hence OK.

Provide web transverse stiffeners at supports.

Evaluation of non-dimensional slenderness

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2 : Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma calculates the non-dimensional slenderness parameter \( \lambda_{LT} \) using the simplified method of EN 1993-2, as allowed by BS EN 1994-2:2005.

Expression for \( \lambda_{LT} \) (\( \lambda_{ALT} \)) - composite construction

The section under consideration is assumed to be at an internal support of a continues girder where hogging bending moment with axial force are present. The non-dimensional slenderness \( \lambda_{LT} \) (\( \lambda_{ALT} \)) could be derived from the following expression as per Clause 6.3.4.2(4):

\[
\lambda_{ALT} = \frac{fy \cdot A_{eff}}{N_{crit}}
\]

where,

- \( N_{crit} \) = Elastic critical load
- \( fy \) = Yield strength
- \( A_{eff} \) = Effective area of the chord

Geometrical and design parameters

Compression flange classification will be taken as Class 3.
Section symmetrical only about the minor axis (unequal flanges).

**Lateral torsional buckling**

The design lateral torsional buckling resistance moment \( (M_{brd}) \) will be calculated. Section under consideration is a welded section and EC3 Part 1-1 Clause 6.3.2.2 expressions will be adopted.

Limiting slenderness value \( \lambda_{LT0}=0.2 \)

According to the NA to BS EN 1993-1-1, Tables 6.3 and 6.4 could be used with Clause 6.3.2.2 to determine the imperfection factor \( \alpha_{LT} \).

Imperfection value \( \alpha_{LT}=0.76 \) (curve d)

Modified chiLT factor \( \chi_{LT}=\chi_{LT}/f=0.87678 \)

Design moment on steel section \( M_{Ed}=2573 \text{ kNm} \)

Composite cracked section moment \( M_{cEd}=M_{max}-M_{Ed}=9377 \text{ kNm} \)

Design yield strength of steel \( f_{yd}=f_{y}/\gamma_{M1}=304.55 \text{ N/mm}^2 \)

Construction stage:

- Stress in steel bottom flange \( s_{sb1}=67 \text{ N/mm}^2 \)
- Composite stage:
  - Stress in steel bottom flange \( s_{sb2}=205 \text{ N/mm}^2 \)
  - Factor \( k \) (EN 1994-2 Cl. 6.2.1.4) \( k=(f_{yd}-s_{sb1})/s_{sb2}=1.1588 \)
  - Design elastic resistance moment \( M_{elRd}=M_{Ed}+k*M_{cEd}=13439 \text{ kNm} \)
  - Modification factor \( \chi_{LT}=0.87678 \)
  - Design buckling resistance moment \( M_{brd}=\chi_{LT}*M_{elRd}=11783 \text{ kNm} \)

**Interaction equation for moments**

- Distance \( L_{1}=0.25*L/\sqrt{m}=1197.6 \text{ mm} \)
- Design moment from analysis \( M_{Ed}=M_{1}-(M_{1}-M_{2})*L_{1}/L=10336 \text{ kNm} \)
- Axial stress from the analysis \( \text{stress}=5 \text{ N/mm}^2 \)
- Axial load \( N_{Ed}=A_{eff}*\text{stress}/1000=192.37 \text{ kN} \)
- Axial resistance of Tee section \( N_{brd}=\chi_{LT}*A_{eff}*f_{yd}/1000=10273 \text{ kN} \)
- Unity factor \( \text{unity}=M_{Ed}/M_{brd}+N_{Ed}/N_{brd}=0.89597 \)

As unity \( \leq 1 \), section chosen is considered to be suitable.

**Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners**

The shear resistance of a web under pure shear will be evaluated. Beam will be stable against shear buckling due to the presence of closely spaced web transverse stiffeners.

**Shear-moment interaction**

- Design shear force (coexisting) \( V_{Ed}=600 \text{ kN} \)
- The value of parameter \( \eta \) is as per the NA to BS EN 1993-1-5.
- Value of \( \eta \) from Clause 5.1(2) \( \eta=1 \)
- Plastic shear resistance \( V_{plRd}=\eta*A*w*f_{y}/(\gamma_{M0}*(\sqrt{3}))/1000 =2707.8 \text{ kN} \)

As \( V_{Ed} \leq 0.5*V_{plRd} \), the design shear will not reduce the design resistance moment. Hence OK.

Expression for lamLT (\( \hat{\alpha}L_T \))

The clause references in this section are as per Appendix C of SCI P356.

2nd moment of area (comp flange) \( I_{zc} = 1.5833E6 \) mm⁴
2nd moment of area (tens. flange) \( I_{zt} = 1.5833E6 \) mm⁴

For buckling over a half wavelength \( Lw \) the parameter \( V \) is as given by the expression below:

\[
V = (4\times a \times (1-a) + 0.05 \times \lambda_{FM}^2 + 0.1 \times \psi_a^2)^{-0.5} = 0.59424
\]

Parameter from C.4.5

\[
\omega = \pi^2 \times \frac{df^2 \times E \times Iz}{G \times It \times Lw^2}
\]

compute

\[
compl = SQR(4 \times tee \times omegaa) + \psi_a \\
\times SQR(omegaa) = 2.1849
\]

Parameter from C.4.5

\[
V_{eq} = (2 \times a \times \omega \times compl^2)^{0.25} = 0.63455
\]

The restraint parameter is calculated from the following expression as given in SCI publication P356:

\[
\frac{Ve_{eq}^4 \times Lw^3}{E \times Iz_{c} \times 0R \times df^2 \times (1-a)}
\]
Rotation of restraint $\theta_R$  
\[
\theta_R = 27 \times 10^{-12} \text{ rad/Nmm}
\]

Restrainment parameter:  
\[
\rho_p = \frac{V_{eq}^4 \cdot L_w^3}{(E \cdot I_{zc} \cdot \theta_R \cdot df^2 \cdot (1-a))} = 109477 \text{ rad/Nmm}
\]

Longest unbraced length  
\[L_r = L_T = 4000 \text{ mm}\]

Beta $\beta_w$  
\[\beta_w = 1.0\]

Plastic section modulus (yy axis)  
\[W_{ply} = 1.22 \times 10^6 \text{ mm}^3\]

Section property from C.1  
\[U = 0.9\]

Non-dimensional slenderness $\hat{\lambda}_{LT}$:  
\[
\hat{\lambda}_{LT} = \frac{1}{(C_1)^{0.5} \cdot U \cdot V \cdot D \cdot \lambda_b \cdot \sqrt{(\beta_w)}} = 1.3942
\]

Partial factors on strength

Partial factor $\gamma_{M0}$  
\[\gamma_{M0} = 1.0\]

Partial factor $\gamma_{M1}$  
\[\gamma_{M1} = 1.1\]

Lateral torsional buckling

The design lateral torsional buckling resistance moment ($M_{bRd}$) will be calculated. Section under consideration is a Hot Rolled section and EC3 Part 1-1 Clause 6.3.2.3 expressions will be adopted.  

Limiting slenderness value  
\[\hat{\lambda}_{LT0} = 0.4\]

According to the NA to BS EN 1993-1-1, for rolled doubly symmetrical sections the imperfection value is as follows:  
Imperfection value  
\[a_{LT} = 0.76 \text{ (curve d)}\]

According to the NA to BS EN 1993-1-1, for not doubly symmetrical sections the imperfection value is as follows:  
Imperfection value  
\[a_{LT} = 0.76 \text{ (curve d)}\]

Modified chi$_{LT}$ factor  
\[\text{Chi}_{LT} = \frac{\chi_{LT}}{f} = 0.37499\]

Design buckling resistance moment  
\[M_{bRd} = \text{Chi}_{LT} \cdot W_{ply} / (\gamma_{M1} \cdot 10^6) = 143.49 \text{ kNm}\]

Interaction equation for moments

The beam is assumed to be without longitudinal stiffeners. The design resistance for bending about the major axis as per Clause 6.2.5(2) of BS EN 1993-2:2006 is as follows:  

Design moment resistance  
\[M_{cRd} = W_{ply} / (\gamma_{M0} \cdot 10^6) = 420.9 \text{ kNm}\]

As $M_{bRd} \leq M_{cRd} \leq 420.9 \text{ kNm}$, the lateral torsional buckling resistance will be adopted.  

Design moment from analysis  
\[M_{Ed} = 135 \text{ kNm}\]

Unity factor  
\[\text{unity} = M_{Ed} / M_{bRd} = 0.94085\]

As $M_{Ed} \leq M_{bRd} \leq 135 \text{ kNm}$, section chosen is considered to be suitable.

Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners

The shear resistance of a web under pure shear will be evaluated. As $h_w/t_w \leq 72/\eta$ (35.636 \leq 59.423), the beam is considered to be stable against shear buckling.
Shear-moment interaction

Design shear force (coexisting) \( V_{Ed} = 450 \text{ kN} \)
The value of parameter \( \eta \) is as per the NA to BS EN 1993-1-5.
Value of \( \eta \) from Clause 5.1(2) \( \eta = 1 \)
Plastic shear resistance \( V_{plRd} = \frac{\eta \cdot A_w \cdot f_y}{(\gamma M_0 \cdot \sqrt{3})/1000} \)
\[ = 858.89 \text{ kN} \]
The beam is not symmetrical and EC3 Part 1-1 expression 6.30 cannot be used. The plastic neutral axis at height \( x_1 \) from the top of the bottom flange is found by balancing forces.
Allowable stress in the web \( f_{yw} = (1 - \rho_o) \cdot f_y = 344.21 \text{ N/mm}^2 \)
Reduced design plastic moment resistance:
\[ M_{vRd} = \frac{(A_1 \cdot L_1 + A_2 \cdot L_2) \cdot f_y + (A_3 \cdot L_3 + A_4 \cdot L_4) \cdot f_{yw}}{1E6} = 414.87 \text{ kNm} \]
Design moment resistance \( M_{Rd} = 420.9 \text{ kNm} \)
Hence the moment resistance of the section reduces from 420.9 kNm to 414.87 kNm with coexistent shear of 450 kN.
As \( M_{Ed} \leq M_{vRd} \ (135 \text{ kNm} \leq 414.87 \text{ kNm}) \), the design moment is less than the design moment resistance. Hence OK.

Provide web transverse stiffeners at supports.

Evaluation of non-dimensional slenderness

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2 : Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma calculates the non-dimensional slenderness parameter lamLT (λLT) and utilises Appendix C of SCI publication P356 or Clause 6.3.2.2 of BS EN 1993-2:2006.

Compression flange classification will be taken as Class 1.
The web classification will be taken as Class 1.
The overall section classification is Class 1.

Lateral torsional buckling

The design lateral torsional buckling resistance moment (MbRd) will be calculated. Section under consideration is a Hot Rolled section and EC3 Part 1-1 Clause 6.3.2.3 expressions will be adopted.

Limiting slenderness value lamLT0=0.4

According to the NA to BS EN 1993-1-1, for rolled doubly symmetrical sections the imperfection value is as follows:
Imperfection value \( a_{LT} = 0.76 \) (curve d)

According to the NA to BS EN 1993-1-1, for not doubly symmetrical sections the imperfection value is as follows:

Imperfection value \( a_{LT} = 0.76 \) (curve d)

Modified chiLT factor \( \chi_{LT} = \frac{\chi_{LT}}{f} = 0.43593 \)

Design buckling resistance moment

\[
Mb_{Rd} = \chi_{LT} \cdot W_{pily} \cdot f_y / (\gamma_M1 \cdot 10^6)
\]

\( = 166.8 \) kNm

**Interaction equation for moments**

The beam is assumed to be without longitudinal stiffeners. The design resistance for bending about the major axis as per Clause 6.2.5(2) of BS EN 1993-2:2006 is as follows:

Design moment resistance

\[
Mc_{Rd} = \frac{W_{pily} \cdot f_y}{(\gamma_M0 \cdot 10^6)} = 420.9 \text{ kNm}
\]

As \( Mb_{Rd} \leq Mc_{Rd} \) (166.8 kNm \( \leq 420.9 \) kNm), the lateral torsional buckling resistance will be adopted.

Design moment from analysis

\( M_{Ed} = 155 \) kNm

Unity factor

\( \text{unity} = \frac{M_{Ed}}{Mb_{Rd}} = 0.92925 \)

As \( M_{Ed} \leq Mb_{Rd} \) (155 kNm \( \leq 166.8 \) kNm), section chosen is considered to be suitable.

**Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners**

The shear resistance of a web under pure shear will be evaluated.

As \( hw/tw \leq 72 \epsilon/\eta \) (35.636 \( \leq 59.423 \)), the beam is considered to be stable against shear buckling.

**Shear-moment interaction**

Design shear force (coexisting)

\( V_{Ed} = 450 \) kN

The value of parameter \( \eta \) is as per the NA to BS EN 1993-1-5.

Value of \( \eta \) from Clause 5.1(2)

\( \eta = 1 \)

Plastic shear resistance

\[
V_{pplRd} = \frac{\eta \cdot A_w \cdot f_y}{(\gamma_M0 \cdot SQR(3))} / 1000
\]

\( = 858.89 \) kN

The beam is not symmetrical and EC3 Part 1-1 expression 6.30 cannot be used. The plastic neutral axis at height \( x1 \) from the top of the bottom flange is found by balancing forces.

Allowable stress in the web

\( f_{yw} = (1 - \rho) \cdot f_y = 344.21 \text{ N/mm}^2 \)

Reduced design plastic moment resistance:

\[
My_{vRd} = \left( (A1 \cdot L1 + A2 \cdot L2) \cdot f_y + (A3 \cdot L3 + A4 \cdot L4) \cdot f_{yw} \right) / 1E6 = 414.87 \text{ kNm}
\]

Design moment resistance

\( Mc_{Rd} = 420.9 \) kNm

Hence the moment resistance of the section reduces from 420.9 kNm to 414.87 kNm with coexistent shear of 450 kN.

As \( M_{Ed} \leq My_{vRd} \) (155 kNm \( \leq 414.87 \) kNm), the design moment is less than the design moment resistance. Hence OK.

Provide web transverse stiffeners at supports.

Evaluation of non-dimensional slenderness

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2 : Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma calculates the non-dimensional slenderness parameter lamLT (ALT) and utilises Appendix C of SCI publication P356 or Clause 6.3.2.2 of BS EN 1993-2:2006.

Compression flange classification will be taken as Class 1.
The web classification will be taken as Class 1.
The overall section classification is Class 1.

Geometrical parameters

Half wavelength of buckling \( L_w = 9000 \text{ mm} \)
Eff.length between restraints \( L_T = 3000 \text{ mm} \)
Depth of section \( h = 528.3 \text{ mm} \)
Flange width \( b = 208.8 \text{ mm} \)
Flange thickness \( t_f = 13.2 \text{ mm} \)
Web thickness \( t_w = 9.6 \text{ mm} \)
Distance between flange centroids \( d_f = 515 \text{ mm} \)

Design parameters

Coefficient \( C_1 \) \( C_1 = 1 \)
Young's modulus \( E = 210000 \text{ N/mm}^2 \)
Shear modulus \( G = 81000 \text{ N/mm}^2 \)
Yield strength \( f_y = 275 \text{ N/mm}^2 \)

Expression for lamLT (ALT)

Warping constant \( I_w = 1.3333E12 \text{ mm}^6 \)
Plastic section modulus (yy axis) \( W_{ply} = 2.06E6 \text{ mm}^3 \)

Partial factors on strength

Partial factor \( \gamma_0 \) \( \gamma_0M_0 = 1.0 \)
Partial factor \( \gamma_1 \) \( \gamma_1M_1 = 1.1 \)

Lateral torsional buckling

The design lateral torsional buckling resistance moment \( (M_{BRd}) \) will be calculated. Section under consideration is a Hot Rolled section and EC3 Part 1-1 Clause 6.3.2.3 expressions will be adopted.
Limiting slenderness value \( \text{lamLT}_0 = 0.4 \)
According to the NA to BS EN 1993-1-1, for rolled doubly symmetrical sections the imperfection value is as follows:
Imperfection value \( a_{LT} = 0.49 \) (curve c)
Modified chiLT factor \( \text{ChiLT} = \text{chiLT}/f = 0.84391 \)
Design buckling resistance moment \( M_{BRd} = \text{ChiLT} \cdot W_{ply} \cdot f_y / (\gamma_1M_1 \cdot 10^6) \)
\[ = 434.61 \text{ kNm} \]
Interaction equation for moments

The beam is assumed to be without longitudinal stiffeners. The design resistance for bending about the major axis as per Clause 6.2.5(2) of BS EN 1993-2:2006 is as follows:

Design moment resistance $McRd = Wply*fy/(\gamma_M0*10^6) = 566.5 \text{ kNm}$

As $MbRd \leq McRd$ (434.61 kNm $\leq 566.5 \text{ kNm}$), the lateral torsional buckling resistance will be adopted.

Design moment from analysis $MEd = 425 \text{ kNm}$

Unity factor $\text{unity} = MEd/MbRd = 0.97788$

As $MEd \leq MbRd$ (425 kNm $\leq 434.61 \text{ kNm}$), section chosen is considered to be suitable.

Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners

The shear resistance of a web under pure shear will be evaluated. As $hw/tw \leq 72\varepsilon/\eta$ (52.281 $\leq 66.558$), the beam is considered to be stable against shear buckling.

Shear-moment interaction

Design shear force (coexisting) $VEd = 400 \text{ kN}$

The value of parameter $\eta$ is as per the NA to BS EN 1993-1-5.

Value of $\eta$ from Clause 5.1(2) $\eta = 1$

Plastic shear resistance $VplRd = \eta*Aw*fy/(\gamma_M0*SQR(3))/1000$

$= 765 \text{ kN}$

As the beam is symmetric EC3 Part 1-1 expression 6.30 will be used to evaluate the reduced design plastic moment resistance:

$MyvRd = (Wply-ro*Aw^2/(4*tw))*fy/(\gamma_M0*1E6) = 566.15 \text{ kNm}$

Design moment resistance $McRd = 566.5 \text{ kNm}$

Hence the moment resistance of the section reduces from 566.5 kNm to 566.15 kNm with coexistent shear of 400 kN.

As $MEd \leq MyvRd$ (425 kNm $\leq 566.15 \text{ kNm}$), the design moment is less than the design moment resistance. Hence OK.

Provide web transverse stiffeners at supports.

| DESIGN | Design moment | 425 kNm |

Evaluation of non-dimensional slenderness

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2 : Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma calculates the non-dimensional slenderness parameter lamLT (ALT) and utilises Appendix C of SCI publication P356 or Clause 6.3.2.2 of BS EN 1993-2:2006.

Compression flange classification will be taken as Class 1.
The web classification will be taken as Class 1.
The overall section classification is Class 1.

Geometrical parameters

Half wavelength of buckling \( L_w=10000 \) mm
Effective length between restraints \( L_T=2000 \) mm
Depth of section \( h=918.5 \) mm
Flange width \( b=305.5 \) mm
Flange thickness \( t_f=27.9 \) mm
Web thickness \( t_w=17.3 \) mm
Distance between flange centroids \( d_f=890 \) mm

Design parameters

Coefficient \( C_1 \)
Young's modulus \( E=210000 \) N/mm\(^2\)
Shear modulus \( G=81000 \) N/mm\(^2\)
Yield strength \( f_y=345 \) N/mm\(^2\)

Expression for lamLT (ALT)

Warping constant \( I_w=26.4E12 \) mm\(^4\)
Plastic section modulus (yy axis) \( W_{ply}=10.9E6 \) mm\(^3\)

Partial factors on strength

Partial factor \( \gamma M_0 \) \( \gamma M_0=1.0 \)
Partial factor \( \gamma M_1 \) \( \gamma M_1=1.1 \)

Lateral torsional buckling

The design lateral torsional buckling resistance moment \( (M_bRd) \) will be calculated. Section under consideration is a Hot Rolled section and EC3 Part 1-1 Clause 6.3.2.3 expressions will be adopted.

Limiting slenderness value \( \text{lamLT}_0=0.4 \)
As \( \text{lamLT} \leq \text{lamLT}_0 \), the segment of the beam is not subject to lateral torsional buckling.

The design buckling resistance \( M_bRd \) will therefore be the same as the design resistance for bending \( M_cRd \).

Design buckling resistance moment \( M_bRd=W_{ply}*f_y/(\gamma M_0*10^6)=3760.5 \) kNm
Design moment resistance  \( \text{McRd}=\text{MbRd}=3760.5 \text{ kNm} \)

**Interaction equation for moments**

The beam is assumed to be without longitudinal stiffeners. The design resistance for bending about the major axis as per Clause 6.2.5(2) of BS EN 1993-2:2006 is as follows:

Design moment resistance  \( \text{McRd}=W_{\text{ply}}*f_y/(\gamma_M*10^6)=3760.5 \text{ kNm} \)

As \( \text{MbRd} \leq \text{McRd} \ (3760.5 \text{ kNm} \leq 3760.5 \text{ kNm}) \), the lateral torsional buckling resistance will be adopted.

Design moment from analysis  \( \text{MEd}=3500 \text{ kNm} \)

Unity factor  \( \text{unity}=\text{MEd}/\text{MbRd}=0.93073 \)

As \( \text{MEd} \leq \text{MbRd} \ (3500 \text{ kNm} \leq 3760.5 \text{ kNm}) \), section chosen is considered to be suitable.

**Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners**

The shear resistance of a web under pure shear will be evaluated. As \( hw/\ell \leq 72\varepsilon/\eta \ (49.867 \leq 59.423) \), the beam is considered to be stable against shear buckling.

**Shear-moment interaction**

Design shear force (coexisting)  \( \text{VED}=182.3 \text{ kN} \)

The value of parameter \( \eta \) is as per the NA to BS EN 1993-1-5.  
Value of \( \eta \) from Clause 5.1(2)  \( \eta=1 \)

Plastic shear resistance  \( \text{VplRd}=\eta*Aw*f_y/(\gamma_M*\text{SQR}(3))/1000 =2972.8 \text{ kN} \)

As \( \text{VED} \leq 0.5*\text{VplRd} \), the design shear will not reduce the design resistance moment. Hence OK.

Expression for lamLT (ΛLT)

The clause references in this section are as per Appendix C of SCI P356.

2nd moment of area (comp flange) Izc=312.5E6 mm^4
2nd moment of area (tens.flange) Izt=160E6 mm^4

For buckling over a half wavelength Lw the parameter V is as given by the expression below:

V=((4*a*(1-a)+0.05*lamF^2+psia^2)^0.5+psia)^-0.5=0.84668

Parameter from C.4.5

omega=PI^2*dt^2*E*Iz/(G*It*Lw^2)
omega=14.894

compute

comp1=SQR(4+tee*omega)+psia*SQR(omega)=5.2785

Parameter from C.4.5

Veq=(2*a*omega/comp1^2)^0.25=0.917
The restraint parameter is calculated from the following expression as given in SCI publication P356:

\[\text{rp} = \frac{V_{eq}^4 L_w^3}{E I_{zc} \theta R df^2 (1-a)}\]

Rotation of restraint \(\theta R\) \(\theta R = 1 \times 10^{-15}\) rad/Nmm

Restraint parameter:
\[\text{rp} = \frac{V_{eq}^4 L_w^3}{E I_{zc} \theta R df^2 (1-a)} = 23.244 \times 10^6\] rad/Nmm

Longest unbraced length \(L_r = L_T = 1000\) mm

Beta \(\beta_w\) \(\beta_w = 1.0\)

Plastic section modulus (yy axis) \(W_{ply} = 22E6\) mm³

Section property from C.1 \(U = 0.9\)

Non-dimensional slenderness \(\lambda_{LT}\):
\[\lambda_{LT} = \frac{1}{(C1)^{0.5} U V D \lambda_{SQR}(\beta_w)} = 0.10196\]

Partial factors on strength

Partial factor \(\gamma M_0\) \(\gamma M_0 = 1.0\)
Partial factor \(\gamma M_1\) \(\gamma M_1 = 1.1\)

Lateral torsional buckling

The design lateral torsional buckling resistance moment \(M_{Brd}\) will be calculated. Section under consideration is a welded section and EC3 Part 1-1 Clause 6.3.2.2 expressions will be adopted. Limiting slenderness value \(\lambda_{LT0} = 0.2\)

As \(\lambda_{LT} \leq \lambda_{LT0}\), the segment of the beam is not subject to lateral torsional buckling.

The design buckling resistance \(M_{Brd}\) will therefore be the same as the design resistance for bending \(M_{Cr}\).

Design buckling resistance moment \(M_{Brd} = W_{ply} f_y / (\gamma M_0 \times 10^6) = 7810\) kNm

Design moment resistance \(M_{Cr} = M_{Brd} = 7810\) kNm

Interaction equation for moments

The beam is assumed to be without longitudinal stiffeners. The design resistance for bending about the major axis as per Clause 6.2.5(2) of BS EN 1993-2:2006 is as follows:

Design moment resistance \(M_{Cr} = W_{ply} f_y / (\gamma M_0 \times 10^6) = 7810\) kNm

As \(M_{Brd} \leq M_{Cr}\) \((7810\) kNm \(\leq 7810\) kNm\), the lateral torsional buckling resistance will be adopted.

Design moment from analysis \(M_{Ed} = 7000\) kNm

Unity factor \(\text{unity} = M_{Ed} / M_{Brd} = 0.89629\)

As \(M_{Ed} \leq M_{Brd}\) \((7000\) kNm \(\leq 7810\) kNm\), section chosen is considered to be suitable.
Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners

The shear resistance of a web under pure shear will be evaluated. As \( \frac{hw}{tw} \leq 72\eta/\varepsilon \) ( 57 \leq 58.58 ), the beam is considered to be stable against shear buckling.

Shear-moment interaction

Design shear force (coexisting) \( V_{Ed} = 4486 \text{ kN} \)
The value of parameter \( \eta \) is as per the NA to BS EN 1993-1-5.
Value of \( \eta \) from Clause 5.1(2) \( \eta = 1.2 \)
Plastic shear resistance \( V_{plRd} = \eta \cdot \frac{Aw \cdot fy}{(\Gamma M0 \cdot SQR(3))}/1000 \)
\( = 5607.7 \text{ kN} \)
The beam is not symmetrical and EC3 Part 1-1 expression 6.30 cannot be used. The plastic neutral axis at height \( x_1 \) from the top of the bottom flange is found by balancing forces.
Allowable stress in the web \( f_{yw} = (1-\rho_0) \cdot fy = 227.22 \text{ N/mm}^2 \)
Reduced design plastic moment resistance:
\[
M_{yvRd} = \frac{(A_1 \cdot L_1 + A_2 \cdot L_2) \cdot fy + (A_3 \cdot L_3 + A_4 \cdot L_4) \cdot f_{yw}}{1E6} = 7021.3 \text{ kNm}
\]
Design moment resistance \( M_{crd} = 7810 \text{ kNm} \)
Hence the moment resistance of the section reduces from 7810 kNm to 7021.3 kNm with coexistent shear of 4486 kN.
As \( M_{Ed} \leq M_{yvRd} \) ( 7000 kNm \leq 7021.3 kNm ), the design moment is less than the design moment resistance. Hence OK.

Provide web transverse stiffeners at supports.

Location: Ex11 - ICE book worked example 6.2-13 (no shear buckling)

Evaluation of non-dimensional slenderness

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2 : Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma calculates the non-dimensional slenderness parameter lamLT (ALT) and utilises Appendix C of SCI publication P356 or Clause 6.3.2.2 of BS EN 1993-2:2006.

Compression flange classification will be taken as Class 3.
The web classification will be taken as Class 3.
The overall section classification is Class 3.

Geometrical parameters

- Half wavelength of buckling: \( L_w = 10000 \text{ mm} \)
- Eff.length between restraints: \( L_T = 1000 \text{ mm} \)
- Depth of section: \( h = 2060 \text{ mm} \)
- Flange width: \( b = 400 \text{ mm} \)
- Flange thickness: \( t_f = 30 \text{ mm} \)
- Web thickness: \( t_w = 20 \text{ mm} \)
- Distance between flange centroids: \( d_f = 2030 \text{ mm} \)

Design parameters

- Coefficient \( C_1 \): \( C_1 = 1.13 \)
- Young's modulus: \( E = 210000 \text{ N/mm}^2 \)
- Shear modulus: \( G = 81000 \text{ N/mm}^2 \)
- Yield strength: \( f_y = 355 \text{ N/mm}^2 \)

Expression for lamLT (ALT)

The clause references in this section are as per Appendix C of SCI P356. The following are the 2nd moments of area of the compression and tension flanges, respectively, about the z-z axes:

For buckling over a half wavelength \( L_w \) the parameter V is as given by the expression below:

\[
V = ((4a^2 + 0.05\lambda F^2 + p_{sia}^2)^0.5 + p_{sia})^{-0.5} = 0.95305
\]

Parameter from C.4.5 \( V_{eq} = V = 0.95305 \)

The restraint parameter is calculated from the following expression as given in SCI publication P356:

\[
\rho_p = \frac{V_{eq}^4 L_w^3}{E I_{zc} \theta_R d_f^2 (1-a)}
\]

Rotation of restraint \( \theta_R \): \( \theta_R = 1E-15 \text{ rad/Nmm} \)

Restraint parameter:

\[
\rho_p = V_{eq}^4 L_w^3 / (E I_{zc} \theta_R d_f^2 (1-a)) = 11.917E6 \text{ rad/Nmm}
\]

Longest unbraced length: \( L_r = L_T = 1000 \text{ mm} \)

Plastic section modulus (yy axis): \( W_{ply} = 44.36E6 \text{ mm}^3 \)
Elastic section modulus (yy axis) \( W_{ely} = 37.5 \times 10^6 \text{ mm}^3 \)
Beta \( \beta_w \)
Section property from C.1 \( U = 0.9 \)
Non-dimensional slenderness \( \hat{\lambda}_{LT} \):
\[
\hat{\lambda}_{LT} = \frac{1}{(C_1)^{0.5} \cdot U \cdot V \cdot D \cdot \sqrt{\beta_w}} = 0.14182
\]

Partial factors on strength

- Partial factor \( \gamma_{M0} \): \( \gamma_{M0} = 1.0 \)
- Partial factor \( \gamma_{M1} \): \( \gamma_{M1} = 1.1 \)

Lateral torsional buckling

The design lateral torsional buckling resistance moment \( (M_{bRd}) \) will be calculated. Section under consideration is a welded section and EC3 Part 1-1 Clause 6.3.2.2 expressions will be adopted.

Limiting slenderness value \( \hat{\lambda}_{LT0} = 0.2 \)
As \( \hat{\lambda}_{LT} \leq \hat{\lambda}_{LT0} \), the segment of the beam is not subject to lateral torsional buckling.
The design buckling resistance \( M_{bRd} \) will therefore be the same as the design resistance for bending \( M_{cRd} \).

Design buckling resistance moment \( M_{bRd} = \frac{W_{ely} \cdot f_y}{(\gamma_{M0} \cdot 10^6)} = 13313 \text{ kNm} \)

Design moment resistance \( M_{cRd} = M_{bRd} = 13313 \text{ kNm} \)

Interaction equation for moments

The beam is assumed to be without longitudinal stiffeners. The design resistance for bending about the major axis as per Clause 6.2.5(2) of BS EN 1993-2:2006 is as follows:

Design moment resistance \( M_{cRd} = \frac{W_{ely} \cdot f_y}{(\gamma_{M0} \cdot 10^6)} = 13313 \text{ kNm} \)
As \( M_{bRd} \leq M_{cRd} \) (13313 kNm \leq 13313 kNm), the lateral torsional buckling resistance will be adopted.

Design moment from analysis \( M_{Ed} = 10000 \text{ kNm} \)
Unity factor \( Unity = \frac{M_{Ed}}{M_{bRd}} = 0.75117 \)
As \( M_{Ed} \leq M_{bRd} \) (10000 kNm \leq 13313 kNm), the section chosen is considered to be suitable.

Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners

The shear resistance of a web under pure shear will be evaluated. Beam will be stable against shear buckling due to the presence of closely spaced web transverse stiffeners.

Shear-moment interaction

Design shear force (coexisting) \( V_{Ed} = 7871 \text{ kN} \)
The value of parameter \( \eta \) is as per the NA to BS EN 1993-1-5.
Value of \( \eta \) from Clause 5.1(2) \( \eta = 1.2 \)
Plastic shear resistance \( V_{plRd} = \frac{\eta \cdot A_w \cdot f_y}{(\gamma_{M0} \cdot \sqrt{3})} / 1000 = 9838 \text{ kN} \)
As the beam is symmetric EC3 Part 1-1 expression 6.30 will be used to evaluate the reduced design plastic moment resistance:

\[ \text{MyvRd} = \left( \frac{W_{\text{ply}} - r_0 \cdot A_w^2}{4 \cdot t_w} \right) \cdot \frac{f_y}{\gamma_M} \cdot 10^6 = 13191 \text{ kNm} \]

Design moment resistance \( M_{\text{Cd}} = 13313 \text{ kNm} \)

Hence the moment resistance of the section reduces from 13313 kNm to 13191 kNm with coexistent shear of 7871 kN.

As \( M_{\text{Ed}} \leq M_{\text{vRd}} \) (10000 kNm ≤ 13191 kNm), the design moment is less than the design moment resistance. Hence OK.

Beam is assumed to be stable against shear buckling due to the presence of closely spaced intermediate web transverse stiffeners.

Provide web transverse stiffeners at supports.

Expression for \( \text{lam}\text{LT} (\hat{\text{LT}}) \)

The clause references in this section are as per Appendix C of SCI P356. The following are the 2nd moments of area of the compression and tension flanges, respectively, about the z-z axes:

For buckling over a half wavelength \( L_w \) the parameter \( V \) is as given by the expression below:

\[
V = (4*a*(1-a) + 0.05*\text{lam}F^2 + \text{psia}^2)^0.5 + \text{psia} \leq 0.96114
\]

Parameter from C.4.5

\[
\text{Veq} = V = 0.96114
\]

The restraint parameter is calculated from the following expression as given in SCI publication P356:

\[
rp = \left[ \frac{\text{Veq}^4*\text{Lw}^3}{E*\text{Izc}*\theta_R*\text{df}^2*(1-a)} \right]
\]

Rotation of restraint \( \theta_R \): \( \theta_R = 1E-15 \text{ rad/Nmm} \)

Restraint parameter:

\[
\text{rp} = \text{Veq}^4*\text{Lw}^3/(E*\text{Izc}*\theta_R*\text{df}^2*(1-a)) = 8.9862E6 \text{ rad/Nmm}
\]

Longest unbraced length \( L_r = L_T = 1000 \text{ mm} \)

Plastic section modulus (yy axis) \( W_{p\text{ly}} = 44.36E6 \text{ mm}^3 \)
Elastic section modulus (yy axis) \( W_{ely} = 37E6 \) mm\(^3\)
Beta \( \beta_w \)
Section property from C.1
Non-dimensional slenderness \( \lambda_{LT} \):
\[
\lambda_{LT} = 1/(C1)^{0.5} \times U \times V \times D \times \lambda_{SQR}(\beta_w) = 0.14129
\]

Partial factors on strength

Partial factor \( \gamma_M0 \) \( \gamma_M0 = 1.0 \)
Partial factor \( \gamma_M1 \) \( \gamma_M1 = 1.1 \)

Lateral torsional buckling

The design lateral torsional buckling resistance moment \( (M_{Brd}) \) will be calculated. Section under consideration is a welded section and EC3 Part 1-1 Clause 6.3.2.2 expressions will be adopted.
Limiting slenderness value \( \lambda_{LT0} = 0.2 \)
As \( \lambda_{LT} \leq \lambda_{LT0} \), the segment of the beam is not subject to lateral torsional buckling.
The design buckling resistance \( M_{Brd} \) will therefore be the same as the design resistance for bending \( M_{Cr} \).

Design buckling resistance moment \( M_{Brd} = W_{ely} \times f_y / (\gamma_M0 \times 10^6) = 13135 \text{ kNm} \)
Design moment resistance \( M_{Cr} = M_{Brd} = 13135 \text{ kNm} \)

Interaction equation for moments

The beam is assumed to be without longitudinal stiffeners. The design resistance for bending about the major axis as per Clause 6.2.5(2) of BS EN 1993-2:2006 is as follows:
Design moment resistance \( M_{Cr} = W_{ely} \times f_y / (\gamma_M0 \times 10^6) = 13135 \text{ kNm} \)
As \( M_{Brd} \leq M_{Cr} \) (13135 kNm \leq 13135 kNm), the lateral torsional buckling resistance will be adopted.
Design moment from analysis \( M_{Ed} = 10000 \text{ kNm} \)
Unity factor \( \text{unity} = M_{Ed} / M_{Brd} = 0.76132 \)
As \( M_{Ed} \leq M_{Brd} \) (10000 kNm \leq 13135 kNm), section chosen is considered to be suitable.

Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners

The shear resistance of a web under pure shear will be evaluated. As \( hw/tw > 72\varepsilon/\eta \) (100 > 58.58), beam is susceptible to shear buckling as there are no web transverse stiffeners except at supports.

Shear-moment interaction

Design shear force (coexisting) \( V_{Ed} = 4000 \text{ kN} \)
Plastic moment resistance \( M_{plRd} = W_{ply} \times f_y / (\gamma_M1 \times 1E6) = 15748 \text{ kNm} \)
Design shear buckling resistance assuming no contribution from the flanges is given by expression 5.2 (EC3 Part 1-5):
\[
V_{bwRd} = \chi_w \times f_y \times hw/tw / (\gamma_M1 \times SQR(3)) / 1000 = 4810.6 \text{ kN}
\]
Shear ratio \( \eta_1 \)
\( \text{eta1} = M_{Ed} / M_{plRd} = 0.63501 \)
Plastic moment resistance ignoring the web is:
MfRd=(Wply-Aw^2/(4*tw))*fy/(gamM0*1E6)=8647.8 kNm

Expression 7.1  \( \eta_1 = \eta_1 + (1 - \frac{MfRd}{MplRd}) \times (2 \times \eta_3 - 1)^2 \approx 0.83319 \)

\( \leq 1 \) hence OK.

Provide web transverse stiffeners at supports.

Evaluation of non-dimensional slenderness

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges" and the NA to BS EN 1993-2:2006.

Expression for lamLT (\(\hat{\lambda}_T\)) - composite construction

The section under consideration is assumed to be at an internal support of a continues girder where hogging bending moment with axial force are present. The non-dimensional slenderness lamLT (\(\hat{\lambda}_T\)) could be derived from the following expression as per Clause 6.3.4.2(4):

\[
\hat{\lambda}_T = \frac{fy \cdot A_{eff}}{N_{crit}}
\]

where,

\(N_{crit}\) = Elastic critical load
\(fy\) = Yield strength
\(A_{eff}\) = Effective area of the chord

Geometrical and design parameters

Compression flange classification will be taken as Class 3.
Section symmetrical about both major and minor axis (equal flanges).
Eff.length between restraints \(LT=5000\) mm
Depth of section \(h=2060\) mm
Flange width \(b=400\) mm
Web thickness \(tw=20\) mm
Flange thickness \(tf=30\) mm
Yield strength \(fy=345\) N/mm²
Non-dimensional slenderness \(\hat{\lambda}_T\) \(\text{lamLT} = \sqrt{\frac{fy \cdot A_{eff}}{N_{crit} \cdot 10^3}} = 0.69678\)

Partial factors on strength

Partial factor \(\gamma_M0\) \(\text{gamM0}=1.0\)
Partial factor \(\gamma_M1\) \(\text{gamM1}=1.1\)

Lateral torsional buckling

The design lateral torsional buckling resistance moment (\(Mb_{Rd}\)) will be calculated. Section under consideration is a welded section and EC3 Part 1-1 Clause 6.3.2.2 expressions will be adopted.

Limiting slenderness value \(\text{lamLT0}=0.2\)
According to the NA to BS EN 1993-1-1, for welded doubly symmetrical sections the imperfection value is as follows:
Imperfection value \( aLT = 0.76 \) (curve d)

Modified chiLT factor \( \text{ChiLT} = \text{chiLT}/f = 0.64525 \)

Total design hogging moment \( M_{\text{max}} = 10000 \) kNm

Design moment on steel section \( M_{\text{Ed}} = 3000 \) kNm

Composite cracked section moment \( M_{cEd} = M_{\text{max}} - M_{\text{Ed}} = 7000 \) kNm

Design yield strength of steel \( f_{yd} = f_y/g_{\text{M1}} = 313.64 \) N/mm²

Construction stage:

**Stress in steel bottom flange**

\( s_{sb f1} = 45 \) N/mm²

**Composite stage**:

**Stress in steel bottom flange**

\( s_{sb f2} = 150 \) N/mm²

**Factor k (EN 1994-2 Cl. 6.2.1.4)**

\( k = (f_{yd} - s_{sb f1})/s_{sb f2} = 1.7909 \)

**Design elastic resistance moment**

\( M_{elRd} = M_{\text{Ed}} + k \times M_{cEd} = 15536 \) kNm

Hello. 

**Imperfection value**

\( aLT = 0.76 \) (curve d)

**Modified chiLT factor**

\( \text{ChiLT} = \text{chiLT}/f = 0.64525 \)

**Total design hogging moment**

\( M_{\text{max}} = 10000 \) kNm

**Design moment on steel section**

\( M_{\text{Ed}} = 3000 \) kNm

**Composite cracked section moment**

\( M_{cEd} = M_{\text{max}} - M_{\text{Ed}} = 7000 \) kNm

**Design yield strength of steel**

\( f_{yd} = f_y/g_{\text{M1}} = 313.64 \) N/mm²

**Construction stage:**

**Stress in steel bottom flange**

\( s_{sb f1} = 45 \) N/mm²

**Composite stage:**

**Stress in steel bottom flange**

\( s_{sb f2} = 150 \) N/mm²

**Factor k (EN 1994-2 Cl. 6.2.1.4)**

\( k = (f_{yd} - s_{sb f1})/s_{sb f2} = 1.7909 \)

**Design elastic resistance moment**

\( M_{elRd} = M_{\text{Ed}} + k \times M_{cEd} = 15536 \) kNm

**Design buckling resistance moment**

\( M_{bRd} = \text{ChiLT} \times M_{elRd} = 10025 \) kNm

**Interaction equation for moments**

**Distance**

\( L_1 = 0.25 \times L/\text{SQR}(m) = 1250 \) mm

**Design moment at brace position**

\( M_2 = 5000 \) kNm

**Design moment from analysis**

\( M_{Ed} = M_1 - (M_1 - M_2) \times L_1/L = 8750 \) kNm

**Axial stress from the analysis**

\( \text{stress} = 4 \) N/mm²

**Axial load**

\( \text{NEd} = A_{\text{eff}} \times \text{stress}/1000 = 74.667 \) kN

**Axial resistance of Tee section**

\( N_{bRd} = \text{ChiLT} \times A_{\text{eff}} \times f_{yd}/1000 = 3777.7 \) kN

**Unity factor**

\( \text{unity} = M_{Ed}/M_{bRd} + \text{NEd}/N_{bRd} = 0.89259 \)

As unity ≤ 1, section chosen is considered to be suitable.

**Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners**

The shear resistance of a web under pure shear will be evaluated. As \( hw/tw > 72\varepsilon/\eta \) (100 > 59.423), beam is susceptible to shear buckling as there are no web transverse stiffeners except at supports. Plastic section modulus (yy axis) \( W_{\text{ply}} = 44.36E6 \) mm²

**Shear-moment interaction**

**Design shear force (coexisting)**

\( V_{Ed} = 4000 \) kN

**Plastic moment resistance**

\( M_{plRd} = W_{\text{ply}} \times f_y/(\varepsilon_{\text{M0}} \times 1E6) = 15304 \) kNm

**Design shear buckling resistance assuming no contribution from the flanges is given by expression 5.2 (EC3 Part 1-5):**

\( V_{bwRd} = \text{chiw} \times f_y \times hw/tw/(\varepsilon_{\text{M1}} \times \text{SQR}(3)) \times 1000 = 4720 \) kN

**Shear ratio \( \eta \)**

\( \eta_1 = \text{MEd}/M_{plRd} = 0.57174 \)

**Area of top reinforcement**

\( A_1 = 12000 \) mm²

**Area of bottom reinforcement**

\( A_2 = 12000 \) mm²

**Axial resistance of the top bars and top flange:**

\( F_1 = ((A_1 + A_2) \times 500/1.15 + tf \times b \times f_y)/(\varepsilon_{\text{M0}} \times 1000) = 14575 \) kN

**Axial resistance of the bottom flange:**

\( F_2 = tf \times b \times f_y/(\varepsilon_{\text{M0}} \times 1000) = 4140 \) kN

**Lever arm**

\( d_{fc} = 2100 \) mm

**Plastic moment resistance ignoring the web is:**

\( M_{fRd} = F_{\text{min}} \times d_{fc}/(\varepsilon_{\text{M0}} \times 1E3) = 8694 \) kNm

**Expression 7.1**

\( u_1 = \eta_1 + (1 - M_{fRd}/M_{plRd}) \times (2 \times \eta_3 - 1)^2 = 0.57175 \)

As \( u_1 \leq 1 \), hence OK.

Provide web transverse stiffeners at supports.

Location: Ex14 - Non-symmetrical composite sect. (w. shear buckling)

Evaluation of non-dimensional slenderness

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma calculates the non-dimensional slenderness parameter \( \lambda_{LT} \) using the simplified method of EN 1993-2, as allowed by BS EN 1994-2:2005.

Expression for \( \lambda_{LT} \) - composite construction

The section under consideration is assumed to be at an internal support of a continuous girder where hogging bending moment with axial force are present. The non-dimensional slenderness \( \lambda_{LT} \) could be derived from the following expression as per Clause 6.3.4.2(4):

\[
\frac{f_y \cdot A_{eff}}{N_{crit}}
\]

where,
- \( N_{crit} \) = Elastic critical load
- \( f_y \) = Yield strength
- \( A_{eff} \) = Effective area of the chord

Geometrical and design parameters

Compression flange classification will be taken as Class 3.
Section symmetrical only about the minor axis (unequal flanges).
Eff.length between restraints \( LT = 5000 \) mm
Depth of section \( h = 2060 \) mm
Top flange width \( b_t = 400 \) mm
Bottom flange width \( b_b = 600 \) mm
Top flange thickness \( t_f = 30 \) mm
Bottom flange thickness \( t_b = 40 \) mm
Web thickness \( t_w = 20 \) mm
Yield strength \( f_y = 345 \) N/mm²

Non-dimensional slenderness \( \lambda_{LT} \) \( \lambda_{LT} = \sqrt{f_y \cdot A_{eff}/(N_{crit} \times 1E3)} \) = 0.41081

Partial factors on strength

Partial factor \( \gamma_M0 \) \( \gamma_M0 = 1.0 \)
Partial factor \( \gamma_M1 \) \( \gamma_M1 = 1.1 \)

Lateral torsional buckling

The design lateral torsional buckling resistance moment (\( M_{Brd} \)) will be calculated. Section under consideration is a welded section and EC3 Part 1-1 Clause 6.3.2.2 expressions will be adopted.
Limiting slenderness value \( \lambda_{LT0} = 0.2 \)
According to the NA to BS EN 1993-1-1, Tables 6.3 and 6.4 could be used with Clause 6.3.2.2 to determine the imperfection factor \( \alpha_{LT} \).

Evaluation of non-dimensional slenderness

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma calculates the non-dimensional slenderness parameter lamLT (ALT) and utilises Clause 6.3.2.2 of BS EN 1993-2:2006.

Expression for lamLT (ALT)

The non-dimensional slenderness lamLT (ALT) could be derived from the following expression:

$$\lambda_{LT} = \left( \frac{f_y W_{pl,y}}{M_{cr}} \right)^{0.5}$$

where,

- $M_{cr}$ = Elastic critical buckling moment from the analysis
- $f_y$ = Yield strength
- $W_{pl,y}$ = Plastic modulus of the section about y-y axis

Compression flange classification will be taken as Class 2.
The web classification will be taken as Class 2.
The overall section classification is Class 2.

Geometrical parameters

- Eff.length between restraints: $LT=5000$ mm
- Depth of section: $h=400$ mm
- Flange thickness: $t_f=20$ mm
- Plastic section modulus (yy axis): $W_{pl,y}=4.25E6$ mm$^3$

Design parameters

- Young's modulus: $E=210000$ N/mm$^2$
- Shear modulus: $G=81000$ N/mm$^2$
- Yield strength: $f_y=345$ N/mm$^2$

Non-dimensional slenderness (ALT)

- Effective length parameter: $K=1$
- Length for LTB: $LT=LT/1000=5$ m
- Critical moment: $M_{cr}=C_1 E_t G_t^{0.5}/10^6=72772$ kNm
- Non-dimensional slenderness: $\lambda_{LT}=(W_{pl,y}/(f_y/(M_{cr}10^6)))^{0.5}=0.14195$

Partial factors on strength

- Partial factor $\gamma_M0$: $\gamma_M0=1.0$
- Partial factor $\gamma_M1$: $\gamma_M1=1.1$
**Lateral torsional buckling**

The design lateral torsional buckling resistance moment \( Mb_{Rd} \) will be calculated. Section under consideration is a Hot Rolled section and EC3 Part 1-1 Clause 6.3.2.3 expressions will be adopted. 

Limiting slenderness value \( \lambda_{MLT0} = 0.4 \)

As \( \lambda_{MLT} \leq \lambda_{MLT0} \), the segment of the beam is not subject to lateral torsional buckling.

The design buckling resistance \( Mb_{Rd} \) will therefore be the same as the design resistance for bending \( Mc_{Rd} \).

Design buckling resistance moment \( Mb_{Rd} = W_{ply} * f_y / (\gamma_{M0} * 10^6) = 1466.3 \text{ kNm} \)

Design moment resistance \( Mc_{Rd} = Mb_{Rd} = 1466.3 \text{ kNm} \)

**Interaction equation for moments**

The beam is assumed to be without longitudinal stiffeners. The design resistance for bending about the major axis as per Clause 6.2.5(2) of BS EN 1993-2:2006 is as follows:

Design moment resistance \( Mc_{Rd} = W_{ply} * f_y / (\gamma_{M0} * 10^6) = 1466.3 \text{ kNm} \)

As \( Mb_{Rd} \leq Mc_{Rd} (1466.3 \text{ kNm} \leq 1466.3 \text{ kNm}) \), the lateral torsional buckling resistance will be adopted.

Design moment from analysis \( M_{Ed} = 1100 \text{ kNm} \)

Unity factor \( unity = M_{Ed} / Mb_{Rd} = 0.75021 \)

As \( M_{Ed} \leq Mb_{Rd} (1100 \text{ kNm} \leq 1466.3 \text{ kNm}) \), section chosen is considered to be suitable.

**Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners**

The shear resistance of a web under pure shear will be evaluated. As \( hw/tw \leq 72\varepsilon/\eta (18 \leq 59.423) \), the beam is considered to be stable against shear buckling.

**Shear-moment interaction**

Design shear force (coexisting) \( V_{Ed} = 2300 \text{ kN} \)

The value of parameter \( \eta \) is as per the NA to BS EN 1993-1-5.

Value of \( \eta \) from Clause 5.1(2) \( \eta = 1 \)

Plastic shear resistance \( V_{plRd} = \eta * A_w * f_y / (\gamma_{M0} * SQR(3)) / 1000 = 3027.6 \text{ kN} \)

As the beam is symmetric EC3 Part 1-1 expression 6.30 will be used to evaluate the reduced design plastic moment resistance:

\[ Myv_{Rd} = (W_{ply} - ro * A_w^2 / (4*tw)) * f_y / (\gamma_{M0} * 1E6) = 1197.5 \text{ kNm} \]

Design moment resistance \( Mc_{Rd} = 1466.3 \text{ kNm} \)

Hence the moment resistance of the section reduces from 1466.3 kNm to 1197.5 kNm with coexistent shear of 2300 kN.

As \( M_{Ed} \leq Myv_{Rd} (1100 \text{ kNm} \leq 1197.5 \text{ kNm}) \), the design moment is less than the design moment resistance. Hence OK.

Provide web transverse stiffeners at supports.
### DESIGN
- Design moment: 1100 kNm

### SUMMARY
- Design shear: 2300 kN
- Yield strength of steel: 345 N/mm²
- Depth of beam: 400 mm
- Flange width: 400 mm
- Classification: Class 2
- Design buckling resistance: 1466.3 kNm
- Plastic shear resistance: 3027.6 kN
- Unity factor: 0.75021 ≤ 1
Location: Ex16 - Welded RHS beam 1000x400 RHS (with shear buckling)

Evaluation of non-dimensional slenderness

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2 : Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma calculates the non-dimensional slenderness parameter lamLT (ALT) and utilises Clause 6.3.2.2 of BS EN 1993-2:2006.

Expression for lamLT (ALT)

The non-dimensional slenderness lamLT (ALT) could be derived from the following expression:

$$ ALT = \left[ \frac{fy \cdot Wy}{Mcr} \right] $$

where,

- Mcr = Elastic critical buckling moment from the analysis
- fy = Yield strength
- Wy = Plastic modulus of the section about y-y axis

Compression flange classification will be taken as Class 1.
The web classification will be taken as Class 1.
The overall section classification is Class 1.

Geometrical parameters

- Eff.length between restraints: LT=8000 mm
- Depth of section: h=1000 mm
- Flange width: b=400 mm
- Top flange thickness: tft=20 mm
- Bottom flange thickness: tfb=20 mm
- Web thickness: tw=16 mm
- Plastic section modulus (yy axis): Wply=18E6 mm³

Design parameters

- Young's modulus: E=210000 N/mm²
- Shear modulus: G=81000 N/mm²
- Yield strength: fy=345 N/mm²

Non-dimensional slenderness (ALT)

- Effective length parameter: K=1
- Length for LTB: LT=LT/1000=8 m
- Critical moment: Mcr=C1*Et*Gt^0.5/10^6=118342 kNm
- Non-dimensional slenderness: lamLT=(Wply*fy/(Mcr*10^6))^0.5=0.22907
Partial factors on strength

Partial factor $\gamma_M 0$  $\text{gamM0}=1.0$
Partial factor $\gamma_M 1$  $\text{gamM1}=1.1$

Lateral torsional buckling

The design lateral torsional buckling resistance moment ($MbRd$) will be calculated. Section under consideration is a welded section and EC3 Part 1-1 Clause 6.3.2.2 expressions will be adopted.

Limiting slenderness value  $\text{lamLT0}=0.2$
According to the NA to BS EN 1993-1-1, Tables 6.3 and 6.4 could be used with Clause 6.3.2.2 to determine the imperfection factor $\alphaLT$.  

Imperfection value  $aLT=0.76$ (curve d)
Modified $\text{ChiLT}$ factor  $\text{ChiLT}=\chiLT/f=0.97724$

Design buckling resistance moment $MbRd=\text{ChiLT}^*Wply^*fy/(\text{gamM1}*10^6)$

$$=5517 \text{ kNm}$$

Interaction equation for moments

The beam is assumed to be without longitudinal stiffeners. The design resistance for bending about the major axis as per Clause 6.2.5(2) of BS EN 1993-2:2006 is as follows:

Design moment resistance  $McRd=Wply^*fy/(\text{gamM0}*10^6)=6210 \text{ kNm}$
As $MbRd \leq McRd$ ( 5517 kNm $\leq$ 6210 kNm ), the lateral torsional buckling resistance will be adopted.

Design moment from analysis  $MEd=1600 \text{ kNm}$

Unity factor  $\text{unity}=MEd/MbRd=0.29001$
As $MEd \leq MbRd$ ( 1600 kNm $\leq$ 5517 kNm ), section chosen is considered to be suitable.

Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners

The shear resistance of a web under pure shear will be evaluated. As $hw/tw > 72e/n$ ( 60 $> 59.423$ ), beam is susceptible to shear buckling as there are no web transverse stiffeners except at supports.

Shear-moment interaction

Design shear force (coexisting)  $VEd=2300 \text{ kN}$

Plastic moment resistance  $MplRd=Wply^*fy/(\text{gamM0}*1E6)=6210 \text{ kNm}$

Design shear buckling resistance assuming no contribution from the flanges is given by expression 5.2 (EC3 Part 1-5):

$$VbwRd=\chiw^*fy^*hw^*tw/(\text{gamM1}*SQR(3))/1000=2743.6 \text{ kN}$$

Shear ratio $n1$  $\text{eta1}=MEd/MplRd=0.25765$

Plastic moment resistance ignoring the web is:

$$Mfrd=(Wply-Aw^2/(4*tw))^*fy/(\text{gamM0}*1E6)=206.72 \text{ kNm}$$

Expression 7.1  $u1=\text{eta1}+(1-Mfrd/MplRd)*(2*eta3-1)^2=0.70023$

$\leq 1$ hence OK.

Provide web transverse stiffeners at supports.

Evaluation of non-dimensional slenderness

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2 : Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma calculates the non-dimensional slenderness parameter lamLT (\(\lambdaLT\)) from an elastic buckling analysis of the structure.

Expression for lamLT (\(\lambdaLT\))

The non-dimensional slenderness lamLT (\(\lambdaLT\)) could be derived from the following expression:

\[
\lambdaLT = \frac{f_y W_y}{M_{cr}}
\]

where,

- \(M_{cr}\) = Elastic critical buckling moment from the analysis
- \(f_y\) = Yield strength
- \(W_y\) = Plastic modulus of the section about y-y axis

Geometrical and design parameters

Section is not symmetrical about either axis (Tee section).
Section under consideration is a Hot Rolled section.
Eff.length between restraints \(LT=4000\) mm
Depth of section \(h=200\) mm
Width of section \(b=150\) mm
Plate thickness \(t_f=18\) mm
Web thickness \(t_w=18\) mm
Yield strength \(f_y=345\) N/mm²
Section classification \(\text{class}=3\)
The overall section classification will be taken as Class 3.
Elastic section modulus \(W_{ley}\) \(=174000\) mm³

Bending moment \(M_{cr}\)
Non-dimensional slenderness \(\lambdaLT\)

\(\lambdaLT=SQR(f_y W_{ley}/(M_{cr}\times1E6))=0.63261\)

Partial factors on strength

Partial factor \(\gamma M_0\) \(\gamma M_0=1.0\)
Partial factor \(\gamma M_1\) \(\gamma M_1=1.1\)

Lateral torsional buckling

The design lateral torsional buckling resistance moment \((M_{Brd})\) will be calculated. Section under consideration is a Hot Rolled section and EC3 Part 1-1 Clause 6.3.2.3 expressions will be adopted.
Limiting slenderness value \(\lambdaLT_0=0.4\)
According to the NA to BS EN 1993-1-1, for all other Hot-Rolled sections the imperfection value is as follows:
Imperfection value  aLT=0.76 (curve d)
Modified chiLT factor  ChiLT=chiLT/f=0.81062
Design buckling resistance moment  MbRd=ChiLT*Wely*fy/(gamM1*10^6)
=44.238 kNm

Interaction equation for moments

The beam is assumed to be without longitudinal stiffeners. The design resistance for bending about the major axis as per Clause 6.2.5(2) of BS EN 1993-2:2006 is as follows:
Design moment resistance  McRd=Wely*fy/(gamM0*10^6)=60.03 kNm
As MbRd ≤ McRd (44.238 kNm ≤ 60.03 kNm), the lateral torsional buckling resistance will be adopted.
Design moment from analysis  MEd=40 kNm
Unity factor  unity=MEd/MbRd=0.90421
As MEd ≤ MbRd (40 kNm ≤ 44.238 kNm), section chosen is considered to be suitable.

Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners

The shear resistance of a web under pure shear will be evaluated. As hw/tw ≤ 72r/η (10.111 ≤ 59.423), the beam is considered to be stable against shear buckling.

Shear-moment interaction

Design shear force (coexisting)  VEd=300 kN
The value of parameter η (η) is as per the NA to BS EN 1993-1-5.
Value of η from Clause 5.1(2)  η=1
Plastic shear resistance  VplRd=ηAw*fy/(gamM0*SQR(3))/1000
=652.53 kN
As VEd ≤ 0.5*VplRd, the design shear will not reduce the design resistance moment. Hence OK.

DESIGN                  SUMMARY
Design moment       40 kNm  Design shear      300 kN
Yield strength of steel  345 N/mm²  Depth of beam     200 mm

Determine the effective section properties - EN 1992-1-5, Cl. 4.4

The process is iterative as the amount of web not considered is a function of the stresses at the top and bottom of the web.

Iteration 1:
Gross area of section A=2*b*tf+hw*tw=50200 mm^2
Gross 2nd moment of area Iy=(b*(hw+2*tf)^3-(b-tw)*hw^3)/12 =12.126E9 mm^4
Stress at top of web s1=MyEd*10^6*hw/2/Iy=131.73 N/mm^2
Stress at bottom of web s2=-MyEd*10^6*(zeff-tf)/Iyeff=-131.68 N/mm^2

Iteration 10 :
Position of effective centroid: zeff=(A*h/2-Aw*(zeffp+be2+lw/2))/Aeff=549.48 mm
Effective 2nd moment of area: Iyeff=Iy+A*(h/2-zeff)^2-tw*lw^3/12-Aw*(zeffp+be2+lw/2-zeff)^2 =12.118E9 mm^4
Top of web stress s1(10)=MyEd*10^6*(h-tf-zeff)/Iyeff =131.95 N/mm^2
Bottom of web stress s2(10)=-MyEd*10^6*(zeff-tf)/Iyeff =-131.68 N/mm^2
Net loss area Aw=lw*tw=85.988 mm^2
Effective area of section Aeff=A-Aw=50114 mm^2
Effective section modulus
Weffy=\text{Iyeff}/(1000*(h-zeff))=22011 \text{ cm}^3

Design parameters

Design moment (major axis) \quad MyEd=3132 \text{ kNm}
Coefficient C1 \quad C1=1
Young's modulus \quad E=210000 \text{ N/mm}^2
Shear modulus \quad G=80768 \text{ N/mm}^2
Yield strength \quad fy=345 \text{ N/mm}^2

Expression for \( \lambda_{\text{LT}} \) (\( \lambda_{\text{ALT}} \))

The clause references in this section are as per Appendix C of SCI P356.
2nd moment of area (comp flange) \quad Izc=416E6 \text{ mm}^4
2nd moment of area (tens. flange) \quad Izt=416E6 \text{ mm}^4
For buckling over a half wavelength \( L_w \) the parameter \( V \) is as given by the expression below:

\[
V = ((4*a*(1-a)+0.05*\lambda_{\text{F}}^2+\text{psia}^2)^{0.5}+\text{psia})^{-0.5}=0.70174
\]

Parameter from C.4.5 \quad \omega=\pi^2*df^2*E*Iz/(G*It*Lw^2)
compute \quad \text{comp}1=\text{SQR}(4+tee*\omega)+\text{psia} \\
\quad \text{SQR}(\omega)=2.3267
Parameter from C.4.5 \quad \text{Veq}=(2*a*\omega/\text{comp}1^2)^{0.25}=0.71485

The restraint parameter is calculated from the following expression as given in SCI publication P356:

\[
rp = \left( \frac{\text{Veq}^4*Lw^3}{E*Izc*\omega*R*df^2*(1-a)} \right)
\]

Rotation of restraint \( \theta_R \) \quad \theta_R=27.06E-12 \text{ rad/Nmm}
Restrainment parameter:

\[
rp=\text{Veq}^4*Lw^3/(E*Izc*\omega*R*df^2*(1-a))=4316.4 \text{ rad/Nmm}
\]
Longest unbraced length \quad Lr=LT=8200 \text{ mm}
Plastic section modulus (yy axis) \quad Wply=23.88E6 \text{ mm}^3
Effect section modulus (yy axis) \quad Weffy=22.011E6 \text{ mm}^3
Beta \( \beta_w \) \quad \text{betaw}=\text{Weffy}/Wply=0.92173
Section property from C.1 \quad U=1
Non-dimensional slenderness \( \lambda_{\text{LT}} \):

\[
\lambda_{\text{LT}}=1/(C1)^{0.5}*U*V*D*\lambda_{\text{SQR}}(\text{betaw})=0.87387
\]

Partial factors on strength

Partial factor \( \gamma_{M0} \) \quad \text{gamM0}=1.0
Partial factor \( \gamma_{M1} \) \quad \text{gamM1}=1.1

Lateral torsional buckling

The design lateral torsional buckling resistance moment (\( M_{\text{BrD}} \)) will be calculated. Section under consideration is a welded section and EC3 Part 1-1 Clause 6.3.2.2 expressions will be adopted.
Limiting slenderness value \( \lambda_{\text{LT0}}=0.2 \)
According to the NA to BS EN 1993-1-1, Tables 6.3 and 6.4 could be used with Clause 6.3.2.2 to determine the imperfection factor \( \alpha_{\text{LT}} \).
Imperfection value  
Modified chiLT factor  
Design buckling resistance moment $M_{bRd} = \frac{\text{ChiLT} \times W_{effy} \times f_y}{(\gamma_{M1} \times 10^6)}$

$$= 3698.2 \text{ kNm}$$

**Interaction equation for moments**

The beam is assumed to be without longitudinal stiffeners. The design resistance for bending about the major axis as per Clause 6.2.5(2) of BS EN 1993-2:2006 is as follows:

- **Design moment resistance** $M_{cRd} = \frac{W_{effy} \times f_y}{(\gamma_{M0} \times 10^6)} = 7593.8 \text{ kNm}$

As $M_{bRd} \leq M_{cRd}$ ($3698.2 \text{ kNm} \leq 7593.8 \text{ kNm}$), the lateral torsional buckling resistance will be adopted.

- **Unity factor** $\text{unity} = \frac{M_{Ed}}{M_{bRd}} = 0.84689$

As $M_{Ed} \leq M_{bRd}$ ($3132 \text{ kNm} \leq 3698.2 \text{ kNm}$), section chosen is considered to be suitable.

**Shear resistance of a web of a beam with transverse stiffeners at supports and with or without intermediate transverse stiffeners**

The shear resistance of a web under pure shear will be evaluated. Beam will be stable against shear buckling due to the presence of closely spaced web transverse stiffeners.

**Shear-moment interaction**

- **Design shear force (coexisting)** $V_{Ed} = 500 \text{ kN}$

The value of parameter $\eta$ is as per the NA to BS EN 1993-1-5.

- **Value of $\eta$ from Clause 5.1(2)** $\eta = 1$

- **Plastic shear resistance** $V_{plRd} = \eta \times A_w \times f_y / (\gamma_{M0} \times SQR(3)) / 1000$

$$= 2031.7 \text{ kN}$$

As $V_{Ed} \leq 0.5 \times V_{plRd}$, the design shear will not reduce the design resistance moment. Hence OK.

\(f_y=345\) N/mm\(^2\)

Design strength of fillet weld  
\(f_{wcd}=f_u/(3^0.5*betw*gamM2)=241.2\) N/mm\(^2\)

Check web thickness

Limiting web thick for service  
\(t_{lim}=hw/250=4.8\) mm

Web thickness exceeds limiting value for serviceability, hence OK.

Limiting web thick flange buckl  
\(t_{lim}=(hw/250)*(f_y/345)=4.8\) mm

Web thickness exceeds limiting value for flange buckling, hence OK.

Bearing stiffeners double sided - BS EN 1993-1-5 section 9

Bearing stiffeners are assumed to be symmetric about the beam web and will be designed as a strut to BS EN 1993-1-5 Clause 9.4(2), resisting the bearing reaction together with any eccentricities.

compute \(k_t\) from Annex A  
\(k_t=5.34\)
Web shear resistance \( V_{bRd} = \chi_{iw} \cdot f_y \cdot h_w \cdot t_w / (\sqrt{3} \cdot \gamma_{M1} \cdot 1000) = 1801.4 \text{ kN} \)

Design bearing reaction \( N_{bEd} = 1800 \text{ kN} \)

**Action as a bearing stiffener**

![Diagram of stiffeners and bearing elements]

NOTE: Stiffeners to be equally spaced about the centreline of bearing.

Depth of bearing stiffener \( h_{sb} = 150 \text{ mm} \)

Thickness of bearing stiffener \( t_{sb} = 20 \text{ mm} \)

Distance \( c_1 = 325 \text{ mm} \)

Distance between stiffener CL's \( c_2 = 300 \text{ mm} \)

Eccentricity in each direction \( \epsilon_c = 10 \text{ mm} \)

Worst stress in web plate:

\[
sw_{p} = N_{bEd} \cdot 1E3 / A + M_{zEd} \cdot 1E6 \cdot (15 \cdot e_{w} \cdot t_{w} + t_{sb} / 2 + c_{2} / 2) / (I_{zz})
\]

\[
= 101.57 \text{ N/mm}^2
\]

Worst stress in stiffener:

\[
\text{comp}_1 = N_{bEd} \cdot 1E3 / A = 90.846 \text{ N/mm}^2
\]

\[
\text{comp}_2 = M_{zEd} \cdot 1E6 \cdot (c_{2} / 2 + t_{sb} / 2) / (I_{zz}) = 5.4915 \text{ N/mm}^2
\]

\[
\text{comp}_3 = M_{yEd} \cdot 1E6 \cdot (h_{sb} + t_{w} / 2) / (I_{yy}) = 27.648 \text{ N/mm}^2
\]

Stiffener stress \( s_{st} = \text{comp}_1 + \text{comp}_2 + \text{comp}_3 = 123.99 \text{ N/mm}^2 \)

**Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)**

Expression 9.3 in EN 1993-1-5 is further simplified by Table 2.6 in "Eurocode 3: Design of steel structures Part 1-5: Design of plated structures" ECCS Eurocode Design Manuals.

Ratio \( p = h_{sb} / t_{sb} = 7.5 \)

Limit to ratio \( p = h_{sb} / t_{sb} \) is \( 13 \epsilon = 10.729 \).

Ratio \( h_{sb} / t_{sb} = 7.5 \) is not greater than limit \( 13 \epsilon = 10.729 \).

Stiffener complies with Clause 9.2.1(8).

**Action as a rigid end post**

A rigid end post comprise of two double-sided transverse stiffeners that form the flanges of a short beam of length \( h_w \). The effective section below will be taken to exclude the outer parts of web plate.

![Diagram of stiffeners and web elements]
Minimum area  
Actual area provided  
As Asp ≥ Amin ( 6000 mm² ≥ 2500 mm² ), stiffener area is adequate.  
In-plane moment  
End post 2nd moment of area  
Worst stiffener stress from membrane action will be calculated below.  
Stress due to membrane action  

Cross-section resistance check

The maximum stresses from membrane action and bearing reaction will be added together here for simplicity, even though they occur at different heights on the stiffener.  
Total stress  
As sstT ≤ fy ( 211.29 N/mm² ≤ 345 mm² ), stiffener is OK.

Buckling check under combined bending and axial load

SCALE 5.48 Office 1007 Proforma 381
DESIGN SUMMARY

Span of plate girder: L=12 m
All steel to be: Grade S 355

End stiffeners: c2

Posts 1 & 2 are double-sided:
- Post 1: 150 mm x 20 mm flats
- Post 2: 150 mm x 20 mm flats

Note: All welds to be 6 mm FW of design strength of 241 N/mm².
Assume rigid end posts to BS EN 1993-1-5, Fig 5.1 & Table 5.1.
Location: Ex2 - Two double-sided bearing stiffeners at support

Bearing stiffeners at end support

The proforma is in accordance with BS EN 1993-2:2006 " EC3 Design of Steel Structures - Part 2:Steel bridges ", the NA to BS EN 1993-2:2006 and BS EN 1993-1-5 section 9.
A rigid end post is assumed in the design which comprise of two double sided transverse stiffeners that form the flanges of a short beam of length hw, as highlighted in BS EN 1993-1-5 Clause 9.3.1(2).

Span of girder                    L=20 m
Depth of girder between flanges   hw=1950 mm
Flange thickness                  tf=30 mm
Web thickness                     tw=18 mm
Assumed stiffener thickness       ts=20 mm
Stiffener corner snipe            snp=15 mm

Partial factors for resistance

Partial factor                    gamM1=1.1
Partial factor (welds)            gamM2=1.25

Strength of steel

Steel grade                       S 275
Yield strength (web)              fyw=265 N/mm²
Yield strength (stiffener)        fys=265 N/mm²
Yield strength to be adopted      fy=265 N/mm²
Design strength of fillet weld    fvwd=fu/(3^0.5*bettw*gamM2)  =222.79 N/mm²

Check web thickness

Stiffener spacing of first panel  ae=1500 mm
Intermediate stiffener spacing   ai=3000 mm
Limiting web thick for service   tlim=hw/250=7.8 mm
Web thickness exceeds limiting value for serviceability, hence OK.
Limiting web thick flange buckl  tlim=(hw/250)*(fy/345)=5.9913 mm
Web thickness exceeds limiting value for flange buckling, hence OK.

Bearing stiffeners double sided - BS EN 1993-1-5 section 9

Bearing stiffeners are assumed to be symmetric about the beam web and will be designed as a strut to BS EN 1993-1-5 Clause 9.4(2), resisting the bearing reaction together with any eccentricities.
compute $kt$ from Annex A

$$kt = 4 + 5.34 \times (hw/a)^2 + ktsl = 13.025$$

Web shear resistance

$$V_{bRd} = \chi_w f_y \frac{hw \times tw}{(\sqrt{3}) \times \text{gamM1} \times 1000} = 4754.2 \text{ kN}$$

Design bearing reaction

$$Nb_{Ed} = 3590 \text{ kN}$$

**Action as a bearing stiffener**

Two double-sided stiffeners at

Support

**NOTE:** Stiffeners to be equally spaced about the centreline of bearing.

Depth of bearing stiffener $hsb = 225 \text{ mm}$

Thickness of bearing stiffener $tsb = 20 \text{ mm}$

Distance $c1 = 0 \text{ mm}$

Distance between stiffener CL's $c2 = 300 \text{ mm}$

Eccentricity in each direction $ecc = 10 \text{ mm}$

Worst stress in web plate:

$$swp = Nb_{Ed} \times 1E3/A + M_{zEd} \times 1E6 \times (15 \times ew \times tw + tsb/2 + c2/2)/(I_{zz})$$

$$= 148.27 \text{ N/mm}^2$$

Worst stress in stiffener:

$$\text{comp1} = Nb_{Ed} \times 1E3/A = 126.69 \text{ N/mm}^2$$

$$\text{comp2} = M_{zEd} \times 1E6 \times (c2/2 + tsb/2)/(I_{zz})$$

$$= 8.336 \text{ N/mm}^2$$

$$\text{comp3} = M_{yEd} \times 1E6 \times (hsb + tw/2)/(I_{yy})$$

$$= 24.586 \text{ N/mm}^2$$

Stiffener stress $sst = \text{comp1} + \text{comp2} + \text{comp3} = 159.61 \text{ N/mm}^2$

**Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)**

Expression 9.3 in EN 1993-1-5 is further simplified by Table 2.6 in "Eurocode 3: Design of steel structures Part 1-5: Design of plated structures" ECCS Eurocode Design Manuals.

Ratio $(hsb/tsb)$ $p = hsb/tsb = 11.25$

Limit to ratio $p = (hsb/tsb)$ is $13\varepsilon = 12.242$.

Ratio $(hsb/tsb) = 11.25$ is not greater than limit $13\varepsilon = 12.242$.

Stiffener complies with Clause 9.2.1(8).

**Action as a rigid end post**

A rigid end post comprise of two double-sided transverse stiffeners that form the flanges of a short beam of length $hw$. The effective section below will be taken to exclude the outer parts of web plate.

Two double-sided stiffeners at

Support
Minimum area
Actual area provided
As Asp ≥ Amin (9000 mm² ≥ 8424 mm²), stiffener area is adequate.
In-plane moment

DESIGN SUMMARY

Span of plate girder  L = 20 m
All steel to be    Grade S 275

End stiffeners:  c2 ae

Posts 1 & 2 are double-sided c2=300 mm
stiffeners at ae=1500 mm end of girder.

Double-sided stiffeners: post 1  2No/225 mm x 20 mm flats
                      post 2  2No/225 mm x 20 mm flats

Note: All welds to be 6 mm FW of design strength of 222 N/mm². Assume rigid end posts to BS EN 1993-1-5, Fig 5.1 & Table 5.1.
Location: Ex3 - Single double-sided bearing stiffener at support

Bearing stiffeners at end support

The proforma is in accordance with BS EN 1993-2:2006 " EC3 Design of Steel Structures - Part 2:Steel bridges ", the NA to BS EN 1993-2:2006 and BS EN 1993-1-5 section 9.
A non-rigid end post is assumed in the design which comprise of a single double sided transverse stiffener of length hw, as highlighted in BS EN 1993-1-5 Clause 9.3.1(2).

Span of girder \( L = 12 \) m
Depth of girder between flanges \( hw = 1200 \) mm
Flange thickness \( tf = 30 \) mm
Web thickness \( tw = 12.5 \) mm
Assumed stiffener thickness \( ts = 20 \) mm
Design bearing reaction \( NbEd = 1825 \) kN
Stiffener corner snipe \( snp = 15 \) mm

Partial factors for resistance

Partial factor \( \gamma_{M1} = 1.1 \)
Partial factor (welds) \( \gamma_{M2} = 1.25 \)

Strength of steel

Steel grade \( S\ 355 \)
Yield strength (web) \( f_{yw} = 355 \) N/mm²
Yield strength (stiffener) \( f_{ys} = 345 \) N/mm²
Yield strength to be adopted \( f_y = 345 \) N/mm²
Design strength of fillet weld \( f_{vwd} = f_u / (3^0.5 * \text{betw} * \gamma_{M2}) = 241.2 \) N/mm²

Check web thickness

Stiffener spacing of first panel \( ae = 1500 \) mm
Intermediate stiffener spacing \( ai = 3000 \) mm
Limiting web thick for service \( t_{lim} = hw / 250 = 4.8 \) mm
Web thickness exceeds limiting value for serviceability, hence OK.
Limiting web thick flange buckl \( t_{lim} = (hw / 250) * (fy/345) = 4.8 \) mm
Web thickness exceeds limiting value for flange buckling, hence OK.
Bearing stiffener (double sided non-rigid end post)

It is assumed that the support reaction acts at the centroid of the effective stiffener section, such that there is no bending moment induced. Bearing stiffener consists a single double-sided stiffener. The stiffener effective cross section is as shown below:

One double-sided stiffener at support

Depth of bearing stiffener \( h_{sb} = 150 \text{ mm} \)
Thickness of bearing stiffener \( t_{sb} = 20 \text{ mm} \)
Distance \( c_1 = 300 \text{ mm} \)
Design buckling resistance \( N_{b,Rd} = \chi \ast A_{st} \ast f_{y,sb} / (\gamma_M 1 \ast 1000) = 3156.4 \text{ kN} \)

As \( N_{b,Ed} \leq N_{b,Rd} (1825 \text{ kN} \leq 3156.4 \text{ kN}) \), the design bearing reaction at the support is less than the design buckling resistance. Hence satisfactory.

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)

Expression 9.3 in EN 1993-1-5 is further simplified by Table 2.6 in "Eurocode 3: Design of steel structures Part 1-5: Design of plated structures" ECCS Eurocode Design Manuals.

Ratio \( p = h_{sb} / t_{sb} = 7.5 \)
Limit to ratio \( p = (h_{sb} / t_{sb}) \) is \( 13\gamma = 10.729 \).
Ratio \( (h_{sb} / t_{sb}) = 7.5 \) is not greater than limit \( 13\gamma = 10.729 \).
Stiffener complies with Clause 9.2.1(8).

Connection of stiffeners to girder web

Net stiffener length \( L_{sn} = h_{w} - 2 \ast s_{np} = 1170 \text{ mm} \)
Assumed weld size \( s_{w}' = 6 \text{ mm} \)
Effective length of weld \( L_{w} = 4 \ast (L_{sn} - 2 \ast s_{w}') = 4632 \text{ mm} \)
Design load on weld \( F_{w,Ed} = N_{b,Ed} \ast 10^{-3} / L_{w} = 394 \text{ N/mm} \)
Design weld resistance \( F_{w,Rd} = 0.7 \ast s_{w}'' \ast f_{w,d} = 1013.1 \text{ N/mm} \)

Plastic shear resistance - Clause 6.2.5

Shear area \( A_{vz} = h_{w} \ast t_{w} = 15000 \text{ mm}^2 \)
Plastic shear resistance of web \( V_{pl,Rd} = A_{vz} \ast f_{y} / SQR(3) / (\gamma_M 0 \ast 1000) = 2987.8 \text{ kN} \)

Shear buckling resistance - EN 1993-1-1, Clause 6.2.6(6)

As \( h_{w} / t_{w} > 72 \ast ew (96 > 58.58) \), the web shear buckling resistance needs to be checked (EN 1993-1-5 Clause 5.2 and 5.3).
Buckling coefficient (Annex A) \( \kappa t = 5.34 + 4 \ast (h_{w} / a) \wedge 2 = 7.9 \)
Modified slenderness $\lambda$

$\lambda_{aw} = \frac{hw}{(37.4 \times tw \times ew \times SQR(kt))} = 1.1224$

Shear resistance of web $V_{plRd} = 2987.8 \text{ kN}$

Reduced design shear resistance at support (web contribution only will be considered):

$V_{bwRd} = \chi_{w} \times f_{yw} \times hw \times tw / (3^{0.5} \times \gamma_{M1} \times 1000) = 2066.7 \text{ kN}$

Design shear at support $V_{Ed(0)} = Nb_{Ed} = 1825 \text{ kN}$

As $V_{Ed(0)} \leq V_{bwRd}$ (1825 kN ≤ 2066.7 kN), the shear force is less than the shear resistance. Hence section OK.

**DESIGN SUMMARY**

Span of plate girder $L = 12 \text{ m}$

All steel to be Grade S 355

End stiffener:

Double-sided stiffeners: post 1 1No/150 mm x 20 mm flats

Note: All welds to be 6 mm FW of design strength of 241 N/mm².

Assume non-rigid end posts to BS EN 1993-1-5, Fig 5.1 & Table 5.1.

Interaction between shear force, bending moment and axial force needs to be considered as the actual shear force exceeds $V_{bwRd}/2$. This is check is beyond the scope of this proforma.
**Location: Ex1 - Stiffener A**

**Transverse web stiffeners (Clause 9.13)**

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

The proforma is for transverse web stiffeners other than at supports for webs without longitudinal stiffeners (Clause 9.13).

![Diagram of web with transverse stiffeners]

Elevation on web without longitudinal stiffening

- Panel length 1: \(a(1)=2300\ mm\)
- Panel width: \(b=2274\ mm\)
- Web panels 1 and 2.

Longitudinal stresses in web calculated without any redistribution to the flanges.

- Stress at top of web plate \(\sigma_{top}\): \(stp(1)=73\ N/mm^2\)
- Stress at btm of web plate \(\sigma_{btm}\): \(sbm(1)=-57\ N/mm^2\)

**Axial force due to tension field action (Clause 9.13.3.2)**

- Depth \(d_w\) for panels: \(dw(1)=2274\ mm\)
- Height of any hole: \(hh(1)=0\ mm\)
- Shear force acting on panels: \(V(1)=1450\ kN\)
- Force due to tension field action: \(F_{tw}=F_{tw}(1)=893.18\ kN\)
Axial force representing the destabilizing influence of the web

\[ b_{we} \quad \text{b_{we}} \]

The effective stiffener section should comprise the stiffener section with a portion of web plate of width \( b_{we} \) on each side of the stiffener connection centreline taken as the lesser of:

- 16 times the web thickness = 176 mm
- Half the web panel length = 2300 mm

Geometric properties of effective stiffener section

Second moment of area about centroidal X-X axis.
Second moment of area \( I_{xx} = 38.512 \times 10^6 \) mm\(^4\)
Cross-sectional area \( A_{st} = 10280 \) mm\(^2\)
Nominal yield stress of stiffener \( f_{ys} = 345 \text{ N/mm}^2 \)
Nominal yield stress of web \( f_{yw} = 345 \text{ N/mm}^2 \)
Axial compressive force representing destabilising influence of web assumed to act along the centroidal axis of the stiffener.
Force \( F_{wi1} = l_s^1 l_s^1 t_w^1 k_s^1 f_{R}^1 / (a(3) \times 1000) \) = 137.98 kN

Strength of transverse web stiffeners (Clause 9.13.5)

Section 1:

Yielding of web plate (Clause 9.13.5.1)
Partial factor on yield strength \( \gamma_{mc} = 1.05 \)
Partial factor \( \gamma_{f3} \) \( \gamma_{f3} = 1.1 \)
Equivalent compressive stress in web \( 175.32 \, \text{N/mm}^2 \) does not exceed limiting stress \( 298.7 \, \text{N/mm}^2 \).
Web plate satisfactory for yielding.

**Yielding of stiffener (Clause 9.13.5.2)**

Distance from X-X axis to section at which stress is calculated:
- X-X axis to section on Side 1 \( dx_1(q) = 64.41 \, \text{mm} \)
- X-X axis to section on Side 2 \( dx_2(q) = 124.59 \, \text{mm} \)
- X-X axis to centre of web \( dx_w(q) = 58.91 \, \text{mm} \)
- Second moment of area (X-X axis) \( I_x(q) = 38.512 \times 10^6 \, \text{mm}^4 \)
- Cross-sectional area \( A(q) = 10280 \, \text{mm}^2 \)
- Force in stiffener \( F_{ts}(1) = 0 \, \text{kN} \)
- Applied moment about X-X axis \( M_t(1) = 0 \, \text{kNm} \)

**Transverse stresses in stiffener:**

**Stress \( \sigma_{es} \):**
- Side 1 \( \sigma_{es}(1) = \frac{F(q)}{A(q)} \times 1000 + \frac{M(q) \times dx_1(q)}{I_x(q)} \times 10^6 = 174.89 \, \text{N/mm}^2 \)
- Side 2 \( \sigma_{es}(1) = \frac{F(q)}{A(q)} \times 1000 - \frac{M(q) \times dx_2(q)}{I_x(q)} \times 10^6 = -83.337 \, \text{N/mm}^2 \)

Partial factor on yield strength \( \gamma_{mc} = 1.05 \)
Partial factor \( \gamma_{f3} \) \( \gamma_{f3} = 1.1 \)
Compressive transverse stress in stiffener \( 174.89 \, \text{N/mm}^2 \) does not exceed limiting stress \( 298.7 \, \text{N/mm}^2 \).
Stiffener satisfactory for yielding.
Buckling of effective stiffener section (Clause 9.13.5.3)

Geometric properties of effective stiffener section

Distance from X-X axis to section at which stress is calculated:
- X-X axis to section on Side 1: \( dx_1(q) = 64.41 \text{ mm} \)
- X-X axis to section on Side 2: \( dx_2(q) = 124.59 \text{ mm} \)
- X-X axis to centre of web: \( dx_w(q) = 58.91 \text{ mm} \)

Second moment of area (X-X axis): \( I_{x(q)} = 38.512 \times 10^6 \text{ mm}^4 \)

Cross-sectional area: \( A(q) = 10280 \text{ mm}^2 \)

Force from tension field action: \( F_{tw(1)} = 893.18 \text{ kN} \)

Force from destabilizing effects: \( F_{wi(1)} = 137.98 \text{ kN} \)

Force in stiffener: \( F_{ts(1)} = 0 \text{ kN} \)

Applied moment about X-X axis: \( M_{t(1)} = 0 \text{ kNm} \)

Inequality for buckling:
- Factor Side 1: \( v_1(1) = \frac{F(q) \times 10^3}{A(q) \times \sigma_{ls}} + \frac{M(q) \times 10^6}{Z_{x1(q)} \times \sigma_{sys}} = 0.61045 \)
- Factor Side 2: \( v_2(1) = \frac{F(q) \times 10^3}{A(q) \times \sigma_{ls}} - \frac{M(q) \times 10^6}{Z_{x2(q)} \times \sigma_{sys}} = -0.13802 \)

Partial factor on yield strength: \( g_{mbc} = 1.2 \)

Partial factor gamma3: \( g_f3 = 1.1 \)

Factor \( \frac{1}{(g_{mbc} \times g_f3)} = \frac{1}{(1.2 \times 1.1)} = 0.75758 \)

Hence critical factor for Side 1: 0.61045

Left hand side of inequality 0.61045 is not greater than right hand side 0.75758. Hence stiffener section is OK for buckling.
Location: Ex2 - Stiffener A

Transverse web stiffeners (Clause 9.13)

The calculations are in accordance with BS 5400:Part 3:2000 "Code of Practice for Design of Steel Bridges" as implemented by Departmental Standard BD 13/06.

The proforma is for transverse web stiffeners other than at supports for webs without longitudinal stiffeners (Clause 9.13).

Shear force acting on panel  
V(2)=1200 kN

Force due to tension field action taken as average value from two panels

Force due to tension field action  
Ftw=(Ftw(1)+Ftw(2))/2=572.99 kN

Axial force representing the destabilizing influence of the web

bwe  bwe
|     |     |
---|---|
web

16 times the web thickness =192 mm

Half the web panel length =2150 mm

Axial compressive force representing destabilising influence of web assumed to act along the centroidal axis of the stiffener.

Force  
Fwi1=ls*ls*tw*ks*sigR/(a(3)*1000)  
=172.95 kN

Reduced force  
Fwi1=Fwi1*ns1=172.12 kN

Axial compressive force representing destabilising influence of web assumed to act along the centroidal axis of the stiffener.

Force  
Fwi2=ls*ls*tw*ks*sigR/(a(3)*1000)  
=86.475 kN

Reduced force  
Fwi2=Fwi2*ns2=86.422 kN
Strength of transverse web stiffeners (Clause 9.13.5)

Section 1:

Yielding of web plate (Clause 9.13.5.1)

Geometric properties of effective stiffener section

Distance from:
Force in stiffener \( Fts(1) = 80 \text{ kN} \)
Applied moment about X-X axis \( Mt(1) = 20 \text{ kNm} \)
Dimension \( ys \) \( ys(1) = 1137 \text{ mm} \)
Equivalent long. stress \( \tau_R = 25.573 \text{ N/mm}^2 \)
Partial factor on yield strength \( gmc = 1.05 \)
Partial factor \( gf3 = 1.1 \)
Equivalent compressive stress in web 158.2 N/mm\(^2\) does not exceed limiting stress 298.7 N/mm\(^2\).
Web plate satisfactory for yielding.
Yielding of stiffener (Clause 9.13.5.2)

Distance from X-X axis to section at which stress is calculated:
- X-X axis to section on Side 1: $dx_1(q) = 60$ mm
- X-X axis to section on Side 2: $dx_2(q) = 100$ mm
- X-X axis to centre of web: $dx_w(q) = 60$ mm

Second moment of area (X-X axis): $I_x(q) = 40E6$ mm$^4$

Cross-sectional area: $A(q) = 9760$ mm$^2$

Force in stiffener: $F_{ts}(1) = 80$ kN

Applied moment about X-X axis: $M_t(1) = 20$ kNm

Transverse stresses in stiffener:
- Side 1: $\sigma_{t3}(1) = \frac{F(q)}{A(q)} \times 1000 + \frac{M(q) \times dx_1(q)}{I_x(q)} \times 1E6 = 148.47$ N/mm$^2$
- Side 2: $\sigma_{t4}(1) = \frac{F(q)}{A(q)} \times 1000 - \frac{M(q) \times dx_2(q)}{I_x(q)} \times 1E6 = -69.044$ N/mm$^2$

Partial factor on yield strength: $g_{mc} = 1.05$

Partial factor $\gamma_f3$: $g_f3 = 1.1$

Compressive transverse stress in stiffener 148.47 N/mm$^2$ does not exceed limiting stress 298.7 N/mm$^2$.

Stiffener satisfactory for yielding.
Buckling of effective stiffener section (Clause 9.13.5.3)

Distance from X-X axis to section at which stress is calculated:
- X-X axis to section on Side 1: \(dx_1(q) = 60 \text{ mm}\)
- X-X axis to section on Side 2: \(dx_2(q) = 100 \text{ mm}\)
- X-X axis to centre of web: \(dx_w(q) = 60 \text{ mm}\)

Second moment of area (X-X axis): \(I_x(q) = 40E6 \text{ mm}^4\)
Cross-sectional area: \(A(q) = 9760 \text{ mm}^2\)
Force from tension field action: \(F_{tw}(1) = 572.99 \text{ kN}\)
Force from destabilizing effects: \(F_{wi}(1) = 172.12 \text{ kN}\)
Force in stiffener: \(F_{ts}(1) = 80 \text{ kN}\)
Applied moment about X-X axis: \(M_t(1) = 20 \text{ kNm}\)

Inequality for buckling:
- Factor Side 1: \(v_1(1) = F(q) \times 1E3 / (A(q) \times \sigma_{l,s}) + M(q) \times 1E6 / (2 \times x_1(q) \times \sigma_{y,s}) = 0.53106\)
- Factor Side 2: \(v_2(1) = F(q) \times 1E3 / (A(q) \times \sigma_{l,s}) - M(q) \times 1E6 / (2 \times x_2(q) \times \sigma_{y,s}) = -0.099428\)

Partial factor on yield strength: \(g_{mbc} = 1.2\)
Partial factor \(\gamma_f3\): \(g_f3 = 1.1\)
Factor \(1 / (\gamma_{mbc} \times \gamma_{f3})\): \(w = 1 / (g_{mbc} \times g_f3) = 0.75758\)

Hence critical factor for Side 1: 0.53106
Left hand side of inequality 0.53106 is not greater than right hand side 0.75758. Hence stiffener section is OK for buckling.
Location: Ex1 - Transverse web stiffener

Transverse web stiffeners (BS EN 1993-1-5 section 9)

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma is for transverse web stiffeners other than at supports for webs without longitudinal stiffeners. No rules are given within BS EN 1993-2:2006 for the design of intermediate transverse stiffeners so reference has to be made to BS EN 1993-1-5 section 9.

```
          a(1)   a(2)                  Top flange

hw          Web panel 1          Web panel 2

          a(1)   a(2)                  Bottom flange

design for this stiffener

Elevation on web without longitudinal stiffening
```

Panel length 1  a(1)=4000 mm
Panel width      hw=1200 mm
Length of stiffener  ls=1200 mm
Thickness of web  tw=12 mm
Modulus of elasticity of web  E=210000 N/mm²
Stiffener corner snipe  snp=15 mm

Web panels 1 & 2:

```
          \sigma_{top}   \sigma_{btm}

ls          Longitudinal stresses in web with transverse stiffeners

ls=1200 mm

Compression stresses are positive

Stress at top of web plate (\sigma_{top}) \sigma_{top}=200 N/mm²
Stress at btm of web plate (\sigma_{btm}) \sigma_{btm}=-200 N/mm²
```

Design parameters

- Depth of stiffener: $h_s = 150$ mm
- Stiffener thickness: $t_s = 15$ mm
- Yield strength (web): $f_{yw} = 355$ N/mm$^2$
- Yield strength (stiffener): $f_{ys} = 355$ N/mm$^2$

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)

Expression 9.3 in EN 1993-1-5 is further simplified by Table 2.6 in "Eurocode 3: Design of steel structures Part 1-5: Design of plated structures" ECCS Eurocode Design Manuals.

Yield strength to be adopted $f_y = 355$ N/mm$^2$

Strain value $\varepsilon$ (EC3 Part 1-1) $\varepsilon = \sqrt{235/f_{yw}} = 0.81362$

Strain value $\varepsilon$ (EC3 Part 1-1) $\varepsilon = \sqrt{235/f_{ys}} = 0.81362$

Ratio $(h_s/t_s)$ $p = h_s/t_s = 10$

Limit to ratio $p = (h_s/t_s)$ is $13\varepsilon = 10.577$.

Ratio $(h_s/t_s) = 10$ is not greater than limit $13\varepsilon = 10.577$.

Stiffener complies with Clause 9.2.1(8).

Design shear resistance (single-sided transverse stiffener)

The effective cross section of the intermediate single-sided transverse stiffener is as shown below:

$$
\begin{align*}
&\text{tsi} & & 15.\varepsilon \cdot tw & & 15.\varepsilon \cdot tw \\
&tw & & & & \\
&hsi & & \text{PLAN ON INTERMEDIATE STIFFENER}
\end{align*}
$$

2nd moment of area $yy$ axis $I_{yy} = I_{pro} = 13.438E6$ mm$^4$

Design shear resistance $V_{bRd} = \chi \cdot A_e \cdot f_{yw} / (\gamma_M 1 \cdot 1000) = 1871.9$ kN

Axial force in the stiffener due to shear - BS EN 1993-1-5

Shear buckling coefficient for web panel $k_t$ is derived from Clause 5.2.

Buckling coefficient (Annex A) $k_t = 5.34 + 4 \cdot (h_w/a)^2 = 5.7$

Modified slenderness $\lambda_w = 0.76 \cdot (f_y/t_{cr}) \cdot 0.5 = 1.3767$

Max design shear force in panel $V_{Ed1} = 1700$ kN

Externally applied design load $P_{ext1} = 0$ kN

Option 1:

Longitudinal compressive stress $\sigma_{Ed} = 0$ for symmetrical sections.

Vertical force generated in stiffener arising from the shear induced tension field (see older version of NA to BS EN 1993-1-5:2006):

$$PE_{d1}' = V_{Ed1} \cdot hw \cdot tw \cdot 0.8 \cdot t_{cr} / 1000 = 453.7 \text{ kN}$$

Option 2:

Vertical force generated in the stiffener as per BS EN 1993-1-5 (see NOTE, Clause 9.3.3(3)):

$$PE_{d1} = V_{Ed1} \cdot f_{yw} \cdot hw \cdot tw / (SQR(3) \cdot \gamma_M 1 \cdot \lambda_w^2 \cdot 1000) = 284.36 \text{ kN}$$
Generated force to be adopted \[ P_{Ed1} = 453.7 \text{ kN} \]

Design axial load in stiffener \[ P_{Ed} = P_{Ed1} + P_{ext1} = 453.7 \text{ kN} \]

As \( P_{Ed} \leq V_{bRd} \) (453.7 kN \leq 1871.9 kN), the design shear force does not exceed the shear resistance. Hence OK.

**Connection to the web**

Design shear load on weld \[
F_{wEd} = tw^2/(5*hs) + P_{Ed}/(hw-2*snp)
\]

\[
= 0.57978 \text{ kN/mm}
\]

Weld size required \[ s_{ww} = F_{wEd} * 10^3/(2*0.7*fvwd) = 1.7169 \text{ mm} \]

Weld size provided \[ s_{w1} = 6 \text{ mm} \]

**Stiffness check - Clause 9.3.3(3)**

2nd moment of area (effe. section) \[ I_{pro} = 13.438E6 \text{ mm}^4 \]

2nd moment of area required \[ I_{req} = 0.75*hw*tw^3 = 1.5552E6 \text{ mm}^4 \]

As \( I_{req} \leq I_{pro} \) (1.5552E6 mm^4 \leq 13.438E6 mm^4), the stiffener is OK.

\[ tw=12 \, \text{mm} \]
\[ E=210000 \, \text{N/mm}^2 \]
\[ \text{snp}=15 \, \text{mm} \]

Web panels 1 & 2:

Longitudinal stresses in web with transverse stiffeners

\[ ls=1200 \, \text{mm} \]

Compression stresses are positive

Stress at top of web plate (\( \sigma_{\text{top}} \)) \( \text{stop}=200 \, \text{N/mm}^2 \)

Stress at btm of web plate (\( \sigma_{\text{btm}} \)) \( \text{sbtm}=-200 \, \text{N/mm}^2 \)
Design parameters

Depth of stiffener \( h_s = 150 \, \text{mm} \)
Stiffener thickness \( t_s = 15 \, \text{mm} \)
Yield strength (web) \( f_yw = 355 \, \text{N/mm}^2 \)
Yield strength (stiffener) \( f_y = 355 \, \text{N/mm}^2 \)

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)

Expression 9.3 in EN 1993-1-5 is further simplified by Table 2.6 in "Eurocode 3: Design of steel structures Part 1-5: Design of plated structures" ECCS Eurocode Design Manuals.

Yield strength to be adopted \( f_y = 355 \, \text{N/mm}^2 \)
Strain value \( \varepsilon \) (EC3 Part 1-1) \( \varepsilon_w = \sqrt{\frac{235}{f_yw}} = 0.81362 \)
Strain value \( \varepsilon \) (EC3 Part 1-1) \( \varepsilon_s = \sqrt{\frac{235}{f_y}} = 0.81362 \)
Ratio \( (h_s/t_s) \) \( p = h_s/t_s = 10 \)
Limit to ratio \( p = (h_s/t_s) \) is \( 13\varepsilon = 10.577 \).
Ratio \( (h_s/t_s) = 10 \) is not greater than limit \( 13\varepsilon = 10.577 \).
Stiffener complies with Clause 9.2.1(8).

Design shear resistance (double sided transverse stiffener)

The effective cross section of the intermediate double-sided transverse stiffener is as shown below:

\[
\begin{align*}
\text{tsi} & \quad \text{15}\varepsilon\cdot\text{tw} & \quad \text{15}\varepsilon\cdot\text{tw} \\
\text{hsi} & \quad \text{tw} & \quad \text{PLAN ON INTERMEDIATE} \\
& & \quad \text{hsi} \quad \text{STIFFENER}
\end{align*}
\]

2nd moment of area \( yy \) axis:
\[
I_{yy} = t_s i \times (2 \times h_s i \times t_w + 3 \times 12 + (30 \times \varepsilon_w \times t_w) \times t_w \times 3 \times 12
= 38,006E6 \, \text{mm}^4
\]

Design shear resistance \( V_{b Rd} = \frac{\chi_i \times A_e \times f_y w}{\gamma_M 1 \times 1000} = 2644.7 \, \text{kN} \)

Axial force in the stiffener due to shear - BS EN 1993-1-5

Shear buckling coefficient for web panel \( k_t \) is derived from Clause 5.2.
Buckling coefficient (Annex A) \( k_t = 5.34 + 4 \times (h_w / a) \times 2 = 5.7 \)
Modified slenderness \( \lambda_w \) \( \lambda_w = 0.76 \times (f_y / t_c r) \times 0.5 = 1.3767 \)
Max design shear force in panel \( V_{Ed1} = 1450 \, \text{kN} \)
Externally applied design load \( P_{ext1} = 0 \, \text{kN} \)

Option 1:
Longitudinal compressive stress \( \sigma_x Ed = 0 \) for symmetrical sections.
Vertical force generated in stiffener arising from the shear induced tension field (see older version of NA to BS EN 1993-1-5:2006):
\[
P_{Ed1} = V_{Ed1} - h_w \times t_w \times 0.8 \times t_c r / 1000 = 203.7 \, \text{kN}
\]
Option 2:
Vertical force generated in the stiffener as per BS EN 1993-1-5
(see NOTE, Clause 9.3.3(3)):
\[
\text{PEd1}=\frac{VEd1-fyw*hw*tw}{(SQR(3))*gamM1*lamw^2*1000}=34.359 \text{ kN}
\]
Generated force to be adopted \( \text{PEd1}=203.7 \text{ kN} \)
Design axial load in stiffener \( \text{PEd}=\text{PEd1}+\text{Pext1}=203.7 \text{ kN} \)
As \( \text{PEd} \leq \text{VbRd} \) (203.7 kN \( \leq \)  2644.7 kN ), the design shear force does not exceed the shear resistance. Hence OK.

**Connection to the web**

Design shear load on weld
\[
\text{FwEd}=\frac{tw^2}{5*hs}+\frac{\text{PEd}}{2*(hw-2*snp)}=0.27905 \text{ kN/mm}
\]
Weld size required \( \text{sww}=\frac{\text{FwEd}*10^3}{2*0.7*fvwd}=0.82636 \text{ mm} \)
Weld size provided \( \text{sw1}=6 \text{ mm} \)

**Stiffness check - Clause 9.3.3(3)**

2nd moment of area (effe.section) \( \text{Ipro}=38.006E6 \text{ mm}^4 \)
2nd moment of area required \( \text{Ireq}=0.75*hw*tw^3=1.5552E6 \text{ mm}^4 \)
As \( \text{Ireq} \leq \text{Ipro} \) (1.5552E6 mm\(^4\) \( \leq \) 38.006E6 mm\(^4\) ), the stiffener is OK.

Transverse web stiffeners (BS EN 1993-1-5 section 9)

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma is for transverse web stiffeners other than at supports for webs without longitudinal stiffeners. No rules are given within BS EN 1993-2:2006 for the design of intermediate transverse stiffeners so reference has to be made to BS EN 1993-1-5 section 9.

---

Elevation on web without longitudinal stiffening

- Panel length 1: a(1) = 1967 mm
- Panel width: hw = 1000 mm
- Length of stiffener: ls = 1000 mm
- Thickness of web: tw = 14 mm
- Modulus of elasticity of web: E = 210000 N/mm²
- Stiffener corner snipe: snp = 15 mm

Web panels 1 & 2:

- Longitudinal stresses in web with transverse stiffeners
  - ls = 1000 mm
- Compression stresses are positive
- Stress at top of web plate (σtop) stop = 277 N/mm²
- Stress at btm of web plate (σbtm) sbtm = -242 N/mm²
Design parameters

Depth of stiffener         hs=200 mm
Stiffener thickness       ts=20 mm
Yield strength (web)      fyw=355 N/mm²
Yield strength (stiffener) fys=345 N/mm²

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)

Expression 9.3 in EN 1993-1-5 is further simplified by Table 2.6 in "Eurocode 3: Design of steel structures Part 1-5: Design of plated structures" ECCS Eurocode Design Manuals.

Yield strength to be adopted    fy=345 N/mm²
Strain value \( \varepsilon \) (EC3 Part 1-1)    \( \varepsilon_w = \sqrt{235/fyw} = 0.81362 \)
Strain value \( \varepsilon \) (EC3 Part 1-1)    \( \varepsilon_s = \sqrt{235/fys} = 0.82532 \)
Ratio (hs/ts)                   \( p = \frac{hs}{ts} = 10 \)
Limit to ratio \( p = \frac{hs}{ts} \) is 13\( \varepsilon \)=10.729.
Ratio (hs/ts)=10 is not greater than limit 13\( \varepsilon \)=10.729.
Stiffener complies with Clause 9.2.1(8).

Design shear resistance (double sided transverse stiffener)

The effective cross section of the intermediate double-sided transverse stiffener is as shown below:

2nd moment of area \( yy \) axis:
\[
I_{yy} = tsi * (2*hsi+tw)^3/12 + (30*ew*tw)*tw^3/12 \\
= 118.34E6 \text{ mm}^4
\]

Design shear resistance
\[
V_{brd} = \frac{\chi_i*Ae*fys1}{(\gamma_{M1}*1000)} \\
= 4097.4 \text{ kN}
\]

Axial force in the stiffener due to shear - BS EN 1993-1-5

Shear buckling coefficient for web panel \( k_t \) is derived from Clause 5.2.
Buckling coefficient (Annex A) \( k_t = 5.34 + 4*(hw/a)^2 = 6.3738 \)
Modified slenderness \( \lambda_w \) \( \lambda_w = hw/(37.4*tw*ew*\sqrt{kt}) = 0.92978 \)
Max design shear force in panel \( V_{Ed1} = 2511 \text{ kN} \)
Externally applied design load \( P_{ext1} = 0 \text{ kN} \)

Option 1:
Longitudinal compressive stress \( \sigma_{Ed} = 0 \) for symmetrical sections.
Vertical force generated in stiffener arising from the shear induced tension field (see older version of NA to BS EN 1993-1-5:2006):
\[
P_{Ed1}' = V_{Ed1} - hw*tw*0.8*tcr/1000 = -144.65 \text{ kN}
\]
Option 2:  
Vertical force generated in the stiffener as per BS EN 1993-1-5 
(see NOTE, Clause 9.3.3(3)):  
\[ \text{PEd1} = \text{VEd1} - \text{fyw} \times \text{hw} \times \text{tw} / (\text{SQR}(3) \times \text{gamM1} \times \text{lamw}^2 \times 1000) = -506.47 \text{ kN} \]

Design axial load in stiffener  
\[ \text{PEd} = \text{PEd1} + \text{Pext1} = 0 \text{ kN} \]

As \( \text{PEd} \leq \text{VbRd} (0 \text{ kN} \leq 4097.4 \text{ kN}) \), the design shear force does not exceed the shear resistance. Hence OK.

### Connection to the web

- **Design shear load on weld**  
  \[ FwEd = \frac{\text{tw}^2}{2 \times (5 \times hs)} = 0.196 \text{ kN/mm} \]
- **Weld size required**  
  \[ sww = \frac{FwEd \times 10^3}{2 \times 0.7 \times \text{fvwd}} = 0.58042 \text{ mm} \]
- **Weld size provided**  
  \[ sw1 = 6 \text{ mm} \]

### Stiffness check - Clause 9.3.3(3)

- 2nd moment of area (effective section)  
  \[ I_{\text{pro}} = 118.34E6 \text{ mm}^4 \]
- 2nd moment of area required  
  \[ I_{\text{req}} = 0.75 \times \text{hw} \times \text{tw}^3 = 2.058E6 \text{ mm}^4 \]

As \( I_{\text{req}} \leq I_{\text{pro}} (2.058E6 \text{ mm}^4 \leq 118.34E6 \text{ mm}^4) \), the stiffener is OK.

Transverse web stiffeners (BS EN 1993-1-5 section 9)

The proforma is in accordance with BS EN 1993-2:2006 "Eurocode 3 Design of Steel Structures - Part 2: Steel bridges" and the NA to BS EN 1993-2:2006.

The proforma is for transverse web stiffeners other than at supports for webs without longitudinal stiffeners. No rules are given within BS EN 1993-2:2006 for the design of intermediate transverse stiffeners so reference has to be made to BS EN 1993-1-5 section 9.

Elevation on web without longitudinal stiffening

Panel length 1  a(1)=1967 mm
Panel width  hw=1000 mm
Length of stiffener  ls=1000 mm
Thickness of web  tw=14 mm
Modulus of elasticity of web  E=210000 N/mm²
Stiffener corner snipe  snp=15 mm

Web panels 1 & 2:

Longitudinal stresses in web with transverse stiffeners

Stress at top of web plate (σtop)  σtop=277 N/mm²
Stress at btm of web plate (σbtm)  σbtm=-242 N/mm²
Design parameters

Depth of stiffener hs=200 mm
Stiffener thickness ts=20 mm
Yield strength (web) fyw=355 N/mm²
Yield strength (stiffener) fys=345 N/mm²

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)

Expression 9.3 in EN 1993-1-5 is further simplified by Table 2.6 in "Eurocode 3: Design of steel structures Part 1-5: Design of plated structures " ECCS Eurocode Design Manuals.

Yield strength to be adopted fy=345 N/mm²
Strain value ε (EC3 Part 1-1) ew=SQR(235/fyw)=0.81362
Strain value ε (EC3 Part 1-1) es=SQR(235/fys)=0.82532
Ratio (hs/ts) p=hs/ts=10
Limit to ratio p=(hs/ts) is 13ε=10.729.
Ratio (hs/ts)=10 is not greater than limit 13ε=10.729.
Stiffener complies with Clause 9.2.1(8).

Design shear resistance (double sided transverse stiffener)

The effective cross section of the intermediate double-sided transverse stiffener is as shown below:

2nd moment of area yy axis:
\[ I_{yy} = tsi \cdot (2 \cdot hsi + tw)^3 / 12 + (30 \cdot ew \cdot tw) \cdot tw^3 / 12 \]
\[ = 118.34 \text{E}6 \text{ mm}^4 \]

Design shear resistance
\[ V_{bRd} = \chi_{*} A_{e} \cdot f_{ysi} / (\gamma_{M1} \cdot 1000) \]
\[ = 4097.4 \text{ kN} \]

Axial force in the stiffener due to shear - BS EN 1993-1-5

Shear buckling coefficient for web panel kt is derived from Clause 5.2.
Buckling coefficient (Annex A) \[ k_{t} = 5.34 + 4 \cdot (hw/a)^2 \cdot 6.3738 \]
Modified slenderness λw \[ \lambda_{w} = hw / (37.4 \cdot tw \cdot ew \cdot SQR(kt)) = 0.92978 \]
Max design shear force in panel \[ V_{Ed1} = 2511 \text{ kN} \]
Externally applied design load \[ P_{ext1} = 0 \text{ kN} \]

Option 1:
Longitudinal compressive stress \( o_{xEd} = 0 \) for symmetrical sections.
Vertical force generated in stiffener arising from the shear induced tension field (see older version of NA to BS EN 1993-1-5:2006):
\[ P_{Ed1}' = V_{Ed1} - hw \cdot tw \cdot 0.8 \cdot tcr / 1000 = -144.65 \text{ kN} \]
Option 2:

Vertical force generated in the stiffener as per BS EN 1993-1-5
(see NOTE, Clause 9.3.3(3)):

\[
PEd_1 = VEd_1 - f_{yw} \cdot h_w \cdot t_w / (SQR(3) \cdot \text{gamM1} \cdot \text{lamw}^2 \cdot 1000) = -506.47 \text{ kN}
\]

Design axial load in stiffener \( PE_d = PE_d_1 + P_{ext1} = 0 \text{ kN} \)

As \( PE_d \leq V_{bRd} \) (0 kN \( \leq 4097.4 \text{ kN} \)), the design shear force does not exceed the shear resistance. Hence OK.

**Connection to the web**

Design shear load on weld \( F_{wEd} = t_w^2 / (5 \cdot h_s) = 0.196 \text{ kN/mm} \)

Weld size required \( s_{ww} = F_{wEd} \cdot 10^3 / (2 \cdot 0.7 \cdot f_{vwd}) = 0.58042 \text{ mm} \)

Weld size provided \( s_{w1} = 6 \text{ mm} \)

**Stiffness check - Clause 9.3.3(3)**

2nd moment of area (effective section) \( I_{pro} = 118.34 \text{E6 mm}^4 \)

2nd moment of area required \( I_{req} = 0.75 \cdot h_w \cdot t_w^3 = 2.058 \text{E6 mm}^4 \)

As \( I_{req} \leq I_{pro} \) (2.058E6 mm\(^4\) \( \leq 118.34\text{E6 mm}^4 \)), the stiffener is OK.

Steel runway beam design

Beam is designed in accordance with BS2853:1957 & BS 449.

Beam span L=3 m
Effective length of beam Le=3.6 m
Trolley capacity Wcap=1.5 tonnes
Number of wheels on trolley Nowheels=4
Load to be carried by trolley W=1.5 tonnes

Strength of steel - BS 449 Clause 3.a.(1)

Steel design grade (43 or 50) Grade=43
Maxm longitudinal bending stress F1max=162 N/mm²
Maxm transverse bending stress F2max=223 N/mm²
Maxm shear stress Fvmax=100 N/mm²

Cross flange bending

Transverse bending stresses
when trolley remote from end Ftr1=1.4*C*Wk*1E3*Dyn/(K1*T*T) =72.72 N/mm²
Transverse bending stresses when trolley at end of beam Ftr2=1.4*C*Wk*1E3*Dyn/(K2*T*T) =116.6 N/mm²

The actual transverse bending stress does not exceed the maximum permissible when load is remote from the end of the beam i.e Ftr1 ≤ F2max (72.72 N/mm² ≤ 223 N/mm²).
Trolley cannot approach end of beam and stress Ftr2 does not apply.

Combined stress check

Actual long'1 bending stress Fbc=41.19 N/mm²
Change back to Tonf/in² F1=Fbc/15.44=2.668 Tonf/in²
Allowable cross flange bending PK2=14.5 Tonf/in²
Convert to N/mm² PK2=PK2*15.44=223.9 N/mm²

The interaction of the longitudinal and transverse stresses at the centre of the span is satisfactory (i.e 72.72 N/mm² ≤ 223.9 N/mm²).
Check for deflection

\[
\text{Total deflection} \quad \text{DEL}=D_1+D_2=1.165 \text{ mm} \\
\text{Limiting deflection} \quad \text{DEL}_{\text{lim}}=L\times1E3/500=6 \text{ mm} \\
\text{Since } \text{DEL} \leq \text{DEL}_{\text{lim}} (1.165 \text{ mm} \leq 6 \text{ mm}), \text{ deflection is within limiting value.}
\]

**DESIGN SUMMARY**

Beam under consideration is simply supported.

- **Beam span is**: 3 m
- **Beam effective length**: 3.6 m
- **Trolley capacity**: 1.5 tonnes
- **Beam S.W.L.**: 1.5 tonnes
- **Hoist type**: Hand operated
- **Dynamic factor**: 1.1
- **Section size**: 254 x 102 x 28 Universal Beam

Section OK for long'l and transverse bending, shear and deflection.
Runway beam to be clearly marked for S.W.L. of 1.5 tonnes.
Location: Default 2

Steel runway beam design

Beam is designed in accordance with BS2853:1957 & BS 449.

Beam span \( L=1.5 \) m
Effective length of beam \( L_e=3 \) m
Trolley capacity \( W_{\text{cap}}=1.5 \) tonnes
Number of wheels on trolley \( N_{\text{wheels}}=4 \)
Load to be carried by trolley \( W=1.5 \) tonnes

Strength of steel - BS 449 Clause 3.a.(1)

Steel design grade (43 or 50) \( \text{Grade}=43 \)
Maxm longitudinal bending stress \( F_{1\text{max}}=162 \) N/mm²
Maxm transverse bending stress \( F_{2\text{max}}=223 \) N/mm²
Maxm shear stress \( F_{\text{vmax}}=100 \) N/mm²

Cross flange bending

Transverse bending stresses
when trolley remote from end \( F_{\text{tr1}}=1.4*C*W_k*1E3*\text{Dyn}/(K1*T*T) \)
\( =72.72 \) N/mm²
Transverse bending stresses
when trolley at end of beam \( F_{\text{tr2}}=1.4*C*W_k*1E3*\text{Dyn}/(K2*T*T) \)
\( =116.6 \) N/mm²

The actual transverse bending stress does not exceed the maximum permissible when load is remote from the end of the beam i.e \( F_{\text{tr1}} \leq F_{2\text{max}} \ (72.72 \text{ N/mm}² \leq 223 \text{ N/mm}²)\).
The actual transverse bending stress does not exceed the max. permissible when load is near end of beam (i.e. \( 116.6 \text{ N/mm}² \leq 223 \text{ N/mm}²\)).

Combined stress check

Beam is a cantilever and longitudinal and transverse stresses cannot be coincident, apart from a small bending moment caused by self weight of beam, so no check is required.
Check for deflection

Total deflection \[ \text{DEL}=D_1+D_2=2.279 \text{ mm} \]
Limiting deflection \[ \text{DELlim}=L\times10^3/250=6 \text{ mm} \]

Since \( \text{DEL} \leq \text{DELlim} \) (2.279 mm \( \leq \) 6 mm), deflection is within limiting value.

DESIGN SUMMARY

Beam under consideration is cantilevered.

- Beam span is 1.5 m
- Beam effective length 3 m
- Trolley capacity 1.5 tonnes
- Beam S.W.L. 1.5 tonnes
- Hoist type Hand operated
- Dynamic factor 1.1
- Section size 254 x 102 x 28 Universal Beam

Section OK for long’l and transverse bending, shear and deflection.
Runway beam to be clearly marked for S.W.L. of 1.5 tonnes.
Location: Default 3

Steel runway beam design

Beam span \( L = 3 \text{ m} \)
Effective length of beam \( L_e = 3.6 \text{ m} \)
Trolley capacity \( W_{\text{cap}} = 1.5 \text{ tonnes} \)
Number of wheels on trolley \( N_{\text{wheels}} = 2 \)
Load to be carried by trolley \( W = 1.5 \text{ tonnes} \)

Strength of steel - BS 449 Clause 3.a.(1)

Steel design grade (43 or 50) \( \text{Grade}=43 \)
Maxm longitudinal bending stress \( F_{1\text{max}} = 162 \text{ N/mm}^2 \)
Maxm transverse bending stress \( F_{2\text{max}} = 223 \text{ N/mm}^2 \)
Maxm shear stress \( F_{v\text{max}} = 100 \text{ N/mm}^2 \)

Cross flange bending

Transverse bending stresses
when trolley remote from end \( F_{t1} = 1.4 \times C \times W_k \times 10^3 \times \text{Dyn}/(K_1 \times T \times T) = 158.9 \text{ N/mm}^2 \)
Transverse bending stresses
when trolley at end of beam \( F_{t2} = 1.4 \times C \times W_k \times 10^3 \times \text{Dyn}/(K_2 \times T \times T) = 233.1 \text{ N/mm}^2 \)
The actual transverse bending stress does not exceed the maximum permissible when load is remote from the end of the beam
i.e \( F_{t1} \leq F_{2\text{max}} \) (158.9 N/mm\(^2\) \leq 223 N/mm\(^2\)).
Member overstressed due to cross flange bending when trolley near end of beam. Place stop ends well away from end of beam or strengthen beam by plating flanges.

Combined stress check

Actual long'\'l bending stress \( F_{bc} = 41.19 \text{ N/mm}^2 \)
Change back to Tonf/in\(^2\) \( F_1 = F_{bc}/15.44 = 2.668 \text{ Tonf/in}^2 \)
Allowable cross flange bending \( PK_2 = 14.5 \text{ Tonf/in}^2 \)
Convert to N/mm\(^2\) \( PK_2 = PK_2 \times 15.44 = 223.9 \text{ N/mm}^2 \)
The interaction of the longitudinal and transverse stresses at the centre of the span is satisfactory (i.e 158.9 N/mm\(^2\) \leq 223.9 N/mm\(^2\)).
Check for deflection

Total deflection \( \text{DEL} = D_1 + D_2 = 1.165 \text{ mm} \)
Limiting deflection \( \text{DEL}_{\text{lim}} = L \times 1 \times 10^3 / 500 = 6 \text{ mm} \)
Since \( \text{DEL} \leq \text{DEL}_{\text{lim}} \) (1.165 mm \( \leq \) 6 mm), deflection is within limiting value.

**DESIGN SUMMARY**

Beam under consideration is suspended.

- Beam span is 3 m
- Beam effective length 3.6 m
- Trolley capacity 1.5 tonnes
- Beam S.W.L. 1.5 tonnes
- Hoist type Hand operated
- Dynamic factor 1.1
- Section size 254 x 102 x 28 Universal Beam

Section OK for long'l and transverse bending, shear and deflection. Runway beam to be clearly marked for S.W.L. of 1.5 tonnes.

Member overstressed due to cross flange bending when trolley near end of beam. Place stop ends well away from the end of beam or strengthen flanges by plating.
Location: Ex1 - Simply supported runway beam

Steel runway beam design

Runway beam is designed in accordance with BS EN 1993-6:2007 and BS EN 1993-1-1:2005.

Beam span \( L = 3 \) m
Effective length of beam \( L_e = 3.6 \) m
Trolley capacity (unfactored) \( W_{cap} = 1.5 \) tonnes
Number of wheels on trolley \( N_{wheels} = 4 \)
Dynamic factor \( \phi = 1.1 \)

Dimensions (mm): \( h = 260.4 \) b=102.2 \( t_w = 6.3 \) tf=10 r=7.6
Properties (cm): \( I_y = 4010 \) \( I_z = 179 \) \( W_{ply} = 353 \) \( W_{plz} = 54.8 \) \( I_t = 9.57 \)
Partial factor (permanent action) \( \gamma_G = 1.35 \)
Partial factor (variable action) \( \gamma_Q = 1.5 \)

Resistance of bottom flange to wheel loads

(EC3 Part 6, Section 6.7)
Stress at mid-line of the flange due to the overall internal moment in the runway beam \( s_f E_d = \frac{M_{Ed} \times 10^3}{W_{ely}} = 61.56 \) N/mm²
Design resistance (bottom flange) \( F_{fRd} = \frac{L_{eff} \times t_f \times f_y \times \text{comp1}}{(4 \times m \times 1000)} = 108.34 \) kN
Vertical crane wheel load \( F_{zEd} = \frac{\gamma_Q \times W_k \times \phi}{N_{wheels}} = 6.1792 \) kN
As \( F_{zEd} \leq F_{fRd} \) (6.1792 \( kN \leq 108.34 \) \( kN \)), the design resistance of the bottom flange is satisfactory.

Lateral torsional buckling

Effective length of beam \( L_e = 3.6 \) m
Critical moment \( M_{cr} = C_1 \times E_t \times S_r / 10^6 = 80.026 \) kNm
Design buckling resistance moment \( M_{bRd} = \chi_{LT} \times W_{ply} \times f_y / (\gamma_M \times 10^3) = 59.642 \) kNm
Unity factor \( \text{unit}_b = \frac{M_{Ed}}{M_{bRd}} = 0.31789 \)
Section chosen is considered suitable.
Local bending stresses in the bottom flange due to wheel loads

Coefficient $C_x^0 = 0.05 - 0.58 \times \mu + 0.148 \times \exp(3.015 \times \mu) = 0.66321$
Coefficient $C_x^1 = 2.23 - 1.49 \times \mu + 1.39 \times \exp(-18.33 \times \mu) = 1.2978$
Coefficient $C_x^2 = 0.73 - 1.58 \times \mu + 2.91 \times \exp(-6.33 \times \mu) = -0.20308$
Coefficient $C_y^0 = -2.11 + 1.977 \times \mu + 0.0076 \times \exp(6.530 \times \mu) = -0.4211$
Coefficient $C_y^1 = 10.108 - 7.408 \times \mu - 10.108 \times \exp(-1.364 \times \mu) = 1.1675$
Coefficient $C_y^2 = 0$

Serviceability limit state stress check - EC3 Part 6, Section 7.5

Global shear stress $v_{Ed} = Vz_{Ed} \times 10^3 / (h \times tw) = 15.41 \text{ N/mm}^2$
Shear resistance (exp. 7.2b) $v_{Rd} = fy / (\sqrt{3} \times \gamma_{M1}) = 144.34 \text{ N/mm}^2$
As $v_{Ed} \leq v_{Rd}$ ($15.41 \text{ N/mm}^2 \leq 144.34 \text{ N/mm}^2$), shear stress OK.

Hence expression 7.2e is satisfied.

Combined bending and torsion check - EC3 Part 6, Annex A

Factored horizontal force $WH_1 = 2.247 \text{ kN}$
Total minor axis design moment $M_{zEd} = M_{zEd1} + M_{zEd2} = 1.9106 \text{ kNm}$
Design warping torsional moment $M_{wEd} = 0.44101 \text{ kNm}$
Minor axis resistance moment $M_{zRd} = fy \times Welz / 10^3 = 9.6331 \text{ kNm}$
Warping torsional resist. moment $M_{wRd} = M_{zRd} / 2 = 4.8165 \text{ kNm}$

\[
\begin{align*}
\frac{My_{Ed}}{Mb_{Rd}} &+ \frac{Cmz.Mz_{Ed}}{Mz_{Rd}} + \frac{kw.kzw.ka.Mw_{Ed}}{Mw_{Rd}/\gamma_{M1}} & \leq 1
\end{align*}
\]

Unity factor $uf = \frac{My_{Ed}}{Mb_{Rd}} + \frac{Cmz.Mz_{Ed}}{Mz_{Rd}} + \frac{kw.kzw.ka.Mw_{Ed}}{Mw_{Rd}/\gamma_{M1}} = 0.56197$
\leq 1

Hence the unity relationship is satisfied.

Check for deflection - EC6 Part 6, Section 7.3

Vertical deflection (payload) $DEL1 = D2 = 1.1007 \text{ mm}$
Vertical deflection (total load) $DEL2 = D1 + D2 = 1.1355 \text{ mm}$
Since $DEL1 \leq DEL11$ ($1.1007 \text{ mm} \leq 6 \text{ mm}$), deflection OK.
Since $DEL2 \leq DEL12$ ($1.1355 \text{ mm} \leq 5 \text{ mm}$), deflection OK.

Vibration of bottom flange

The slenderness ratio of the bottom flange $L/iz$ should be limited to 250, where $iz$ is the radius of gyration of the bottom flange and $L$ is the distance between lateral restraints. For simplicity, the inertia of the bottom flange will be taken as half of $Iz$.
Bottom flange inertia $Izf = I_z / 2 \times 1E4 = 895000 \text{ mm}^4$
Radius of gyration of the flange $iz = \sqrt{Izf / (b \times tf)} = 29.593 \text{ mm}$
Slenderness of bottom flange $sbf = L \times 1E3 / iz = 101.38$
As slenderness of bottom flange is $\leq 250$ vibration is satisfactory.
## DESIGN SUMMARY

**NOTE:** The runway beam under consideration is simply supported. Longitudinal & transverse bending, shear and deflection are OK. Runway beam to be clearly marked for S.W.L. of 14.7 kN.
Location: Ex2 - Cantilever runway beam

Steel runway beam design

| / | / | Runway beam is designed |
| / | / | in accordance with |
| / | / | BS EN 1993-6:2007 and |

Beam span $L=1.5$ m
Effective length of beam $L_e=3$ m
Trolley capacity (unfactored) $W_{cap}=1.5$ tonnes
Number of wheels on trolley $N_{wheels}=4$
Dynamic factor $\phi=1.1$

Dimensions (mm): $h=260.4$ $b=102.2$ $t_w=6.3$ $t_f=10$ $r=7.6$
Properties (cm): $I_y=4010$ $I_z=179$ $W_{ply}=353$ $W_{plz}=54.8$ $I_t=9.57$
Partial factor (permanent action) $\gamma_G=1.35$
Partial factor (variable action) $\gamma_Q=1.5$

Resistance of bottom flange to wheel loads

(EC3 Part 6, Section 6.7)
Stress at mid-line of the flange due to the overall internal moment in the runway beam
$\sigma_{Ed}=\frac{M_{Ed} \times 10^3}{W_{ely}}=121.75$ N/mm²
Distance from LHS support to load $x_L=1.35$ m
Design resistance (bottom flange) $F_{fRd}=\frac{\text{leff} \times t_f \times f_y \times \text{comp}1}{(4 \times \text{m} \times 1000)}$
$=38.995$ kN
Vertical crane wheel load $F_{zEd}=\frac{\gamma_Q \times W_k \times \phi \times N_{wheels}}{4.1}$
As $F_{zEd} \leq F_{fRd}$ ($6.1792$ kN $\leq 38.995$ kN), the design resistance of the bottom flange is satisfactory.

Lateral torsional buckling

Effective length of beam $L_e=3$ m
Critical moment $M_{cr}=\frac{C_1 \times E \times Sr}{10^6}=103.49$ kNm
Design buckling resistance moment $M_{bRd}=\frac{\chi_{LT} \times W_{ply} \times f_y}{(4 \times \gamma_m \times 10^3)}$
$=68.427$ kNm
Unity factor $\text{unitb}=\frac{M_{Ed}}{M_{bRd}}=0.54799$
Section chosen is considered suitable.
Local bending stresses in the bottom flange due to wheel loads

Coefficient Cx0=0.05-0.58*mu+0.148*EXP(3.015*mu) =0.66321
Coefficient Cx1=2.23-1.49*mu+1.39*EXP(-18.33*mu) =1.2978
Coefficient Cx2=0.73-1.58*mu+2.91*EXP(-6.33*mu) =-0.20308
Coefficient Cy0=-2.11+1.977*mu+0.0076*EXP(6.530*mu) =-0.4211
Coefficient Cy1=10.108-7.408*mu-10.108*EXP(-1.364*mu) =1.1675
Coefficient Cy2=0 =0

Serviceability limit state stress check - EC3 Part 6, Section 7.5

Global shear stress vEd=VzEd*10^3/(h*tw)=15.41 N/mm²
Shear resistance (exp. 7.2b) vRd=fy/(SQR(3)*gamMs)=144.34 N/mm²
As vEd ≤ vRd ( 15.41 N/mm² ≤ 144.34 N/mm² ), shear stress OK.
Hence expression 7.2e is satisfied.

Combined bending and torsion check - EC3 Part 6, Annex A

Factored horizontal force WH1=2.247 kN
Total minor axis design moment MzEd=MzEd1+MzEd2=3.0462 kNm
Design warping torsional moment MwEd=0.13503 kNm
Minor axis resistance moment MzRd=fy*Welz/10^3=9.6331 kNm
Warping torsional resist. moment MwRd=MzRd/2=4.8165 kNm

\[
\frac{MyEd}{MbRd} + \frac{Cmz.MzEd}{MzRd} + \frac{kw.kzw.ka.MwEd}{MwRd/gamM1} \leq 1
\]

Unity factor uf=MyEd/MbRd+Cmz*MzEd/MzRd+kw*kzw*ka*MwEd/MwRd=0.85347 ≤ 1
Hence the unity relationship is satisfied.

Check for deflection - EC6 Part 6, Section 7.3

Vertical deflection (payload) DEL1=D2=2.2014 mm
Vertical deflection (total load) DEL2=D1+D2=2.2222 mm
Since DEL1 ≤ DEL11 ( 2.2014 mm ≤ 6 mm ), deflection OK.
Since DEL2 ≤ DEL12 ( 2.2222 mm ≤ 5 mm ), deflection OK.

Vibration of bottom flange

The slenderness ratio of the bottom flange L/iz should be limited to 250, where iz is the radius of gyration of the bottom flange and L is the distance between lateral restraints. For simplicity, the inertia of the bottom flange will be taken as half of Iz.
Bottom flange inertia Izf=Iz/b*1E4=895000 mm²
Radius of gyration of the flange iz=SQR(Izf/(b²tf))=29.593 mm
Slenderness of bottom flange sbf=L*1E3/iz=50.688
As slenderness of bottom flange is ≤ 250 vibration is satisfactory.

254 x 102 x 28 UKB

**Resistance of bottom flange to wheel loads**

(EC3 Part 6, Section 6.7)

Stress at mid-line of the flange due to the overall internal moment in the runway beam

\[ sfEd = \frac{MyEd \times 10^3}{Wely} = 61.56 \text{ N/mm}^2 \]

Design resistance (bottom flange)

\[ FfRd = \frac{leff \times tf^2 \times fy \times \text{compl}}{4 \times m \times 1000} = 108.34 \text{ kN} \]

Vertical crane wheel load

\[ FzEd = \frac{\text{gamQ} \times Wk \times Phi}{\text{Nowheels}} = 12.358 \text{ kN} \]

As \( FzEd \leq FfRd \) (12.358 kN ≤ 108.34 kN), the design resistance of the bottom flange is satisfactory.

**Lateral torsional buckling**

<table>
<thead>
<tr>
<th>Effective length of beam</th>

</tr>
</tbody>
</table>

Unity factor

\[ \text{unitb} = \frac{MyEd}{MbRd} = 0.31789 \]

Section chosen is considered suitable.
Local bending stresses in the bottom flange due to wheel loads

Coefficient $C_{x0} = 0.05 - 0.58 \mu + 0.148 \exp(3.015 \mu) = 0.66321$
Coefficient $C_{x1} = 2.23 - 1.49 \mu + 1.39 \exp(-18.33 \mu) = 1.2978$
Coefficient $C_{x2} = 0.73 - 1.58 \mu + 2.91 \exp(-6.33 \mu) = -0.20308$
Coefficient $C_{y0} = -2.11 + 1.977 \mu + 0.0076 \exp(6.530 \mu) = -0.4211$
Coefficient $C_{y1} = 10.108 - 7.408 \mu - 10.108 \exp(-1.364 \mu) = 1.1675$
Coefficient $C_{y2} = 0$

Serviceability limit state stress check - EC3 Part 6, Section 7.5

Global shear stress $\sigma_{Ed} = V_{zEd} \times 10^3 / (h \times t_w) = 15.41 \text{ N/mm}^2$
Shear resistance (exp. 7.2b) $\sigma_{Rd} = f_y / (\sqrt{3} \times \gamma_{Ms}) = 144.34 \text{ N/mm}^2$
As $\sigma_{Ed} \leq \sigma_{Rd}$ (15.41 N/mm ≤ 144.34 N/mm²), shear stress OK.

Combined bending and torsion check - EC3 Part 6, Annex A

Factored horizontal force $W_{H1} = 2.247 \text{ kN}$
Total minor axis design moment $M_{zEd} = M_{zEd1} + M_{zEd2} = 1.9106 \text{ kNm}$
Design warping torsional moment $M_{wEd} = 0.44101 \text{ kNm}$
Minor axis resistance moment $M_{zRd} = f_y \times W_{elz} / 10^3 = 9.6331 \text{ kNm}$
Warping torsional resist. moment $M_{wRd} = M_{zRd} / 2 = 4.8165 \text{ kNm}$

$$ \frac{M_{yEd}}{M_{wRd}} + \frac{C_{mz} \cdot M_{zEd}}{M_{zRd}} + \frac{kw \cdot kzw \cdot ka \cdot M_{wEd}}{M_{wRd} \times \gamma_{M1}} \leq 1 $$

Unity factor $uf = \frac{M_{yEd}}{M_{wRd}} + C_{mz} \cdot M_{zEd} / M_{zRd} + kw \cdot kzw \cdot ka \cdot M_{wEd} / M_{wRd} = 0.56197 \leq 1$
Hence the unity relationship is satisfied.

Check for deflection - EC6 Part 6, Section 7.3

Vertical deflection (payload) $D_2 = 1.1007 \text{ mm}$
Vertical deflection (total load) $D_2 = D_1 + D_2 = 1.1355 \text{ mm}$
Since $D_1 \leq D_2$ (1.1007 mm ≤ 6 mm), deflection OK.
Since $D_2 \leq D_{EL2}$ (1.1355 mm ≤ 5 mm), deflection OK.

Vibration of bottom flange

The slenderness ratio of the bottom flange $L / iz$ should be limited to 250, where $iz$ is the radius of gyration of the bottom flange and $L$ is the distance between lateral restraints. For simplicity, the inertia of the bottom flange will be taken as half of $Iz$.
Bottom flange inertia $Izf = Iz / 2 \times 1E4 = 895000 \text{ mm}^4$
Radius of gyration of the flange $iz = \sqrt{Izf / (b \times tf)} = 29.593 \text{ mm}$
Slenderness of bottom flange $sbf = L \times 1E3 / iz = 101.38$
As slenderness of bottom flange is ≤ 250 vibration is satisfactory.
DESIGN SUMMARY

Section size 260 x 102 x 28 UKB
Beam actual span 3 m
Beam effective length 3.6 m
Trolley capacity 14.7 kN
Beam S.W.L. 14.7 kN
Hoist type Hand operated.
Dynamic factor 1.1
Total load vertical deflection 1.03 mm (without dynamic effects)
Total load vertical deflection 1.14 mm (with dynamic effects)
Total load limiting deflection 5 mm
Bending and torsion interaction 0.562 ≤ 1

NOTE: The runway beam under consideration is suspended. Longitudinal & transverse bending, shear and deflection are OK. Runway beam to be clearly marked for S.W.L. of 14.7 kN.
Location: Default example

Stainless steel CHS

Calculations in accordance with BS5950-1:2000 and SCI publication "Structural Design of Stainless Steel"

All loads and moments are factored

Factored moment about z-z axis: Mz = 5.04 kNm
Factored SF in y direction: Fv = 5.6 kN
Axial load (comp. positive): F = 298 kN
Length of member: L = 3.6 m
Factored moment about axis yy: My = 0 kNm
168.3 O.D x 5 Circular Hollow Section
Young's Modulus: E = 200 kN/mm²

Length between restraints z axis: Lz = 3600 mm
Length between restraints y axis: Ly = 1800 mm
Quarter point: m2 = 0 kNm
Mid-span: m3 = 5.04 kNm
Three quarter point: m4 = 0 kNm
Quarter point: mz2 = 0 kNm
Mid-span: mz3 = 5.04 kNm
Three quarter point: mz4 = 0 kNm
Maximum moment on central half: M24 = 5.04 kNm

Location: bi-axial bending - slender z-z axis

Stainless Steel Section

Structural Hollow Section Design

Calculations in accordance with BS5950-1:2000 and SCI publication 'Structural Design of Stainless steel'

All loads and moments are factored.

Factored bending moment axis zz \( M_z = 56 \, \text{kNm} \)
Factored SF in y direction \( F_v = 8 \, \text{kN} \)
Axial load (comp. positive) \( F = 800 \, \text{kN} \)
Length of member \( L = 4 \, \text{m} \)
Factored bending moment axis y-y \( M_y = 20 \, \text{kNm} \)
400 x 200 x 6 RHS
Length between restraints z axis \( L_z = 4000 \, \text{mm} \)
Length between restraints y axis \( L_y = 4000 \, \text{mm} \)
Young's Modulus \( E = 200 \, \text{kN/mm}^2 \)
Dist. betwn torsional restraints \( L_T = 4 \, \text{m} \)

SECTION

400 x 200 x 6 SHS Grade S 1.4462

SUMMARY

Section is satisfactory for axial load, and overall buckling check.

Axial load \( 800 \, \text{kN} \)
Compression resistance \( 1760.5 \, \text{kN} \)
Maximum moment z axis \( 56 \, \text{kNm} \)
Moment capacity \( 273.65 \, \text{kNm} \)
Maximum moment y axis \( 20 \, \text{kNm} \)
Moment capacity \( 129.29 \, \text{kNm} \)
Local capacity check \( 0.79771 \leq 1 \)
Overall buckling checks \( 0.84289 \leq 1 \)
Location: Bi-axial bending - slender section both axes

Stainless Steel Section

Calculations in accordance with BS5950-1:2000 and SCI publication 'Structural Design of Stainless steel'

All loads and moments are factored.

Factored bending moment axis zz \( M_z = 110 \text{ kNm} \)
Factored SF in y direction \( F_v = 21 \text{ kN} \)
Axial load (comp. positive) \( F = 20 \text{ kN} \)
Length of member \( L = 4 \text{ m} \)
Factored bending moment axis y-y \( M_y = 100 \text{ kNm} \)

Length between restraints zz-axis \( L_z = 2700 \text{ mm} \)
Young's Modulus \( E = 200 \text{ kN/mm}^2 \)

100 x 50 x 6 RHS

Section is satisfactory for axial load, and overall buckling check.

Design axial load \( 18.6 \text{ kN} \)
Compression resistance \( 99.12 \text{ kN} \)
Design moment y-y axis \( 2.6 \text{ kNm} \)
Moment resistance \( 8.75 \text{ kNNm} \)
Overall buckling checks \( 0.54422 \leq 1 \)
\( 0.48479 \leq 1 \)
Simply supported stainless steel beam

Calculations in accordance with BS5950-1: 2000 and SCI publication "Structural Design of Stainless Steel"

Beam span \( L = 6 \text{ m} \)

200 x 75 x 8 Channel

Young's Modulus \( E = 200 \text{ kN/mm}^2 \)

Dead load factor \( \gamma_d = 1.4 \)

Imposed load factor \( \gamma_i = 1.6 \)

Distance from left support \( L_{c(1)} = 2 \text{ m} \)

Unfactored dead load \( G_{kc(1)} = 0.4 \text{ kN} \)

Unfactored imposed load \( Q_{kc(1)} = 0 \text{ kN} \)

Distance from left support \( L_{c(2)} = 4 \text{ m} \)

Unfactored dead load \( G_{kc(2)} = 0.4 \text{ kN} \)

Unfactored imposed load \( Q_{kc(2)} = 0 \text{ kN} \)

Dist. from left support to start \( L_{au(1)} = 0 \text{ m} \)

Distance from left support to end \( L_{bu(1)} = 6 \text{ m} \)

Unfactored dead load \( G_{ku(1)} = 0.196 \text{ kN/m} \)

Unfactored imposed load \( Q_{ku(1)} = 3.85 \text{ kN/m} \)

Length of beam between restraints \( L_T = 2 \text{ m} \)

Maximum end moment on segment \( M_e = 27 \text{ kNm} \)

Start of segment \( m_1 = 27 \text{ kNm} \)

Quarter point \( m_2 = 29 \text{ kNm} \)

Mid-span \( m_3 = 30.435 \text{ kNm} \)

Three quarter point \( m_4 = 29 \text{ kNm} \)

Emissivity \( \varepsilon_r = 0.5 \)

Assumed value of load ratio \( R = 0.5 \)

Since \( M_f > M_b(0) \) \( (15.037 \text{ kNm} > 10.437 \text{ kNm}) \) applied moment exceeds buckling resistance moment. Addition fire resistance is required

Var. load shear @ LHE 21 kN

Perm. load shear @ RHE 15 kN

Var. load shear @ RHE 21 kN

**Fire resistance without applied protection**

The critical temperature method given in BS EN 1993-1-2 Clause 4.2.4 will be adopted. For further clarification refer to Thomas Telford publication entitled 'Designer's guide to EN 1991-1-2, EN 1992-1-2, EN 1993-1-2 and EN 1994-1-2'.
Factor for variable actions $\psi_1$ $\psi_1=0.7$
Max span design bending moment $M_{yEd}=44.55$ kNm

Critical temperature of stainless steel

Design moment (fire limit state) $M_{fEd}=M_{yEd}=44.55$ kNm
Design buckling resistance $M_{bRdfi}=\chi_{LTf}\cdot M_{cRd}=151.68$ kNm
Design moment resistance $M_{fRd}=k_y\cdot \left(\frac{\gamma_M}{\gamma_{fi}}\right)\cdot M_{bRdfi}/(k_1\cdot k_2)=216.69$ kNm
Critical temperature $\theta_{acr}$ $\theta_{acr}=39.19\cdot \text{LOG}(\text{comp}-1)+482=720.83$ °C
Fire resistance period 26 minutes

FIRE RESISTANCE
SUMMARY

The section does not have an inherent fire resistance of 30 minutes. Fire protection should be provided.
Axially loaded stainless steel column

Calculations are in accordance with BS5950-1:2000 and 'Structural Design of Stainless Steel' published by The Steel Construction Institute.

L = length of member  
F = compressive load

Factored axial compressive load  \( F = 19.6 \text{ kN} \)  
Length between restraints  \( L = 2700 \text{ mm} \)  
Effective length factor (y axis)  \( e_f = 1 \)  
100 x 50 x 6 RHS  
Young's Modulus  \( E = 200 \text{ kN/mm}^2 \)  
Shear Modulus  \( G = 76.9 \text{ kN/mm}^2 \)  

Steel temperature after 30 minutes fire duration

Initial steel temperature is assumed to be 20 degrees C.  
Density at 20 degrees C  \( \rho_{od} = 8000 \text{ kg/m}^3 \)  
Emissivity  \( e_r = 0.4 \)  
Coefficient of heat transfer  \( a_c = 25 \text{ W/m}^2 \text{ C} \)  
The calculation of the temperature rise in the stainless steel is an iterative process, the result of this process is:  
temperature at 30 minutes  \( \theta = 832 \text{ degrees C} \)  

Reduction of mechanical properties at elevated temperature

The following factors are required for calculation of resistance at elevated temperatures, they have been obtained by linear interpolation from Table 6.2 of the design guide for 832 degrees C.  
The value of 2% yield strength at elevated temperature is also required.  
Ultimate strength  \( U_s = 520 \text{ N/mm}^2 \)  
Assumed value of load ratio  \( R = 0.67 \)  
Load at fire limit state  \( F_f = R \times F = 13.132 \text{ kN} \)  
Since \( F_f \leq P_c0 \) ( 13.132 kN \( \leq 39.417 \text{ kN} \) ) applied load within compressive resistance.

100 x 50 x 6 RHS
Young's Modulus \( E = 200 \, \text{kN/mm}^2 \)

Stainless Steel Section

RECTANGULAR HOLLOW SECTION 100 x 50 x 6 RHS Grade 1.4401
DESIGN Design compr.load 18.6 kN
SUMMARY Compr.resistance 99.12 kN

Fire resistance without applied protection

The method for calculating the temperature rise in carbon steel can also be applied to stainless steel (refer to SCI publication P403 and BS EN 1993-1-2 Clauses 4.2.4 & 4.2.5).

Determine critical temperature of steel in fire situation

Buckling length in fire situation \( L_{fi} = 1890 \, \text{mm} \)
Critical temperature \( \theta_{cr} \)
\( t_{CR} = \text{TABLE 252 for } m_o = 0.039394, \lambda_{fi} = 1.2292 \)
\( = 776.14 \, ^\circ \text{C} \)
Fire resistance period 30 minutes

Reduction of mechanical properties at elevated temperature

The following reduction factors (as per EN 1993-1-2, Table C.1) are required for calculation of resistance at elevated temperatures.

Young's modulus retention factor \( k_{Et} = 0.64909 \)
0.2% proof strength ret. factor \( k_{0.2p} = 0.42625 \)
Ultimate tensile strength factor \( k_{ult} = 0.39011 \)
Yield strength factor \( k_{2t} = 0.32375 \)
Buckling resistance

Design buckling resistance
\[ Nb_{fRd} = \frac{Chifi*A*k02p*fy}{(gamfi*10)} \]
= 64.173 kN

Design axial compressive force
\[ N_{fEd} = 13 \text{ kN} \]

As \( N_{fEd} \leq Nb_{fRd} \) (13 kN \( \leq 64.173 \text{ kN} \)), the buckling resistance of member is OK.

**FIRE RESISTANCE**

**SUMMARY**

Design axial force 13 kN
Design axial resistance 64.173 kN
Section has an inherent fire resistance of 30 minutes.
Location: Ex2 - RHS section

Axially loaded stainless steel column

Calculations are in accordance with the SCI publication entitled 'Design Manual For Structural Stainless steel' (Third Edition) dated 18th April 2006.

NEd = design axial compressive load
L = length of member

Unfactored permanent axial force \( N_p = 133 \text{ kN} \)
Unfactored variable axial force \( N_v = 133 \text{ kN} \)

Length between restraints y-axis \( L_y = 6000 \text{ mm} \)
Length between restraints z-axis \( L_z = 4000 \text{ mm} \)
200 x 125 x 10 RHS
Young's Modulus \( E = 200 \text{ kN/mm}^2 \)

Stainless Steel Section

RECTANGULAR HOLLOW SECTION 200 x 125 x 10 RHS Grade 1.4462
DESIGN Design compr.load 379.05 kN
SUMMARY Compr.resistance 970.66 kN

Fire resistance without applied protection

The method for calculating the temperature rise in carbon steel can also be applied to stainless steel (refer to SCI publication P403 and BS EN 1993-1-2 Clauses 4.2.4 & 4.2.5).

Determine critical temperature of steel in fire situation

Buckling length in fire situation \( L_{fi} = 2800 \text{ mm} \)
Critical temperature \( \theta_{cr} \)

\[
t_{CR} = \text{TABLE 256 for } m_0 = 0.10199, \lambda_{fi} = 1.0288 = 670.67 \text{ °C}
\]

Fire resistance period 22 minutes

Reduction of mechanical properties at elevated temperature

The following reduction factors (as per EN 1993-1-2, Table C.1) are required for calculation of resistance at elevated temperatures.

Young's modulus retention factor \( k_E = 0.72467 \)
0.2% proof strength ret. factor \( k_{0.2p} = 0.42574 \)
Ultimate tensile strength factor \( k_{uT} = 0.43574 \)
Yield strength factor \( k_{2t} = 0.37947 \)
Buckling resistance

Design buckling resistance

\[ N_{BfIRd} = \frac{Ch_{\text{fi}}A^*k02p*fy}{(\gamma_{\text{fi}}*10)} \]

= 682.89 kN

Design axial compressive force

\[ N_{fiEd} = 266 \text{ kN} \]

As \( N_{fiEd} \leq N_{BfIRd} \) (266 kN \leq 682.89 kN), the buckling resistance of member is OK.

FIRE RESISTANCE

Design axial force

266 kN

Design axial resistance

682.89 kN

The section does not have an inherent fire resistance of 30 minutes. Fire protection should be provided.

**Stainless Steel Section**

100 mm x 100 mm x 15 mm Grade 1.4301

Section is satisfactory for axial load.

Welding equivalent to at least two bolts at each end has been assumed.

Design compressive load \( 230 \text{ kN} \)
Compressive resistance \( 299.48 \text{ kN} \)
Design tensile load \( 200 \text{ kN} \)
Tensile resistance \( 424.01 \text{ kN} \)
Location: Ex2 - Back to back equal angles

Design axial compressive load \( \text{NEd} = 690 \text{ kN} \)
Design axial tensile load \( \text{NEdT} = 550 \text{ kN} \)

Two stainless steel equal angles back to back
\[ b = h \]
\[ D = 2h \]

300 x 150 x 15 Same size angles back to back
Young's Modulus \( E = 200 \text{ kN/mm}^2 \)
Length of member \( L = 3000 \text{ mm} \)
Effective length (y-y axis) \( L_y = 3000 \text{ mm} \)
Effective length (z-z axis) \( L_z = 3000 \text{ mm} \)
Distance between bolts \( L_c = 1000 \text{ mm} \)

Stainless Steel Section
DOUBLE ANGLE
2No. 150 mm x 150 mm x 15 mm Grade 1.4301 Back to Back angles
DESIGN
Section is satisfactory for axial load.
Welding equivalent to at least two bolts at each end has been assumed.
Design compressive load 690 kN
Compressive resistance 1275.8 kN
Design tensile load 550 kN
Tensile resistance 1438.4 kN
Location: Ex3 - Tension only single angle

Design axial tensile load \( \text{NEdT}=340 \text{ kN} \)

![Diagram of stainless steel equal angle]

150 x 150 x 12 equal angle
Young's Modulus \( E=200 \text{ kN/mm}^2 \)
Diameter of bolts \( d_b=20 \text{ mm} \)

**Stainless Steel Section**
**150 mm x 150 mm x 12 mm Grade 1.4401**

**DESIGN**
Section is satisfactory for axial load.

**SUMMARY**
Design tensile load \( 340 \text{ kN} \)
Tensile resistance \( 455.28 \text{ kN} \)
Location: Ex4 - Tension only double angle

Design axial tensile load $N_{EdT}=890$ kN

![Diagram of double angle connection]

Two stainless steel equal angles back to back
$b = h$
$D = 2h$

300 x 150 x 15 Same size angles back to back

Young's Modulus $E=200$ kN/mm²

Diameter of bolts $d_b=24$ mm

Stainless Steel Section

DOUBLE ANGLE

DESIGN
Section is satisfactory for axial load.

SUMMARY
Design tensile load 890 kN
Tensile resistance 1193 kN
Location: Ex1 - SHS column under axial load

Concrete filled SHS column

Calculations in accordance with British Steel (Corus) publication TD 296 entitled 'SHS Design Manual for Concrete Filled Columns Part 1 Structural Design'.

Loads and moments are factored.

Factored BM about z-z axis \( M_{dz}=0 \) kNm
Factored SF in y direction \( N_{v}=0 \) kN
Axial compressive load \( N_{d}=1800 \) kN
Length of member \( L=4 \) m
Maximum BM about y-y axis \( M_{dy}=0 \) kNm

200 x 200 x 10 SHS - Hot finished.
Properties (cm): \( A=74.9 \) \( r_{x}=7.72 \) \( Z_{x}=447 \) \( S_{x}=531 \) \( I_{x}=4470 \) \( J=7030 \) \( C=655 \)
(\( r_{z}=r_{x}, \ Z_{z}=Z_{x}, \ S_{z}=S_{x} \) & \( I_{z}=I_{x} \))
Young's Modulus \( E_{s}=210 \) kN/mm\(^2\)

Characteristic concrete strength \( f_{cu}=25 \) N/mm\(^2\)
Length btwn restraints z-z axis \( L_{z}=4 \) m
Length btwn restraints y-y axis \( L_{y}=0 \) m
Effective length factor (z-axis) \( e_{fz}=1 \)

DESIGN SUMMARY

Section is satisfactory

HOT FINISHED

In accordance with EN 10210

SQUARE HOLLOW SECTION

200 x 200 x 10 SHS  Grade S 275

WITH CONCRETE INFILL (NWC)

Cylinder strength: 25 N/mm²

Design axial load: 1800 kN

Column axial resistance: 2220.2 kN
Location: Ex2 - Bending about major axis, other axis restrained

Concrete filled SHS column

All loads and moments are factored.

Design moment about major axis $M_y = 140 \text{ kNm}$
Design SF in z direction $V_z = 20 \text{ kN}$
Design axial compressive load $N = 1500 \text{ kN}$
Length of member $L = 7 \text{ m}$
Design moment about minor axis $M_z = 0 \text{ kNm}$

250 x 150 x 16 RHS - Hot finished.

Properties (cm): $A = 115$ $i_z = 5.8$ $W_{ely} = 710$ $W_{ply} = 906$ $I_y = 8880$ $I_t = 8870$ $W_{elz} = 516$ $W_{plz} = 625$ $I_z = 3870$ $i_y = 8.79$

Permanent design load $N_g = 1200$
Steel $\gamma_a = 1$
Concrete $\gamma_c = 1.5$

Length btw restraints y-y axis $L_y = 7 \text{ m}$
Length btw restraints z-z axis $L_z = 0 \text{ m}$
Effective length factor y-y axis $K_y = 1$
Effective length factor z-z axis $K_z = 1$
Far end BM $N_{yEd} = 0 \text{ kNm}$
Shear plastic resistance $V_{plRd} = A_v \cdot f_y / \sqrt{3} / (\gamma_M \cdot 1000) = 1473.1 \text{ kN}$

Design shear force $V_z = 20 \text{ kN}$
Since $V_z \leq 0.5V_{plRd}$ (20 kN $\leq 736.57$ kN) design shear force is within the shear plastic resistance.

DESIGN SUMMARY

Section is satisfactory
HOT FINISHED In accordance with EN 10210
RECTANGULAR HOLLOW SECTION 250 x 150 x 16 RHS Grade S 355
WITH CONCRETE INFILL (NWC) Cylinder strength 32 N/mm$^2$
Design axial load 1500 kN
Design moment y-y axis 224.02 kNm
Moment capacity y-y axis 256.46 kNm
Location: Ex3 - Biaxial bending

Concrete filled SHS column

All loads and moments are factored.

Design moment about major axis    MyEd=135 kNm
Design SF in z direction          VzEd=16 kN
Design axial compressive load     NEd=1200 kN
Length of member                  L=8.5714 m
Design moment about minor axis    MzEd=100 kNm

300 x 200 x 10 RHS - Hot finished.
Properties (cm): A=94.9 iz=8.13 Wely=788 Wply=956 Iy=11800
                   It=12900 Wt=1020 Welz=628 Wplz=721 Iy=6280 iy=11.2
Permanent design load              NgEd=900
Steel ya                           gama=1
Concrete yc                        gamc=1.5

Length btwn restraints y-y axis    Ly=8.5714 m

CIRCULAR HOLLOW SECTION

457 O.D. x 8 CHS Grade S 355

WITH CONCRETE INFILL

Cube strength \( 40 \text{ N/mm}^2 \)

Period of protection \( 90 \text{ minutes} \)

Axial load \( 670 \text{ kN} \)

Applied moment \( x-x \) \( 14 \text{ kNm} \)

Applied moment \( y-y \) \( 14 \text{ kNm} \)

Effective length \( x-x \) \( 4.0375 \text{ m} \)

Effective length \( y-y \) \( 4.0375 \text{ m} \)

Squash resistance \( 3900.9 \text{ kN} \)

Load ratio \( 0.28977 \)

Limiting load ratio \( 0.397 \)
Location: Ex1 - SCI P259 Example 1 (355.6 x 8 CHS with r'ment)

Calculations are in accordance with EN 1994-1-2 and SCI publication P259 entitled "Fire Resistance of Concrete Filled Tubes to EC4" or SCI publication P159.

No external fire protection is provided, fire protection is based on concrete infill.

Axial compressive load \( N_f = 2000 \) kN
Maximum BM about y-y axis \( M_{fy} = 60 \) kNm
Maximum BM about z-z axis \( M_{fz} = 10 \) kNm
Length of member \( L = 3 \) m

355.6 dia x 8 thick CHS - Hot finished.
Properties (cm): \( A = 87.361 \) \( iy = 12.293 \) \( W_{ely} = 742.48 \) \( W_{ply} = 966.78 \) \( I_y = 13201 \) \( I_t = 26403 \)

Concrete filled CHS column

All loads and moments are factored, column is assumed to be in simple construction.

\( D = 355.6 \) mm
\( t = 8 \) mm

Cylinder characteristic strength \( f_{ck} = 35 \) N/mm²

Effective lengths

Length btwn restraints y-y axis \( L_y = 3 \) m
Length btwn restraints z-z axis \( L_z = 3 \) m
Effective length factor y-y axis \( e_{fy} = 0.7 \)
Effective length factor z-z axis \( e_{fz} = 0.7 \)
Buckling length of column \( l = 2.1 \) m

Moment resistance, stiffness and squash load - reinforced concrete

Provide four main bars with link reinforcement at least a quarter the diameter of the main longitudinal bars.
Buckling resistance (NfIRd)

Critical Euler buckling load  \( N_{f,icr} = \pi^2 \frac{E I}{l^2} = 34828 \) kN
Non dimensional slenderness \( \lambda^0 \)  \( \lambda^0 = \sqrt{\frac{N_{f,Rd}}{N_{f,icr}}} = 0.3449 \)
Reduction coefficient \( \chi \)  \( \chi = \frac{1}{\phi + (\phi^2 - \lambda^0)^{0.5}} = 0.9261 \)
Buckling resistance  \( N_{f,Rd} = \chi N_{f,ipRd} = 3836.9 \) kN

Slenderness check

Consider y-y axis:
Minimum column moment  \( M_{2y} = -30 \) kNm
Slenderness modification factor  \( k_y = 1 \)
Consider z-z axis:
Minimum column moment  \( M_{2z} = 0 \) kNm
Slenderness modification factor  \( k_z = 1 \)

Interaction of axial loads and moments

The interaction of axial compression and bending is checked using the following expression (SCI P259 Section 3.5):

Unity expression  \( R = \frac{N_f}{N_{f,Rd} + k_y M_{fy} / M_{f,Rd} + k_z M_{fz} / M_{f,Rd}} = 0.90588 \)

As \( R \leq 1 \), section capacity is sufficient.

## SUMMARY

**BASEPLATE**
Size 450 mm x 350 mm x 40 mm

**REQUIREMENTS**
- Grade S 355 steel
- Edge distance 50 mm
- Number of H.D. bolts 4
- Diameter of bolts 20 mm
- Grade 8.8
- Concrete/grout (fck) 40 N/mm²

**WELDS**
- Fillet weld (all round) 8 mm

Contact areas on the baseplate and column are machined to give a tight bearing contact.

**NOTE:** The surfaces of baseplate and end of column are assumed to be machined square to give bearing contact.
Calculations are in accordance with EC3 Parts 1-1, 1-8 and publication entitled 'Joints in Steel Construction: Simple Joints to EC3' by SCI. 

Axial load (+ve compression) \( \text{NEd}=700 \text{ kN} \)
Moment about y-y axis \( \text{MyEd}=289 \text{ kNm} \)
Shear on the base in z direction \( \text{VcEd}=96 \text{ kN} \)

300 x 300 x 12.5 SHS - Hot finished.
Properties (cm): \( A=142 \) \( iy=11.7 \) \( Wely=1300 \) \( Wply=1530 \) \( Iy=19400 \) \( It=30300 \) \( Wt=1900 \)

Length of baseplate \( hp=500 \text{ mm} \)
Breadth of baseplate \( bp=500 \text{ mm} \)
Edge distance to bolt centre line \( k=50 \text{ mm} \)
Characteristic cylinder strength \( fck=32 \text{ N/mm}^2 \)
Special control must be applied over the placing of the high strength bedding material.
Selected baseplate thickness \( tp=40 \text{ mm} \)
Total number of bolts to be used \( n=6 \)
Assumed diameter of bolt \( bd=24 \text{ mm} \)
Overall embedded depth \( Lo=450 \text{ mm} \)
Assumed cover to reinforcement \( cv=40 \text{ mm} \)
Assumed percentage area of tension reinforcement \( Asp=0.2 \% \)
Punching shear force \( VEd=\text{ABS}(\text{Ft1Ed})=490.73 \text{ kN} \)
Shear stress at control perimeter \( \text{vEd}=\beta \times \text{VEd} 	imes 1000 / (u1 \times \text{dav})=0.222 \text{ N/mm}^2 \)
Design punching shear resistance \( \text{vRdc}=\sqrt{0.18 / \text{gamc}} \times k \times (100 \times \text{p1} \times fck)^{0.333} =0.37817 \text{ N/mm}^2 \)
Shear enhancement \( 2d/\text{av} \) \( \text{senh}=1 \)
The min design punching shear resistance governs and will be adopted.
Design punching shear resistance \( \text{vRdc}=\text{senh} \times 0.035 \times k \times 1.5 \times fck \times 0.5 =0.43824 \text{ N/mm}^2 \)
As \( vEd \leq vRdc \) ( \( 0.222 \text{ N/mm}^2 \leq 0.43824 \text{ N/mm}^2 \) ), the anchorage arrangement is considered suitable.
## SUMMARY

**BASEPLATE**
- Size 500 mm x 500 mm x 40 mm

**REQUIREMENTS**
- Grade S 275 steel
- Edge distance 1.7 mm
- Number of H.D. bolts 6
- Diameter of bolts 24 mm
- Grade 8.8
- Overall embedded depth 450 mm
- Anchor plate size: 120 mm x 120 mm x 20 mm
- Concrete/grout (fck) 32 N/mm²

**WELDS**
- Fillet weld (all round) 15 mm

Contact areas on the baseplate and column are machined to give a tight bearing contact.

NOTE: The surfaces of baseplate and end of column are assumed to be machined square to give bearing contact.
Location: Ex1 - Simply supported beam

Beam sizing

Calculations in accordance with BS5950-1:2000. Loads are factored. Low shear condition applies.

Beam span \( L = 6 \) m
Total factored load \( W = 200 \) kN
Factored bending moment \( M = W \times L / 8 = 150 \) kNm
Minimum elastic modulus \( Z = M \times 10^3 / (\pi y \times 1.2) = 454.55 \) cm³
For a semi-compact section
Minimum elastic modulus \( Z = M \times 10^3 / py = 545.45 \) cm³

Resistance to lateral-torsional buckling - Clause 4.3.6

For sections of uniform cross-section and for simplicity taking \( u \times v = 0.9 \) and \( \beta w = 1.0 \) i.e. equivalent slenderness = 0.9(\lambda)
Values of minimum plastic modulus \( (S) \) based on slenderness \( (\lambda) \) and bending strength \( (p_b) \).

**Location:** Ex2 - Axially loaded section

**Axially loaded section**

Calculations are in accordance with BS5950-1:2000. Load is factored. Length between restraints is for the weakest axis and end restraint factor 1.0. Compressive strengths are based on strut buckling curve (c) values. Section classification is at least semi-compact.

Factored load (comp. positive) $F=1200$ kN
Length between restraints $L=6$ m
Location: Ex3 - Beam check 254 x 146 x 43 UB

Moment capacity of beam subject to lateral load only. Classification of member is assumed to be at least semi-compact.

- Factored bending moment: \( M = 108 \text{ kNm} \)
- Plastic modulus: \( S = 568 \text{ cm}^3 \)
- Elastic modulus: \( Z = 505 \text{ cm}^3 \)
- Length between restraints: \( L_e = 2 \text{ m} \)
- Minimum radius of gyration: \( r = 3.51 \text{ cm} \)
Location: Ex4 - Column check - 254 x 254 x 89UC

Compressive resistance based on strut curve (c) values. The section classification is assumed to be at least semi-compact. The resistance is based on the length between restraints for the weakest axis and for an effective length factor equal to 1.0.

Factored axial load \( F = 1200 \text{ kN} \)
Length between restraints \( L = 6 \text{ m} \)
Radius of gyration \( r = 6.52 \text{ cm} \)
Area of section \( A = 114 \text{ cm}^2 \)
### Location: Ex5 - Check on 254 x 254 x 73 UC

Beam sizing

Calculations in accordance with EC3 Part 1-1.

Loads are factored. Low shear condition applies.

Beam span \( L = 6 \, \text{m} \)
Total factored load \( W = 200 \, \text{kN} \)
Factored bending moment \( M_{yEd} = W \times L / 8 = 150 \, \text{kNm} \)
For a plastic or compact section (Class 1 or Class 2),
Minimum plastic modulus \( W_{pl} = M_{yEd} \times 10^3 / f_y = 545.45 \, \text{cm}^3 \)
For a semi-compact section (Class 3),
Minimum elastic modulus \( W_{el} = M_{yEd} \times 10^3 / f_y = 545.45 \, \text{cm}^3 \)

Resistance to lateral-torsional buckling

The values in table below are for uniform cross-sections. The minimum plastic modulus \( W_{pl} \), is based on the section slenderness \( \lambda \) and bending strength \( s_b \).

Made by: IFB
Date: 02/12/19
Ref No: SC411 BS

Eaves to 1st. torsional restraint \(L_{ly1}=1226.6\) mm

- Maximum applied moment: \(BM_1=573.68\) kNm
- Axial load: \(F_{c1}=126.2\) kN
- Pitch of haunch: \(\gamma=17.14^\circ\)
- Distance between ref. axes: \(a'=245\) mm
- Larger end moment: \(BM=573.68\) kNm
- Smaller end moment: \(Ms=419.19\) kNm
- Resistance moment: \(M_{bi}=M_b*(1-\frac{F_c}{P_c})=943.16\) kNm
- Design moment: \(M_{xi}=BM=573.68\) kNm

The relationship is satisfied, thus the stability is ensured between effective torsional restraints for the section chosen.

1st to 2nd torsional restraint \(L_{ly2}=1500\) mm

- Maximum applied moment: \(BM_2=419.19\) kNm
- Axial load: \(F_{c2}=122.77\) kN
- Distance between ref. axes: \(a'=245\) mm
- Larger end moment: \(BM=419.19\) kNm
- Smaller end moment: \(Ms=251\) kNm
- Resistance moment: \(M_{bi}=M_b*(1-\frac{F_c}{P_c})=653.96\) kNm
- Design moment: \(M_{xi}=BM=419.19\) kNm

The relationship is satisfied, thus the stability is ensured between effective torsional restraints for the section chosen.

### HOGGING ZONE B

**Check segment from sharp end of haunch to point of contraflexure**

- Distance between lateral restraints: \(L_{yl}=2776\) mm
- Start end restraint: \(N_1=251\) kNm
- Quarter point: \(N_2=181\) kNm
- Mid-length: \(N_3=116\) kNm
- Three quarter point: \(N_4=55\) kNm
- End restraint: \(N_5=0\) kNm
- Largest value of moment: \(RS=251\) kNm

**Overall out-of-plane buckling resistance - Annex G Section G.2.1**

**UNIVERSAL BEAM**

406 x 178 x 60 UB Grade S 275

**HAUNCH SECTION**

533 x 210 x 101 UB Grade S 275

Section is satisfactory for bending, buckling resistance between intermediate restraints and overall buckling between torsional restraints.

Restraint spacing:

Rafter plastic hinge is assumed to form just below the portal apex at the point of maximum sagging moment. Provide restraint to both flanges at the plastic hinge location. If this is not practicable, restraint to both flanges should be provided within a distance of half the depth of the member along the flanges of the member from the location of the plastic hinge.

- **Adjacent to apex hinge**: Lateral restraint 1100 mm
- **Along the rafter**: Lateral restraints 1500 mm, Torsional restraints 4500 mm
- **At eaves position**: Lateral restraint 1226.6 mm, Torsional restraint 1226.6 mm, Torsional restraint 2726.6 mm
Location: Example - small span

Rafter stability

Calculations in accordance with BS5950-1: 2000 Clause 5.3 and Annex G - Members with one flange laterally restrained.

Loads and moments are factored.

**UNIVERSAL BEAM**

406 x 178 x 60 UB Grade S 275

Section is satisfactory for bending, buckling resistance between intermediate restraints and overall buckling between torsional restraints.

**Restraint spacing:**

Rafter plastic hinge is assumed to form just below the portal apex at the point of maximum sagging moment. Provide restraint to both flanges at the plastic hinge location. If this is not practicable, restraint to both flanges should be provided within a distance of half the depth of the member along the flanges of the member from the location of the plastic hinge.

**Along the rafter**

- Lateral restraints 1500 mm
- Torsional restraints 4500 mm

**At eaves position**

- Lateral restraint 1500 mm
- Torsional restraint 2776 mm
**Location:** Ex1 - Based on example 13, 'Steelwork Design Guide'

**Rafter stability**

Calculations in accordance with BS EN 1993-1-1:2005 Clause 6.3.5 and Annex BB.3.

The proforma assumes a plastic hinge forms just below the portal apex (at the point of max sagging moment).

Loads and moments are factored.

**UNIFORM SECTION OF RAFTER**

- Design moment about major axis $M_{Ed}=283.8$ kNm
- Design shear force $V_{zEd}=150$ kN
- Design axial load (+ve comp) $N_{Ed}=92.615$ kN

810  
Assume a plastic hinge at point B. Zone B terminates at point of contraflexure.

**ELASTIC STABILITY CHECKS - Zones A & B**

**Zone A - segment adjacent to column face**

The haunched rafter segment adjacent to column face (2045 mm long) in hogging moment zone A will be checked.

- Dist. between eff. torsional restr. \( L_{tz3} = 2045 \) mm
- Max design moment on segment  \( BM_1 = MA = 573 \) kNm
- Min design moment on segment  \( BM_3 = MAB = 375.38 \) kNm
- Design axial load  \( N_{Ed3} = 92 \) kN
- Length for LTB  \( LT = Lz/1000 = 2.045 \) m
- Critical moment  \( Mcr = C_1 * E_t * S_r / 10^6 = 2800.1 \) kNm
- Design buckling resistance moment  \( Mb_{Rd} = \chi L_T * W_{ply} * f_y / (\gamma M_1 * 10^3) \)  
  \( = 792 \) kNm

As \( My_{Ed}' \leq Mb_{Rd} \) (573 kNm \( \leq 792 \) kNm), design moment is within the buckling resistance moment. Hence OK.

- Resistance moment  \( M_{bi} = Mb_{Rd} * (1-N_{Ed}' / Nb_{Rd}) = 736.35 \) kNm
- Design moment  \( M_{xi} = BM = 573 \) kNm
- As \( M_{xi} \leq M_{bi} \) stability is ensured between effective torsional restraints for the section chosen.

**Zone B - segment adjacent to sharp end of haunch**

The uniform rafter segment adjacent to the sharp end of the haunch in hogging moment zone B (2776 mm long) will be checked.

- Dist. between eff. torsional restr. \( L_{tz4} = 2776 \) mm
- Maximum design moment  \( BM_1 = MB = 283.8 \) kNm
- Minimum design moment  \( BM_4 = 0 \) kNm
- Design axial load  \( N_{Ed4} = 92 \) kN
Length for LTB

Critical moment

Design buckling resistance moment

As \( \text{MEd'} \leq \text{MbRd} \) (283.8 kNm ≤ 330 kNm), design moment is within the buckling resistance moment. Hence OK.

Design moment

As \( \text{Mxi} \leq \text{Mbi} \) stability is ensured between effective torsional restraints for the section chosen.

Location: Ex2 - Small span rafter

Rafter stability

Calculations in accordance with BS EN 1993-1-1:2005 Clause 6.3.5 and Annex BB.3.

The proforma assumes a plastic hinge forms just below the portal apex (at the point of max sagging moment).

Loads and moments are factored.

UNIFORM SECTION OF RAFTER

Design moment about major axis $M_{Ed}=45$ kNm
Design shear force $V_{zEd}=40$ kN
Design axial load (+ve comp) $N_{Ed}=14$ kN
Length of member $L=4.5$ m
203 x 102 x 23 UKB
Axial load at hinge position $N_{Ed}'=14$ kN
Correction factor $k_c=1$
Dist. between lateral restraints $L_z=1100$ mm
Dist. between torsional restraints $L_{zt}=2200$ mm
Design span moment near the apex $M_{Ed1}=38$ kNm
Design axial load $N_{Ed1}=15$ kN

Length of the whole rafter $L_y=5100$ mm
Correction factor $k_c=1$
Maximum end moment $M_{h}(1)=48$ kNm
Maximum span moment $M_{s}(1)=-38$ kNm
End moment $pM_{h}(1)=-35$ kNm

HOGGING MOMENT REGION

203 x 102 x 23 UKB
Vertical overall depth of section $h_0=375$ mm
Pitch of rafter $\theta=11.3^\circ$
Pitch of haunch $\gamma=17.14^\circ$
ELASTIC STABILITY CHECKS - Zones A & B

Zone A - segment adjacent to column face

The haunched rafter segment adjacent to column face (10 mm long) in hogging moment zone A will be checked.

Dist. between eff. torsional restr. $\text{LTz}_3$ = 10 mm

Max design moment on segment $BM_1$ = $MA$ = 48 kNm

Min design moment on segment $BM_3$ = $MAB$ = 47.947 kNm

Design axial load $N_{Ed3}$ = 14 kN

Length for $LTB$ $LT$ = $L_{z}/1000$ = 0.01 m

Critical moment $Mc_r$ = $C_1*E_t*S_r/10^6$ = 5.9676E6 kNm

Design buckling resistance moment $Mb_{Rd}$ = $Ch_l LT*W_{ply}*f_y/(\gamma M_{1}*10^3)$

As $My_{Ed'} \leq Mb_{Rd}$ (48 kNm $\leq$ 136.95 kNm), design moment is within the buckling resistance moment. Hence OK.

Resistence moment $Mb_i$ = $Mb_{Rd}*(1-N_{Ed'}/N_{Rd})$ = 134.55 kNm

Design moment $Mx_i$ = $BM$ = 48 kNm

As $Mx_i \leq Mb_i$ stability is ensured between effective torsional restraints for the section chosen.

Zone B - segment adjacent to sharp end of haunch

The uniform rafter segment adjacent to the sharp end of the haunch in hogging moment zone B (1800 mm long) will be checked.

Dist. between eff. torsional restr. $\text{LTz}_4$ = 1800 mm

Maximum design moment $BM_1$ = $MB$ = 45 kNm

Minimum design moment $BM_4$ = 0 kNm

Design axial load $N_{Ed4}$ = 14 kN

Length for $LTB$ $LT$ = $L_{z}/1000$ = 1.8 m

Critical moment $Mc_r$ = $C_1*E_t*S_r/10^6$ = 225.93 kNm

Design buckling resistance moment $Mb_{Rd}$ = $Ch_l LT*W_{ply}*f_y/(\gamma M_{1}*10^3)$

As $My_{Ed'} \leq Mb_{Rd}$ (45 kNm $\leq$ 64.35 kNm), design moment is within the buckling resistance moment. Hence OK.
Resistance moment $M_{bi} = M_{bRd} \times (1 - N_{Ed}' / N_{bRd}) = 63.22 \text{ kNm}$

Design moment $M_{xi} = BM = 45 \text{ kNm}$

As $M_{xi} \leq M_{bi}$ stability is ensured between effective torsional restraints for the section chosen.

## DESIGN SUMMARY

### UNIVERSAL BEAM

203 x 102 x 23 UKB Grade S 275

### HAUNCH SECTION

203 x 102 x 23 UKB Grade S 275

Section is satisfactory for bending, buckling resistance between intermediate restraints and overall buckling between torsional restraints.

Restraint spacing:

Rafter plastic hinge is assumed to form just below the portal apex at the point of maximum sagging moment and at the sharp end of the haunch. Provide restraint to both flanges at the plastic hinge locations. If this is not practicable, restraint to both flanges should be provided within a distance of half the depth of the member.

Adjacent to apex hinge  First lateral restraint  650 mm
Along the rafter  Lateral restraints  1100 mm
Torsional restraints  2200 mm

Restraint spacing (measured from column face):

At eaves position  Lateral restraint  10 mm
Torsional restraint  570 mm

For spacing of lateral restraints adjacent to the sharp end of haunch see diagram in "Haunch stability" section.
Location: Ex3 - Uniform section only based on Example 13

Rafter stability

Calculations in accordance with BS EN 1993-1-1:2005 Clause 6.3.5 and Annex BB.3.

The proforma assumes a plastic hinge forms just below the portal apex (at the point of max sagging moment).

Loads and moments are factored.

UNIFORM SECTION OF RAFTER

Design moment about major axis \( M_{yEd} = 283.8 \text{ kNm} \)
Design shear force \( V_{zEd} = 150 \text{ kN} \)
Design axial load (+ve comp) \( N_{Ed} = 92 \text{ kN} \)
Length of member \( L = 12.145 \text{ m} \)
406 x 178 x 60 UKB
Axial load at hinge position \( N_{Ed'} = 92 \text{ kN} \)
Correction factor \( k_c = 1 \)
Dist. between lateral restraints \( L_z = 1500 \text{ mm} \)
Dist. between torsional restraints \( L_{zt} = 4500 \text{ mm} \)
Design span moment near the apex \( M_{yEd1} = 279 \text{ kNm} \)
Design axial load \( N_{Ed1} = 92 \text{ kN} \)

Length of the whole rafter \( L_y = 12145 \text{ mm} \)

Correction factor \( k_c = 1 \)
Maximum end moment \( M_{h(1)} = 284 \text{ kNm} \)
Maximum span moment \( M_{s(1)} = -279 \text{ kNm} \)
End moment \( pM_{h(1)} = -247 \text{ kNm} \)

HOGGING MOMENT REGION

Eaves to 1st. torsional restraint \( L_{zt1} = 1226 \text{ mm} \)
Maximum design moment \( B_{M1} = 284 \text{ kNm} \)
Axial load \( N_{Ed1} = 92 \text{ kN} \)
Correction factor \( k_c = 1 \)
Resistance moment \( M_{bi} = M_{bRd} \times (1 - N_{Ed'}/N_{bRd}) = 315.57 \text{ kNm} \)
Design moment \( M_{xi} = BM = 284 \text{ kNm} \)
As \( M_{xi} \leq M_{bi} \) stability is ensured between effective torsional restraints for the section chosen.
1st to 2nd torsional restraint \( L_{tz2} = 1500 \) mm
Max moment @ 1st tors.restraint \( B M_2 = 251 \) kNm
Axial load @ 1st tors.restraint \( N_{Ed2} = 90 \) kN
Correction factor \( k_c = 1 \)
Resistance moment \( M_{bi} = M_{bRd} \times (1 - N_{Ed}'/N_{bRd}) = 315.88 \) kNm
Design moment \( M_{xi} = BM = 251 \) kNm
As \( M_{xi} \leq M_{bi} \) stability is ensured between effective torsional restraints for the section chosen.

&X & X & X & X & X
\end{align*}
\]

1167 \( \text{C.L. of member} \) \( \text{Hogging BM Zone B} \)
\( L_z \) \( \text{Ls} \) \( \text{Lk} \) \( \text{Hogging BM Zone B} \)
\( \text{terminates at point of contraflexure} \)
\( \text{X} = \text{lateral restraint} \)
\( \text{* = torsional restraint} \)

ELASTIC STABILITY CHECKS - Zones A & B

Zone A - segment adjacent to column face

The haunched rafter segment adjacent to column face (1829 mm long) in hogging moment zone A will be checked.
Dist. between eff. torsional restr. \( L_{t3} = 1829 \) mm
Max design moment on segment \( BM_1 = MA = 1711 \) kNm
Min design moment on segment \( BM_3 = MAB = 1246 \) kNm
Design axial load \( N_{Ed3} = 164 \) kN
Length for LTB \( LT = L_z / 1000 = 1.829 \) m
Critical moment \( Mcr = C1 * E_t * S_r / 10^6 = 11723 \) kNm
Design buckling resistance moment \( Mb_{Rd} = C1 * L_T * W_{ply} * f_y / (\gamma M_1 * 10^3) = 2488.6 \) kNm

As \( My_{Ed} \leq Mb_{Rd} \) (1711 kNm \( \leq 2488.6 \) kNm), design moment is within the buckling resistance moment. Hence OK.
Resistance moment \( M_{bi} = Mb_{Rd} * (1 - N_{Ed} / Nb_{Rd}) = 2342.4 \) kNm
Design moment \( M_{xi} = BM = 1711 \) kNm
As \( M_{xi} \leq M_{bi} \) stability is ensured between effective torsional restraints for the section chosen.

Zone B - segment adjacent to sharp end of haunch

The uniform rafter segment adjacent to the sharp end of the haunch in hogging moment zone B (4000 mm long) will be checked.
Dist. between eff. torsional restr. \( L_{t4} = 3305 \) mm
Maximum design moment \( BM_1 = MB = 781 \) kNm
Minimum design moment \( BM_4 = 135.7 \) kNm
Design axial load \( N_{Ed4} = 164 \) kN
Length for LTB  \( LT = \frac{Lz}{1000} = 3.305 \text{ m} \)

Critical moment  \( Mcr = C1*Et*Sr/10^6 = 2763.1 \text{ kNm} \)

Design buckling resistance moment  \( MbRd = \text{ChiLT}*Wply*fy/(\text{gamM1}*10^3) = 999.96 \text{ kNm} \)

As  \( MyEd' \leq MbRd \) (781 kNm \( \leq 999.96 \text{ kNm} \)), design moment is within the buckling resistance moment. Hence OK.

Resistance moment  \( Mbi = MbRd*(1-NEd'/NbRd) = 941.25 \text{ kNm} \)

Design moment  \( Mxi = BM = 781 \text{ kNm} \)

As  \( Mxi \leq Mbi \) stability is ensured between effective torsional restraints for the section chosen.

**DESIGN SUMMARY**

**UNIVERSAL BEAM**  
610 x 229 x 101 UKB Grade S 355

**HAUNCH SECTION**  
610 x 229 x 101 UKB Grade S 355

Section is satisfactory for bending, buckling resistance between intermediate restraints and overall buckling between torsional restraints.

Restraint spacing:
Rafter plastic hinge is assumed to form just below the portal apex at the point of maximum sagging moment. Provide restraint to both flanges at the plastic hinge location. If this is not practicable, restraint to both flanges should be provided within a distance of half the depth of the member.

Adjacent to apex hinge  
First lateral restraint 950 mm

Along the rafter  
Lateral restraints 1800 mm
Torsional restraints 5400 mm

Restraint spacing (measured from column face):

At eaves position  
Lateral restraint 1829 mm
Torsional restraint 1829 mm
Torsional restraint 3658 mm

Provide an additional bottom flange torsional restraint at a distance \( \leq 3305 \text{ mm} \) from the sharp end of the haunch on the higher side beyond point B.

ELEVATION PLAN

Axial load (+ve compression) \( N = 300 \) kN
Moment about X-X axis \( M = 345 \) kNm
Shear on the base in Y direction \( F_y = 75 \) kN

305 x 305 x 118 UC.
Length of baseplate \( h_p = 600 \) mm
Breadth of baseplate \( b_p = 600 \) mm
Edge distance to bolt centre line \( k = 75 \) mm
Strength of concrete \( f_{cu} = 30 \) N/mm²
Assumed weld size \( s_w = 12 \) mm
Selected baseplate thickness \( t_p = 50 \) mm

Total number of bolts to be used \( n = 8 \)
Assumed diameter of bolt \( b_d = 24 \) mm
Overall embedded depth \( L_o = 450 \) mm
Assumed cover to reinforcement \( c_v = 50 \) mm
tension reinforcement \( A_{sp} = 0.15 \% \)
Selected fillet weld size \( s_w = 12 \) mm

Web welds

Length of web weld \( L_{wv} = 2 \times d_c = 493.4 \) mm
Weld force per mm \( F_{yw} = F_y \times 10^{-3} / L_{wv} = 152.01 \) N/mm
Weld size required \( s_{ww} = F_{yw} / (0.7 \times p_w) = 0.98706 \) mm
Selected fillet weld size \( s_{fw} = 8 \) mm
### SUMMARY

**BASEPLATE**
Size 600 mm x 600 mm x 50 mm

**REQUIREMENTS**
- Grade S 275 steel
- Edge distance 75 mm
- Number of H.D. bolts 8
- Diameter of bolts M 24
- Grade 8.8
- Overall embedded depth 450 mm
- Anchor plate size: 120 mm x 120 mm x 20 mm
- Concrete/grout (fcu) 30 N/mm²

### WELDS

**TENSION**
- Fillet weld 12 mm
  - Contact areas on the baseplate and column are machined to give a tight bearing contact.
  - The specified tension weld will be used for both flanges.

**WEB**
- Fillet weld 8 mm
Location: Example based on proforma 462 arrangement

Unstiffened column slab base

Calculations are in accordance with 'Joints in Steel Construction Moment Connections' published by The Steel Construction Institute.

Axial load (+ve compression) \( N = 38.34 \text{ kN} \)
Moment about X-X axis \( M = 204 \text{ kNm} \)
Shear on the base in Y direction \( F_y = 12.15 \text{ kN} \)

533 x 210 x 101 UB.
Length of baseplate \( h_p = 700 \text{ mm} \)
Breadth of baseplate \( b_p = 400 \text{ mm} \)
Edge distance to bolt centre line \( k = 50 \text{ mm} \)
Strength of concrete \( f_{cu} = 25 \text{ N/mm}^2 \)
Assumed weld size \( s_w = 8 \text{ mm} \)
Selected baseplate thickness \( t_p = 25 \text{ mm} \)

Total number of bolts to be used \( n = 6 \)
Assumed diameter of bolt \( b_d = 24 \text{ mm} \)
Overall embedded depth \( L_o = 450 \text{ mm} \)
Assumed cover to reinforcement \( c_v = 50 \text{ mm} \)
tension reinforcement \( A_{sp} = 0.2 \% \)
Selected fillet weld size \( s_w = 8 \text{ mm} \)

Web welds

Length of web weld \( L_{wv} = 2 \times d_c = 953 \text{ mm} \)
Weld force per mm \( F_{yw} = F_y \times 10^3 / L_{wv} = 12.749 \text{ N/mm} \)
Weld size required \( s_{ww} = F_{yw} / (0.7 \times p) = 0.082787 \text{ mm} \)
Selected fillet weld size \( s_{fw} = 8 \text{ mm} \)

Location: Ex1 - Example in Moment Connections publication

Unstiffened column slab base

Calculations are in accordance with EC3 Parts 1-1, 1-8 and publication entitled 'Joints in Steel Construction: Simple Joints to EC3' by SCI.

Axial load (compression) \( N_{Ed} = 300 \text{ kN} \)
Moment about y-y axis \( M_{yEd} = 345 \text{ kNm} \)
Shear on the base in z direction \( V_{cEd} = 75 \text{ kN} \)

305 x 305 x 118 UKC
Length of baseplate \( h_p = 600 \text{ mm} \)
Breadth of baseplate \( b_p = 600 \text{ mm} \)
Edge distance to bolt centre line \( k = 75 \text{ mm} \)
Characteristic cylinder strength \( f_{ck} = 25 \text{ N/mm}^2 \)
Selected baseplate thickness \( t_p = 50 \text{ mm} \)
Total number of bolts to be used \( n = 8 \)
Assumed diameter of bolt \( b_d = 24 \text{ mm} \)
Overall embedded depth \( L_o = 450 \text{ mm} \)
Assumed cover to reinforcement \( c_v = 50 \text{ mm} \)
Assumed percentage area of tension reinforcement \( A_{sp} = 0.15 \% \)
Punching shear force \( V_{Ed} = \text{ABS}(F_{tlEd}) = 775.18 \text{ kN} \)
Shear stress at control perimeter \( \nu_{Ed} = \beta \cdot \nu_{Ed} \cdot 1000/(u_1 \cdot d_{av}) \)
\[= 0.36062 \text{ N/mm}^2 \]
Design punching shear resistance \( \nu_{Rdc} = (0.18/g_{mc}) \cdot k^* (100 \cdot P_1 \cdot f_{ck})^0.333 = 0.31812 \text{ N/mm}^2 \)
Shear enhancement 2d/av \( \text{senh} = 1 \)
The min design punching shear resistance governs and will be adopted.
Design punching shear resistance \( \nu_{Rdc} = \text{senh} \cdot 0.035 \cdot k^{1.5} \cdot f_{ck}^{0.5} = 0.39033 \text{ N/mm}^2 \)

As \( \nu_{Ed} \leq \nu_{Rdc} \) (0.36062 N/mm² ≤ 0.39033 N/mm²), the anchorage arrangement is considered suitable.
Column tension flange welds

Weld design shear strength
\[ fvwd = \frac{fu}{\sqrt{3} \cdot \beta \cdot \gamma} \]
\[ = 222.79 \text{ N/mm}^2 \]

Force in the tension flange
\[ T_t = \frac{M_y \cdot E}{D} \cdot 10^3 / (h_c - t_f + c) - T_a = 1051.4 \text{ kN} \]

Weld force per mm
\[ F_{wRd} = \frac{F_{wF}}{2 \cdot b_c - t_w} = 1.7442 \text{ kN/mm} \]

Weld size required
\[ s_{wf} = \frac{F_{wRd} \cdot 10^3}{0.7 \cdot fvwd} = 11.184 \text{ mm} \]

Selected fillet weld size
\[ s_{w} = 12 \text{ mm} \]

Column compression flange welds

The specified tension weld will be used for both flanges.

Column web welds

Weld force per mm
\[ F_{wRd1} = \frac{V_c \cdot E}{L_w} = 152.01 \text{ N/mm} \]

Weld size required
\[ s_{ww} = \frac{F_{wRd1}}{0.7 \cdot fvwd} = 0.9747 \text{ mm} \]

Selected fillet weld size
\[ s_{fw} = 8 \text{ mm} \]

SUMMARY

BASEPLATE
Size 600 mm x 600 mm x 50 mm

REQUIREMENTS
Grade S 275 steel
Edge distance 75 mm
Number of H.D. bolts 8
Diameter of bolts M 24
Grade 8.8
Overall embedded depth 450 mm
Anchor plate size:
120 mm x 120 mm x 20 mm
Concrete/grout (fck) 25 N/mm²

WELD SUMMARY
TENSION
Fillet weld 12 mm
Contact areas on the baseplate and column are machined to give a tight bearing contact.
The specified tension weld will be used for both flanges.

WEB
Fillet weld 8 mm
Location: Ex2 - Example based on proforma 462 arrangement

Unstiffened column slab base

Calculations are in accordance with EC3 Parts 1-1, 1-8 and publication entitled 'Joints in Steel Construction: Simple Joints to EC3' by SCI.

Axial load (compression) \( N_{Ed} = 38.34 \text{ kN} \)

Moment about y-y axis \( M_{yEd} = 204 \text{ kNm} \)

Shear on the base in z direction \( V_{cEd} = 12.15 \text{ kN} \)

533 x 210 x 101 UKB

Length of baseplate \( h_p = 700 \text{ mm} \)

Breadth of baseplate \( b_p = 400 \text{ mm} \)

Edge distance to bolt centre line \( k = 50 \text{ mm} \)

Characteristic cylinder strength \( f_{ck} = 20 \text{ N/mm}^2 \)

Selected baseplate thickness \( t_p = 25 \text{ mm} \)

Total number of bolts to be used \( n = 6 \)

Assumed diameter of bolt \( b_d = 24 \text{ mm} \)

Overall embedded depth \( L_o = 450 \text{ mm} \)

Assumed cover to reinforcement \( c_v = 50 \text{ mm} \)

Assumed percentage area of tension reinforcement \( A_{sp} = 0.2 \% \)

Punching shear force \( V_{Ed} = \text{ABS}(F_{tlEd}) = 345.34 \text{ kN} \)

Shear stress at control perimeter \( \sigma_{Ed} = \beta_{VEd} * V_{Ed} * 1000 / (u_1 * d_{av}) \)

\( = 0.16885 \text{ N/mm}^2 \)

Design punching shear resistance \( \sigma_{Rdc} = (0.18 / \gamma_{mc}) * k^* (100 * p_1 * fck)^0.333 = 0.32503 \text{ N/mm}^2 \)

Shear enhancement \( 2d_{av} / d_{av} \)

\( \text{senh}=1 \)

The min design punching shear resistance governs and will be adopted.

Design punching shear resistance \( \sigma_{Rdc} = \text{senh} * 0.035 * k^* 1.5 * fck^0.5 \)

\( = 0.34912 \text{ N/mm}^2 \)

As \( \sigma_{Ed} \leq \sigma_{Rdc} \) (\( 0.16885 \text{ N/mm}^2 \leq 0.34912 \text{ N/mm}^2 \)), the anchorage arrangement is considered suitable.
**Column tension flange welds**

Weld design shear strength: \( fvwd = \frac{fu}{\sqrt{3}/(\beta_{aw} \cdot \gamma_M^2)} \)

- \( = 222.79 \text{ N/mm}^2 \)

Force in the tension flange: \( T_t = \frac{MyE_d}{10^3/(hc-tfc)} - Ta = 381.98 \text{ kN} \)

Weld force per mm: \( FwRd = \frac{T_{ff}}{2*bc-tw} = 0.93348 \text{ kN/mm} \)

Weld size required: \( sw_f = \frac{FwRd*10^3/(0.7*fvwd)}{0.7*fvwd} = 5.9857 \text{ mm} \)

Selected fillet weld size: \( sw = 8 \text{ mm} \)

**Column compression flange welds**

The specified tension weld will be used for both flanges.

**Column web welds**

Weld force per mm: \( FwRd_1 = \frac{VcE_d}{10^3/Lw} = 12.749 \text{ N/mm} \)

Weld size required: \( sw_w = FwRd_1/(0.7*fvwd) = 0.081751 \text{ mm} \)

Selected fillet weld size: \( sw = 8 \text{ mm} \)

**SUMMARY**

**BASEPLATE**

| Size 700 mm x 400 mm x 25 mm |

- Edge distance 50 mm
- Number of H.D. bolts 6
- Diameter of bolts M 24
- Grade 8.8
- Overall embedded depth 450 mm
- Anchor plate size: 120 mm x 120 mm x 20 mm
- Concrete/grout (fck) 20 N/mm²

**WELD SUMMARY**

**TENSION**

Fillet weld 8 mm

Contact areas on the baseplate and column are machined to give a tight bearing contact.

The specified tension weld will be used for both flanges.

**WEB**

Fillet weld 8 mm
Location: Ex3 - Odd numbers arrangement

Unstiffened column slab base

Calculations are in accordance with EC3 Parts 1-1, 1-8 and publication entitled 'Joints in Steel Construction: Simple Joints to EC3' by SCI.

Axial load (compression) \( \text{NE}_\text{Ed}=200 \text{ kN} \)
Moment about y-y axis \( \text{M}_\text{y}_\text{Ed}=350 \text{ kNm} \)
Shear on the base in z direction \( \text{V}_\text{c}_\text{Ed}=50 \text{ kN} \)

Length of baseplate \( \text{hp}=600 \text{ mm} \)
Breadth of baseplate \( \text{bp}=400 \text{ mm} \)
Edge distance to bolt centre line \( \text{k}=50 \text{ mm} \)
Characteristic cylinder strength \( \text{f}_\text{ck}=25 \text{ N/mm}^2 \)
Selected baseplate thickness \( \text{tp}=35 \text{ mm} \)
Total number of bolts to be used \( \text{n}=6 \)
Assumed diameter of bolt \( \text{bd}=30 \text{ mm} \)
Overall embedded depth \( \text{Lo}=450 \text{ mm} \)
Assumed cover to reinforcement \( \text{cv}=50 \text{ mm} \)
Assumed percentage area of tension reinforcement \( \text{As}_\text{p}=0.42 \% \)
Punching shear force \( \text{V}_{\text{Ed}}=\text{ABS}(\text{Ft}_\text{Ed})=652.69 \text{ kN} \)
Shear stress at control perimeter \( \text{v}_\text{Ed}=\text{beta}_\text{Ed}^\times\text{VE}_\text{Ed}^\times1000/(\text{u}_1^\times\text{dav}) \)
\( =0.43137 \text{ N/mm}^2 \)
Design punching shear resistance \( \text{v}_{\text{Rdc}}=(0.18/\text{gam}_\text{c})^\times(100^\times\text{p}_1^\times\text{fck})^\times0.333=0.44823 \text{ N/mm}^2 \)
As \( \text{v}_\text{Ed} \leq \text{v}_{\text{Rdc}} (0.43137 \text{ N/mm}^2 \leq 0.44823 \text{ N/mm}^2) \), the anchorage arrangement is considered suitable.

Column tension flange welds

Weld design shear strength \( \text{fv}_{\text{wd}}=\text{fu}/\text{SQR}(3)/(\text{betaw}_\text{x}\text{gamM}_2) \)
\( =222.79 \text{ N/mm}^2 \)
Force in the tension flange \( \text{T}_\text{t}=\text{My}_\text{Ed}_\times10^3/(\text{hc}-\text{tfc})-\text{T}_\text{a}=752.6 \text{ kN} \)
Weld force per mm \( \text{Fw}_{\text{Rd}}=\text{Tff}/(2\times\text{bc}-\text{twc})=1.5518 \text{ kN/mm} \)
Weld size required \( \text{sw}_{\text{f}}=\text{Fw}_{\text{Rd}}\times10^3/(0.7\times\text{fv}_{\text{wd}})=9.9502 \text{ mm} \)
Selected fillet weld size \( \text{sw}=12 \text{ mm} \)
Column compression flange welds

The specified tension weld will be used for both flanges.

Column web welds

Weld force per mm  \[ F_{wRd1} = \frac{V_c E_d \times 10^3}{L_{wv}} = 64.767 \text{ N/mm} \]
Weld size required  \[ s_{ww} = \frac{F_{wRd1}}{0.7 \times f_{wvd}} = 0.4153 \text{ mm} \]
Selected fillet weld size  \[ s_{fw} = 12 \text{ mm} \]

Summary

**BASEPLATE**  
Size 600 mm x 400 mm x 35 mm

**REQUIREMENTS**  
Grade S 275 steel
Edge distance 50 mm
Number of H.D. bolts 6
Diameter of bolts M 30
Grade 8.8
Overall embedded depth 450 mm
Anchor plate size: 150 mm x 150 mm x 25 mm
Concrete/grout (fck) 25 N/mm²

Weld Summary

**TENSION**  
Fillet weld 12 mm
Contact areas on the baseplate and column are machined to give a tight bearing contact.
The specified tension weld will be used for both flanges.

**WEB**  
Fillet weld 12 mm
Location: Ex4 - SCI Example 20

Unstiffened column slab base

Calculations are in accordance with EC3 Parts 1-1, 1-8 and publication entitled 'Joints in Steel Construction: Simple Joints to EC3' by SCI.

Axial load (compression) \( N_{Ed}=1380 \text{ kN} \)
Moment about y-y axis \( M_{yEd}=185 \text{ kNm} \)
Shear on the base in z direction \( V_{cEd}=75 \text{ kN} \)

305 x 305 x 137 UKC

Length of baseplate \( h_p=600 \text{ mm} \)
Breadth of baseplate \( b_p=600 \text{ mm} \)
Edge distance to bolt centre line \( k=75 \text{ mm} \)
Characteristic cylinder strength \( f_{ck}=25 \text{ N/mm}^2 \)
Selected baseplate thickness \( t_p=40 \text{ mm} \)
Number of bolts to be used \( n=4 \)
Bolt diameter \( b_d=24 \)

Column tension flange welds

Weld design shear strength \( f_{vwd}=f_u/SQR(3)\) \( \times \) (betaw \( \times \) gamM2) 
\( =222.79 \text{ N/mm}^2 \)

As tension is not developed in the foundation, a nominal weld size needs to be specified.
Selected fillet weld size \( s_w=8 \text{ mm} \)

Column compression flange welds

The specified tension weld will be used for both flanges.
Column web welds

Weld force per mm \[ F_{Wd1} = \frac{VcEd \times 10^3}{Lwv} = 152.01 \text{ N/mm} \]
Weld size required \[ s_{WW} = \frac{F_{Wd1}}{0.7 \times f_{Wd}} = 0.9747 \text{ mm} \]
Selected fillet weld size \[ s_{FW} = 8 \text{ mm} \]

Bolted extended end plate connection - beam to column

Calculations are in accordance with BS5950-1:2000 and follow the procedure given in the SCI publication entitled 'Joints in Steel Construction Moment Connections'.

Beams are connected to both column flanges. The web panel shear can be discounted in the determination of the compressive force as the connection is assumed to have balanced moments.

Factored moment \( M_a = 350 \text{ kNm} \)
Factored shear force \( V = 60 \text{ kN} \)
Axial force (+ve compression) \( N = 0 \text{ kN} \)

254 x 254 x 73 UC.
533 x 210 x 92 UB.
Diameter of bolts \( b_d = 24 \text{ mm} \)
Thickness of plate \( t_p = 25 \text{ mm} \)
Total number of bolts \( b_n = 8 \)
Number of shear bolts \( n_s = 2 \)
Distance to first row of bolts \( e_x = 50 \text{ mm} \)
Distance to beam flange \( x = 40 \text{ mm} \)
Pitch to second row of bolts \( p_1 = 100 \text{ mm} \)
Pitch of tension bolts \( p_2 = 90 \text{ mm} \)
Distance tension to shear bolts \( p_3 = 320 \text{ mm} \)
Edge distance for shear bolts \( p_n = 100 \text{ mm} \)
Bolt cross-centres \( g = 100 \text{ mm} \)
Width of end plate \( b_p = 250 \text{ mm} \)
Assumed web fillet weld size \( s_{ww} = 8 \text{ mm} \)
Assumed flange fillet weld size \( s_{wf} = 12 \text{ mm} \)
SUMMARY OF BOLT POTENTIAL RESISTANCES

Top row of bolts                  Pr1=297.07 kN

Distance to beam flange \( x = 40 \text{ mm} \)
Pitch to second row of bolts \( p_2 = 100 \text{ mm} \)
Pitch of tension bolts \( p_1 = 90 \text{ mm} \)
Edge distance for shear bolts \( e_1' = 100 \text{ mm} \)
Over-all length of end plate hp=730 mm
Bolt cross-centres p3=140 mm
Width of end plate bp=300 mm
Assumed web fillet weld size sww=8 mm
Assumed flange fillet weld size swf=10 mm

SUMMARY OF BOLT POTENTIAL RESISTANCES

Top row of bolts Pr1=312.2 kN
Row 2 Pr2=199.38 kN
Row 3 Pr3=110.98 kN
Design axial load on column NEdc=500 kN
Weld size sc=6 mm
Selected fillet weld size swt=10 mm
Selected fillet weld size sfw=10 mm

CONNECTION SUMMARY - all dimensions in diagram are in mm

Number of bolts 8
Bolt diameter 24 mm
Bolt grade Preloaded HSFG bolts
General grade (8.8) with grade 10 nuts.
Welds Tension flange fillet weld 10 mm
Web fillet weld 10 mm
Compression flange fillet weld 10 mm
Supporting column section 305 x 305 x 97 UKC
Grade S 275
Beam / Rafter section 610 x 229 x 101 UKB
Grade S 275

Column stiffener details

Diagonal stiffeners 2/145 mm x 20 mm Grade S 275
on line between the beam tension and compression flanges connected by 4/6 mm fillet welds.
Diagonal stiffeners also act as compression stiffeners.
Location: Ex5 - Backing plates example

Bolted extended end plate connection - beam to column

Calculations are in accordance with EC3 Parts 1-1, 1-5, 1-8 and follow the procedure given in the SCI publication entitled 'Joints in Steel Construction Moment Connections'. Beams are connected to both column flanges. The web panel shear can be discounted in the determination of the compressive force as the connection is assumed to have balanced moments.

Factored moment: MyEd=630 kNm
Factored shear force: VEd=215 kN
Axial force (+ve compression): NEd=200 kN

Supporting column details
305 x 305 x 97 UKC

Supported beam details
686 x 254 x 140 UKB

Bolt details
Diameter of bolts: db=24 mm
Tensile resistance (EC3 Part 1-8): FtRd=k2*fub*At/(gamM2*10^3)=203.33 kN

End plate details
Thickness of plate: tp=25 mm
Total number of bolts: bn=14
Number of shear bolts: ns=2
Distance to first row of bolts: ex=50 mm
Distance to beam flange: x=40 mm
Pitch to second row of bolts: p2=100 mm
Pitch of tension bolts: p1=90 mm
Edge distance for shear bolts        e1' = 100 mm
Over-all length of end plate        hp = 815 mm
Bolt cross-centres                  p3 = 140 mm
Width of end plate                  bp = 280 mm
Assumed web fillet weld size        sww = 8 mm
Assumed flange fillet weld size     swf = 12 mm

SUMMARY OF BOLT POTENTIAL RESISTANCES

Top row of bolts                  Pr1 = 312.2 kN
Row 2                             Pr2 = 199.38 kN

<tr>
<td>Design axial load on column</td>
<td>( N_{Edc} = 500 \text{ kN} )</td>
</tr>
</tbody>
</table>

**Connection of stiffeners to column web**

- Effective length of weld  \( L_w = 4 \times (L_{sn} - 2 \times s_{ww}) = 718.8 \text{ mm} \)
- Load on welds  \( F_{wEds} = F_{Crds} / L_w = 1.1613 \text{ kN/mm} \)
- Weld design strength  \( f_{wEds} = f_u / \sqrt{3} / (\beta_{aw} \cdot \gamma_{M2}) = 222.79 \text{ N/mm}^2 \)
- Weld size (leg length)  \( s_s = 8 \text{ mm} \)
- Resistance of weld  \( F_{wRds} = 0.7 \times s_s \times f_{wEds} / 1000 = 1.2476 \text{ kN/mm} \)

Adopt 2/120 mm x 15 mm plate stiffeners Grade S 275 adjacent to the haunch compression flange connected by 4/8 mm fillet welds.

**Beam tension flange welds**

- Weld design strength  \( f_{vwd} = f_u / \sqrt{3} / (\beta_{aw} \cdot \gamma_{M2}) = 222.79 \text{ N/mm}^2 \)
- Tension resistance of the flange  \( T_f = b_p \times t_{fb} \times f_{yb} / 10^3 = 858 \text{ kN} \)
- Tension force in top 2 bolt rows  \( T_{fc} = P_{r1} + P_{r2} = 690.89 \text{ kN} \)
- Weld force per mm  \( F_{wEdf} = T_{fb} / (2 \times b_p - t_{wb}) = 1.772 \text{ kN/mm} \)
- Selected fillet weld size  \( s_{wt} = 12 \text{ mm} \)

**Beam web welds**

- Tension zone - a full strength weld is recommended in the web tension zone with the sum of the throat thicknesses \( \geq t_{wb} \) \( s_{fw} = 8 \text{ mm} \)
- Shear zone - assume an 8 mm FW continued for the full depth.
- Length of weld for shear  \( L_{ws} = h_b - 2 \times (t_{fb} + r_b) - L_{wt} = 178.3 \text{ mm} \)
- Resistance of weld for shear  \( F_{wRds} = 2 \times 0.7 \times s_{fw} \times f_{vwd} \times L_{ws} / 10^3 = 444.9 \text{ kN} \)
- Vertical shear  \( V_{Ed} = 128 \text{ kN} \)

An 8 mm weld size is therefore considered suitable.

- Effective length of weld: \( L_w = 4 \times (L_{sn} - 2 \times s_{ww}) = 718.8 \text{ mm} \)
- Load on welds: \( F_{wEds} = F_{crds} / L_w = 1.1613 \text{ kN/mm} \)
- Weld design strength: \( f_{wds1} = f_u / \sqrt{3} / (\beta_{aw} \cdot \gamma_{M2}) = 222.79 \text{ N/mm}^2 \)
- Weld size (leg length): \( s_s = 10 \text{ mm} \)
- Resistance of weld: \( F_{wRds} = 0.7 \times s_s \times f_{wds1} / 1000 = 1.5595 \text{ kN/mm} \)
- Adopt 2/120 mm x 15 mm plate stiffeners Grade S 275 adjacent to the haunch compression flange connected by 4/10 mm fillet welds.
- Thickness of backing plate: \( t_{bp} = 25 \text{ mm} \)
- Width of backing plate: \( b_{bp} = 125 \text{ mm} \)
- Length of backing plate: \( L_{bp} = 550 \text{ mm} \)

Beam tension flange welds

- Weld design strength: \( f_{wds} = f_u / \sqrt{3} / (\beta_{aw} \cdot \gamma_{M2}) = 222.79 \text{ N/mm}^2 \)
- Tension resistance of the flange: \( T_f = b_b \times t_{fb} \times f_y / 10^3 = 897.9 \text{ kN} \)
- Tension force in top 2 bolt rows: \( T_{fc} = P_{r1} + P_{r2} = 723.02 \text{ kN} \)
- Weld force per mm: \( F_{wEdf} = T_f / (2 \times b_b - t_{wb}) = 1.7699 \text{ kN/mm} \)
- Selected fillet weld size: \( s_{wt} = 12 \text{ mm} \)

Beam web welds

- Tension zone - a full strength weld is recommended in the web tension zone with the sum of the throat thicknesses \( \geq \) the web thickness, \( t_{wb} \).
- Selected fillet weld size: \( s_{fw} = 8 \text{ mm} \)

- Shear zone - assume an 8 mm FW continued for the full depth.

Length of weld for shear: \( L_{ws} = h_b - 2 \times (t_{fb} + r_b) - L_{wt} = 251 \text{ mm} \)
Resistance of weld for shear  \[ F_{\text{wRds}} = 2 \times 0.7 \times sfw \times fvwd \times Lws / 10^3 \]  
\[ = 626.31 \text{ kN} \]

Vertical shear  \[ V_{\text{Ed}} = 137 \text{ kN} \]
An 8 mm weld size is therefore considered suitable.

### SUMMARY OF BOLT POTENTIAL RESISTANCES

<table>
<thead>
<tr>
<th>Component</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Top row of bolts</td>
<td>( P_{r1} = 282.24 \text{ kN} )</td>
</tr>
<tr>
<td>Row 2</td>
<td>( P_{r2} = 234.16 \text{ kN} )</td>
</tr>
<tr>
<td>Design axial load on column</td>
<td>( N_{Edc} = 500 \text{ kN} )</td>
</tr>
</tbody>
</table>

**Connection of stiffeners to column web**

Effective length of weld \( L_w = 4 \times (L_{sn} - 2 \times s_{ww}) = 718.8 \text{ mm} \)
Load on welds \( F_{wEds} = F_{cRds}/L_w = 1.1613 \text{ kN/mm} \)
Weld design strength \( f_{wd1} = f_u / \sqrt{3} / (\beta_{w} \gamma_{M2}) = 222.79 \text{ N/mm}^2 \)
Weld size (leg length) \( s_s = 8 \text{ mm} \)
Resistance of weld \( F_{wRds} = 0.7 \times s_s \times f_{wd1}/1000 = 1.2476 \text{ kN/mm} \)
Adopt 2/120 mm x 15 mm plate stiffeners Grade S 275 adjacent to the haunch compression flange connected by 4/8 mm fillet welds.

**Beam tension flange welds**

Weld design strength \( f_{vd} = f_u / \sqrt{3} / (\beta_{w} \gamma_{M2}) = 222.79 \text{ N/mm}^2 \)
Tension resistance of the flange \( T_f = b_p t_f b \cdot f_y b / 10^3 = 858 \text{ kN} \)
Tension force in top 2 bolt rows \( T_{fc} = P_{r1} + P_{r2} = 516.4 \text{ kN} \)
Weld force per mm \( F_{wEdf} = T_{fb} / (2 \times b_p - t_w b) = 1.3245 \text{ kN/mm} \)
Selected fillet weld size \( s_{wt} = 10 \text{ mm} \)

**Beam web welds**

A full strength weld will be used.
As the beam web ≤ 11.3 mm, no calculations are needed for tension or shear provided that full strength welds are used.
Full strength weld \( s_{wf'} = \text{INT}(s_{wf'}) = 7 \text{ mm} \)
Selected fillet weld size \( s_{fw} = 8 \text{ mm} \)
CONNECTION SUMMARY - all dimensions in diagram are in mm

Supported beam details
356 x 171 x 57 UKB

Bolt details
Diameter of bolts  db=24 mm
Tensile resistance (EC3 Part 1-8)  FtRd=k2*fub*At/(gamM2*10^3)=203.33 kN

End plate details
Thickness of plate  tp=15 mm
Number of bolts in end plate  bn=6
Number of shear bolts  ns=2
Distance to beam flange  xl=30 mm
Distance to first row of bolts  e1=90 mm
Pitch of tension bolts  p1=120 mm
Distance tension to shear bolts \( p_1' = 230 \text{ mm} \)
Edge distance for shear bolts \( e_1' = 93 \text{ mm} \)
Cross-centres of bolts \( p_3 = 90 \text{ mm} \)
Width of end plate \( b_p = 190 \text{ mm} \)
Assumed web fillet weld size \( s_{ww} = 8 \text{ mm} \)
Assumed flange fillet weld size \( s_{wf} = 8 \text{ mm} \)

**SUMMARY OF BOLT POTENTIAL RESISTANCES**

| Top row of bolts | \( P_{r1} = 302.96 \text{ kN} \) |
| Row 2            | \( P_{r2} = 250.75 \text{ kN} \) |
| Design axial load on column | \( N_{Edc} = 521.8 \text{ kN} \) |

**Connection of stiffeners to column web**

| Effective length of weld | \( L_w = 4 \times (L_{sn} - 2 \times s_{ww}) = 556.8 \text{ mm} \) |
| Load on welds            | \( F_{wEds} = F_{cRds} / L_w = 1.215 \text{ kN/mm} \) |
| Weld design strength     | \( f_{vwd1} = f_u / \sqrt{3} / (\beta_{w} \cdot \gamma_{M2}) \) = 222.79 N/mm² |
| Weld size (leg length)   | \( s_s = 8 \text{ mm} \) |
| Resistance of weld       | \( F_{wRds} = 0.7 \times s_s \times f_{vwd1} / 1000 = 1.2476 \text{ kN/mm} \) |
| Adopt 2/95 mm x 15 mm plate stiffeners Grade S 275 adjacent to the haunch compression flange connected by 4/8 mm fillet welds. |
| Stiffener width           | \( b_{sgt} = 75 \text{ mm} \) |
| Proposed rib stiffener thickness | \( t_{sr} = 10 \text{ mm} \) |
| Proposed weld size       | \( s_{sr} = 8 \text{ mm} \) |

**Beam tension flange welds**

| Weld design strength     | \( f_{vwd} = f_u / \sqrt{3} / (\beta_{w} \cdot \gamma_{M2}) \) = 222.79 N/mm² |
| Tension resistance of the flange | \( T_f = b_b \times t_{fb} \times f_{yb} / 10^3 = 615.62 \text{ kN} \) |
| Tension force in top 2 bolt rows | \( T_{fc} = P_{r1} + P_{r2} = 586.31 \text{ kN} \) |
| Weld force per mm        | \( F_{wEdf} = T_{fb} / (2 \times b_b - t_{wb}) = 1.7434 \text{ kN/mm} \) |
| Selected fillet weld size | \( s_{wt} = 12 \text{ mm} \) |

**Beam web welds**

Tension zone - a full strength weld is recommended in the web tension zone with the sum of the throat thicknesses ≥ the web thickness, \( t_{wb} \).

| Selected fillet weld size | \( s_{fw} = 8 \text{ mm} \) |

Shear zone - assume an 8 mm FW continued for the full depth.

| Length of weld for shear  | \( L_{ws} = h_b - 2 \times (t_{fb} + r_b) - L_{wt} = 76.95 \text{ mm} \) |
| Resistance of weld for shear | \( F_{wRds} = 2 \times 0.7 \times s_{fw} \times f_{vwd} \times L_{ws} / 10^3 = 192.01 \text{ kN} \) |
| Vertical shear            | \( V_{Ed} = 164.6 \text{ kN} \) |
An 8 mm weld size is therefore considered suitable.

Web fillet weld 8 mm
Compression flange fillet weld 8 mm
Supporting column section 203 x 203 x 60 UKC
Beam / Rafter section 356 x 171 x 57 UKB

Column stiffener details

Compression stiffeners 2/95 mm x 15 mm Grade S 275
connected by 4/8 mm fillet welds.
Tension stiffeners Full depth 10 mm thick.
2/75 mm wide placed midway
between the following bolt rows:
1 and 2

The connection under consideration is two sided.
Location: Ex1 - Based on Joints publication

The calculations are in accordance with BS5950-1:2000 and follow the procedure given in the SCI publication 'Joints in Steel Construction Moment Connections'.

Bolted end plate beam splice one-way extended

Design assumptions:
- all bolts are subject to tension
- shear is evenly distributed between the tension bolts
- the connection consists of two identical beam and end plate arrangements
- moment is not reversible.
- pes is the edge distance to shear bolts if provided.

Factored moment \( M = 410 \text{ kNm} \)
Factored shear force \( V = 60 \text{ kN} \)
Axial force (+ve compression) \( N = 0 \text{ kN} \)

533 x 210 x 92 UB.
Diameter of bolts \( b_d = 24 \text{ mm} \)
Thickness of plate \( t_p = 25 \text{ mm} \)
Total number of tension bolts \( b_n = 6 \)
Distance to first row of bolts \( e_x = 50 \text{ mm} \)
Distance to beam flange \( x = 40 \text{ mm} \)
Pitch to second row of bolts \( p_1 = 100 \text{ mm} \)
Pitch of tension bolts \( p_2 = 90 \text{ mm} \)
Edge distance to bottom of flange \( p_{ed} = 36.9 \text{ mm} \)
Edge distance to shear bolts \( p_{es} = 100 \text{ mm} \)
Bolt cross-centres \( g = 100 \text{ mm} \)
Width of end plate \( b_p = 250 \text{ mm} \)
Assumed web fillet weld size \( s_{ww} = 8 \text{ mm} \)
Assumed flange fillet weld size \( s_{wf} = 12 \text{ mm} \)

**SUMMARY OF BOLT POTENTIAL RESISTANCES**

Top row of bolts \( P_{r1} = 370.98 \text{ kN} \)
Row 2 \( P_{r2} = 395.36 \text{ kN} \)
Row 3 \( P_{r3} = 318.89 \text{ kN} \)
Beam tension flange welds

As an alternative to a single fillet weld of minimum size 15 mm a partial penetration butt weld with a superimposed fillet weld will probably be a more economical solution.

Penetration butt weld size   \( sbt = 8 \text{ mm} \)
Superimposed fillet weld size \( swt = 10 \text{ mm} \)

Tension stress \( \leq pyb \ (275 \text{ N/mm}^2) \), hence OK.
Shear stress \( \leq pyb \ (275 \text{ N/mm}^2) \), hence OK.

Tension stress \( \leq \text{allowable shear stress, hence OK.} \)
Provide partial penetration butt welds (8 mm preparation), with 10 mm superimposed fillet welds.

Beam web welds

Tension zone - a full strength weld is recommended in the web tension zone with the sum of the throat thicknesses \( \geq \) the web thickness, \( tb \).

Selected fillet weld size   \( sfw = 8 \text{ mm} \)
Length of web weld   \( Lwt = (p1-x-Tb-rb)+(nt/2-2)*p2+1.73*g/2 = 208.2 \text{ mm} \)

Shear zone - assuming a fillet weld of 8 mm continued for the full depth, the capacity of the beam web weld for vertical shear:

Length of weld for shear \( Lws = Db-2*(Tb+rb)-Lwt = 268.3 \text{ mm} \)
Capacity of weld for shear \( Psw = 2*0.7*sfw*pw*Lws/10^3 = 661.09 \text{ kN} \)
Vertical shear \( V = 60 \text{ kN} \)
Web weld size 8 mm is considered to be suitable.

Compression welds

Assuming a bearing fit between the flange and end plate, the use of an 8 mm fillet weld will suffice for the beam compression flange.
CONNECTION SUMMARY - all dimensions in diagram are in mm

Web fillet weld 8 mm
Compression flange fillet weld 8 mm
Beam / Rafter section 533 x 210 x 92 UB
Location: Ex2 - Reversible moment 12 bolts

The calculations are in accordance with BS5950-1:2000 and follow the procedure given in the SCI publication 'Joints in Steel Construction Moment Connections'.

Bolted end plate beam splice two-way extended

Factored moment \( M = 510 \text{ kNm} \)
Factored shear force \( V = 129 \text{ kN} \)
Axial force (+ve compression) \( N = 0 \text{ kN} \)

533 x 210 x 92 UB.
Diameter of bolts \( b_d = 24 \text{ mm} \)
Thickness of plate \( t_p = 25 \text{ mm} \)
Total number of tension bolts \( b_n = 12 \)
Distance to first row of bolts \( e_x = 50 \text{ mm} \)
Distance to beam flange \( x = 40 \text{ mm} \)
Pitch to second row of bolts \( p_1 = 100 \text{ mm} \)
Pitch of tension bolts \( p_2 = 90 \text{ mm} \)
Bolt cross-centres \( g = 100 \text{ mm} \)
Width of end plate \( b_p = 250 \text{ mm} \)
Assumed web fillet weld size \( s_{ww} = 8 \text{ mm} \)
Assumed flange fillet weld size \( s_{wf} = 12 \text{ mm} \)

SUMMARY OF BOLT POTENTIAL RESISTANCES

Top row of bolts \( P_{r1} = 370.98 \text{ kN} \)
Row 2 \( P_{r2} = 395.36 \text{ kN} \)
Row 3 \( P_{r3} = 318.89 \text{ kN} \)
Beam tension flange welds

As an alternative to a single fillet weld of minimum size 15 mm a partial penetration butt weld with a superimposed fillet weld will probably be a more economical solution.

Penetration butt weld size \( sbt = 8 \, \text{mm} \)

Superimposed fillet weld size \( swt = 10 \, \text{mm} \)

Tension stress \( \leq \) \( pyb \ (275 \, \text{N/mm}^2) \), hence OK.

Shear stress \( \leq \) allowable shear stress, hence OK.

Provide partial penetration butt welds (8 mm preparation), with 10 mm superimposed fillet welds.

Beam web welds

Tension zone - a full strength weld is recommended in the web tension zone with the sum of the throat thicknesses \( \geq \) the web thickness, \( tb \).

Selected fillet weld size \( sfw = 8 \, \text{mm} \)

Length of web weld

\[
L_{wt} = (p_1 - x - T_b - r_b) + (n/2 - 2) \times p_2 + 1.73 \times g / 2 = 208.2 \, \text{mm}
\]

Shear zone - assuming a fillet weld of 8 mm continued for the full depth, the capacity of the beam web weld for vertical shear:

Length of weld for shear \( L_{ws} = D_b - 2 \times (T_b + r_b) - L_{wt} = 268.3 \, \text{mm} \)

Capacity of weld for shear \( P_{sw} = 2 \times 0.7 \times sfw \times pw \times L_{ws} / 10^3 = 661.09 \, \text{kN} \)

Vertical shear \( V = 129 \, \text{kN} \)

Web weld size 8 mm is considered to be suitable.

Compression welds

As moment is reversible tension and compression surfaces are interchangeable, welding must be the same for both flanges.

Pitch of tension bolts \( p_1 = 90 \) mm
Edge distance to bottom of flange \( x_2 = 36.9 \) mm
Edge distance to shear bolts \( e_{1'} = 100 \) mm
Bolt cross-centres \( p_3 = 100 \) mm
Width of end plate \( b_p = 250 \) mm
Assumed web fillet weld size \( s_{ww} = 8 \) mm
Assumed flange fillet weld size \( s_{wf} = 12 \) mm
SUMMARY OF BOLT POTENTIAL RESISTANCES

| Top row of bolts | Pr1=377.26 kN |
| Row 2            | Pr2=406.66 kN |
| Row 3            | Pr3=328 kN    |

Beam tension flange welds

Weld design strength \( f_{vwd} = \frac{f_u}{\sqrt{3}} \frac{1}{\beta_w \gamma_{M2}} \) = 222.79 N/mm²

The force in the tension flange welds is the lesser of:

- Tension resistance of the flange \( T_f = b_b \cdot t_f b \cdot f_y b / 10^3 = 897.9 \text{ kN} \)
- Tension force in top 3 bolt rows \( T_{fc} = P_{r1} + P_{r2} + P_{r3} = 1111.9 \text{ kN} \)

Weld size required \( s_{wr} = F_{wEdf} \cdot 10^3 / (0.7 \cdot f_{vwd}) = 14.094 \text{ mm} \)

Penetration butt weld size \( s_{bt} = 8 \text{ mm} \)

Superimposed fillet weld size \( s_{wt} = 12 \text{ mm} \)

Tension stress \( \leq f_y b \) (275 N/mm²), hence OK.

Shear stress \( \leq f_y b \) (275 N/mm²), hence OK.

Provide partial penetration butt welds (8 mm preparation), with 12 mm superimposed fillet welds.

Beam web welds

Tension zone - a full strength weld is recommended in the web tension zone with the sum of the throat thicknesses ≥ the web thickness, \( t_{wb} \).

Selected fillet weld size \( s_{fw} = 8 \text{ mm} \)

Shear zone - assume an 8 mm FW continued for the full depth.

Length of weld for shear \( L_{ws} = h_b - 2 \cdot (t_f b + r_b) - L_w t = 268.3 \text{ mm} \)

Resistance of weld for shear \( F_{wRds} = 2 \cdot 0.7 \cdot s_{fw} \cdot f_{vwd} \cdot L_w s / 10^3 = 669.47 \text{ kN} \)

Vertical shear \( V_{Ed} = 60 \text{ kN} \)

An 8 mm fillet weld size is therefore considered suitable.

Compression welds

Assuming a bearing fit between the flange and end plate, the use of an 8 mm fillet weld will suffice for the beam compression flange.

Location: Ex3 - Reversible moment 8 bolts

Bolted end plate beam splice one-way extended

Calculations are in accordance with EC3 Parts 1-1, 1-5, 1-8 and follow the procedure given in the SCI publication entitled 'Joints in Steel Construction Moment Connections'.

The bolted end plate beam splice is two-way extended.

Design assumptions:
• the bolt arrangement is symmetrical about the centre line (y-y axis) of beam
• moment is reversible
• moment is carried by half the bolts
• shear is carried by the other half of the bolts
• the connection consists of two identical beam and end plate arrangements
• p1' is the distance between tension and shear bolts.

Factored moment MyEd=46 kNm
Factored shear force VEd=60 kN
Axial force (+ve compression) NEd=0 kN

Supported beam details
178 x 102 x 19 UKB

Bolt details
Diameter of bolts db=20 mm
Tensile resistance (EC3 Part 1-8) FtRd=k2*fub*At/(gamM2*10^3)=141.12 kN

End plate details
Thickness of plate tp=20 mm
Distance to first row of bolts ex=40 mm
Distance to beam flange x=35 mm
Pitch to second row of bolts p2=80 mm
Bolt cross-centres p3=60 mm
Width of end plate bp=120 mm
Assumed web fillet weld size sww=6 mm
Assumed flange fillet weld size swf=6 mm
SUMMARY OF BOLT POTENTIAL RESISTANCES

Top row of bolts  Pr1=203.6 kN
Row 2  Pr2=282.24 kN

Beam tension flange welds

Weld design strength  \( f_{\text{vwd}} = \frac{f_u}{\sqrt{3}} \times \left( \frac{\gamma_{M2}}{\beta_{\omega}} \right) \)
=222.79 N/mm²

The force in the tension flange welds is the lesser of:
Tension resistance of the flange  \( T_f = b_b \times t_{fb} \times f_{yb} / 10^3 = 219.86 \text{ kN} \)
Tension force in top 3 bolt rows  \( T_{fc} = Pr1 + Pr2 + Pr3 = 274.82 \text{ kN} \)
Weld size required  \( s_{wfr} = F_{wEd} \times 10^3 / (0.7 \times f_{vwd}) = 7.1345 \text{ mm} \)
Selected fillet weld size  \( s_{wt} = 8 \text{ mm} \)

Beam web welds

Tension zone - a full strength weld is recommended in the web tension zone with the sum of the throat thicknesses ≥ the web thickness, \( t_{wb} \).
Selected fillet weld size  \( s_{fw} = 8 \text{ mm} \)

Shear zone - assume an 8 mm FW continued for the full depth.
Length of weld for shear  \( L_{ws} = h_b - 2 \times (t_{fb} + r_b) - L_{wt} = 65.4 \text{ mm} \)
Resistance of weld for shear  \( F_{wRds} = 2 \times 0.7 \times s_{fw} \times f_{vwd} \times L_{ws} / 10^3 = 163.19 \text{ kN} \)
Vertical shear  \( V_{Ed} = 60 \text{ kN} \)
An 8 mm fillet weld size is therefore considered suitable.

Compression welds

As moment is reversible tension and compression surfaces are interchangeable, welding must be the same for both flanges.
CONNECTION SUMMARY - all dimensions in diagram are in mm

Number of bolts: 8
Bolt diameter: 20 mm
Bolt grade: Preloaded HSFG bolts. General grade (8.8) with grade 10 nuts.
Welds: Tension flange fillet weld 8 mm
Web fillet weld 8 mm
Compression flange fillet weld 8 mm
Beam / Rafter section: 178 x 102 x 19 UKB
Location: Ex4 - Larger beam with shear bolts

Bolted end plate beam splice one-way extended

Calculations are in accordance with EC3 Parts 1-1, 1-5, 1-8 and follow the procedure given in the SCI publication entitled 'Joints in Steel Construction Moment Connections'.

The bolted end plate beam splice is one-way extended.

Design assumptions:
- all bolts are in tension except of the bottom two which will resist all the applied shear load
- the connection consists of two identical beam and end plate arrangements
- moment is not reversible
- p1' is the distance between tension and shear bolts.

Factored moment
Factored shear force
Axial force (+ve compression)

SCALE 5.48 Office 1007 Proforma 424
SUMMARY OF BOLT POTENTIAL RESISTANCES

Top row of bolts  Pr1=377.09 kN
Row 2        Pr2=406.66 kN
Row 3        Pr3=314.29 kN
Row 4        Pr4=256.5 kN
Row 5        Pr5=228.7 kN
Row 6        Pr6=169.39 kN

Beam tension flange welds

Weld design strength  \( f_vwd = \frac{fu}{\sqrt{3}/(\beta_{aw} \cdot \gamma_{M2})} \)
=222.79 N/mm²

The force in the tension flange welds is the lesser of:
Tension resistance of the flange  \( T_f = b_p \cdot t_{fb} \cdot f_{yb}/10^3 = 1280 \text{ kN} \)
Tension force in top 3 bolt rows  \( T_{fc} = P_{r1} + P_{r2} + P_{r3} = 1098 \text{ kN} \)
Weld size required  \( s_{fr} = F_{wEdf} \cdot 10^3/(0.7 \cdot f_{vwd}) = 15.758 \text{ mm} \)
Penetration butt weld size  \( s_{bt} = 9 \text{ mm} \)
Superimposed fillet weld size  \( s_{wt} = 12 \text{ mm} \)
Tension stress \( \leq f_{yb} \ (265 \text{ N/mm}^2) \), hence OK.
Tension stress \( \leq f_{yb} \ (265 \text{ N/mm}^2) \), hence OK.
Shear stress \( \leq \) allowable shear stress, hence OK.

Provide partial penetration butt welds (9 mm preparation), with
12 mm superimposed fillet welds.

Beam web welds

Tension zone - a full strength weld is recommended in the web tension
zone with the sum of the throat thicknesses \( \geq \) the web thickness, \( t_{wb} \).
Selected fillet weld size  \( s_{fw} = 10 \text{ mm} \)

Shear zone - assume an 10 mm FW continued for the full depth.
Length of weld for shear  \( L_{ws} = h_b - 2 \cdot (t_{fb} + r_b) - L_{wt} = 110.2 \text{ mm} \)
Resistance of weld for shear  \( F_{wRds} = 2 \cdot 0.7 \cdot s_{fw} \cdot f_{vwd} \cdot L_{ws}/10^3 \)
=343.72 kN
Vertical shear  \( V_{Ed} = 215 \text{ kN} \)
An 10 mm fillet weld size is therefore considered suitable.

Compression welds

Assuming a bearing fit between the flange and end plate, the use of
an 8 mm fillet weld will suffice for the beam compression flange.
CONNECTION SUMMARY - all dimensions in diagram are in mm

Number of bolts 14
Bolt diameter 24 mm
Bolt grade 8.8
Tension Partial penetration butt welds 9 mm
Flange Welds Superimposed fillet welds 12 mm
Web fillet weld 10 mm
Compression flange fillet weld 8 mm

### Beam tension flange welds

- **Weld design strength**
  \[ fv_{wd} = \frac{f_u}{\sqrt{3}} \left( \frac{1}{\beta_{aw} \cdot \gamma_{M2}} \right) \]
  \[ = 222.79 \text{ N/mm}^2 \]

- **Weld size required**
  \[ sw_{fr} = \frac{F_{wEdf} \cdot 10^3}{0.7 \cdot fv_{wd}} = 11.532 \text{ mm} \]

- **Selected fillet weld size**
  \[ sw_{t} = 12 \text{ mm} \]

### Beam web welds

- **Tension zone** - a full strength weld is recommended in the web tension zone with the sum of the throat thicknesses ≥ the web thickness, \( t_{wb} \).
- **Selected fillet weld size**
  \[ sw_{f} = 8 \text{ mm} \]
- **Length of web weld**
  \[ L_{wt} = (ex - x - t_{fb} - rb) + (t_{row} - 1) \cdot p_{1} + \frac{1.73 \cdot p_{3}}{2} = 388.2 \text{ mm} \]

- **Shear zone** - assume an 8 mm FW continued for the full depth.
- **Length of weld for shear**
  \[ L_{ws} = hb - 2 \cdot (t_{fb} + rb) - L_{wt} = 88.3 \text{ mm} \]
- **Resistance of weld for shear**
  \[ F_{wRds} = 2 \cdot 0.7 \cdot sw_{f} \cdot fv_{wd} \cdot L_{ws} / 10^3 = 220.33 \text{ kN} \]

### Compression welds

Assuming a bearing fit between the flange and end plate, the use of an 8 mm fillet weld will suffice for the beam compression flange.

Beam web welds

Tension zone - a full strength weld is recommended in the web tension zone with the sum of the throat thicknesses ≥ the web thickness, \( t_{wb} \).
Selected fillet weld size \( s_{fw} = 10 \text{ mm} \)
Length of web weld \( L_{wt} = (ex-x-t_{fb}-rb)+(t_{row}-1) \times p_{1}+1.73 \times p_{3}/2 = 560.1 \text{ mm} \)
Shear zone - assume an 10 mm FW continued for the full depth.
Length of weld for shear \( L_{ws} = hb-2 \times (t_{fb}+rb)-L_{wt} = 55 \text{ mm} \)
Resistance of weld for shear \( F_{wRds} = 2 \times 0.7 \times s_{fw}^{*} f_{wd}^{*} L_{ws}/10^3 = 171.55 \text{ kN} \)
Vertical shear \( V_{Ed} = 60 \text{ kN} \)
An 10 mm fillet weld size is therefore considered suitable.

Compression welds

Assuming a bearing fit between the flange and end plate, the use of an 8 mm fillet weld will suffice for the beam compression flange.
CONNECTION SUMMARY - all dimensions in diagram are in mm

Number of bolts: 14
Bolt diameter: 24 mm
Bolt grade: 8.8
Welds:
- Tension flange fillet weld: 10 mm
- Web fillet weld: 10 mm
- Compression flange fillet weld: 8 mm

Beam / Rafter section: 686 x 254 x 125 UKB
Flush beam splice

Calculations are in accordance with EC3 Parts 1-1, 1-5, 1-8 and follow the procedure given in the SCI publication entitled 'Joints in Steel Construction Moment Connections'.

Bolted end plate beam splice two-way (reversible moment)

Factored moment \( M_{Ed} = 280 \text{ kNm} \)
Factored shear force \( V_{Ed} = 238 \text{ kN} \)
Axial force (+ve compression) \( N_{Ed} = 0 \text{ kN} \)

Supported beam details

533 x 210 x 92 UKB

Bolt details

Diameter of bolts \( d_b = 24 \text{ mm} \)
Tensile resistance (EC3 Part 1-8) \( F_{T,Rd} = k_2 f_{ub} A_t / (\gamma_M 10^3) = 203.33 \text{ kN} \)

End plate details

Thickness of plate \( t_p = 25 \text{ mm} \)
Total number of bolts \( b_n = 8 \)
Distance to first row of bolts \( e_x = 90 \text{ mm} \)
Edge distance \( x = 36 \text{ mm} \)
Pitch of tension bolts \( p_l = 90 \text{ mm} \)
Bolt cross-centres \( p_3 = 140 \text{ mm} \)
Width of end plate \( b_p = 220 \text{ mm} \)
Assumed web fillet weld size \( s_{ww} = 8 \text{ mm} \)
Assumed flange fillet weld size \( s_{wf} = 12 \text{ mm} \)
SUMMARY OF BOLT POTENTIAL RESISTANCES

Top row of bolts  
Pr1=406.66 kN

Row 2  
Pr2=265.66 kN

Beam tension flange welds

Weld design strength  
fvwd=fu/SQR(3)/(betaw*gamM2)  
=222.79 N/mm²

Weld size required  
swfr=FwEdf*10^3/(0.7*fvwd)=10.553 mm

Selected fillet weld size  
swt=12 mm

Beam web welds

Tension zone - a full strength weld is recommended in the web tension zone with the sum of the throat thicknesses ≥ the web thickness, twb.

Selected fillet weld size  
sfw=8 mm

Length of web weld  
Lwt=(ex-x-tfb-rb)+(trow-1)*p1+1.73*p3/2=236.8 mm

Shear zone - assume an 8 mm FW continued for the full depth.

Length of weld for shear  
Lws=hb-2*(tfb+rb)-Lwt=239.7 mm

Resistance of weld for shear  
FwRds=2*0.7*sfw*fvwd*Lws/10^3  
=598.11 kN

Vertical shear  
VED=238 kN

An 8 mm fillet weld size is therefore considered suitable.

Compression welds

As moment is reversible tension and compression surfaces are interchangeable, welding must be the same for both flanges.

Flush beam splice

Calculations are in accordance with EC3 Parts 1-1, 1-5, 1-8 and follow the procedure given in the SCI publication entitled 'Joints in Steel Construction Moment Connections'.

Bolted end plate beam splice two-way (reversible moment)

Design assumptions:
- the bolt arrangement is symmetrical about the centre line (y-y axis) of the beam
- moment is reversible
- moment is carried by half of the bolts
- shear is carried by the other half of the bolts
- the connection consists of two identical beam & end plate arrangements.

Factored moment \( M_{Ed}=33 \text{ kNm} \)
Factored shear force \( V_{Ed}=129 \text{ kN} \)
Axial force (+ve compression) \( N_{Ed}=0 \text{ kN} \)

Supported beam details

178 x 102 x 19 UKB

Bolt details

Diameter of bolts \( d_b=24 \text{ mm} \)
Tensile resistance (EC3 Part 1-8) \( F_{Rd}=k_2*f_{ub}*A_t/(\gamma M_2*10^3)=203.33 \text{ kN} \)

End plate details

Thickness of plate \( t_p=25 \text{ mm} \)
Total number of bolts \( b_n=4 \)
Distance to first row of bolts \( e_x=80 \text{ mm} \)
Edge distance \( x=30 \text{ mm} \)
Bolt cross-centres \( p_3=60 \text{ mm} \)
Width of end plate \( b_p=125 \text{ mm} \)
Assumed web fillet weld size \( s_{ww}=8 \text{ mm} \)
Assumed flange fillet weld size \( s_{wf}=8 \text{ mm} \)
SUMMARY OF BOLT POTENTIAL RESISTANCES

Top row of bolts  Pr1=406.66 kN

**Beam tension flange welds**

Weld design strength  \( fvwd=\frac{fu}{\sqrt{3}}/\beta_{aw}\times \gamma_{M2} \)  
=222.79 N/mm²

Weld size required  \( swfr=\frac{F_{wEdf}\times 10^3}{0.7\times fvwd} \)=7.1345 mm

Selected fillet weld size  swt=8 mm

**Beam web welds**

Tension zone - a full strength weld is recommended in the web tension zone with the sum of the throat thicknesses ≥ the web thickness, twb.

Selected fillet weld size  sfw=8 mm

Length of web weld  \( L_{wt}=\left( e_x-x-t_{fb}-r_{b}\right)+1.73\times p_3/2=86.4 \) mm

Shear zone - assume an 8 mm FW continued for the full depth.

Length of weld for shear  \( L_{ws}=h_b-2\times \left(t_{fb}+r_{b}\right)-L_{wt}=60.4 \) mm

Resistance of weld for shear  \( F_{wRds}=2\times 0.7 \times sfw\times fvwd\times L_{ws}/10^3 \)

=150.71 kN

Vertical shear  \( V_{Ed}=129 \) kN

An 8 mm fillet weld size is therefore considered suitable.

**Compression welds**

As moment is reversible tension and compression surfaces are interchangeable, welding must be the same for both flanges.

Column details

Column section 254 x 254 x 107 UKC

Compression stiffeners

2/110 mm x 15 mm plate Grade S 275 connected by 4/8 mm fillet welds.

Tension stiffeners

2/110 mm x 25 mm plate Grade S 275 connected by 4/8 mm fillet welds

to the web and 4/14 mm fillet welds to the flanges.
Location: Ex4 - High shear, grade 355 steel

Welded beam to column connection

Calculations are in accordance with EC3 Parts 1-1, 1-5, 1-8 and follow the procedure given in the SCI publication entitled 'Joints in Steel Construction Moment Connections'.

The connection is attached to the supporting column flange.

All loads and moments are factored.

There is a similar beam on each column face.

- Design moment: MyEd=569 kNm
- Design shear force: VEd=334 kN
- Axial force (+ve compression): NEd=189 kN

Supporting column details

- 305 x 305 x 198 UKC

Supported beam details

- 610 x 229 x 113 UKB

Column web in transverse compression - EC3 Part 1-8

- Design axial load on column: NEEdc=500 kN
- Selected fillet weld size: ww=8 mm

Flush beam splice with end plates and single flange plate

Calculations are in accordance with BS5950-1:2000 and follow the procedure given in the SCI publication entitled 'Joints in Steel Construction Moment Connections'.

Design assumptions

- all end plate bolts are subject to tension
- shear is evenly distributed between the bolts in the end plate arrangement
- the connection consists of two identical beam and end plate arrangements
- moment is not reversible
- flange plate (FP) on the compression surface.

Factored moment  
M=405 kNm

Factored shear force  
V=60 kN

Axial force (+ve compression)  
N=0 kN

Beam details

533 x 210 x 92 UB.

Bolt details

#### Beam tension flange welds

- Selected fillet weld size: swt=12 mm

#### Beam web welds

- Selected fillet weld size: sfw=8 mm
- Vertical shear: V=60 kN

#### FLANGE SPLICE

**Assumptions:**
- the flange plate(s) resist a compressive force, Fcc
- the splice uses HSFG bolts to avoid producing bolt slip and consequent additional beam deflection.

### Flange plate details

- Thickness of flange plate: tcp=20 mm
- Width of flange cover plate: Bfp=210 mm

### Flange plate bolt details

- Bolt diameter in flange plate: bdf=24 mm
- Bolt spacing (across the beam): crs=140 mm
- Total no. of bolts in cover plate: np=16
- Pitch of bolts (along the beam): pit=70 mm
- Spacing of bolts across beams: spac=150 mm
- End distance in flange plate: end=50 mm
- Edge distance: ed=(Bfp-crs)/2=35 mm
- Projection of flange cover plate: P=(np/4-1)*pit+spac/2+end=335 mm
- Length of flange cover plate: Dfp=2*P=670 mm

### Slip resistance of one fastener

- Slip factor for preloaded bolts: mu=0.5
- Coefficient for type of hole: Ks=1
- Proof load (BS4395): Po=207 kN
- Slip resistance: PsL=1.1*Ks*mu*Po=113.85 kN

### Beam tension flange welds

- Selected fillet weld size
  - \( swt = 12 \text{ mm} \)

### Beam web welds

- **Selected fillet weld size**
  - \( sfw = 8 \text{ mm} \)
- **Resistance of weld for shear**
  - \( FwRds = 2 \times 0.7 \times sfw \times fvwd \times Lws / 10^3 = 220.33 \text{ kN} \)
- **Vertical shear**
  - \( VEd = 60 \text{ kN} \)

### FLANGE SPLICE

**Assumptions:**
- the flange plate(s) resist a compressive force, \( FcEdp \)
- the splice uses preloaded HSFG bolts to avoid producing bolt slip and consequent additional beam deflection.

### Flange cover plate details

- **Thickness of flange cover plate**
  - \( tfp = 20 \text{ mm} \)
- **Width of flange cover plate**
  - \( bfp = 210 \text{ mm} \)

### Flange cover plate bolt details

- **Bolt diameter in flange plate**
  - \( dbfp = 24 \text{ mm} \)
- **Bolt cross-centres**
  - \( p3fp = 140 \text{ mm} \)
- **Total no. of bolts in cover plate**
  - \( np = 16 \)
- **Pitch of bolts (along the beam)**
  - \( plfp = 70 \text{ mm} \)
- **Spacing of bolts across beams**
  - \( spac = 150 \text{ mm} \)
- **End distance in flange plate**
  - \( elfp = 50 \text{ mm} \)
- **Edge distance at cross centres**
  - \( e2fp = (bfp - p3fp) / 2 = 35 \text{ mm} \)
- **Projection of flange cover plate**
  - \( P = (np / 4 - 1) \times plfp + spac / 2 + elfp = 335 \text{ mm} \)
- **Length of flange cover plate**
  - \( hfp = 2 \times P = 670 \text{ mm} \)

### Slip resistance of one fastener - EC3 Part 1-8

- **Slip resistance**
  - \( FsRd = ks \times n \times \mu \times Fpc / 1.25 = 98.84 \text{ kN} \)
CONNECTION SUMMARY - all dimensions in diagram are in mm

NOTE: Bottom flange cover plate omitted for clarity.

Bolt grade 8.8

FLANGE COVER PLATE SUMMARY - all dimensions in diagram are in mm

Flange cover plate: 210 mm x 15 mm x 810 mm
Number of bolts: 20
Bolt diameter: 24 mm
Bolt grade: Preloaded (HSFG), general grade (8.8) with grade 10 nuts.
Flush beam splice with end plates and single flange plate

Calculations are in accordance with EC3 Parts 1-1, 1-5, 1-8 and follow the procedure given in the SCI publication entitled 'Joints in Steel Construction Moment Connections'.

**Design assumptions**
- all bolts will resist the applied shear force
- connection consists of two identical beam & end plate arrangements
- moment is not reversible
- tension flange plate (TFP) as shown in diagram.

**Factored moment**  \( My_{Ed} = 30 \, \text{kNm} \)
**Factored shear force**  \( V_{Ed} = 20 \, \text{kN} \)
**Axial force (+ve compression)**  \( N_{Ed} = 0 \, \text{kN} \)

**Beam details**
152 x 152 x 37 UKC

**End plate details**
- Diameter of bolts  \( d_b = 20 \, \text{mm} \)
- Thickness of plate  \( t_p = 16 \, \text{mm} \)
- Number of bolts (in shear)  \( b_n = 4 \)
- Distance to first row of bolts  \( e_1 = 72 \, \text{mm} \)
- Distance to beam flange  \( x = 16 \, \text{mm} \)
- Pitch of remaining bolts  \( p_1 = 50 \, \text{mm} \)
- Bolt cross-centres  \( p_3 = 90 \, \text{mm} \)
- Width of end plate  \( b_p = 156 \, \text{mm} \)
- Assumed web fillet weld size  \( s_{ww} = 8 \, \text{mm} \)
- Assumed flange fillet weld size  \( s_{wf} = 8 \, \text{mm} \)

**Beam tension flange welds**

**Beam web welds**
- Full strength weld used
- Selected fillet weld size  \( s_{fw} = 8 \, \text{mm} \)
FLANGE SPlice

Assumptions:
• the flange plate(s) resist a tensile force, FtEdp
• the splice uses preloaded HSFG bolts to avoid producing bolt slip and consequent additional beam deflection.

Flange cover plate details

Thickness of flange cover plate tfp=16 mm
Width of flange cover plate bfp=154 mm

Flange cover plate bolt details

Bolt cross-centres p3fp=90 mm
Total no. of bolts in cover plate np=8
Pitch of bolts (along the beam) plfp=50 mm
Spacing of bolts across beams spac=120 mm
End distance in flange plate elfp=75 mm
Edge distance at cross centres e2fp=(bfp-p3fp)/2=32 mm
Projection of flange cover plate P=(np/4-1)*plfp+spac/2+elfp=185 mm
Length of flange cover plate hfp=2*P=370 mm

Slip resistance of one fastener - EC3 Part 1-8

Slip resistance FsRd=ks*n*mu*Fpc/1.25=54.88 kN

CONNECTION SUMMARY - all dimensions in diagram are in mm

- Assumed web fillet weld size \( s_{ww} = 8 \ \text{mm} \)
- Assumed flange fillet weld size \( s_{wf} = 8 \ \text{mm} \)

**Slip resistance of one fastener - EC3 Part 1-8**

Slip resistance \( F_{sRd} = k_s \cdot n \cdot \mu \cdot F_{pc} / 1.25 = 43.904 \ \text{kN} \)
Beam tension flange welds

Beam web welds

Selected fillet weld size \( sfw = 6 \text{ mm} \)

Resistance of weld for shear

\[
F_{wwd} = 2 \times 0.7 \times sfw \times fvwd \times Lws / 10^3
\]
\[= 762.79 \text{ kN} \]

Vertical shear \( V_{Ed} = 20 \text{ kN} \)

FLANGE SPLICE

Assumptions:
- the flange plate(s) resist a tensile force, \( F_{tEdp} \)
- the splice uses preloaded HSFG bolts to avoid producing bolt slip and consequent additional beam deflection.

Flange cover plate details

Thickness of flange cover plate \( t_{fp} = 16 \text{ mm} \)

Width of flange cover plate \( b_{fp} = 190 \text{ mm} \)

Flange cover plate bolt details

Bolt cross-centres \( p_{3fp} = 90 \text{ mm} \)

Total no. of bolts in cover plate \( n_p = 8 \)

Pitch of bolts (along the beam) \( p_{1fp} = 50 \text{ mm} \)

Spacing of bolts across beams \( \text{spac} = 120 \text{ mm} \)

End distance in flange plate \( e_{1fp} = 100 \text{ mm} \)

Edge distance at cross centres \( e_{2fp} = (b_{fp} - p_{3fp}) / 2 = 50 \text{ mm} \)

Projection of flange cover plate \( P = (n_p / 4 - 1) \times p_{1fp} + \text{spac} / 2 + e_{1fp} = 210 \text{ mm} \)

Length of flange cover plate \( h_{fp} = 2 \times P = 420 \text{ mm} \)

Slip resistance of one fastener - EC3 Part 1-8

Slip resistance \( F_{sRd} = k_s \times n \times \mu \times F_{pc} / 1.25 = 43.904 \text{ kN} \)

Member buckling resistance

Overall buckling check - Clause 4.8.3.3.2

For major axis in-plane buckling

\[
\frac{F}{P_{cz}} + \frac{mz \cdot M_z}{M_{cz}} \left[ 1 + 0.5 \frac{F}{P_{cz}} \right] \leq 1.0
\]

Unity relationship

\[
\text{unity} = \frac{F}{P_{cz}} + mz \cdot M_z \cdot M_{cz} \cdot (1 + 0.5 \cdot F/P_{cz}) = 0.48843
\]

The unity relationship is satisfied.

For out-of-plane buckling,

\[
\frac{F_c}{P_{cy}} + \frac{mLT \cdot MLT}{M_b} \leq 1.0
\]
Unity relationship \[ ufy = F / P_c y + mL_T * mL_T / M_b = 0.6948 \]

The unity relationship is satisfied.

**UNIVERSAL BEAM**

533 x 210 x 82 UB Grade S 355

**SECTION**

Section is satisfactory for bending, axial load, local capacity, and overall buckling check.

**SUMMARY**

**DESIGN**

Axial load (+ve comp) 160 kN

**SUMMARY**

Compressive resistance 3402.2 kN

Maximum moment (z-axis) 530 kNm

Moment resistance 731.3 kNm

Local capacity check 0.76766 ≤ 1

Overall buckling check 0.48843 ≤ 1

0.6948 ≤ 1

Deflection check is beyond the scope of this proforma. It has been assumed that the beam deflection is satisfactory or not critical.
Location: Ex2 As Ex1 but with reduced axial load - no restraint

Open Section Beam

Calculations in accordance with BS5950-1:2000.

All loads and moments are factored.

Design moment about z-z axis \( M_z = 400 \text{ kNm} \)
Design shear force \( F_v = 95 \text{ kN} \)
Design axial load (+ve comp) \( F = 160 \text{ kN} \)
Length of member \( L = 5.6 \text{ m} \)
Design moment about minor axis \( M_y = 0 \text{ kNm} \)
Design shear force // flanges \( F_{vz} = 0 \text{ kN} \)

533 x 210 x 82 UB.
Young's Modulus \( E = 205 \text{ kN/mm}^2 \)

Length between restraints z axis \( L_z = 5600 \text{ mm} \)
Length between restraints y axis \( L_y = 5600 \text{ mm} \)
Length between restraints \( L_T = 5.6 \text{ m} \)
Maximum moment on segment \( M_{LT} = 400 \text{ kNm} \)
Far end BM \( \beta M = 0 \text{ kNm} \)
Maximum moment on segment \( M_z' = 530 \text{ kNm} \)
Far end BM \( \beta M_z = 0 \text{ kNm} \)

Member buckling resistance

Overall buckling check - Clause 4.8.3.3.2

For members with moments about major axis only
For major axis in-plane buckling

\[
\frac{F}{P_{cz}} + \frac{mz.M_z}{Mc_z} \left[ 1 + 0.5 \frac{F}{P_{cz}} \right] \leq 1.0
\]

Unity relationship

\[
\text{unity} = \frac{F}{P_{cz}} + mz \cdot M_z / Mc_z \cdot (1 + 0.5 \cdot F / P_{cz}) = 0.37942
\]

The unity relationship is satisfied.
For out-of-plane buckling,

\[
\frac{F_c}{P_{cy}} + \frac{mLT.MLT}{Mb} \leq 1.0
\]
Unity relationship \[ u_{fy} = \frac{F}{P_{cy} + mLT \cdot MLT / Mb} = 0.99052 \]
The unity relationship is satisfied.

**Location: Ex4 - Biaxial bending**

![Diagram](image)

**Open Section Beam**

Calculations in accordance with BS5950-1:2000.

All loads and moments are factored.

- **Design moment about z-z axis**: $M_z = 230$ kNm
- **Design shear force**: $F_v = 65$ kN
- **Design axial load (+ve comp)**: $F = 1500$ kN
- **Length of member**: $L = 4.3$ m
- **Design moment about minor axis**: $M_y = 87$ kNm
- **Design shear force // flanges**: $F_{vz} = 0$ kN

305 x 305 x 118 UC.

**Young's Modulus**: $E = 205$ kN/mm²

- **Length between restraints z axis**: $L_z = 4300$ mm
- **Length between restraints y axis**: $L_y = 4300$ mm
- **Length between restraints**: $L_T = 4.3$ m
- **Maximum moment on segment**: $M_{LT} = 230$ kNm
- **Far end BM**: $\beta_M = -100$ kNm
- **Maximum moment on segment**: $M_{z'} = 230$ kNm
- **Far end BM**: $\beta_M z = -100$ kNm
- **Maximum moment on segment**: $M_{y'} = 87$ kNm
- **Far end BM**: $\beta_M y = 23$ kNm
- **Maximum moment on segment**: $M_{maxy} = 87$ kNm
- **Far end BM**: $\beta_y = 23$ kNm

**Member buckling resistance**

**Overall buckling check - Clause 4.8.3.3.2**

For members with moments about both axes

For major axis in-plane buckling

\[
\frac{F}{P_{cz}} + \frac{mz.M_z}{M_{cz}} \left[ \frac{1 + 0.5}{P_{cz}} \right] + 0.5 \frac{myz.M_y}{M_{cy}} \leq 1.0
\]

Unity relationship

\[
unity = \frac{F}{P_{cz}} + mz \frac{M_z}{M_{cz}} (1 + 0.5 \frac{F}{P_{cz}}) + 0.5 \frac{myz.M_y}{M_{cy}} = 0.5985
\]

The unity relationship is satisfied.
For lateral torsional buckling,

$$\frac{F}{P_{cy}} + \frac{mLT \cdot MLT}{M_b} + \frac{m_y \cdot M_y}{M_{cy}} \left[ 1 + \frac{F}{P_{cy}} \right] \leq 1.0$$

Unity relationship

$$u_f_y = \frac{F}{P_{cy}} + \frac{mLT \cdot MLT}{M_b} + \frac{m_y \cdot M_y}{M_{cy}} \left( 1 + \frac{F}{P_{cy}} \right)$$

The unity relationship is satisfied.

For interactive buckling

$$\frac{m_z \cdot M_z (1+0.5F/P_{cz})}{M_{cz}(1-F/P_{cz})} + \frac{m_y \cdot M_y (1+F/P_{cy})}{M_{cy}(1-F/P_{cy})} \leq 1.0$$

Unity relationship z term

$$u_z = \frac{m_z \cdot M_z (1+0.5F/P_{cz})}{M_{cz}(1-F/P_{cz})}$$

Unity relationship y term

$$u_y = \frac{m_y \cdot M_y (1+F/P_{cy})}{M_{cy}(1-F/P_{cy})}$$

Unity relationship

$$U_n = u_z + u_y = 0.69183$$

The unity relationship is satisfied.

FIRE RESISTANCE
SUMMARY

Heated perimeter 1673.4 mm²
Area of section 114 cm²
Section factor 145
Load Ratio (R) 0.56247

Section does not have an inherent fire resistance of 30 minutes.
Fire protection should be provided.
Location: Ex1 - Default example (with FR check)

Simply supported beam

\[ W_n = \text{permanent point load} + \text{variable point load} \]

Beam span \( L = 10 \text{ m} \)

Permanent UDL (including S.W) \( \text{wd} = 1.44 \text{ kN/m} \)
Variable UDL \( \text{wi} = 0 \text{ kN/m} \)
Permanent point load 1 (+ve down) \( W_{1d} = 140 \text{ kN} \)
Variable point load 1 \( W_{1i} = 85 \text{ kN} \)
Distance from L.H. supp to load 1 \( x_1 = 5 \text{ m} \)

Dimensions (mm): \( h = 539.5 \text{ b=210.8 tw=11.6 tf=18.8 r=12.7} \)
Properties (cm): \( I_y = 66800 \text{ Iz=2940 Wply=2830 Wplz=436 It=126} \)

Coefficient C1

The beam is restrained at intervals by other steel members.
The member is not loaded between restraints (only beam self weight).
Eff.length between restraints \( LT = 5 \text{ m} \)

Lateral torsional buckling

Critical moment \( M_c = C_1 \times E_t \times S_r / 10^6 = 1427.8 \text{ kNm} \)
Design buckling resistance moment \( M_{bRd} = C_1 \times L \times W_{ply} \times f_y / 10^3 = 832.35 \text{ kNm} \)
Section chosen is considered suitable.

SECTION 533 x 210 x 109 UKB Grade S 355
DESIGN
SUMMARY
Maximum moment 778.75 \text{ kNm}
Moment resistance 976.35 \text{ kNm}
Unity factor bending 0.79761 \leq 1
Maximum shear force 160.25 \text{ kN}
Shear plastic resistance 1328.5 \text{ kN}
Unity factor shear 0.12063 \leq 1
Maximum BM on segment 778.75 \text{ kNm}
Buckling resistance BM 832.35 \text{ kNm}
Unity factor buckling 0.93561 \leq 1
Deflection to span ratio 1: 792
Fire resistance without applied protection

The critical temperature method given in BS EN 1993-1-2 Clause 4.2.4 will be adopted. For further clarification refer to Thomas Telford publication entitled 'Designer's guide to EN 1991-1-2, EN 1992-1-2, EN 1993-1-2 and EN 1994-1-2'.

Factor for variable actions $\psi_l = 0.5$

Maximum moment $M_{yEd} = M = 474.25$ kNm

Maximum shear force $V_{zEd} = V_b = 98.45$ kN

Section classification

Classify outstanding element of compression flange:
As $c/t_f \leq 9e$ (4.6223 $\leq$ 6.3137), outstanding element of compression flange is classified as Class 1 plastic.

Classify web element of section:
As $C/t_w \leq 72e$ (41.078 $\leq$ 50.51), web element in bending is classified as Class 1 plastic.

Critical temperature of carbon structural steel

Design moment (fire limit state) $M_{fiEd} = M_{yEd} = 474.25$ kNm

Design buckling resistance $M_{bRdfi} = \chi_{LTf} * M_{crd} = 563.46$ kNm

Design moment resistance $M_{fiRd} = k_y (\gamma_{M0} / \gamma_{fi}) * M_{bRdfi} / (k_1 * k_2) = 804.94$ kNm

Critical temperature $\theta_{acr}$ $t_aCR = 39.19 \times \log(\text{comp} - 1) + 482 = 557.43^\circ$C

Fire resistance period 17 minutes

FIRE RESISTANCE SUMMARY

The section does not have an inherent fire resistance of 30 minutes. Fire protection should be provided.
Simply supported steel beam

Calculations are in accordance with BS5950-1:2000 and 'Design Examples to BS5950' published by British Steel Tubes Division. The beam is assumed to be a square or rectangular hollow section.

\[ w = wd + wi \]

The n'th point load is shown:

\[ W_n = W_{nd} + W_{ni} \]

where,

\[ W_{nd} = \text{dead point load} \]
\[ W_{ni} = \text{imposed point load} \]

Beam span \( L = 5 \text{ m} \)

250 x 150 x 8 RHS - Hot finished.

Properties (cm): \( A = 60.8 \), \( r_x = 9.17 \), \( Z_x = 409 \), \( S_x = 501 \), \( I_x = 5110 \)

\( J = 5020 \), \( C = 506 \), \( Z_y = 306 \), \( S_y = 350 \), \( I_y = 2300 \), \( r_y = 6.15 \)

Young's Modulus \( E = 205 \text{ kN/mm}^2 \)

Dead UDL (including S.W) \( wd = 2 \text{ kN/m} \)

Imposed UDL \( wi = 3 \text{ kN/m} \)

Dead point load 1 (+ve down) \( W_{1d} = 40 \text{ kN} \)

Imposed point load 1 \( W_{1i} = 40 \text{ kN} \)

Distance from L.H. supp to load 1 \( x_1 = 2.5 \text{ m} \)

Check section for combined moment and shear

Maximum moment and co-existent shear

Shear capacity \( P_v = 809.4 \text{ kN} \)

Design shear force \( F_v = 60 \text{ kN} \)

Moment capacity for compact sec \( M_c = p_y S_x / 10^3 = 177.86 \text{ kNm} \)

Reduce \( M_c \) to limiting value \( M_c = 1.2 p_y Z_x / 10^3 = 174.23 \text{ kNm} \)

Since \( M \leq M_c \) \( (173.75 \text{ kNm} \leq 174.23 \text{ kNm} \) applied moment within moment capacity.

Limiting value of slenderness - Clause 4.3.6.1

Dist. betwn torsional restraints \( L_y = 5 \text{ m} \)
Effective length (Table 13) \( Le = 0.8 \times Ly \times 1000 = 4000 \) mm
Slenderness (minor axis) \( \lambda = \frac{Le}{(ry \times 10)} = 65.041 \)
Side ratio D/B (Table 15) \( D'B = D/B = 1.6667 \)
Limiting slenderness \( \lambda_{ml} = \frac{d'b \times 275}{py} = 338.19 \)
As actual slenderness is less than limiting slenderness
Lateral Torsional Buckling is not critical and no further check is required.

**Fire resistance of beam**

Calculations in accordance with BS 5950-8:2003 and 'Fire Resistant Design of Steel Structures' published by SCI.

**Fire resistance without applied protection**

The design temperature \( \text{temp} = \text{TABLE 10 for } T = 16.4, \text{ column } = 30 = 731.8 \) deg.C.
The load ratio, \( R \), at the fire limit state is to be calculated from:

\[
R = \frac{\text{Moment at the fire limit state}}{\text{Moment capacity at 20 deg.C.}}
\]

Permanent load \( wp = 3 \text{ kN/m} \)
Permanent load \( Wlp = 40 \text{ kN} \)
Moment capacity \( Mc = 174.23 \text{ kNm} \)
Load ratio \( R = \frac{Mf}{Mc} = 0.59905 \)

**HOT FINISHED**

**RECTANGULAR HOLLOW SECTION** 250 x 150 x 8 RHS Grade S 355

**HOLLOW SECTION**

**SUMMARY**

Unfactored end shears

**FIRE RESISTANCE SUMMARY**

Exposed surface area \( 650 \text{ mm}^2 \)
Area of section \( 60.8 \text{ cm}^2 \)
Section factor \( 105 \)
Load Ratio (R) \( 0.59905 \)
Section does not have an inherent fire resistance of 30 minutes.
Fire protection should be provided.
Location: Moment applied about minor axis

Simply supported steel beam

Calculations are in accordance with BS5950-1:2000 and 'Design Examples to BS5950' published by British Steel Tubes Division. The beam is assumed to be a square or rectangular hollow section.

[Diagram: \[ w = wd + wi \]

The n'th point load is shown:

\[ Wn = Wnd + Wni \]

where,

\[ Wnd = \text{dead point load} \]
\[ Wni = \text{imposed point load} \]

Beam span \( L = 5 \text{ m} \)

200 x 400 x 8 RHS - Cold formed.

Properties (cm): \( A = 91.2 \) \( rx = 8.45 \) \( Zx = 652 \) \( Sx = 728 \) \( Ix = 6520 \)

\( J = 15800 \) \( C = 1130 \) \( Zy = 949 \) \( Sy = 1170 \) \( Iy = 19000 \) \( ry = 14.4 \)

Young's Modulus \( E = 205 \text{ kN/mm}\^2 \)

Dead UDL (including S.W) \( wd = 2 \text{ kN/m} \)

Imposed UDL \( wi = 3 \text{ kN/m} \)

Dead point load 1 (+ve down) \( Wld = 30 \text{ kN} \)

Imposed point load 1 \( Wli = 30 \text{ kN} \)

Distance from L.H. supp to load 1 \( x1 = 2.5 \text{ m} \)

Check section for combined moment and shear

Maximum moment and co-existent shear

Shear capacity \( P_v = 647.52 \text{ kN} \)

Design shear force \( F_v = F = 45 \text{ kN} \)

Moment capacity based on effective elastic section

Since \( F_v < 0.6 P_v \) \( M_c = p_y * Z_{eff} / 10^3 = 179.38 \text{ kNm} \)

Since \( M \leq M_c \) (136.25 kNm ≤ 179.38 kNm) applied moment within moment capacity.

Hollow section

.simply supported beam

Point load n is shown
\[ W_n = W_{nd} + W_{ni} \]
where,
\[ W_{nd} = \text{permanent point load} \]
\[ W_{ni} = \text{variable point load} \]

Beam span \( L = 10 \text{ m} \)

Permanent UDL (including S.W) \( w_d = 1.44 \text{ kN/m} \)
Variable UDL \( w_i = 0 \text{ kN/m} \)
Permanent point load 1 (+ve down) \( W_{1d} = 100 \text{ kN} \)
Variable point load 1 \( W_{1i} = 45 \text{ kN} \)
Distance from L.H. supp to load 1 \( x_1 = 5 \text{ m} \)
400 x 400 x 12.5 SHS - Hot finished.
Properties (cm): \( A = 192 \) \( i_y = 15.8 \)
\( W_{ely} = 2390 \) \( W_{ply} = 2780 \) \( I_y = 47800 \) \( I_t = 73900 \)
\( W_t = 3530 \)

Moment resistance

\[ \text{Moment resistance} \quad M_{Cr} = W_{ply} \times f_y / 10^3 = 986.9 \text{ kNm} \]
\[ \text{Unity factor} \quad \text{unity} = M_{Ed} / M_{Cr} = 0.51044 \]
Section chosen is suitable.

Shear plastic resistance

\[ \text{Shear plastic resistance} \quad V_{plRd} = A_{vy} \times f_y / \sqrt{3} / 10^3 = 1967.6 \text{ kN} \]
\[ \text{Unity factor} \quad \text{Unity} = V_{zEd} / V_{plRd} = 0.053491 \]
Section chosen is suitable.
Note: No M-V interaction has to be considered as since the maximum moment occurs near the mid-span and the maximum shear force is obtained at the supports.

Coefficient \( C_1 \)

The beam is simply supported and is not restrained at point loads.
Effective length parameter \( K = 1.0 \)
Length for LTB \( L_T = 10 \text{ m} \)
Coefficient \( C_1 = 1.13 \)

Lateral torsional buckling

\[ \text{Critical moment} \quad M_{cr} = C_1 \times E_t \times G_t^{0.5} / 10^6 = 27479 \text{ kNm} \]
As \( \lambda a_{LT} \leq \lambda a_{LT0} \),
The segment of the beam is not subject to lateral torsional buckling.
Design buckling resistance moment \( M_{bRd} = W_{ply} \times f_y / 10^3 = 986.9 \text{ kNm} \)
Unity factor \( \frac{\text{unitb}}{\text{MyEd/MbRd}} = 0.51044 \)

Section chosen is suitable.

**HOT FINISHED SQUARE HOLLOW SECTION**

- DESIGN
  - Maximum moment: 503.75 kNm
  - Moment resistance: 986.9 kNm
  - Unity factor bending: \( 0.51044 \leq 1 \)
  - Maximum shear force: 105.25 kN
  - Shear plastic resistance: 1967.6 kN
  - Unity factor shear: \( 0.053491 \leq 1 \)
  - Deflection/span ratio: 1071
  - Buckling resistance: 986.9 kNm

**Fire resistance without applied protection**

The critical temperature method given in BS EN 1993-1-2 Clause 4.2.4 will be adopted. For further clarification refer to Thomas Telford publication entitled 'Designer's guide to EN 1991-1-2, EN 1992-1-2, EN 1993-1-2 and EN 1994-1-2'.

- Factor for variable actions \( \psi_1 \)
  - \( \psi_1 = 0.5 \)
- Maximum moment
  - MyEd = M = 324.25 kNm
- Maximum shear force
  - VzEd = Vb = 68.45 kN

**Section classification**

- Internal part subject to compression (flange): As \( C/t \leq 42e \left( 29 \leq 29.046 \right) \), internal element in compression is classified as Class 3 semi-compact.
- Internal part subject to bending (web): As \( C/t \leq 72e \left( 29 \leq 49.793 \right) \), web element in bending is classified as Class 1 plastic.

Section classification is therefore Class 3.

**Critical temperature of carbon structural steel**

- Design moment (fire limit state)
  - MfiEd = MyEd = 324.25 kNm
- Design buckling resistance
  - MbRdfi = ChiLTf*McRd = 768.81 kNm
- Design moment resistance
  - MfiRd = ky*(gamM0/gamfi)*MbRdfi/(k1 *k2) = 1098.3 kNm
- Critical temperature \( \theta_{acr} \)
  - \( \theta_{acr} = 39.19 \times \text{LOG(comp-1)} + 482 = 666.21 ^\circ \text{C} \)
- Fire resistance period
  - 22 minutes

**FIRE RESISTANCE SUMMARY**

The section does not have an inherent fire resistance of 30 minutes. Fire protection should be provided.
Location: Example RHS

Hollow section
simply supported beam

Point load n is shown
WN = Wn + Wni
where,
Wn = permanent point load
Wni = variable point load

Beam span L = 5 m

Permanent UDL (including S.W) Wd = 3 kN/m
Variable UDL Wi = 3 kN/m
Permanent point load 1 (+ve down) W1d = 40 kN
Variable point load 1 W1i = 50 kN
Distance from L.H. supp to load 1 x1 = 2.5 m
250 x 150 x 16 RHS - Hot finished.
Properties (cm): A = 115 iz = 5.8 Wely = 710 Wply = 906 Iy = 8880
It = 8870 Wt = 849 Welz = 516 Wplz = 625 Iz = 3870 iy = 8.79

Moment resistance

Moment resistance Mrd = Wply * fy / 10^3 = 321.63 kNm
Unity factor unity = MyEd / Mrd = 0.56596
Section chosen is suitable.

Shear plastic resistance

Shear plastic resistance VplRd = Avz * fy / SQR(3) / 1000 = 1473.1 kN
Unity factor Unity = VzEd / VplRd = 0.056427
Section chosen is suitable.
Note: No M-V interaction has to be considered as since the maximum
moment occurs near the mid-span and the maximum shear force
is obtained at the supports.

Coefficient C1

The beam is assumed to be restrained at point loads.
Length for LTB LT = 2.5 m
Eff.length between restraints LT = 2.5 m
Coefficient C1 = TABLE 3.1 for psi = 0
= 1.77
**Lateral torsional buckling**

Critical moment: \[ \text{M}_{cr} = C_1 \times E_t \times G_t^{0.5}/10^6 = 16972 \text{ kNm} \]

As \( \text{lam}_{LT} \leq \text{lam}_{LT0} \),

The segment of the beam is not subject to lateral torsional buckling.

Design buckling resistance moment: \[ \text{M}_{br} = W_{ply} \times f_y/10^3 = 321.63 \text{ kNm} \]

Unity factor: \[ \text{unit}_b = \frac{M_y E_d}{M_{br}} = 0.56596 \]

Section chosen is suitable.

Stiff bearing length: \( b_1 = 75 \text{ mm} \)

**HOT FINISHED**

**RECTANGULAR HOLLOW SECTION**

**Location: Example 6 'Structural Steelwork Design'**

Calculations are in accordance with BS 5950 Part 1:2000 and follow Ex 6 of 'Structural Steelwork Design' by L.J.Morris & D.R.Plum.

**Purlin on sloping roof**

Purlin centres  
**crs=2 m**  

Purlin span (rafter centres)  
**L=6 m**

Angle of rafter with horizontal  
**theta=20°**

Dead load (cladding+insulation)  
**wd=0.15 kN/m²**

Imposed load (on plan)  
**wi=0.75 kN/m²**

Wind load (suction)  
**ww=0.4 kN/m²**

152 x 76 Tapered Channel.

Young's Modulus  
**E=205 kN/mm²**

Unity factor  
**uf=mx*(-Mx)/(py*Zx/10^3)+my*My/(py*Zy/10^3) =0.21342**

**Check for deflection under serviceability loads**

Total deflection  
**DEL=5*Wix*L^3*10^5/(384*E*Ix)**

=12.797 mm

Limiting deflection  
**DELlim=L*1000/200=30 mm**

Since **DEL ≤ DELlim ( 12.797 mm ≤ 30 mm )**, deflection within limiting value.

**PURLIN SECTION SUMMARY**

152 x 76  
Tapered flange Channel Grade S 275  
Section is satisfactory for bending, shear, combined bending & shear, and deflection.
Location: Ex1 - Roof purlin with wind suction load using UKPFC

Calculations are in accordance with EC3 Part 1-1:2005.

\[ L = \text{purlin span} \]
\[ \text{crs} = \text{purlin centres} \]
\[ \theta = \text{rafter slope} \]

Purlin centres \( \text{crs} = 2 \text{ m} \)
Purlin span (rafter centres) \( L = 6 \text{ m} \)
Angle of rafter with horizontal \( \theta = 20^\circ \)
Permanent load (cladding+insulation) \( g_k = 0.15 \text{ kN/m}^2 \)
Variable load (on plan) \( q_k = 0.75 \text{ kN/m}^2 \)
Wind suction (input as positive) \( w_k = 0.4 \text{ kN/m}^2 \)

150 x 75 UKPFC

The rafter slope \( \theta = 20^\circ \) results in the purlins at the same angle. Components of load are used to calculate moments about \( yy \) & \( zz \) axes, i.e. normal and tangential to the rafter. It would be possible to ignore bending in the plane of the cladding, but in practice, biaxial bending is usually considered in purlin design.

Length for LTB \( LT = 6 \text{ m} \)
Equivalent uniform moment factor \( C_{my} = 1 \)
Equivalent uniform moment factor \( C_{mz} = 1 \)

DESIGN 150 x 75 UKPFC
SUMMARY Parallel flange Channel Grade S 275

tf=10 mm tw=5.5 mm Grade S 275
Section is satisfactory for bending, shear, combined bending & shear, and deflection.

SUMMARY tf=10 mm tw=5.5 mm Grade S 275
Location: Example 7 in Structural Steelwork Design

---

Side rail

Calculations are in accordance with BS5950-1: 2000 and follow Example 7 of 'Structural Steelwork Design' by L.J. Morris and D.R. Plum.

X-X = major axis

Y-Y = minor axis

---

Side rail span \( L=5 \text{ m} \)
Side rail centres \( \text{crs}=2 \text{ m} \)
Characteristic wind load \( \text{ww}=0.8 \text{ kN/m}^2 \)
125 x 75 x 10 mm Unequal Angle.
Young's Modulus \( E=205 \text{ kN/mm}^2 \)

Loading

Wind load \( W_w=\text{crs} \times L \times \text{ww}=8 \text{ kN} \)
Ultimate wind load \( W_x=1.4 \times W_w=11.2 \text{ kN} \)

Applied moment and shear

Max moment occurs at centre \( M_x=W_x \times L/8=7 \text{ kNm} \)
Max shear occurs at ends \( F_x=W_x/2=5.6 \text{ kN} \)

Shear capacity

Shear area (bending about xx) \( A_{vx}=0.9 \times A \times t=1125 \text{ mm}^2 \)
Shear capacity \( P_{vx}=0.6 \times p_y \times A_{vx}/1000=185.63 \text{ kN} \)
Since \( F_x \leq P_{vx} \) (5.6 kN \( \leq 185.63 \text{ kN} \)) shear force in web within shear capacity.

Moment capacity

Moment capacity \( M_{cx}=p_y \times Z/10^3=10.042 \text{ kNm} \)
Since \( M_x \leq M_{cx} \) (7 kNm \( \leq 10.042 \text{ kNm} \)) section is satisfactory.
## Check for deflection under serviceability loads

Total deflection: $DEL = \frac{5 \times Ww \times L^3 \times 10^5}{384 \times E \times I_x} = 21.032\ mm$

Limiting deflection: $DEL_{\text{lim}} = \frac{L}{1000} = 25\ mm$

Since $DEL \leq DEL_{\text{lim}}$ (21.032 mm ≤ 25 mm), deflection within limiting value.

<table>
<thead>

</tr>
</tbody>
</table>
Location: Ex1 - Cladding side rail design

Cladding side rail

Calculations are in accordance with EC3 Part 1-1:2005

crs = rail centres

Y-Y = major axis

Z-Z = minor axis

L = column centres = side rail span

Side rail span \( L = 5 \, \text{m} \)

Side rail centres \( \text{crs} = 2 \, \text{m} \)

Characteristic wind load \( w_k = 0.8 \, \text{kN/m}^2 \)

125 x 75 x 10 mm Unequal Angle (Advance UKA)

Partial factors for actions and resistance

Variable action (horizontal wind) \( \gamma_Q = 1.5 \)

Partial factor \( \gamma_{M0} = 1.0 \)

Partial factor \( \gamma_{M1} = 1.0 \)

Design moment and shear

Max moment occurs at centre \( M_{yEd} = \frac{W_y \cdot L}{8} = 7.5 \, \text{kNm} \)

Max shear occurs at ends \( V_{yEd} = \frac{W_y}{2} = 6 \, \text{kN} \)

Design shear resistance

Shear area (bending about y-axis) \( A_v = 0.9 \cdot h \cdot t = 1125 \, \text{mm}^2 \)

Shear resistance \( V_{plRdy} = A_v \cdot (f_y/3^{0.5})/(\gamma_{M0} \cdot 1000) = 178.62 \, \text{kN} \)

Since \( V_{yEd} \leq V_{plRdy} \) ( 6 kN ≤ 178.62 kN ) design shear force in web is within the shear resistance.

Moment resistance

Moment resistance \( M_{crdy} = W_e1 \cdot f_y/(\gamma_{M0} \cdot 10^3) = 10.042 \, \text{kNm} \)

Since \( M_{yEd} \leq M_{crdy} \) ( 7.5 kNm ≤ 10.042 kNm ) section is satisfactory.
Check for deflection under serviceability loads

Total deflection \( \text{DEL} = 5 \times Wk \times L^3 \times 10^8 / (384 \times E \times I_y) = 20.531 \text{ mm} \)

Since \( \text{DEL} \leq \text{DELlim} \) (20.531 mm \( \leq \) 25 mm) deflection OK.

I Section Column

Calculations in accordance with BS EN 1993-1-1:2005. Internal forces and moments have been determined by elastic global analysis.

All forces and moments are factored.

Design moment about major axis \( M_{yEd} = 30 \text{ kNm} \)
Design shear force \( V_{zEd} = 30 \text{ kN} \)
Design axial load (+ve comp) \( N_{Ed} = 7000 \text{ kN} \)
Length of member \( L = 5 \text{ m} \)
Moment about the minor axis \( M_{zEd} = 0 \text{ kNm} \)
Design shear force // to flanges \( V_{yEd} = 0.6 \text{ kN} \)

Dimensions (mm): \( h = 970.3 \), \( b = 300 \), \( t_w = 16 \), \( t_f = 21.1 \), \( r = 30 \)
Properties (cm): \( I_y = 408000 \), \( I_z = 9550 \), \( W_{ply} = 9810 \), \( W_{plz} = 1020 \), \( I_t = 390 \)

Determine the effective section properties - EN 1992-1-5, Cl. 4.4

The process is iterative as the amount of web not considered is a function of the stresses at the top and bottom of the web.

Iteration 1:
Gross area of section \( A = 2b * t_f + h_w * t_w = 27510 \text{ mm}^2 \)
Gross 2nd moment of area \( I_y = (b^2 * (h_w + 2 * t_f)^3) - (b - t_w) * h_w^3 - 12 = 3.918E9 \text{ mm}^4 \)
Stress at top of web \( s_1 = \frac{M_{yEd} * 10^6 * h_w}{2 * I_y} = 3.5532 \text{ N/mm}^2 \)
Stress at bottom of web \( s_2 = \frac{-M_{yEd} * 10^6 * h_w}{2 * I_y} = -3.5532 \text{ N/mm}^2 \)

Iteration 10:
Position of effective centroid:
\( z_{eff} = \frac{(A * h/2 - A_w * (z_{effp} + b * 2 + l_w/2))}{A_{eff}} = 485.15 \text{ mm} \)
Effective 2nd moment of area:
\( I_{y_{eff}} = I_y + A * (h/2 - z_{eff})^2 - t_w * l_w^3/12 - A_w * (z_{effp} + b * 2 + l_w/2 - z_{eff})^2 \)
\( = 3.918E9 \text{ mm}^4 \)
Top of web stress \( s_{1(10)} = \frac{M_{yEd} * 10^6 * (h - t_f - z_{eff})}{I_{y_{eff}}} = 3.5532 \text{ N/mm}^2 \)
Bottom of web stress \( s_{2(10)} = \frac{-M_{yEd} * 10^6 * (z_{eff} - t_f)}{I_{y_{eff}}} = -3.5532 \text{ N/mm}^2 \)
Net loss area \( A_w = l_w * t_w = 0 \text{ mm}^2 \)
Effective area of section \( A_{eff} = A - A_w = 27510 \text{ mm}^2 \)
Effective section modulus \( W_{eff} = \frac{I_{y_{eff}}}{(1000 * (h - z_{eff}))} = 8075.8 \text{ cm}^3 \)
Effective length parameter                  K=1
Length for LTB                                 LT=5 m
Maximum moment on section                      M=30 kNm
Far end moment                                  psiM=0 kNm
Far end bending moment                         pM(1)=0 kNm

Buckling length in fire situation $L_{fi}=2450$ mm  
Critical temperature $\theta_{cr}$  
$t_{CR}=TABLE 254$ for $m_o=0.33047$, $\lambda_{fi}=0.64492$  
$=579.41 \degree C$

Fire resistance period 18 minutes

**Interaction of axial loads and moments in fire situation**

The interaction of axial compression and bending is given by the following expression (EN 1993-1-2 Clause 4.2.3.5):  

Unity expression  
$R=N_{fi}E_d/N_{fi}R_d+k_{fi}L*T_{fi}M_{fi}E_d/M_{y_b}R_d+k_z*M_{fi}E_dz/M_zR_d$  
$=0.67281$

As $R \leq 1$, section capacity is OK for a FR period of 18 minutes.

**FIRE RESISTANCE SUMMARY**  
The section does not have an inherent fire resistance of 30 minutes. Fire protection should be provided.
Location: Method of Clause 5.3.3

Plastic design of stanchions

Calculations in accordance with BS5950:Part 1:2000
Sections 5.3 and Annex G.

All loads and moments are factored.

Note: Plastic design may be used where loading is predominantly static and fatigue will not be a design criterion.

Design moment about z-z axis $M_z=614$ kNm
Design shear force $F_v=94.9$ kN
Design axial load (+ve comp) $F=173$ kN
Length of member $L=6.47$ m

533 x 210 x 92 UB.
Young's Modulus $E=205$ kN/mm²

Far end bending moment value $M_f=462$ kNm
Maximum moment on segment $M_{LT}=462$ kNm
Far end BM $\beta M=0$ kNm
Effective length $L_e=4870$ mm

maximum moment on segment $M'_z=462$ kNm
Far end BM $\beta M'_z=0$ kNm

UNIVERSAL BEAM 533 x 210 x 92 UB Grade S 275
DESIGN SUMMARY Section is satisfactory for plastic design in accordance with BS5950-1.
Provide lateral restraint to both flanges at plastic hinge location.
Intermediate torsional restraint(s) provided 1600 mm below hinge.

Compressive load 173 kN
Compressive resistance 1485 kN
Factored moment 614 kNm
Local capacity check 1 ≤ 1
Overall buckling check 0.639 ≤ 1
0.89 ≤ 1

**DESIGN SUMMARY**

Section is satisfactory for plastic design in accordance with BS5950-1.
Provide lateral restraint to both flanges at plastic hinge location.
Location: Ex1 - Based on example 13, 'Steelwork Design Guide'

Plastic design of stanchions

Calculations in accordance with BS EN 1993-1-1:2005
Clause 6.3.5 and Annex BB.3.

All loads and moments are factored.

Note: Plastic design may be used where loading is predominantly static and fatigue will not be a design criterion.

Design moment about major axis \( \text{MyEd} = 608 \text{ kNm} \)
Design shear force \( \text{VzEd} = 94.9 \text{ kN} \)
Design axial load (+ve comp) \( \text{NEd} = 173 \text{ kN} \)
Length of member \( L = 6.47 \text{ m} \)

533 x 210 x 92 UKB

Moment resistance - Clause 6.2.5

Design moment resistance yy axis \( \text{McRd} = \text{fy} \times \text{Wply} / (\text{gamM0} \times 10^3) = 649 \text{ kNm} \)
Since \( \text{MyEd} \leq \text{McRd} \) (608 kNm \( \leq \) 649 kNm) design moment within the moment resistance.

Cross-section resistance - Clause 6.2(7)

\[
\frac{\text{NEd}}{A \times \text{fy}} + \frac{\text{MyEd}}{\text{McRd}} \leq 1
\]

Unity factor \( \text{uf} = \frac{\text{NEd} \times 10}{(A \times \text{fy})} + \frac{\text{MyEd}}{\text{McRd}} = 0.991 \)
The interaction formula is satisfied.

Column stability

At the column plastic hinge location (i.e. at the bottom of the haunch lateral restraint to both flanges needs to be provided (Annex BB.3). The maximum distance from the plastic hinge to the adjacent lateral restraint is derived from the following expression:

\[
\text{Lm}' = 38 \text{ iz } \left[ \frac{1}{57.4} \left( \frac{\text{NEd}'}{A} \right) + \frac{1}{756} \left( \frac{(\text{Wply})^2}{A \times \text{It}} \right) \left( \frac{\text{fy}}{235} \right)^2 \right]^{0.5}
\]

Axial load at hinge position \( \text{NEd}' = 173 \text{ kN} \)
Provide a restraint at \( \text{Lm} = 1125 \text{ mm below plastic hinge} \)
CALCULATIONS FOR LOWER COLUMN SEGMENT AB

Column segment length AB
Le=L*1000-Lm=5345 mm
Moment at column base
MyEdA=0 kNm (pinned base)
Moment at restraint position B
MyEdB=502 kNm

Lateral torsional buckling - lower column segment

Length for LTB
LT=Lz/1000=5.35 m
Critical moment
Mcr=C1*Et*Sr/10^6=981 kNm
Modified chiLT factor
ChiLT=0.862
Design buckling resistance moment
MbRd=ChiLT*Wply*fy/(gamM1*10^3)=560 kNm

As MyEdB ≤ MbRd ( 502 kNm ≤ 560 kNm ), design moment at
point B is within the buckling resistance moment. Hence OK.

As MyEdB ≤ MbRd ( 502 kNm ≤ 560 kNm ), design moment at
point B is within the buckling resistance moment. Hence OK.

CALCULATIONS FOR UPPER COLUMN SEGMENT BC

Upper column segment length
Le=Lm=1125 mm
Lengths for buckling:
about y-y axis (major axis) Ly=6470 mm (whole col.length)
about z-z axis (minor axis) Lz=1125 mm

Lateral torsional buckling

Length for LTB
LT=Lz/1000=1.12 m
Critical moment
Mcr=C1*Et*Sr/10^6=11245 kNm
Lateral torsional buckling effects are ignored.
Modification factor
ChiLT=1.0
Design buckling resistance moment
MbRd=ChiLT*Wply*fy/(gamM1*10^3)=649 kNm

As MyEd ≤ MbRd ( 608 kNm ≤ 649 kNm ), design moment at
point B is within the buckling resistance moment. Hence OK.

As MyEd ≤ MbRd ( 608 kNm ≤ 649 kNm ), design moment at
point B is within the buckling resistance moment. Hence OK.
UNIVERSAL BEAM

DESIGN SUMMARY

Section is satisfactory for plastic design to EC3 Part 1-1.

Lateral restraint to both flanges assumed at points B and C.

Design axial load 173 kN
Buckling resistance 1281 kN
Design moment at point C 608 kNm
Design moment at point B 502 kNm
Cross-section resistance 0.991 ≤ 1
Interaction factors 0.711 ≤ 1
0.997 ≤ 1
0.62 ≤ 1
0.884 ≤ 1
Location: Ex2 - I Column section with moment at base

Plastic design of stanchions

Calculations in accordance with BS EN 1993-1-1:2005
Clause 6.3.5 and Annex BB.3.

All loads and moments are factored.

Note: Plastic design may be used where loading is predominantly static and fatigue will not be a design criterion.

Design moment about major axis \( M_{yEd} = 820 \text{ kNm} \)
Design shear force \( V_{zEd} = 102 \text{ kN} \)
Design axial load (+ve comp) \( N_{Ed} = 193 \text{ kN} \)
Length of member \( L = 8 \text{ m} \)

610 x 229 x 125 UKB

Moment resistance - Clause 6.2.5

Design moment resistance yy axis \( M_{crd} = f_y \cdot W_{ply} / (\gamma M_0 \cdot 10^3) = 975 \text{ kNm} \)
Since \( M_{yEd} \leq M_{crd} \) (820 kNm \( \leq 975 \text{ kNm} \)) design moment within the moment resistance.

Cross-section resistance - Clause 6.2(7)

\[
\frac{N_{Ed}}{A \cdot f_y} + \frac{M_{yEd}}{M_{crd}} \leq 1
\]

Unity factor \( u_f = \frac{N_{Ed} \cdot 10}{A \cdot f_y} + \frac{M_{yEd}}{M_{crd}} = 0.887 \)
The interaction formula is satisfied.

Column stability

At the column plastic hinge location (i.e. at the bottom of the haunch lateral restraint to both flanges needs to be provided (Annex BB.3)). The maximum distance from the plastic hinge to the adjacent lateral restraint is derived from the following expression:

\[
L_{m'} = \frac{1}{57.4} \left[ \frac{N_{Ed'}^2}{A} \right] + \frac{1}{756(C1)^2} \left[ \frac{(W_{ply})^2}{A \cdot I_t} \right] \cdot \left[ \frac{f_y}{235} \right]^2 \cdot 0.5
\]

Axial load at hinge position \( N_{Ed'} = 193 \text{ kN} \)
Provide a restraint at \( L_{m'} = 1300 \text{ mm below plastic hinge} \)
CALCULATIONS FOR LOWER COLUMN SEGMENT AB

Column segment length AB          Le=L*1000-Lm=6700 mm
Maximum moment on segment         MyEdB=673 kNm
Far end bending moment value      MyEdA=-82 kNm (fixed base)

Lateral torsional buckling - lower column segment

Length for LTB                    LT=Lz/1000=6.7 m
Critical moment                   Mcr=C1*Et*Sr/10^6=1368 kNm
Modified chiLT factor             ChiLT=chiLT/f=0.85
Design buckling resistance moment MbRd=ChiLT*Wply*fy/(gamM1*10^3) =829 kNm

As MyEdB ≤ MbRd ( 673 kNm ≤ 829 kNm ), design moment at point B is within the buckling resistance moment. Hence OK.

  - $0.799 \leq 1$
Location: Ex3 - I Column section with moment at base

Plastic design of stanchions

Calculations in accordance with BS EN 1993-1-1:2005 Clause 6.3.5 and Annex BB.3. All loads and moments are factored.

Note: Plastic design may be used where loading is predominantly static and fatigue will not be a design criterion.

Design moment about major axis \( \text{MyEd}=635 \text{ kNm} \)
Design shear force \( \text{VzEd}=108 \text{ kN} \)
Design axial load (+ve comp) \( \text{NEd}=206 \text{ kN} \)
Length of member \( \text{L}=6 \text{ m} \)

457 x 191 x 89 UKB

Moment resistance - Clause 6.2.5

Design moment resistance yy axis \( \text{McRd}=\text{fy*Wply}/(\text{gamM0*10^3})=693 \text{ kNm} \)
Since \( \text{MyEd} \leq \text{McRd} \) ( 635 kNm ≤ 693 kNm ) design moment within the moment resistance.

Cross-section resistance - Clause 6.2(7)

\[
\frac{\text{NEd}}{\text{A*fy}} + \frac{\text{MyEd}}{\text{McRd}} \leq 1
\]

Unity factor \( \text{uf}=\text{NEd*10/(A*fy)}+\text{MyEd/McRd}=0.968 \)
The interaction formula is satisfied.

Column stability

At the column plastic hinge location (i.e. at the bottom of the haunch lateral restraint to both flanges needs to be provided (Annex BB.3). The maximum distance from the plastic hinge to the adjacent lateral restraint is derived from the following expression:

\[
\text{Lm'} = \frac{1}{57.4} \left[ \frac{\text{NEd'}}{\text{A}} \right] + \frac{1}{756(C1)^2} \left[ \frac{(\text{Wply})^2}{\text{A.It}} \right] \left[ \frac{\text{fy}}{235} \right]^{2}^{0.5}
\]

Axial load at hinge position \( \text{NEd'}=206 \text{ kN} \)
Provide a restraint at \( \text{Lm}=950 \text{ mm below plastic hinge} \)
CALCULATIONS FOR LOWER COLUMN SEGMENT AB

Column segment length AB  \( L_e = L \times 1000 - L_m = 5050 \text{ mm} \)
Maximum moment on segment \( M_{YEdB} = 524 \text{ kNm} \)
Far end bending moment value \( M_{YEdA} = -64 \text{ kNm} \) (fixed base)

**Lateral torsional buckling - lower column segment**

Length for LTB  \( L_T = L_z / 1000 = 5.05 \text{ m} \)
Critical moment  \( M_{cr} = C_1 \times E_t \times S_r / 10^6 = 987 \text{ kNm} \)
Modified chiLT factor  \( \text{ChiLT} = \text{chiLT} / f = 0.855 \)
Design buckling resistance moment  \( M_{Brd} = \text{ChiLT} \times W_{ply} \times f_y / (\gamma_M \times 10^3) = 593 \text{ kNm} \)

As \( M_{YEdB} \leq M_{Brd} \leq 524 \text{ kNm} \leq 593 \text{ kNm} \), design moment at point B is within the buckling resistance moment. Hence OK.

Far end bending moment  \( pM(1) = -64 \text{ kNm} \)
Far end bending moment  \( pM(2) = -64 \text{ kNm} \)
Interaction factor  \( k_{yy} = 0.566 \)
Interaction factor  \( k_{zy} = 0.948 \)
Section chosen is suitable.

CALCULATIONS FOR UPPER COLUMN SEGMENT BC

Upper column segment length  \( L_e = L_m = 950 \text{ mm} \)
Lengths for buckling:
about y-y axis (major axis)  \( L_y = 6000 \text{ mm} \) (whole col.length)
about z-z axis (minor axis)  \( L_z = 950 \text{ mm} \)

**Lateral torsional buckling**

Length for LTB  \( L_T = L_z / 1000 = 0.95 \text{ m} \)
Critical moment  \( M_{cr} = C_1 \times E_t \times S_r / 10^6 = 11919 \text{ kNm} \)
Lateral torsional buckling effects are ignored.
Modification factor  \( \text{ChiLT} = 1.0 \)
Design buckling resistance moment  \( M_{Brd} = \text{ChiLT} \times W_{ply} \times f_y / (\gamma_M \times 10^3) = 693 \text{ kNm} \)

As \( M_{YEd} \leq M_{Brd} \leq 635 \text{ kNm} \leq 693 \text{ kNm} \), design moment at point B is within the buckling resistance moment. Hence OK.

Far end bending moment  \( pM(3) = 524 \text{ kNm} \)
Interaction factor  \( k_{yy} = 0.566 \)
Interaction factor  \( k_{zy} = 0.886 \)
Section chosen is suitable.
Section chosen is suitable.

Location: Ex4 - Using UC section with moment at base

Plastic design of stanchions

Calculations in accordance with BS EN 1993-1-1:2005
Clause 6.3.5 and Annex BB.3.

All loads and moments are factored.

Note: Plastic design may be used where loading is predominantly static and fatigue will not be a design criterion.

Design moment about major axis \( M_{Ed} = 414 \text{ kNm} \)
Design shear force \( V_{zEd} = 94.9 \text{ kN} \)
Design axial load (+ve comp) \( N_{Ed} = 575 \text{ kN} \)
Length of member \( L = 4.27 \text{ m} \)

254 x 254 x 132 UKC

Moment resistance - Clause 6.2.5

Design moment resistance \( yy \) axis \( M_{crd} = f_y \frac{W_{pl} y}{(\gamma M_0 \times 10^3)} = 496 \text{ kNm} \)

Since \( M_{Ed} \leq M_{crd} \) (414 kNm \( \leq 496 \text{ kNm} \)) design moment within the moment resistance.

Cross-section resistance - Clause 6.2(7)

\[
\frac{N_{Ed}}{A f_y} + \frac{M_{Ed}}{M_{crd}} \leq 1
\]

Unity factor \( u_f = \frac{N_{Ed} \times 10}{A f_y} + \frac{M_{Ed}}{M_{crd}} = 0.965 \)

The interaction formula is satisfied.

Column stability

At the column plastic hinge location (i.e. at the bottom of the haunch lateral restraint to both flanges needs to be provided (Annex BB.3)). The maximum distance from the plastic hinge to the adjacent lateral restraint is derived from the following expression:

\[
38 iz
\]

\[
L_m' = \left[ \frac{1}{57.4} \left( \frac{N_{Ed}'}{A} \right) + \frac{1}{756(C1)^2} \left( \frac{(W_{pl}y)^2}{A \cdot I_t} \right) \right] \left( \frac{f_y}{235} \right)^2 ^{0.5}
\]

Axial load at hinge position \( N_{Ed}' = 575 \text{ kN} \)
Provide a restraint at \( L_m = 1825 \text{ mm below plastic hinge} \)
CALCULATIONS FOR LOWER COLUMN SEGMENT AB

Column segment length AB
Le=L*1000-Lm=2445 mm

Maximum moment on segment
MyEdB=186 kNm

Far end bending moment value
MyEdA=-120 kNm (fixed base)

Lateral torsional buckling - lower column segment

Length for LTB
LT=Lz/1000=2.45 m

Critical moment
Mcr=C1*Et*Sr/10^6=10319 kNm

Design buckling resistance moment
MbRd=ChiLT*Wply*fy/(gamM1*10^3)
        =496 kNm

As MyEdB ≤ MbRd ( 186 kNm ≤ 496 kNm ), design moment at point B is within the buckling resistance moment. Hence OK.

Far end bending moment
pM(1)=-120 kNm

Far end bending moment
pM(2)=-120 kNm

Interaction factor
kyy=0.498

Interaction factor
kzy=0.964

Section chosen is suitable.

Section chosen is suitable.

CALCULATIONS FOR UPPER COLUMN SEGMENT BC

Upper column segment length
Le=Lm=1825 mm

Lengths for buckling:

about y-y axis (major axis)    Ly=4270 mm (whole col.length)
about z-z axis (minor axis)    Lz=1825 mm

Lateral torsional buckling

Length for LTB
LT=Lz/1000=1.82 m

Critical moment
Mcr=C1*Et*Sr/10^6=9242 kNm

Lateral torsional buckling effects are ignored.

Modification factor
ChiLT=1.0

Design buckling resistance moment
MbRd=ChiLT*Wply*fy/(gamM1*10^3)
        =496 kNm

As MyEd ≤ MbRd ( 414 kNm ≤ 496 kNm ), design moment at point B is within the buckling resistance moment. Hence OK.

Far end bending moment
pM(3)=186 kNm

Interaction factor
kyy=0.498

Interaction factor
kzy=0.908

Section chosen is suitable.

Section chosen is suitable.

\begin{align*}
\text{Plastic design of stanchions} \\
\text{Calculations in accordance with BS EN 1993-1-1:2005} \\
\text{Clause 6.3.5 and Annex BB.3.}
\end{align*}
\]

All loads and moments are factored.

Note: Plastic design may be used where loading is predominantly static and fatigue will not be a design criterion.

Design moment about major axis \( \text{MyEd}=1034 \text{kNm} \)
Design shear force \( \text{VzEd}=100 \text{kN} \)
Design axial load (+ve comp) \( \text{NEd}=271 \text{kN} \)
Length of member \( \text{L}=12.3 \text{m} \)

686 x 254 x 125 UKB

**Moment resistance - Clause 6.2.5**

Design moment resistance yy axis \( \text{McRd}=fy*Wply/(\text{gamM0}*10^3)=1377 \text{kNm} \)
Since \( \text{MyEd} \leq \text{McRd} \) (1034 kNm \( \leq \) 1377 kNm) design moment within the moment resistance.

**Cross-section resistance - Clause 6.2(7)**

\[
\frac{\text{NEd}}{A*fy} + \frac{\text{MyEd}}{\text{McRd}} \leq 1
\]

Unity factor \( \text{uf} = \frac{\text{NEd} * 10}{(A*fy)} + \frac{\text{MyEd}}{\text{McRd}} = 0.801 \)
The interaction formula is satisfied.

**Column stability**

At the column plastic hinge location (i.e. at the bottom of the haunch lateral restraint to both flanges needs to be provided (Annex BB.3)). The maximum distance from the plastic hinge to the adjacent lateral restraint is derived from the following expression:

\[
\text{Lm}' = \left[ \frac{1}{57.4} \left( \frac{\text{NEd}'}{A} \right) + \frac{1}{756(C1)^2} \left( \frac{(Wply)^2}{A*It} \right) \right] \left( \frac{\text{fy}^2}{235} \right)^{0.5}
\]

Axial load at hinge position \( \text{NEd}'=271 \text{kN} \)
Provide a restraint at \( \text{Lm}=1050 \text{mm} \text{ below plastic hinge} \)
CALCULATIONS FOR LOWER COLUMN SEGMENT AB

Column segment length AB \( Le = 6450 \text{ mm} \)
Moment at column base \( MyEdA = 0 \text{ kNm} \) (pinned base)
Moment at restraint position C \( MyEdC = 946 \text{ kNm} \)
Moment at restraint position B \( MyEdB = 542 \text{ kNm} \)

**Lateral torsional buckling - lower column segment**

Length for LTB \( LT = Lz / 1000 = 6.45 \text{ m} \)
Critical moment \( Mcr = C1 * Et * Sr / 10^6 = 1508 \text{ kNm} \)
Modified chiLT factor \( ChiLT = chiLT / f = 0.756 \)
Design buckling resistance moment \( MbRd = ChiLT * Wply * fy / (gamM1 * 10^3) = 1040 \text{ kNm} \)

As \( MyEdB \leq MbRd \) ( 542 kNm \( \leq 1040 \text{ kNm} \) ), design moment at point B is within the buckling resistance moment. Hence OK.

Far end bending moment \( pM(1) = 0 \text{ kNm} \)
Far end bending moment \( pM(2) = 0 \text{ kNm} \)
Interaction factor \( kyy = 0.611 \)
Interaction factor \( kzy = 0.955 \)
Section chosen is suitable.

Section chosen is suitable.

CALCULATIONS FOR INTERMEDIATE COLUMN SEGMENT BC

Lengths for buckling:
about y-y axis (major axis) \( Ly = 12300 \text{ mm} \) (whole col.length)
about z-z axis (minor axis) \( Lz = 4800 \text{ mm} \)

**Lateral torsional buckling**

Length for LTB \( LT = Lz / 1000 = 4.8 \text{ m} \)
Critical moment \( Mcr = C1 * Et * Sr / 10^6 = 1813 \text{ kNm} \)
Limiting slenderness value \( lamLT0 = 0.4 \)
Modified chiLT factor \( ChiLT = chiLT / f = 0.766 \)
Design buckling resistance moment \( MbRd = ChiLT * Wply * fy / (gamM1 * 10^3) = 1054 \text{ kNm} \)

As \( MyEdC \leq MbRd \) ( 946 kNm \( \leq 1054 \text{ kNm} \) ), design moment at point B is within the buckling resistance moment. Hence OK.

Far end bending moment \( pM(4) = 542 \text{ kNm} \)
Interaction factor \( kyy = 0.611 \)
Interaction factor \( kzy = 0.983 \)
Section chosen is suitable.

Unity factor \( Un6 = NEd / (chiz * NRd) + kzy * MyEdC / (ChiLT * McRd) = 0.983 \)
Section chosen is suitable.

CALCULATIONS FOR UPPER COLUMN SEGMENT CD
Upper column segment length
Le=Lm=1050 mm

Lengths for buckling:
about y-y axis (major axis) Ly=12300 mm (whole col.length)
about z-z axis (minor axis) Lz=1050 mm

Lateral torsion buckling

Length for LTB LT=Lz/1000=1.05 m
Critical moment Mcr=C1*Et*Sr/10^6=28689 kNm
Lateral torsional buckling effects are ignored.
Modification factor ChiLT=1.0
Design buckling resistance moment MbRd=ChiLT*Wply*fy/(gamM1*10^3)
=1377 kNm
As MyEd ≤ MbRd (1034 kNm ≤ 1377 kNm), design moment at point B is within the buckling resistance moment. Hence OK.
Far end bending moment pM(3)=946 kNm
Interaction factor kyy=0.611
Interaction factor kzy=0.858
Section chosen is suitable.

**Determine the effective section properties - EN 1992-1-5, Cl. 4.4**

The process is iterative as the amount of web not considered is a function of the stresses at the top and bottom of the web.

**Iteration 1:**

Gross area of section \( A=2*b*tf+hw*tw=27510 \text{ mm}^2 \)

Gross 2nd moment of area \( I_y=(b*(hw+2*tf)^3-(b-tw)*hw^3)/12=3.918E9 \text{ mm}^4 \)

Stress at top of web \( s_1=MyEd*10^6*hw/2/Iy=0 \text{ N/mm}^2 \)

Stress at bottom of web \( s_2=-MyEd*10^6*(hw/2)/Iy=0 \text{ N/mm}^2 \)

**Iteration 10:**

Position of effective centroid:

\[ z_{eff}=(A*h/2-Aw*(zeffp+be2+lw/2))/Aeff=485.15 \text{ mm} \]

Effective 2nd moment of area:

\[ I_{yeff}=I_y+A*(h/2-zeff)^2-tw*lw^2/12-Aw*(zeffp+be2+lw/2-zeff)^2=3.918E9 \text{ mm}^4 \]

Top of web stress \( s_{1(10)}=MyEd*10^6*(h-tf-zeff)/I_{yeff}=0 \text{ N/mm}^2 \)

Bottom of web stress \( s_{2(10)}=-MyEd*10^6*(zeff-tf)/I_{yeff}=0 \text{ N/mm}^2 \)

Net loss area \( Aw=lw*tw=0 \text{ mm}^2 \)

Effective area of section \( A_{eff}=A-Aw=27510 \text{ mm}^2 \)

Effective section modulus \( W_{eyff}=I_{yeff}/(1000*(h-zeff))=8075.8 \text{ cm}^3 \)

Factor about y-y axis \( f_{Ly}=1 \)

Factor about z-z axis \( f_{Lz}=0.7 \)

SQUARE HOLLOW SECTION 200 x 200 x 6.3 SHS Grade S 355
SECTION Section is satisfactory for axial compression load.
SUMMARY
DESIGN Axial compressive load 1200 kN
SUMMARY Compressive Resistance 1206.6 kN
Location: slender section

**Axially loaded SHS column**

Calculations are in accordance with BS5950-1:2000.

Load is factored and for compression members length between restraints is the same for both axes.

Design load (+ve compression) \( F = 1550 \text{ kN} \)
Length between restraints \( L = 6000 \text{ mm} \)

300 x 200 x 6.3 RHS - Hot finished.
Properties (cm): \( A = 61 \), \( r_x = 11.3 \), \( Z_x = 522 \), \( S_x = 624 \), \( I_x = 7830 \)
\( J = 8480 \), \( C = 681 \), \( Z_y = 419 \), \( S_y = 472 \), \( I_y = 4190 \), \( r_y = 8.29 \)
Young's Modulus \( E = 205 \text{ kN/mm}^2 \)

Effective length factor (x axis) \( e_{fx} = 1 \)
Effective length factor (y axis) \( e_{fy} = 1 \)

**WARNING:**
As \( F > P_c \) (1550 kN > 1480.4 kN) design axial compressive load exceeds compression resistance and section size must be increased.
Location: SCI example

Axially loaded column

Calculations are in accordance with BS EN 1993-1-1:2005.

Compressive load is factored.

Factored axial compressive load  \( N_{Ed} = 920 \text{ kN} \)

Column in simple construction

Calculations are in accordance with EN 1993-1-1 and EN 1993-1-2.

- Column is continuous and forms part of a structure of simple construction
- Column is nominally pinned at the base
- Beams are connected to the column by "simple" connections.

All loads and moments are factored.

Factored axial compressive load \( N_{Ed} = 589 \text{ kN} \)
Factored BM about y-y axis \( M_{yEd} = 11.11 \text{ kNm} \)
Factored BM about z-z axis \( M_{zEd} = 0.35 \text{ kNm} \)
Length between restraints \( L = 5000 \text{ mm} \)
203 x 203 x 46 UKC
Dimensions (mm): \( h=203.2 \text{ b}=203.6 \text{ tw}=7.2 \text{ tf}=11 \text{ r}=10.2 \)
Properties (cm): \( I_y=4570 \text{ I}_z=1550 \text{ W}_{ply}=497 \text{ W}_{plz}=231 \text{ I}_t=22.2 \)

SECTION 203 x 203 x 46 UKC Grade S 275
DESIGN Design axial load 589 kN
SUMMARY Buckling resistance 764.02 kN
Design BM y-y axis 11.11 kNm
LTB resistance 136.68 kNm
Design BM z-z axis 0.35 kNm
Moment resistance (z-z) 63.525 kNm
Unity factor 0.86048 \( \leq 1 \)

Fire resistance without applied protection

Unfactored permanent axial force \( N_p = 200 \text{ kN} \)
Unfactored variable axial force \( N_v = 210 \text{ kN} \)
Design axial compressive force \( N_{fiEd} = 1.0*N_p + 1.0* N_v = 410 \text{ kN} \)

Determine critical temperature of steel in fire situation

Buckling length in fire situation \( L_{fi} = 3500 \text{ mm} \)
Critical temperature \( \theta_{cr} \) \( t_{CR} = \text{TABLE 253 for } \Theta = 0.25399, \text{ lamfi} = 0.92314 \)
\( = 566.28 \text{ °C} \)
Fire resistance period 17 minutes

Interaction of axial loads and moments in fire situation

The interaction of axial compression and bending is given by the following expression (EN 1993-1-2 Clause 4.2.3.5):

\[
R = \frac{N_{fiEd}}{N_{fiRd} + k_L T M_{fiEd} y / M_{byRd} + k_z M_{fiEd} z / M_{zRd}} = 0.33058
\]
As $R \leq 1$, section capacity is OK for a FR period of 17 minutes.

SUMMARY Axial compressive load 1300 kN
Compressive resistance 1757.4 kN
Moment about major axis 24 kNm
Buckling resistance 158.91 kNm
Moment about minor axis 12 kNm
Overall buckling check \( 0.96629 \leq 1 \)
Location: Ground to first floor column

SHS column in 'simple' construction

Calculations are in accordance with BS5950 and 'SHS Design Examples to BS5950' published by British Steel General Steels.

The column is part of simple construction and in accordance with 4.7.7 it is not necessary to consider the effect of pattern loading. All beams supported by the column are assumed to be fully loaded.

It is assumed that all elements of the column remain in compression.

Number of storeys

Design axial load 470 kN
Buckling resistance 824.38 kN
Design BM y-y axis 11.375 kNm
Moment resistance (y-y) 55.38 kNm
Design BM z-z axis 1.3125 kNm
Moment resistance (z-z) 55.38 kNm
Unity factor 0.81108 ≤ 1

Fire resistance without applied protection

Unfactored permanent axial force Np=150 kN
Unfactored variable axial force Nv=150 kN
Design axial compressive force NfiEd=1.0*Np+1.0*Nv=300 kN

Determine critical temperature of steel in fire situation

Buckling length in fire situation Lfi=2450 mm
Critical temperature θcr tCR=TABLE 254 for mo=0.29445, lamfi =0.63945
=598.71 °C

Fire resistance period 18 minutes
Interaction of axial loads and moments in fire situation

The interaction of axial compression and bending is given by the following expression (EN 1993-1-2 Clause 4.2.3.5):

Unity expression \[ R = \frac{N_{f}E_{d}}{N_{f}R_{d}} + kLT \frac{M_{f}E_{dy}}{M_{b}R_{d}} + kz \frac{M_{f}E_{dz}}{M_{z}R_{d}} \]

= 0.51012

As \( R \leq 1 \), section capacity is OK for a FR period of 18 minutes.

FIRE RESISTANCE

SUMMARY

The section does not have an inherent fire resistance of 30 minutes. Fire protection should be provided.

**Location:** Ex1 - Staircase with flat plate stringers

---

**Staircase stringer**

- **Flat plate stringer**
  - Calculations are in accordance with EC3 Part 1-1:2005
  - $crs =$ stringer centres
  - $Y-Y =$ major axis
  - $Z-Z =$ minor axis
  - $L =$ Stringer span

### Stringer span
- $L = 4.5 \text{ m}$

### Distance between stringers
- $crs = 2 \text{ m}$

### Depth of stringer
- $h = 220 \text{ mm}$

### Thickness of plate stringer
- $t = 15 \text{ mm}$

### Permanent action partial factor
- $\gamma_G = 1.35$

### Variable action partial factor
- $\gamma_Q = 1.5$

### Staircase loading

- **Characteristic permanent load** $w_{kp} = 1.7 \text{ kN/m}^2$
- **Characteristic variable load** $w_{kv} = 4 \text{ kN/m}^2$
- **Char permanent load on stringer** $W_{kp} = W_{ks} + w_{kp} * crs * L / 2 = 8.8157 \text{ kN}$
- **Char variable load on stringer** $W_{kv} = w_{kv} * crs * L / 2 = 18 \text{ kN}$

**Design load on stringer:**

$$Wy = \gamma_G * W_{ks} + (\gamma_G * w_{kp} + \gamma_Q * w_{kv}) * crs * L / 2 = 38.901 \text{ kN}$$

### Design moment and shear

- **Design moment (at centre)** $My_{Ed} = Wy * L / 8 = 21.882 \text{ kNm}$
- **Design shear (at ends)** $Vy_{Ed} = Wy / 2 = 19.451 \text{ kN}$

### Design shear resistance

- **Shear resistance** $V_{plRdy} = Av * (fy / 3^{0.5}) / (\gamma_M0 * 1000)$
  - $= 471.55 \text{ kN}$

Since $Vy_{Ed} \leq V_{plRdy}$ (19.451 kN $\leq$ 471.55 kN) design shear force in web is within the shear resistance.
Design moment resistance

(BS EN 1993-1-1, Clause 6.2.5(2))
Design moment resistance \( McRd = \frac{Wel \cdot f_y}{(\gamma M_0 \cdot 10^3)} = 33.275 \text{ kNm} \)
Since \( MyEd \leq McRd \) (21.882 kNm \( \leq 33.275 \text{ kNm} \)) section is satisfactory.

Lateral torsional buckling check

(BS EN 1993-1-1, Clause 6.3.2.2(1))
The buckling resistance of the stringer over a buckling length equal to the tread spacing will be evaluated here, assuming Class 3 stringer. Refer to SCI AD 391 for further clarification as BS EN 1993-1-1 does not explicitly cover LTB of rectangular plates.
Tread spacing \( L_{tr} = 300 \text{ mm} \)
Design buckling resistance moment \( MbRd = \frac{\chi L_{tr} \cdot Wel \cdot f_y}{(\gamma M_1 \cdot 10^3)} \)
\( = 27.249 \text{ kNm} \)
Since \( MyEd \leq MbRd \) (21.882 kNm \( \leq 27.249 \text{ kNm} \)) section is satisfactory.

Check for deflection under serviceability loads

Variable load deflection \( \Delta E = 5 \cdot W_{kv} \cdot L^3 \cdot 10^8 / (384 \cdot E \cdot I_y) = 7.641 \text{ mm} \)
Total stringer deflection \( d_{Total} = \Delta E \cdot W_{kp} / W_{kv} + \Delta E = 11.383 \text{ mm} \)
Limiting deflection (var. load) \( \Delta E_{lim} = L \cdot 1000 / 250 = 12.5 \text{ mm} \)
Limiting deflection (total load) \( \Delta E_{lim} = L \cdot 1000 / 360 = 18 \text{ mm} \)
Since \( \Delta E \leq \Delta E_{lim} \) (7.641 mm \( \leq 12.5 \text{ mm} \)) deflection within limiting value for imposed loading only.

FLAT PLATE STRINGER          220 x 15 Flat plate, Grade S 275

![Axially loaded struts](image.png)

**Calculations are in accordance with EC3 Part 1-1:2005.**

Compression load is factored and length between restraints is the same for both yy and zz axes.

- **Design axial compressive load**: $N_{Ed} = 850 \text{ kN}$
- **Overall length**: $L = 6.5 \text{ m}$

**Dimensions (mm):**
- $h = 304.4$, $b = 123.4$, $tw = 7.1$, $tf = 10.7$, $r = 8.9$

**Properties (cm):**
- $I_y = 7170$, $I_z = 336$, $W_{pl y} = 539$, $W_{pl z} = 85.4$, $I_t = 14.8$

**Overall width combined elements**: $s = 300 \text{ mm}$

**Effective length factor (yy axis)**: $e_{ff y} = 1.5$

**Effective length factor (zz axis)**: $e_{ff z} = 1.5$

**Inclined angle of lacing**: $\theta = 45^\circ$

**Width of lacings**: $b_l = 50 \text{ mm}$

**Thickness of lacing**: $t_l = 6 \text{ mm}$

**Length of batten**: $l_{en g} = 200 \text{ mm}$

**Width of batten**: $b_b = 250 \text{ mm}$

**Thickness of batten**: $t_b = 8 \text{ mm}$

**UNIVERSAL BEAM**

**2/305 x 127 x 37 UB's Grade S 275**

**DESIGN SUMMARY**

- **Applied compressive load**: $850 \text{ kN}$
- **Design compressive load**: $877.73 \text{ kN}$
- **Compression resistance**: $1040.7 \text{ kN}$

**LACINGS**

- $50 \text{ mm x 6 mm plate}$ at 45 degrees to horizontal

**TIE BATTENS AT ENDS**

- $250 \text{ mm x 200 mm x 8 mm plate}$
Location: Ex4 - Parallel flange channels (PFC), lacings on two sides

UNIVERSAL BEAM

533 x 210 x 122 UKB Grade S 355

DESIGN SUMMARY

Section is satisfactory for axial, bending, shear, and local capacity, and overall buckling checks.

Design shear force \( 155 \text{ kN} \)
Design shear resistance \( 1451 \text{ kN} \)
Design moment \( 321 \text{ kNm} \)
Moment resistance \( 1092.3 \text{ kNm} \)
LTB resistance \( 662.41 \text{ kNm} \)
Interaction factors \( 0.29386 \leq 1 \)
\( 0.48976 \leq 1 \)
Location: Ex2 - SCI Example 1 (compression convex side)

I section beam curved in elevation

Beam is curved in elevation & design calculations are in accordance with BS EN 1993-1-1:2005.

In the calculations the length of member (L) refers to the segment length of beam to be designed.

All loads and moments are factored.

Design moment about major axis \( MyEd = 546 \text{ kNm} \)
Design shear force \( VzEd = 155 \text{ kN} \)
Design axial load (+ve comp) \( NEd = 0 \text{ kN} \)
Length of member \( L = 5 \text{ m} \)

533 x 210 x 122 UKB
Dimensions (mm): \( h=544.5 \text{ b=211.9} \text{ tw=12.7} \text{ tf=21.3} \text{ r=12.7} \)
Properties (cm): \( Iy=76000 \text{ Iz=3390} \text{ Wply=3200} \text{ Wplz=500} \text{ It=178} \)
Radius of curvature of beam \( R=17.05 \text{ m} \)
Length of segment \( Ls=5 \text{ m} \)
Correction factor \( kc=1 \)

**UNIVERSAL BEAM**

533 x 210 x 122 UKB Grade S 355

**DESIGN SUMMARY**

Section is satisfactory for axial, bending, shear, and local capacity, and overall buckling checks.

Design shear force 155 kN
Design shear resistance 1451 kN
Design moment 546 kNm
Moment resistance 1084 kNm
LTB resistance 572.91 kNm
Interaction factors \( 0.50371 \leq 1 \text{ 0.97065 \leq 1} \)
Location: Ex3 - Based on SCI example 2 load case 1 values

I section beam curved in elevation

Beam is curved in elevation & design calculations are in accordance with BS EN 1993-1-1:2005.

In the calculations the length of member (L) refers to the segment length of beam to be designed.

All loads and moments are factored.

Design moment about major axis \( M_{yEd} = 172 \text{ kNm} \)
Design shear force \( V_{zEd} = 56 \text{ kN} \)
Design axial load (+ve comp) \( N_{Ed} = 276 \text{ kN} \)
Length of member \( L = 3.348 \text{ m} \)

457 x 191 x 98 UKB
Dimensions (mm): \( h = 467.2 \text{ b = 192.8 \ tw = 11.4 \ tf = 19.6 \ r = 10.2} \)
Properties (cm): \( I_y = 45700 \text{ Iz = 2350 \ W_{ply} = 2230 \ W_{plz} = 379 \ It = 121} \)
Radius of curvature of beam \( R = 18.6 \text{ m} \)
Length of segment \( L_s = 3.348 \text{ m} \)
Effective length for LTB \( L_T = 3.348 \text{ m} \)
Effective length parameter \( K = 1 \)
Correction factor \( k_c = 1 \)
Arch rise \( h' = 11.282 \text{ m} \)
Arch span \( l = 34.2 \text{ m} \)
Maximum end moment \( M_{h(1)} = 172 \text{ kNm} \)
Maximum span moment \( M_{s(1)} = 172 \text{ kNm} \)
End moment \( pM_{h(1)} = 172 \text{ kNm} \)
Maximum end moment \( M_{h(2)} = 172 \text{ kNm} \)
Maximum span moment \( M_{s(2)} = 172 \text{ kNm} \)
End moment \( pM_{h(2)} = 172 \text{ kNm} \)

UNIVERSAL BEAM
DESIGN SUMMARY

457 x 191 x 98 UKB Grade S 275
Section is satisfactory for axial, bending, shear, and local capacity, and overall buckling checks.

Design shear force \( 56 \text{ kN} \)
Design shear resistance \( 851.51 \text{ kN} \)
Design moment \( 172 \text{ kNm} \)
Moment resistance \( 584.3 \text{ kNm} \)
LTB resistance \( 590.95 \text{ kN姆} \)
Design axial load \( 276 \text{ kN} \)
Buckling resistance \( 1254.4 \text{ kN} \)
Interaction factors \( 0.37864 \leq 1 \)
\( 0.56622 \leq 1 \)
\( 0.41432 \leq 1 \)
Location: Ex1 - Sway check compliant

Portal frame (plastic design)

Procedure to determine the initial section sizes of pitched roof, haunched steel portal frames with partial base restraint.

Span of frame  \( L = 30 \text{ m} \)
Frame centres  \( L_2 = 6 \text{ m} \)
Height to eaves  \( h = 7 \text{ m} \)
Height, eaves to ridge  \( h_1 = 4 \text{ m} \)
Sheeting and insulation  \( w_{si} = 0.2 \text{ kN/m}^2 \)
Purlins  \( w_{p} = 0.07 \text{ kN/m}^2 \)
Frame  \( w_f = 0.16 \text{ kN/m}^2 \)
Imposed load  \( w_{i}' = 0.75 \text{ kN/m}^2 \)
Rafter to column moment ratio \( \beta = 0.95 \)
the bottom of the haunch \( a = 0.75 \text{ m} \)
533 x 210 x 82 UB.
457 x 191 x 82 UB.
Actual length considered \( L_h = 1.3 \text{ m} \)

**Longitudinal stability to SCI P313 Section 2.8**

Height of masonry wall \( Hwall = 1 \text{ m} \)

Number of frames \( nf = 10 \)

Vertical reaction \( Vr = 18 \text{ kN} \)

Height of masonry wall \( Hwall = 1 \text{ m} \)

Height of unprotected area \( Hua = H - Hwall = 4.7 \text{ m} \)

Load in fire on horizontal member \( HR = 0.025 \cdot nf \cdot Vr \cdot Hua / He = 3.7105 \text{ kN} \)

For an unprotected member the tensile stress may be taken to be 0.065 of the design strength for normal temperature design.

Cross-sectional area required \( Acl = HR \cdot 10^3 / (fyc \cdot 0.065) = 207.58 \text{ mm}^2 \)

The horizontal steel members providing longitudinal stability do not require fire protection.
Location: Ex2 - Single span steel frame with lattice rafter

Design of column bases subject to boundary conditions using the recommended procedures set out in The Steel Construction Institute publication "Single Storey Steel Framed Buildings in Fire Boundary Conditions". Calculations are in accordance with EC3 Part 1-1.

Design of column bases subject to boundary conditions using the recommended procedures set out in The Steel Construction Institute publication "Single Storey Steel Framed Buildings in Fire Boundary Conditions". Calculations are in accordance with EC3 Part 1-1.

Span of portal frame \( L = 38 \text{ m} \)
Eaves height \( H_e = 8.25 \text{ m} \)
Frame centres \( c_2 = 6 \text{ m} \)
Rafter pitch \( \theta = 6^\circ \)
Length of haunch \( L_h = 3.8 \text{ m} \)

**Column section properties**

686 x 254 x 140 UKB
Dimensions (mm): \( h_c = 683.5 \text{ mm}, b_c = 253.7 \text{ mm}, t_w_c = 12.4 \text{ mm}, t_f_c = 19 \text{ mm}, r_c = 15.2 \text{ mm} \)
Properties (cm): \( I_{y_c} = 136000 \text{ cm}^4, I_{z_c} = 5180 \text{ cm}^4, W_{p_{y_c}} = 4560 \text{ cm}^3, W_{p_{z_c}} = 638 \text{ cm}^3, I_{t_c} = 169 \text{ cm}^4, A_c = 178 \text{ cm}^2, i_{y_c} = 27.641 \text{ cm}, i_{z_c} = 5.3945 \text{ cm} \)

**Rafter section properties**

533 x 210 x 101 UKB
Dimensions (mm): \( h_r = 536.7 \text{ mm}, b_r = 210 \text{ mm}, t_w_r = 10.8 \text{ mm}, t_f_r = 17.4 \text{ mm}, r_r = 12.7 \text{ mm} \)
Properties (cm): \( I_{y_r} = 61500 \text{ cm}^4, I_{z_r} = 2690 \text{ cm}^4, W_{p_{y_r}} = 2610 \text{ cm}^3, W_{p_{z_r}} = 399 \text{ cm}^3, I_{t_r} = 101 \text{ cm}^4, A_r = 129 \text{ cm}^2, i_{y_r} = 21.834 \text{ cm}, i_{z_r} = 4.5665 \text{ cm} \)

Cladding loading \( d_c = 0.2 \text{ kN/m}^2 \)
Purlin loading \( d_p = 0.08 \text{ kN/m}^2 \)
Rafter loading \( d_r = 0.166 \text{ kN/m}^2 \)
Reduced cladding load \( r_d_c = 0.02 \text{ kN/m}^2 \)
Wall panel weight \( w_p = 10 \text{ kN} \)

**SUMMARY**

- Overturning moment \( 350.03 \text{ kNm} \)
- Horizontal reaction \( 23.281 \text{ kN} \)
- Vertical reaction \( 40.324 \text{ kN} \)

Length of baseplate \( h_p = 875 \text{ mm} \)
Breadth of baseplate \( b_p = 450 \text{ mm} \)
Number of bolts \( N_b = 6 \)
Assumed diameter of bolt \( b_d = 30 \text{ mm} \)
Spacing in line with frame axis \( s_p ac = 650 \text{ mm} \)
Edge distance to tension bolts \( k = 50 \text{ mm} \)
Spacing in longitudinal direct. \( s_b = 350 \text{ mm} \)
Sample output for SCALE Proforma 462. (ans=4)                       Page: 2

Reduced cladding load \( r_{d_c}=0.012 \text{ kN/m}^2 \)
Wall panel weight \( w_p=8 \text{ kN} \)

SUMMARY

Overturning moment 4.7025 kNm
Horizontal reaction 1.0056 kN
Vertical reaction 11 kN

Length of baseplate \( h_p=340 \text{ mm} \)
Breadth of baseplate \( b_p=240 \text{ mm} \)
Number of bolts \( N_b=4 \)
Assumed diameter of bolt \( b_d=20 \text{ mm} \)
Spacing in line with frame axis \( \text{spac}=200 \text{ mm} \)
Edge distance to tension bolts \( k=50 \text{ mm} \)
Spacing in longitudinal direct. \( s_b=120 \text{ mm} \)
Selected baseplate thickness \( t_p = 15 \text{ mm} \)

Tensile resistance per anchor \( F_{tRd} = 0.9\cdot f_{ub}\cdot A_s / (\gamma_M 2\cdot 10^3) = 70.56 \text{ kN} \)

Selected fillet weld size \( s_w = 8 \text{ mm} \)

Selected fillet weld size \( s_{fw} = 8 \text{ mm} \)

**SUMMARY OF BASEPLATE**
- Size \( 340 \text{ mm} \times 240 \text{ mm} \times 15 \text{ mm} \)
- Grade S 275 steel

**REQUIREMENTS**
- Number of H.D. bolts 4
- Diameter of bolts M 20
- Grade 4.6

**WELD SUMMARY**

**TENSION**
- Fillet weld 8 mm
- Contact areas on the baseplate and column are machined to give a tight bearing contact.
- The specified tension weld will be used for both flanges.

**WEB**
- Fillet weld 8 mm

**Longitudinal stability to SCI P313 Section 2.8**

Height of masonry wall \( H_{wall} = 4.5 \text{ m} \)

As the masonry wall is at least 75% of the height to the eaves provided it is connected to the column the code requirements for longitudinal stability will be satisfied.
Location: Example 9, 'Beams subject to bending and torsion'.

Simply supported steel channel unrestrained along its length

Calculations are in accordance with BS5950 and 'Beams Subject to Bending and Torsion' published by The Steel Construction Institute. The beam is considered as "torsion fixed, warping free".

Beam span \( L = 4 \text{ m} \)

Uniformly distributed load

\[
\begin{align*}
\text{w/metre} & \\
\text{vvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvvv} & \\
\text{A} & \text{B} \\
\text{////} & \text{ooo} \\
\text{------------------------------} & \text{L} \end{align*}
\]

305 x 102 Tapered Channel.  
Young's Modulus \( E = 205 \text{ kN/mm}^2 \)

Loading

Dead load \( wd = 2 \text{ kN/m} \)
Imposed load \( wi = 0 \text{ kN/m} \)

Distance between shear centre and centre of web \( eo = 35.869 \text{ mm} \)

Eccentricity \( ecc = decc - t/2 + eo = -19.231 \text{ mm} \)

Eccentricity value must be positive,
Eccentricity \( ecc = -ecc = 19.231 \text{ mm} \)
Shear force

Axial loading (inc. self weight) \( sw = 0.7 \text{ kN/m} \) (factored)
Shear force \( F_v = (sw+w) \frac{L}{2} = 7 \text{ kN} \)

Check section for combined bending and torsion

Torsional stress in flange \( fw = E \times 10^3 \times W_{no} \times 10^2 \times \phi'' = 2.9022 \text{ N/mm}^2 \)

(i) Buckling Check

Equation 2.21

\[
\frac{M}{Mb/mLT} + \frac{fbyt + fw}{py} \left[ 1 + \frac{0.5 M}{Mb/mLT} \right] \leq 1.0
\]

Equation 2.21 \( uf = mLT \frac{M}{Mb} + \frac{(fbyt + fw)}{py} \times (1 + 0.5 \frac{mLT \times M}{Mb}) = 0.082079 \)
Since \( uf \leq 1 \), Section is adequate for buckling.

(ii) Local "Capacity" Check

Equation 2.22

\( fbx + fbyt + fw \leq py \)

where:
bending normal stress \( fbx = \frac{M \times (D/2)}{Ix} \times 100 = 12.997 \text{ N/mm}^2 \)
combined stress \( fcb = fbx + fbyt + fw = 16.196 \text{ N/mm}^2 \)
Since \( fcb \leq py \) (16.196 N/mm² ≤ 275 N/mm²), section is suitable.

SECTION 305 x 102 Grade S 275
PROPERTIES Tapered Flange Channel
Applied shear force 7 kN
Shear capacity 512.98 kN
DESIGN Applied moment 7 kNm
SUMMARY Buckling resistance 92.449 kNm
Buckling check 0.082079 ≤ 1
Combined bending str. 16.196 N/mm²
Design strength 275 N/mm²
Midspan deflection 0 mm
Limiting deflection 11.111 mm
Location: Example using parallel flange channel

Simply supported steel channel unrestrained along its length

Calculations are in accordance with BS5950 and 'Beams Subject to Bending and Torsion' published by The Steel Construction Institute. The beam is considered as "torsion fixed, warping free".

Beam span \( L = 4 \text{ m} \)

Concentrated load along length

\[
\text{300 x 100 UKPFC}
\]

Young's Modulus \( E = 205 \text{ kN/mm}^2 \)

Loading

Dead load \( W_d = 0.5 \text{ kN} \)

Imposed load \( W_i = 20 \text{ kN} \)

Distance from support A to load \( xL = 2 \text{ m} \)

Eccentricity \( ecc = \text{decc} - \frac{t}{2} + eo = -16.898 \text{ mm} \)

Eccentricity value must be positive, \( ecc = -ecc = 16.898 \text{ mm} \)
Shear force

Axial loading (inc.self weight) \( sw = 0.7 \text{kN/m} \) (factored)
Max shear \( F_v = \frac{W}{2} + sw \cdot L/2 = 17.75 \text{kN} \)

Check section for combined bending and torsion

Torsional stress in flange \( fw = E \cdot 10^3 \cdot W_{no} \cdot 10^2 \cdot \phi'' = 20.923 \text{N/mm}^2 \)

(i) Buckling Check

Equation 2.21

\[
\frac{M}{Mb/mLT} + \left( \frac{fbyt + fw}{py} \right) \left[ \frac{0.5 M}{Mb/mLT} + 1 \right] \leq 1.0
\]

Equation 2.21 \( uf = \frac{mLT \cdot M}{Mb} + \left( \frac{fbyt + fw}{py} \right) \cdot (1 + 0.5 \cdot \frac{mLT \cdot M}{Mb}) = 0.30666 \)
Since \( uf \leq 1 \), Section is adequate for buckling.

(ii) Local "Capacity" Check

Equation 2.22

\[ fbx + fbyt + fw \leq py \]
where:
bending normal stress \( fbx = \frac{M \cdot (D/2)}{I_x} \cdot 100 = 62.151 \text{N/mm}^2 \)
combined stress \( fcb = fbx + fbyt + fw = 88.04 \text{N/mm}^2 \)
Since \( fcb \leq py \) (88.04 N/mm² \leq 345 N/mm²), section is suitable.

SECTION 300 x 100 Grade S 355
PROPERTIES Parallel Flange Channel
Applied shear force 17.75 kN
Shear capacity 558.9 kN

DESIGN
Applied moment 34.1 kN

SUMMARY
Buckling resistance 130.31 kNm
Buckling check 0.30666 ≤ 1
Combined bending str. 88.04 N/mm²
Design strength 345 N/mm²
Midspan deflection 1.5806 mm
Limiting deflection 11.111 mm
Simply supported steel channel unrestrained along its length

Calculations are in accordance with BS EN 1993-1-1: 2005 and 'Design of Steel Beams in Torsion' published by SCI. The beam is considered as "torsion fixed, warping free".

Beam span \( L = 5 \text{ m} \)

Uniformly distributed load

\[
	ext{w/metre} \\
\begin{array}{c}
A \\
\hline
/// \\
\hline
B
\end{array}
\]

300 x 100 UKPFC

Loading

Permanent load \( wd = 8.36 \text{ kN/m} \)
Variable (non-permanent) load \( wi = 0 \text{ kN/m} \)

Distance between shear centre and section centroid \( eo = 37.602 \text{ mm} \)

Eccentricity \( ecc = decc - tw/2 + eo = -21.898 \text{ mm} \)

Shear force

Axial loading (inc. self weight) \( sw = 0.63 \text{ kN/m (factored)} \)
Shear force \( Fv = (sw+w) \cdot L/2 = 29.79 \text{ kN} \)
Design value of torsion effects

Allowing for elastic interaction between St Venant torsion and warping torsion.

Torsional bending constant
\[ a = \left( \frac{E}{10^3 I_w} / (G I_t) \right)^{0.5} \times 10 \]
\[ = 756.81 \text{ mm} \]

Minor axis moment
\[ M_{zEd} = M \phi = 0.80095 \text{ kNm} \]

Warping moment at mid-span
\[ M_{wEd} = E I_w \phi'' \times 10^{-6} / (h-t_f) \]
\[ = 0.46264 \text{ kNm} \]

Bending resistance

Design bending moment
\[ M_{yEd} = 37.238 \text{ kNm} \]

Bending resistance moment (y-y)
\[ M_{yRd} = W_{ply} \phi_y / 10^3 = 169.87 \text{ kNm} \]

Bending resistance moment (z-z)
\[ M_{zRd} = W_{plz} \phi_z / 10^3 = 39.22 \text{ kNm} \]

Shear plastic resistance - Clause 6.2.6

Shear plastic resistance
\[ V_{plRd} = A_{vz} \phi_y / SQR(3) / 1000 = 443.08 \text{ kN} \]

Reduced shear resistance in the presence of torsion

at support \( z = 0 \) mm

Reduced shear plastic resistance
\[ V_{TRd} = (t_{r1} - t_{r2}) \times V_{plRd} = 428.53 \text{ kN} \]

As shear force less than shear plastic resistance, OK.

Lateral torsional buckling

Non-dimensional slenderness
\[ \lambda_{LT} = L \times 100 / (iz \times 96) = 1.6643 \]

Design Buckling resistance moment
\[ M_{bRd} = \chi_{LT} \times W_{ply} \phi_y / 10^3 = 49.476 \text{ kNm} \]

Unity factor
\[ \text{unitb} = M_{yEd} / M_{bRd} = 0.75264 \]

Section chosen is suitable for lateral torsional buckling.

Interaction of LTB with minor axis bending and torsion

Critical moment
\[ M_{cr} = W_{ply} \phi_y / (\lambda_{LT}^2 \times 1000) = 61.323 \text{ kNm} \]

Unity expression
\[ u_t = M_{yEd} / M_{bRd} + C_{mz} M_{zEd} / M_{zRd} + k_w k_z w \times k_a M_{wEd} / M_{wRd} \]
\[ = 0.84503 \]

Section chosen is suitable.

\text{Distance between shear centre and centre of web} \\
\text{eo} = 35.869 \text{ mm}
\end{array}
\]

305 x 102 Tapered Channel.

**Loading**

Variable load $W_d=30 \text{ kN}$

Variable (non-permanent) load $W_i=0 \text{ kN}$

Distance from support A to load $xL=2 \text{ m}$

\[
\begin{array}{c}
\text{load} \\
\text{Decc} \\
\text{eo} \\
\text{Distance from the back of channel} \\
\text{Decc}=-70 \text{ mm} \\
\text{Eccentricity} \\
ecc=\text{decc}-\text{tw}/2+\text{eo}=-39.231 \text{ mm}
\end{array}
\]

Eccentricity value must be positive,

Eccentricity $ecc=-ecc=39.231 \text{ mm}$
**Shear force**

Axial loading (inc. self weight) \( sw = 0.63 \text{ kN/m (factored)} \)

Max shear \( F_v = W/2 + sw \times L/2 = 21.51 \text{ kN} \)

**Design value of torsion effects**

Allowing for elastic interaction between St Venant torsion and warping torsion.

- Torsional bending constant \( a = \left( \frac{E}{10^3} \frac{I_w}{(G \times I_t)} \right)^{0.5} \times 10 \)
  - \( = 779.79 \text{ mm} \)
- Torsional moment \( T_d = W \times \text{ecc}/10^3 = 1.5889 \text{ kNm} \)
- Distance along member \( z = \alpha \times L \times 1000 = 2000 \text{ mm} \)
- Minor axis moment \( M_{zEd} = M \times \phi = 1.4026 \text{ kNm} \)
- Warping moment at mid-span \( M_{wEd} = E \times I_w \times \phi^{''} \times 10^{-6} / (h-t_f) = 2.111 \text{ kNm} \)

**Bending resistance**

- Design bending moment \( M_{yEd} = 41.76 \text{ kNm} \)
- Bending resistance moment (y-y) \( M_{yRd} = W_{ply} \times f_y / 10^3 = 175.45 \text{ kNm} \)
- Bending resistance moment (z-z) \( M_{zRd} = W_{plz} \times f_y / 10^3 = 35.2 \text{ kNm} \)

**Shear plastic resistance - Clause 6.2.6**

- Shear plastic resistance \( V_{plRd} = A_{vz} \times f_y / SQR(3) / 1000 = 517.37 \text{ kN} \)

**Reduced shear resistance in the presence of torsion**

at support \( z = 0 \text{ mm} \)

Reduced shear plastic resistance \( V_{TRd} = (tr_1 - tr_2) \times V_{plRd} = 479.05 \text{ kN} \)

As shear force less than shear plastic resistance, OK.

**Lateral torsional buckling**

- Non-dimensional slenderness \( \lambda_{LT} = L \times 100 / (iz \times 96) = 1.4315 \)
- Design Buckling resistance moment \( M_{bRd} = \chi_{LT} \times W_{ply} \times f_y / 10^3 = 63.453 \text{ kNm} \)
- Unity factor \( \text{unitb} = M_{yEd} / M_{bRd} = 0.65812 \)

Section chosen is suitable for lateral torsional buckling.

**Interaction of LTB with minor axis bending and torsion**

- Critical moment \( M_{cr} = W_{ply} \times f_y / (\lambda_{LT}^2 \times 1000) = 85.617 \text{ kNm} \)
- Unity expression \( \text{ut} = M_{yEd} / M_{bRd} + C_{mz} \times M_{zEd} / M_{zRd} + k_w \times k_{zw} \times k_a \times M_{wEd} / M_{wRd} = 0.94256 \)

Section chosen is suitable.

Beam with rectangular web opening

Calculations in accordance with BS5950-1:2000 and SCI CIRIA publication entitled 'Design for openings in the web of composite beams'.

Section properties

457 x 152 x 60 UB.  
Young's Modulus E=205 kN/mm²

Opening details

Depth of opening Do=300 mm  
Length of opening l=500 mm  
Distance from top of comp. flange df=77.3 mm

Factored loading at web opening

Factored shear force V=37.4 kN  
Factored bending moment M=86.3 kNm  
Moment capacity Mc=py*Sx/10^3=457.95 kNm

Moment capacities

Vierendeel moment capacity Mv=0.9*(Mv1+Mv2)=31.998 kNm  
Ultimate vierendeel moment Mu=V*l/10^3=18.7 kNm

Stiffener details

Stiffener outstand bs=70 mm  
Stiffener thickness ts=10 mm  
Distance from opening edge to stiffener centre line d2=13 mm

Single stiffener to one side of beam web will be provided.
### Stiffener welding details

#### UNIVERSAL BEAM
- **457 x 152 x 60 UB Grade S 355**
- Shear force: 37.4 kN

#### DESIGN
- Factored moment: 86.3 kNm

#### SUMMARY
- Vierendeel moment: 18.7 kNm
- Vierendeel mt. cap.: 71.338 kNm

#### SINGLE STIFFENER
- O/A length (2): 800 mm
- Width: 70 mm
- Thickness: 10 mm
- Distance from open.: 13 mm

#### STIFFENER WELDING
- Fillet weld size: 6 mm

#### DETAILS
- Electrode Grade: 35
Location: Ex1 - Stiffeners one side of web

Rectangular web opening

ho

Rectangular web opening

ho  Factored shear force VEd=37.4 kN
ho  Factored bending moment MyEd=86.3 kNm
ho  Moment resistance McRd=Wply*fy/(gamM0*10^3)=457.95 kNm
ho

Moment resistances

Vierendeel moment resistance MvRd=0.9*(Mv1+Mv2)=31.998 kNm
ho  Ultimate vierendeel moment MvEd=VED*lo/10^3=18.7 kNm

Stiffener details

ho  Stiffener thickness ts=10 mm
ho  Stiffener outstand bs=70 mm
ho  Distance from opening edge to stiffener centre line d2=13 mm
ho

Provide a single stiffener to one side of beam web as shown.
**Stiffener welding details**

- **Weld design strength**: \( fvwd = \frac{fu}{\sqrt{3} \times \beta_w \times \gamma_{M2}} \)
  \[ = 241.2 \text{ N/mm}^2 \]
- **Fillet weld leg length**: \( sw = 6 \text{ mm} \)
- **Resistance of weld per mm run**: \( FwR_d = 0.7 \times sw \times fvwd / 10^3 = 1.0131 \text{ kN/mm} \)
- **For fillet welds on both sides, take the projection of stiffener** beyond the opening to be \( lw = \frac{FaR_d}{2 \times FwR_d} = 122.65 \text{ mm} \)
- **Minimum length beyond opening**: \( lw = 20 \times ts = 200 \text{ mm} \)
- **Overall length of stiffener**: \( L = 900 \text{ mm} \)

**Shear buckling resistance - Clause 6.2.6(6)**

- **Clear web depth between flanges**: \( hw = h - 2 \times tf = 428 \text{ mm} \)
- **Buckling ratio**: \( hw'/tw = 52.84 \)
- Since \( hw/tw < 72e \ (58.58) \), no check for shear buckling is required.

**UNIVERSAL BEAM**

- **457 x 152 x 60 UKB Grade S 355**
  - **Shear force**: 37.4 kN
  - **Factored moment**: 86.3 kNm
  - **Vierendeel moment**: 18.7 kNm
  - **Vierendeel mt.resist.**: 71.338 kNm

**SUMMARY**

- **SINGLE STIFFENER**
  - **O/A length (2No)**: 900 mm
  - **Width**: 70 mm
  - **Thickness**: 10 mm
  - **Distance from open.**: 13 mm

**STIFFENER WELDING**

- **Fillet weld size**: 6 mm
Location: Ex2 - Stiffeners both sides of web

Rectangular web opening

- \( \text{ht} \): Calculations in accordance with BS EN 1993-1-1:2005, NCCI: Design rules for web openings in beams' reference "Access Steel" SN019b-EN-EU and SCI P355 entitled 'Design of Composite Beams With Large Web Openings'.
- \( \text{ho} \): Depth of opening \( \text{ho}=300 \text{ mm} \)
- \( \text{lo} \): Length of web opening \( \text{lo}=500 \text{ mm} \)
- \( \text{ht} \): Distance from top of comp.flange \( \text{ht}=78.5 \text{ mm} \)

Section properties

- \( 457 \times 191 \times 74 \text{ UKB} \)
- Young's Modulus \( E=210 \text{ kN/mm}^2 \)

Opening details

- Depth of opening \( \text{ho}=300 \text{ mm} \)
- Length of web opening \( \text{lo}=500 \text{ mm} \)
- Distance from top of comp.flange \( \text{ht}=78.5 \text{ mm} \)

Factored loading at web opening

- Factored shear force \( \text{VEd}=121 \text{ kN} \)
- Factored bending moment \( \text{MyEd}=310 \text{ kNm} \)
- Moment resistance \( \text{McRd}=\text{Wply*fy}/(\gamma\text{M0}*10^3)=585.75 \text{ kNm} \)

Moment resistances

- Vierendeel moment resistance \( \text{MvRd}=0.9*(\text{Mv1+Mv2})=25.819 \text{ kNm} \)
- Ultimate vierendeel moment \( \text{MvEd}=\text{VEd}*\text{lo}/10^3=60.5 \text{ kNm} \)

Stiffener details

- Stiffener thickness \( \text{ts}=10 \text{ mm} \)
- Stiffener outstand \( \text{bs}=80 \text{ mm} \)
- Distance from opening edge to stiffener centre line \( \text{d2}=13 \text{ mm} \)

Double stiffener will be provided as shown.
**Stiffener welding details**

Weld design strength  
\[ \text{fvwd} = \frac{\text{fu}}{\sqrt{3}} \left( \frac{1}{\text{betaw} \times \text{gamM2}} \right) \]  
\[ = 241.2 \text{ N/mm}^2 \]

Fillet weld leg length  
\[ \text{sw} = 6 \text{ mm} \]

Resistance of weld per mm run  
\[ \text{FwRd} = 0.7 \times \text{sw} \times \text{fvwd} / 10^3 = 1.0131 \text{ kN/mm} \]

For fillet welds on both sides, take the projection of stiffener beyond the opening to be  
\[ \text{lw} = \frac{\text{FaRd}}{4 \times \text{FwRd}} = 140.17 \text{ mm} \]

Minimum length beyond opening  
\[ \text{lw} = 20 \times \text{ts} = 200 \text{ mm} \]

Overall length of stiffener  
\[ \text{L} = 900 \text{ mm} \]

**Shear buckling resistance - Clause 6.2.6(6)**

Clear web depth between flanges  
\[ \text{hw} = \text{h} - 2 \times \text{tf} = 428 \text{ mm} \]

Buckling ratio  
\[ \text{hw'} = \frac{\text{hw}}{\text{tw}} = 47.556 \]

Since \( \text{hw/tw} < 72e \ (58.58) \), no check for shear buckling is required.

**UNIVERSAL BEAM**  
457 x 191 x 74 UKB Grade S 355

Thickness of flange                  tf=15 mm
Thickness of web                     tw=15 mm
Young's Modulus                      E=210 kN/mm²

Opening details

Depth of opening                     ho=300 mm
Length of web opening                lo=500 mm
Distance from top of comp.flange     ht=80 mm

Factored loading at web opening

Factored shear force                 VEd=37.4 kN
Factored bending moment             MyEd=86.3 kNm
Moment resistance                   McRd=fyw*b*tf*(h-tf)/(gamM0*10^6) =367.29 kNm

Moment resistances

Vierendeel moment resistance        MvRd=0.9*(Mv1+Mv2)=30.339 kNm
Ultimate vierendeel moment          MvEd=VEd*lo/10^3=18.7 kNm

Stiffener details

Stiffener thickness                 ts=10 mm
Stiffener outstand                  bs=70 mm
Distance from opening edge          d2=13 mm

d2

Provide a single stiffener to one side of beam web as shown.
Stiffener welding details

Weld design strength  
fvwd = \( \frac{f_u}{\text{SQR}(3)/(\beta_{aw} \cdot \gamma_{M2})} \)  

= 241.2 \( \text{N/mm}^2 \)

Fillet weld leg length  
sw = 6 mm

Resistance of weld per mm run  
FwRd = 0.7 * sw * fvwd / 10^3 = 1.0131 \( \text{kN/mm} \)

For fillet welds on both sides, take the projection of stiffener beyond the opening to be  
\( lw = \frac{F_aRd}{(2 \cdot FwRd)} \) = 122.65 mm

Minimum length beyond opening  
\( lw = 20 \cdot ts = 200 \) mm

Overall length of stiffener  
L = 900 mm

Flange/web interface welds

Fillet weld leg length  
sww = 6 mm

Shear buckling resistance - Clause 6.2.6(6)

Clear web depth between flanges  
hw = h - 2 * tf = 430 mm

Buckling ratio  
\( hw' = \frac{hw}{tw} = 28.667 \)

Since hw/tw < 72e (58.58), no check for shear buckling is required.

| Shear force | 37.4 kN |
| Factored moment | 86.3 kNm |
| Vierendeel moment | 18.7 kNm |
| Vierendeel mt. resist. | 73.772 kNm |

Loading diagram

Uniformly distributed load

Unfactored permanent load \( G_{ku} = 7.14 \text{ kN/m} \)
Unfactored variable load \( Q_{ku} = 1.5 \text{ kN/m} \)

The compression flange of the cellular beam is fully restrained.
Buckling resistance is \( M_{bRd} = M_{cRd} = 660.01 \text{ kNm} \)

Shear buckling resistance - EN 1993-1-1, Clause 6.2.6(6)

The shear buckling resistance should be determined in accordance with BS EN 1993-1-5 Clause 5.2 and 5.3.
As the ratio \( h_w/t_w > 72e \) \( (69.554 > 58.58) \), allowance needs to be made for the influence of the web opening on the shear buckling resistance of the web. Assume transverse stiffeners at supports.
Modified slenderness \( \lambda_{mw} = h_w/(86.4*t_w*e) = 0.98943 \)
Shear resistance at support \( V_{plRd} = 1074.2 \text{ kN} \)
Reduced design shear resistance at support (web contribution only will be considered):
\[ V_{bwRd} = \chi_w f_y h_w / (3^{0.5} \gamma_{M1} 1000) = 864.01 \text{ kN} \]

Assumed angle for critical sect. \( \theta = 25^\circ \)

Simplified deflection calculation

Total deflection \( DEF = DEF_p + DEF_v = 12.381 \)

Diameter of openings \( h_0=400 \) mm
Spacing of web openings \( S=600 \) mm
Overall depth of beam \( h=h'+h_0/2-e'-10=616.61 \) mm

Partial factors for actions

Factor for permanent actions \( \gamma_G=1.35 \)
Factor for variable actions \( \gamma_Q=1.5 \)

Properties of steel cellular beam at CL of opening

Second moment of area of Tee \( I=2*(I_{tee}+A_{tee}z'^2)=540.88E6 \) mm\(^4\)
Plastic modulus \( W_{ply}=2*(A_{tee}z')=1.8592E6 \) mm\(^3\)
Moment resistance (Cl.6.2.5(2)) \( Mc_{Rd}=W_{ply}*f_y/(\gamma_{M0}*10^6)=660.01 \) kNm
Loading details

Loads are symmetrical about the beam CL.

Number of point loads: \( N_c = 10 \)

Unfactored permanent load: \( G_{kc} = 7 \) kN

Unfactored variable load: \( Q_{kc} = 1.5 \) kN

The compression flange of the cellular beam is fully restrained.

Buckling resistance is: \( M_{BRd} = M_{CRd} = 660.01 \) kNm

Shear buckling resistance - EN 1993-1-1, Clause 6.2.6(6)

The shear buckling resistance should be determined in accordance with BS EN 1993-1-5 Clause 5.2 and 5.3.

As the ratio \( h_w/t_w > 72 \) e.g. \( 69.554 > 58.58 \), allowance needs to be made for the influence of the web opening on the shear buckling resistance of the web. Assume transverse stiffeners at supports.

Modified slenderness: \( \lambda_{w} = h_w/(86.4*t_w*e) = 0.98943 \)

Shear resistance at support: \( V_{plRd} = 1074.2 \) kN

Reduced design shear resistance at support (web contribution only will be considered):

\[
V_{bwRd} = \chi_{w} * f_y * h_w * t_w / (3^{0.5} * \gamma_M1 * 1000) = 864.01 \text{ kN}
\]

Assumed angle for critical sect. \( \theta = 25^\circ \)

Simplified deflection calculation

Equivalent permanent UDL: \( G_{ku} = 7.14 \) kN/m

Equivalent variable UDL: \( Q_{ku} = 1.5 \) kN/m

Total deflection: \( \text{DEF} = \text{DEFp} + \text{DEFv} = 12.381 \)

Original Section

UNIVERSAL BEAM: 457 x 191 x 67 UKB Grade S 355
CELLULAR: 616.61 x 191 x 67

Opening size: 400 mm
Opening spacing: 600 mm
Support shear force: 58.5 kN
Reduced shear resistance: 864.01 kN
Shear @ opening centre line: 58.5 kN
Shear resistance: 339.62 kN

DESIGN:
Maximum moment: 159.55 kNm

SUMMARY:
Moment resistance: 660.01 kNm
Buckling resistance: 660.01 kNm

Assume non-rigid end posts to EN 1993-1-5, Figure 5.1 & Table 5.1
Location: Ex3 - UDL loading and unrestrained compression flange

Simply supported steel beam

Calculations are in accordance with EC3 Part 1-1, SCI P355 entitled 'Design of Composite Beams With Large Web Openings' and SCI-P-100 (1990).

Openings are placed centrally in the web depth.

Positions 0, 2 and 3 are considered when determining shear, moment etc.

In the diagram position 0 is the beam support, position 1 is the end web post, positions 2 to 9 represent the centre line of web openings and position 10 is the centre of the beam under consideration.

Beam span \( L = 9 \text{ m} \)

Initial beam

457 x 191 x 67 UKB

Dimensions (mm): \( h = 453.4 \) \( b = 189.9 \) \( tw = 8.5 \) \( tf = 12.7 \) \( r = 10.2 \)

Properties (cm): \( I_y = 29400 \) \( I_z = 1450 \) \( W_{ply} = 1470 \) \( W_{plz} = 237 \) \( I_t = 37.1 \)

Strength of steel

Design strength \( f_y = 355 \text{ N/mm}^2 \)

Young's Modulus \( E = 210 \text{ kN/mm}^2 \)

Cellular beam details

Diameter of openings \( h_o = 400 \text{ mm} \)

Spacing of web openings \( S = 600 \text{ mm} \)

Overall depth of beam \( h = h' + h_o/2 - e' - 10 = 616.61 \text{ mm} \)

Partial factors for actions

Factor for permanent actions \( \gamma_G = 1.25 \)

Factor for variable actions \( \gamma_Q = 1.5 \)

Properties of steel cellular beam at CL of opening

Second moment of area of Tee \( I = 2 \times (I_{tee} + A_{tee} \times z' \times 2) = 540.88 \times 10^6 \text{ mm}^4 \)

Plastic modulus \( W_{ply} = 2 \times (A_{tee} \times z') = 1.8592 \times 10^6 \text{ mm}^3 \)

Moment resistance (Cl.6.2.5(2)) \( M_{Rd} = W_{ply} \times f_y / (\gamma_M \times 10^6) = 660.01 \text{ kNm} \)
Loading details

w/metre

Unfactored permanent load \( G_{ku} = 5 \text{ kN/m} \)
Unfactored variable load \( Q_{ku} = 1.5 \text{ kN/m} \)
Eff. length between restraints \( L_T = 9 \text{ m} \)

Shear buckling resistance - EN 1993-1-1, Clause 6.2.6(6)

The shear buckling resistance should be determined in accordance with BS EN 1993-1-5 Clause 5.2 and 5.3.
As the ratio \( h_w/t_w > 72e \) (69.554 > 58.58), allowance needs to be made for the influence of the web opening on the shear buckling resistance of the web. Assume transverse stiffeners at supports.
Modified slenderness \( \lambda_w = h_w/(86.4*t_w*e) = 0.98943 \)
Shear resistance at support \( V_{plRd} = 1074.2 \text{ kN} \)
Reduced design shear resistance at support (web contribution only will be considered):
\[
V_{bwRd} = \chi_w*f_y*h_w*t_w/(\sqrt{3}\cdot\gamma_{M1}*1000) = 864.01 \text{ kN}
\]
Assumed angle for critical sect. \( \theta = 25^\circ \)

Simplified deflection calculation

Total deflection \( \text{DEF} = \text{DEFp} + \text{DEFv} = 6.111 \)

\end{array}
\]

Anchor panel: stiffener 1 2No/250 mm x 20 mm flats
stiffener 2 2No/200 mm x 16 mm flats
Spacing ai=3000 mm

Intermediate stiffeners:
Arrangement (1) 2No/100 mm x 13 mm flats

\[
\begin{array}{c}
\text{B=700 mm} \\
\text{T=40 mm} \\
\text{D=2030 mm} \\
\text{t=13 mm} \\
\text{T=40 mm} \\
\end{array}
\]

- Fillet welds to be used for connecting stiffeners to girder web & flanges
- Weld sizes as detailed in calculations
- Weld design strength to be 35 N/mm²
- Electrode Grade 35
Location: Ex3 - Same example with single stiffener end post

Stiffened plate girder

The girder is fully restrained along its length. The design method follows the procedure of section 4.4 & 4.5 of BS5950 Part 1: 2000.

Loads and moments are factored.

Span of girder span=25 m
Maximum factored bending moment Mmax=14028 kNm
Young's Modulus E=210000 kN/mm²
Depth of girder D=2030 mm
Flange thickness to be tried T=40 mm
Flange width to be tried B=700 mm
Web thickness to be tried t=13 mm
Stiffener corner snipe snp=15 mm

End stiffener spac.for end panel ab=2500 mm
Intermediate stiffener spacing ai=3500 mm
Accompanying shear force Fvm=0 kN
End shear force Fve=1910 kN
Assumed weld size ss'=6 mm
ADOPT 2/208 mm x 16 mm plate stiffeners Grade S 275 connected by 4/6 mm fillet welds.
Panel length ain1=3000 mm
Thickness of stiffener ti1=13 mm
Shear force at stiffener Vn1=1680 kN
Outstand to be used in design bi=100 mm
Weld size selected sw=6 mm

UDL applied between stiffeners w'=92 kN/m
Largest panel length a'=3000 mm
Selected fillet weld size s=8 mm
DESIGN SUMMARY

Span of plate girder          L=25 m
All steel grade to be         S 275 steel

End stiffener:  

Single stiffener required at end of girder.  

End panel  

ab=2500 mm

Single stiffener: end post 1  2No/208 mm x 16 mm flats
Spacing ai=3000 mm

Intermediate stiffeners:  
Arrangement (1)  2No/100 mm x 13 mm flats

B=700 mm

- Fillet welds to be used for connecting stiffeners to girder web & flanges
- Weld sizes as detailed in calculations
- Weld design strength to be 35 N/mm²
- Electrode Grade 35
Location: Ex1 - Rigid end posts and intermediate stiffeners

Stiffened plate girder - with rigid end post

The girder is fully restrained along its length. The design calculations are in accordance with BS EN 1993-1-1 and BS EN 1993-1-5. Loads and moments are factored.

Assume rigid end posts (two double-sided stiffeners at supports).

Span of girder \( L = 25 \text{ m} \)

Maximum design bending moment \( M_{yEd} = 14028 \text{ kNm} \)

Design bearing reaction \( N_{bEd} = 3500 \text{ kN} \)

Depth of girder \( h = 2030 \text{ mm} \)

Web thickness \( t_w = 18 \text{ mm} \)

Stiffener corner snipe \( s_{np} = 15 \text{ mm} \)

Dimensions of web and flanges

Stiffener spacing of first panel \( a_e = 3000 \text{ mm} \)

Intermediate stiffener spacing \( a_i = 3000 \text{ mm} \)

Accompanying design shear \( V_{zEd}' = 0 \text{ kN} \)

Bearing stiffeners double sided - BS EN 1993-1-5 section 9

Bearing stiffeners are assumed to be symmetric about the beam web and will be designed as a strut to BS EN 1993-1-5 Clause 9.4(2), resisting the bearing reaction together with any eccentricities.

compute \( k_t \) from Annex A

\[
k_t = 5.34 + 4 \left( \frac{h_w}{a} \right)^2 = 7.03
\]

Design shear resistance

\[
V_{bRd} = \frac{\chi w \cdot f_y \cdot h_w \cdot t_w}{(\sqrt{3}) \cdot \gamma_{M1} \cdot 1000} = 3955.2 \text{ kN}
\]

Design shear at the support \( V_{Ed(0)} = N_{bEd} = 3500 \text{ kN} \)

As \( V_{Ed(0)} \leq V_{bRd} \) (3500 kN \( \leq 3955.2 \text{ kN} \)), the design shear at the support is less than the design shear resistance. Hence OK.

Action as a bearing stiffener

Two double-sided stiffeners at support

\[
\text{ PLAN ON BEARING STIFFENERS}
\]

NOTE: Stiffeners to be equally spaced about the centreline of bearing.
Depth of bearing stiffener  
Thickness of bearing stiffener  
Distance  
Distance between stiffener CL's  
Eccentricity in each direction  
Worst stress in web plate: 
\[
\text{swp} = \frac{N_b E_d * 1E3}{A} + \frac{M_z E_d b * 1E6 * (15 * e_w * t_w + t_s b/2 + c_2/2)}{I_{zz}}
\]
= 115.88 N/mm²

Worst stress in stiffener: 
\[
\text{comp1} = \frac{N_b E_d * 1E3}{A} = 98.796 \text{ N/mm}²
\]
\[
\text{comp2} = \frac{M_z E_d b * 1E6 * (c_2/2 + t_s b/2)}{I_{zz}} = 6.6595 \text{ N/mm}²
\]
\[
\text{comp3} = \frac{M_y E_d b * 1E6 * (h_s b + t_w/2)}{I_{yy}} = 15.653 \text{ N/mm}²
\]
Stiffener stress  
\[
s_{st} = \text{comp1} + \text{comp2} + \text{comp3} = 121.11 \text{ N/mm}²
\]

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)

Ratio (h_s b/t_s b)  
\[p = \frac{h_s b}{t_s b} = 10\]
Limit to ratio  \[p = \frac{h_s b}{t_s b}\]  is 13r=12.242. 
Ratio (h_s b/t_s b)=10 is not greater than limit 13r=12.242. 
Stiffener complies with Clause 9.2.1(8).

Action as a rigid end post

A rigid end post comprise of two double-sided transverse stiffeners that form the flanges of a short beam of length hw. The effective section below will be taken to exclude the outer parts of web plate.

Minimum area  
\[A_{min} = 4 * h_w * t_w^2 / c_2 = 8424 \text{ mm}²\]
Actual area provided  
\[A_{sp} = 2 * h_s b * t_s b = 12500 \text{ mm}²\]
As \[A_{sp} \geq A_{min}\]  (12500 mm² ≥ 8424 mm²), stiffener area is adequate.
In-plane moment  
\[M_{zEdm} = N_h * h_w / (8 * 1E3) = 87.315 \text{ kN}m\]
End post 2nd moment of area  
\[I_{zze} = 2 * (A_{sp} * (c_2/2)^2) = 562.56E6 \text{ mm}^4\]
Worst stiffener stress from membrane action will be calculated below. 
Stress due to membrane action  
\[s_{stm} = \frac{M_z E_d b * 1E6}{I_{zze} / (c_2/2 + t_s b/2)} = 25.224 \text{ N/mm}²\]

Cross-section resistance check

The maximum stresses from membrane action and bearing reaction will be added together here for simplicity, even though they occur at different heights on the stiffener. 
Total stress  
\[s_{stT} = s_{st} + s_{stm} = 146.33 \text{ N/mm}²\]
As \[s_{stT} \leq f_y\]  (146.33 N/mm² ≤ 265 mm² ), stiffener is OK.
Buckling check under combined bending and axial load

The stiffener will be checked for buckling under combined bending and axial load in accordance with BS EN 1993-1-1, Clause 6.3.3.

Critical load
\[ N_{cry} = \pi^2 E I_{yy} / (L_{cry}^2 \times 1000) \]
\[ = 315666 \text{ kN} \]

Slenderness of the stiffener
\[ \lambda = (A \times f_y / (N_{cry} \times 1E3))^{0.5} = 0.17245 \]

Design axial load resistance
\[ N_{plRd} = A \times f_y / (\gamma_M 1 \times 1000) = 9388.1 \text{ kN} \]

Design moment resistance yy axis
\[ M_{yRd} = W_{ely} \times f_y / (\gamma_M 1 \times 10^6) = 592.55 \text{ kNm} \]

Design moment resistance zz axis
\[ M_{zRdb} = W_{elzb} \times f_y / (\gamma_M 1 \times 10^6) = 1392.8 \text{ kNm (bearing)} \]
\[ M_{zRdm} = W_{elzm} \times f_y / (\gamma_M 1 \times 10^6) = 917.31 \text{ kNm (membrane)} \]

Interaction equation:
\[ \text{Uni} = N_{Ed} / (\chi_{yy} \times N_{plRd}) + \text{ratio} \times (M_{yEd} / M_{yRd}) + (M_{zEdb} / M_{zRdb} + M_{zEdm} / M_{zRdm}) \]
\[ = 0.55286 \]

As \( \text{Uni} \leq 1.0 \) ( 0.55286 \leq 1.0 ), the interaction equation is OK.

Connection of stiffeners to girder web

Net stiffener length
\[ L_{sn} = h_w - 2 \times s_{np} = 1920 \text{ mm} \]

Assumed weld size
\[ s_s' = 6 \text{ mm} \]

Effective length of weld
\[ L_w = 8 \times (L_{sn} - 2 \times s_s') = 15264 \text{ mm} \]

Design load on weld
\[ F_{wEd} = N_{bEd} \times 10^3 / L_w = 229.3 \text{ N/mm} \]

Design weld resistance
\[ F_{wRd} = 0.7 \times s_s' \times f_{vwd} = 935.71 \text{ N/mm} \]

Shear buckling resistance - EN 1993-1-1, Clause 6.2.6(6)

As \( h_w / t_w > 72 \times e_w \) ( 108.33 > 67.802 ), the web shear buckling resistance needs to be checked (EN 1993-1-5 Clause 5.2 and 5.3).

Buckling coefficient (Annex A)
\[ k_t = 5.34 + 4 \times (h_w / a)^2 = 7.03 \]

Modified slenderness \( \lambda \)
\[ \lambda_{mw} = h_w / (37.4 \times t_w \times e_w \times SQR(k_t)) = 1.1601 \]

Shear resistance of web
\[ V_{plRd} = 5370.2 \text{ kN} \]

Reduced design shear resistance at support (web contribution only will be considered):
\[ V_{bwRd} = c_l \times f_{yw} \times h_w / t_w / (3 \times 0.5 \times \gamma_M 1 \times 1000) = 3955.2 \text{ kN} \]

Design shear at support
\[ V_{Ed}(0) = N_{bEd} = 3500 \text{ kN} \]

As \( V_{Ed}(0) \leq V_{bwRd} \) ( 3500 kN \leq 3955.2 kN ), the shear force is less than the shear resistance. Hence section OK.

compute
\[ \text{comp} = \eta_1 + (1 - M_{fRd} / M_{plRd}) \times (2 \times \eta_3 - 1)^2 = 0.89626 \]

As \( \text{comp} \leq 1 \) ( 0.89626 \leq 1 ), interaction equation is satisfied.
Intermediate transverse web stiffeners - Arrangement (1)

Panel length 1 \(a(1) = 3000\) mm  
Length of stiffener \(l_s = 1950\) mm  

Stress at top of web plate \((\sigma_{\text{top}})\) \(\sigma_{\text{top}} = 251.76\) N/mm²  
Stress at btm of web plate \((\sigma_{\text{btm}})\) \(\sigma_{\text{btm}} = -251.76\) N/mm²  

Design parameters  
Stiffener outstand \(h_{s1} = 100\) mm  
Stiffener thickness \(t_{s1} = 15\) mm  

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)

Yield strength to be adopted \(f_y = 265\) N/mm²  
Ratio \((h_{s1}/t_{s1})\) \(p = h_{s1}/t_{s1} = 6.6667\)  
Limit to ratio \(p = (h_{s1}/t_{s1})\) is 13\(\varepsilon = 12.017\).  
Ratio \((h_{s1}/t_{s1}) = 6.6667\) is not greater than limit 13\(\varepsilon = 12.017\).  
Stiffener complies with Clause 9.2.1(8).
Design shear resistance (double sided transverse stiffener)

The effective cross section of the intermediate double-sided transverse stiffener is as shown below:

\[
\begin{align*}
&\text{tsi} \\
&15.6\text{tw} \\
&15.6\text{tw} \\
&\downarrow \\
&\text{hsi} \quad \text{PLAN ON INTERMEDIATE} \\
&\text{tw} \quad \text{STIFFENER} \\
&\downarrow \\
&\text{hsi} \\
&\uparrow y \\
&z
\end{align*}
\]

2nd moment of area yy axis:
\[
I_{yy} = tsi \times (2 \times hsi + tw)^3/12 + (30 \times e_w \times tw) \times tw^3/12 = 13.197E6 \text{ mm}^4
\]

Design shear resistance
\[
V_{bRd} = \chi \times A_e \times f_{yw}/(\gamma M1 \times 1000) = 2761.5 \text{ kN}
\]

Axial force in the stiffener due to shear - BS EN 1993-1-5

Shear buckling coefficient for web panel \( k_t \) is derived from Clause 5.2.
Buckling coefficient (Annex A) \( k_t = 5.34 + 4 \times (hw/a)^2 = 7.03 \)
Modified slenderness \( \lambda_w \) \( \lambda_w = 0.76 \times (f_y/t_{cr})^{0.5} = 1.1603 \)
Max design shear force in panel \( V_{Ed1} = 1700 \text{ kN} \)
Externally applied design load \( P_{ext1} = 1200 \text{ kN} \)

Option 1:
Longitudinal compressive stress \( \sigma_{xEd} = 0 \) for symmetrical sections.
Vertical force generated in stiffener arising from the shear induced tension field (see older version of NA to BS EN 1993-1-5:2006):
\[
P_{Ed1}' = V_{Ed1} - hw \times tw \times 0.8 \times t_{cr}/1000 = -1492.5 \text{ kN}
\]

Option 2:
Vertical force generated in the stiffener as per BS EN 1993-1-5
(see NOTE, Clause 9.3.3(3)):
\[
P_{Ed1} = V_{Ed1} - f_{yw} \times hw \times tw/(\sqrt{3} \times \gamma M1 \times \lambda_w^2 \times 1000) = -2288.8 \text{ kN}
\]
Design axial load in stiffener \( P_{Ed} = P_{Ed1} + P_{ext1} = 1200 \text{ kN} \)
As \( P_{Ed} \leq V_{bRd} \) (1200 \text{ kN} \leq 2761.5 \text{ kN}) , the design shear force does not exceed the shear resistance. Hence OK.

Connection to the web

Design shear load on weld \( F_{wEd} = tw^2/(5 \times hsi) + P_{Ed}/(2 \times (hw-2 \times s_n)) \)
\[
= 0.9605 \text{ kN/mm}
\]
Weld size provided \( s_w1 = 6 \text{ mm} \)

Stiffness check - Clause 9.3.3(3)

2nd moment of area (effe. section) \( I_{pro} = 13.197E6 \text{ mm}^4 \)
2nd moment of area required \( I_{req} = 0.75 \times hw \times tw^3 = 8.5293E6 \text{ mm}^4 \)
As \( I_{req} \leq I_{pro} (8.5293E6 \text{ mm}^4 \leq 13.197E6 \text{ mm}^4) \), the stiffener is OK.
Web check between stiffeners

\[ w' \text{ kN/m} \]

Girder assumed to have rigid end posts.

UDL applied between stiffeners \( w' = 92 \text{ kN/m (factored load)} \)

Largest panel length \( a' = 3000 \text{ mm} \)

Compressive stress of web \( \text{sed} = w'/tw = 5.1111 \text{ N/mm}^2 \)

Compressive strength of web \( \text{fed} = (2.75 + 2/(a'/hw)^2) \times E/(C/tw)^2 \)

\[ = 65.94 \text{ N/mm}^2 \]

Since \( \text{sed} \leq \text{fed} \) \( (5.1111 \text{ N/mm}^2 \leq 65.94 \text{ N/mm}^2) \), the web is OK.

Selected fillet weld size \( s = 12 \text{ mm} \)

Intermediate transverse web stiffeners - Arrangement (2)

Panel length 1 \( a(3) = 2800 \text{ mm} \)

Stiffener outstand \( h_2 = 200 \text{ mm} \)

Stiffener thickness \( t_2 = 20 \text{ mm} \)

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)

Yield strength to be adopted \( f_y = 265 \text{ N/mm}^2 \)

Ratio \( (h_2/t_2) \)

\[ p = h_2/t_2 = 10 \]

Limit to ratio \( p = (h_2/t_2) \) is \( 13 \pi = 12.242 \).

Ratio \( (h_2/t_2) = 10 \) is not greater than limit \( 13 \pi = 12.242 \).

Stiffener complies with Clause 9.2.1(8).

Design shear resistance (double sided transverse stiffener)

The effective cross section of the intermediate double-sided transverse stiffener is as shown below:

2nd moment of area \( yy \) axis:

\[ I_{yy} = t_{si} \times (2 \times h_{si} + tw)^3/12 + (30 \times ew \times tw) \times tw^3/12 \]

\[ = 121.97E6 \text{ mm}^4 \]

Design shear resistance

\[ V_{bRd} = \chi \times A_e \times f_yw / (\gamma M_1 \times 1000) = 4641 \text{ kN} \]
Axial force in the stiffener due to shear

Max design shear force in panel $V_{Ed2}=3200 \text{ kN}$
Externally applied design load $P_{ext2}=1200 \text{ kN}$
Design axial load in stiffener $P_{Ed}'=P_{Ed2}+P_{ext2}=1200 \text{ kN}$

As $P_{Ed}' \leq V_{bRd}$ ($1200 \text{ kN} \leq 4641 \text{ kN}$), the design shear force does not exceed the shear resistance. Hence OK.

Connection to the web

Design shear load on weld $F_{wEd}=\frac{tw^2}{5*hs2}+\frac{P_{Ed}'}{2*(hw-2*snp)}=0.6365 \text{ kN/mm}$
Weld size provided $sw2=6 \text{ mm}$

Stiffness check - Clause 9.3.3(3)

2nd moment of area (eff. section) $I_{pro}=121.97E6 \text{ mm}^4$
2nd moment of area required $I_{req}=0.75*hw*tw^3=8.5293E6 \text{ mm}^4$

As $I_{req} \leq I_{pro}$ ($8.5293E6 \text{ mm}^4 \leq 121.97E6 \text{ mm}^4$), the stiffener is OK.

DESIGN SUMMARY

Span of plate girder $25 \text{ m}$
Design moment $14028 \text{ kNm}$
All steel to be Grade S 275

End stiffeners: $c_2||ae||ai$ $c_2=300 \text{ mm}$ $ae=3000 \text{ mm}$ $ai=3000 \text{ mm}$

Double-sided stiffeners: post 1 2No/250 mm x 25 mm flats
post 2 2No/250 mm x 25 mm flats

Intermediate stiffeners:
Arrangement (1) Double-sided stiffeners
2No/100 mm x 15 mm flats spaced at 3000 mm centres

Intermediate stiffeners:
Arrangement (2) Double-sided stiffeners
2No/200 mm x 20 mm flats spaced at 2800 mm centres
b=700 mm

h=2030 mm

tw=18 mm

tf=40 mm

• Fillet welds to be used for connecting stiffeners to girder web & flanges
• Weld sizes as detailed in calculations
• Weld design strength to be 222 N/mm²

Assume rigid end posts to BS EN 1993-1-5, Figure 5.1 & Table 5.1.
Location: Ex2 - Rigid end posts only

Stiffened plate girder - with rigid end post

The girder is fully restrained along its length. The design calculations are in accordance with BS EN 1993-1-1 and BS EN 1993-1-5. Loads and moments are factored.

Assume rigid end posts (two double-sided stiffeners at supports).
Span of girder \( L = 12 \, \text{m} \)
Maximum design bending moment \( M_{yEd} = 1800 \, \text{kNm} \)
Design bearing reaction \( N_{bEd} = 1845 \, \text{kN} \)
Depth of girder \( h = 1200 \, \text{mm} \)
Web thickness \( t_w = 12.5 \, \text{mm} \)
Stiffener corner snipe \( snp = 15 \, \text{mm} \)

Dimensions of web and flanges

Accompanying design shear \( V_{zEd}' = 0 \, \text{kN} \)

Bearing stiffeners double sided - BS EN 1993-1-5 section 9

Bearing stiffeners are assumed to be symmetric about the beam web and will be designed as a strut to BS EN 1993-1-5 Clause 9.4(2), resisting the bearing reaction together with any eccentricities.

Shear buckling coefficient for web panel \( k_t \) from BS EN 1993-1-5.
compute \( k_t \) from Annex A \( k_t = 5.34 \)
Design shear resistance \( V_{bRd} = \frac{\gamma_{w} \cdot f_y \cdot h_w \cdot t_w}{(\sqrt{2} \cdot \gamma_{M1}) \cdot 1000} = 1958.7 \, \text{kN} \)
Design shear at the support \( V_{Ed(0)} = N_{bEd} = 1845 \, \text{kN} \)
As \( V_{Ed(0)} \leq V_{bRd} \) (1845 kN \( \leq 1958.7 \, \text{kN} \)), the design shear at the support is less than the design shear resistance. Hence OK.

Action as a bearing stiffener

Two double-sided stiffeners at support

\[ \text{hsb} \]
\[ \text{tw} \]
\[ \text{hsb} \]

NOTE: Stiffeners to be equally spaced about the centreline of bearing.
Depth of bearing stiffener \( h_{sb} = 150 \, \text{mm} \)
Thickness of bearing stiffener: $tsb = 20$ mm
Distance: $c_1 = 325$ mm
Distance between stiffener CL's: $c_2 = 300$ mm
Eccentricity in each direction: $ecc = 10$ mm

Worst stress in web plate:
$$swp = \frac{NbEd \times 1E3}{A} + \frac{MzEdb \times 1E6 \times (15 \times ew \times tw + tsb/2 + c_2/2)}{Izz}$$
$$= 104.11 \text{ N/mm}^2$$

Worst stress in stiffener:
- $comp_1 = \frac{NbEd \times 1E3}{A} = 93.117 \text{ N/mm}^2$
- $comp_2 = \frac{MzEdb \times 1E6 \times (c_2/2 + tsb/2)}{Izz} = 5.6288 \text{ N/mm}^2$
- $comp_3 = \frac{MyEdb \times 1E6 \times (hsb + tw/2)}{Iyy} = 28.339 \text{ N/mm}^2$

Stiffener stress: $sst = comp_1 + comp_2 + comp_3 = 127.08 \text{ N/mm}^2$

Limiting outstanding to prevent torsional buckling - Clause 9.2.1(8)
Ratio $(hsb/tsb) = p = hsb/tsb = 7.5$
Limit to ratio $p = (hsb/tsb)$ is $13\pi = 10.729$.
Ratio $(hsb/tsb) = 7.5$ is not greater than limit $13\pi = 10.729$.
Stiffener complies with Clause 9.2.1(8).

Action as a rigid end post
A rigid end post comprise of two double-sided transverse stiffeners that form the flanges of a short beam of length $hw$. The effective section below will be taken to exclude the outer parts of web plate.

Minimum area: $A_{min} = 4 \times hw \times tw^2/c_2 = 2416.7 \text{ mm}^2$
Actual area provided: $A_{sp} = 2 \times hsb \times tsb = 6000 \text{ mm}^2$
As $A_{sp} \geq A_{min} (6000 \text{ mm}^2 \geq 2416.7 \text{ mm}^2)$, stiffener area is adequate.
In-plane moment: $MzEdm = NH \times hw/(8 \times 1E3) = 140.88 \text{ kNm}$
End post 2nd moment of area: $I_{zze} = 2 \times (Asp \times (c_2/2)^2) = 270E6 \text{ mm}^4$
Worst stiffener stress from membrane action will be calculated below.
Stress due to membrane action: $sst_m = \frac{MzEdm \times 1E6}{I_{zze}/(c_2/2 + tsb/2)} = 83.484 \text{ N/mm}^2$

Cross-section resistance check
The maximum stresses from membrane action and bearing reaction will be added together here for simplicity, even though they occur at different heights on the stiffener.
Total stress: $sst_T = sst + sstm = 210.57 \text{ N/mm}^2$
As $sst_T \leq fy (210.57 \text{ N/mm}^2 \leq 345 \text{ mm}^2)$, stiffener is OK.

Buckling check under combined bending and axial load
The stiffener will be checked for buckling under combined bending and axial load in accordance with BS EN 1993-1-1, Clause 6.3.3.
Critical load

\[ N_{cry} = \pi^2 E I_{yy} / (L_{cry}^2 \times 1000) \]
\[ = 156687 \text{ kN} \]

Slenderness of the stiffener

\[ \lambda = (A \times f_y / (N_{cry} \times E^3))^{0.5} = 0.5 = 0.20887 \]

Design axial load resistance

\[ N_{pl,Rd} = A \times f_y / (\gamma M_1 \times 1000) = 6835.8 \text{ kN} \]

Design moment resistance yy axis

\[ M_{y,Rd} = W_{ely} \times f_y / (\gamma M_1 \times 10^6) = 224.61 \text{ kNm} \]

Design moment resistance zz axis

\[ M_{z,Rdb} = W_{elzb} \times f_y / (\gamma M_1 \times 10^6) = 1130.8 \text{ kNm (bearing)} \]

Design moment resistance zz axis

\[ M_{z,Rdm} = W_{elzm} \times f_y / (\gamma M_1 \times 10^6) = 582.19 \text{ kNm (membrane)} \]

Interaction equation:

\[ \text{Uni} = N_{Ed} / (\chi_y \times N_{pl,Rd}) + \text{ratio} \times (M_{y,Edb} / M_{y,Rd}) + (M_{z,Edb} / M_{z,Rdb} + M_{z,Edm} / M_{z,Rdm}) \]
\[ = 0.61255 \]

As Uni \leq 1.0 (0.61255 \leq 1.0), the interaction equation is OK.

Connection of stiffeners to girder web

Net stiffener length

\[ L_{sn} = h_w - 2 \times s_{np} = 1130 \text{ mm} \]

Assumed weld size

\[ s_{w} = 6 \text{ mm} \]

Effective length of weld

\[ L_w = 8 \times (L_{sn} - 2 \times s_{w}) = 8944 \text{ mm} \]

Design load on weld

\[ F_{w,Ed} = N_{b,Ed} \times 10^3 / L_w = 206.28 \text{ N/mm} \]

Design weld resistance

\[ F_{w,Rd} = 0.7 \times s_{w} \times f_{wd} = 1013.1 \text{ N/mm} \]

Shear buckling resistance - EN 1993-1-1, Clause 6.2.6(6)

As \( h_w / t_w > 72 \times w \) (92.8 > 58.58), the web shear buckling resistance needs to be checked (EN 1993-1-5 Clause 5.2 and 5.3).

Modified slenderness \( \lambda \)

\[ \lambda_{mw} = h_w / (86.4 \times t_w \times w) = 1.3201 \]

Shear resistance of web

\[ V_{pl,Rd} = 2888.2 \text{ kN} \]

Reduced design shear resistance at support (web contribution only will be considered):

\[ V_{bw,Rd} = \chi_{w} \times f_{yw} \times h_w / (3 \times 10^3 \times \gamma M_1) = 2015.5 \text{ kN} \]

Design shear at support

\[ V_{Ed}(0) = N_{b,Ed} = 1845 \text{ kN} \]

As \( V_{Ed}(0) < V_{bw,Rd} \) (1845 kN < 2015.5 kN), the shear force is less than the shear resistance. Hence section OK.

compute

\[ \text{comp} = \eta_1 + (1 - M_{f,Rd} / M_{pl,Rd}) \times (2 \times \eta_3 - 1)^2 = 0.58198 \]

As \( \text{comp} \leq 1 \) (0.58198 \leq 1), interaction equation is satisfied.

Selected fillet weld size

\[ s = 8 \text{ mm} \]
DESIGN SUMMARY

Span of plate girder: 12 m
Design moment: 1800 kNm
All steel to be: Grade S 355

End stiffeners:

Posts 1 & 2 are double-sided stiffeners at end of girder. c2=300 mm

Double-sided stiffeners: post 1 2No/150 mm x 20 mm flats
post 2 2No/150 mm x 20 mm flats

b=400 mm
htf=20 mm
h=1200 mm
tw=12.5 mm
tf=20 mm

- Fillet welds to be used for connecting stiffeners to girder web & flanges
- Weld sizes as detailed in calculations
- Weld design strength to be 241 N/mm²

Assume rigid end posts to BS EN 1993-1-5, Figure 5.1 & Table 5.1.
Location: Ex3 - Intermediate stiffeners and non-rigid end posts

Stiffened plate girder

The girder is fully restrained along its length. The design calculations are in accordance with BS EN 1993-1-1 and BS EN 1993-1-5. Loads and moments are factored.

Assume non-rigid end posts to BS EN 1993-1-5, Figure 5.1 & Table 5.1.

Span of girder                  L=12 m
Maximum design bending moment   MyEd=1800 kNm
Design bearing reaction        NbEd=1500 kN
Depth of girder                h=1200 mm
Web thickness                  tw=12.5 mm
Stiffener corner snipe         snp=15 mm

Dimensions of web and flanges

Stiffener spacing of first panel ae=1550 mm
Intermediate stiffener spacing ai=3000 mm
Accompanying design shear     VzEd'=0 kN

Shear buckling resistance - EN 1993-1-1, Clause 6.2.6(6)

As hw/tw > 72*ew (92.8 > 66.558), the web shear buckling resistance needs to be checked (EN 1993-1-5 Clause 5.2 and 5.3).

Buckling coefficient (Annex A)       kt=5.34+4*(hw/a)^2=7.5803
Modified slenderness λ               lamw=hw/(37.4*tw*ew*SQR(kt))=0.97491
Shear resistance of web               VplRd=2218.5 kN
Reduced design shear resistance at support (web contribution only will be considered): VbwRd=chiw*fyw*hw*tw/(3^0.5*gamM1*1000)=1960 kN

Design shear at support VEd(0)=NbEd=1500 kN
As VEd(0) ≤ VbwRd (1500 kN ≤ 1960 kN), the shear force is less than the shear resistance. Hence section OK.
compute
comp=eta1+(1-MfRd/MplRd)*(2*eta3 -1)^2=0.62629
As comp ≤ 1 (0.62629 ≤ 1), interaction equation is satisfied.
**Intermediate transverse web stiffeners - Arrangement (1)**

![Diagram of web stiffeners]

---

**Panel length 1**

- \( a(1) = 3000 \text{ mm} \)
- \( ls = 1160 \text{ mm} \)

**Longitudinal stresses in web with transverse stiffeners**

- \( ls = 1160 \text{ mm} \)

**Compression stresses are positive**

**Stress at top of web plate (\( \sigma_{top} \))**

- \( \sigma_{top} = 190.68 \text{ N/mm}^2 \)

**Stress at btm of web plate (\( \sigma_{btm} \))**

- \( \sigma_{btm} = -190.68 \text{ N/mm}^2 \)

**Design parameters**

- Stiffener outstand \( hs_1 = 100 \text{ mm} \)
- Stiffener thickness \( ts_1 = 15 \text{ mm} \)

**Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)**

- Yield strength to be adopted \( fy = 275 \text{ N/mm}^2 \)
- Ratio \( p = \frac{hs_1}{ts_1} = 6.6667 \)
  - Limit to ratio \( p = \frac{hs_1}{ts_1} \) is \( 13\varepsilon = 10.577 \).
  - Ratio \( \frac{hs_1}{ts_1} = 6.6667 \) is not greater than limit \( 13\varepsilon = 10.577 \).
  - Stiffener complies with Clause 9.2.1(8).
Design shear resistance (double sided transverse stiffener)

The effective cross section of the intermediate double-sided transverse stiffener is as shown below:

\[
\begin{align*}
&\text{tsi} \\
&15.\text{t}w \\
&15.\text{t}w \\
&\text{hsi} \\
&\text{tw} \quad \text{PLAN ON INTERMEDIATE} \\
&\text{hsi} \quad \text{STIFFENER}
\end{align*}
\]

2nd moment of area yy axis:
\[
I_{yy} = tsi \times (2 \times hsi + tw)^3/12 + (30 \times ew \times tw) \times tw^3/12
\]
\[
= 12.051 \times 10^6 \text{ mm}^4
\]

Design shear resistance
\[
V_{bRd} = \frac{\chi A_e f_y w}{\gamma_{M1} \times 1000} = 2015.2 \text{ kN}
\]

Axial force in the stiffener due to shear - BS EN 1993-1-5

Shear buckling coefficient for web panel \(kt\) is derived from Clause 5.2.

Buckling coefficient (Annex A)
\[
kt = 5.34 + 4 \times (hw/a)^2 = 5.938
\]

Modified slenderness \(\lambda_w\)
\[
\lambda_w = 0.76 \times (fy/tcr)^0.5 = 1.1017
\]

Max design shear force in panel \(V_{Ed1} = 600 \text{ kN}\)

Externally applied design load \(P_{ext1} = 1000 \text{ kN}\)

Option 1:
Longitudinal compressive stress \(\sigma_{xEd} = 0\) for symmetrical sections.

Vertical force generated in stiffener arising from the shear induced tension field (see older version of NA to BS EN 1993-1-5:2006):
\[
P_{Ed1}' = V_{Ed1} \times hw \times tw \times 0.8 \times tcr/1000 = -918.11 \text{ kN}
\]

Option 2:
Vertical force generated in the stiffener as per BS EN 1993-1-5 (see NOTE, Clause 9.3.3(3)):  
\[
P_{Ed1} = V_{Ed1} \times f_y w \times hw \times tw / (SQR(3) \times \gamma_{M1} \times \lambda_w^2 \times 1000) = -1296.8 \text{ kN}
\]

Design axial load in stiffener \(P_{Ed} = P_{Ed1} + P_{ext1} = 1000 \text{ kN}\)

As \(P_{Ed} \leq V_{bRd}\) (1000 kN \(\leq 2015.2 \text{ kN}\), the design shear force does not exceed the shear resistance. Hence OK.

Connection to the web

Design shear load on weld
\[
F_{wEd} = tw^2/(5 \times hsi) + P_{Ed}/(2 \times (hw-2 \times snp)) = 0.75498 \text{ kN/mm}
\]

Weld size provided \(sw1 = 6 \text{ mm}\)

Stiffness check - Clause 9.3.3(3)

2nd moment of area (effe. section) \(I_{pro} = 12.051 \times 10^6 \text{ mm}^4\)

2nd moment of area required \(I_{req} = 0.75 \times hw \times tw^3 = 1.6992 \times 10^6 \text{ mm}^4\)

As \(I_{req} \leq I_{pro}\) (1.6992 \text{ mm}^4 \(\leq 12.051 \times 10^6 \text{ mm}^4\)), the stiffener is OK.
Web check between stiffeners

Girder assumed to have non-rigid end posts.

UDL applied between stiffeners: $w' = 100 \text{ kN/m (factored load)}$
Largest panel length: $a' = 3000 \text{ mm}$
Compressive stress of web: $sed = w'/tw = 8 \text{ N/mm}^2$
Compressive strength of web: $fed = (2.75 + 2/(a'/hw)^2)*E/(C/tw)^2$

$$fed = 77.525 \text{ N/mm}^2$$

Since $sed \leq fed$ ($8 \text{ N/mm}^2 \leq 77.525 \text{ N/mm}^2$), the web is OK.

Selected fillet weld size: $s = 6 \text{ mm}$

Bearing stiffener (double sided non-rigid end post)

It is assumed that the support reaction acts at the centroid of the effective stiffener section, such that there is no bending moment induced. Bearing stiffener consists a single double-sided stiffener. The stiffener effective cross section is as shown below:

Depth of bearing stiffener: $hsb = 150 \text{ mm}$
Thickness of bearing stiffener: $tsb = 20 \text{ mm}$
Distance: $c_1 = 100 \text{ mm}$
Design buckling resistance: $NbRd = \chi*Ast*fysb/(\gamma M1*1000)$

$$NbRd = 2561.6 \text{ kN}$$

As $NbEd \leq NbRd$ (1500 kN $\leq 2561.6$ kN), the design bearing reaction at the support is less than the design buckling resistance. Hence satisfactory.

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)

Ratio ($hsb/tsb$): $p = hsb/tsb = 7.5$
Limit to ratio $p = (hsb/tsb)$ is $13\varepsilon = 12.242$.
Ratio ($hsb/tsb$) = 7.5 is not greater than limit $13\varepsilon = 12.242$.
Stiffener complies with Clause 9.2.1(8).
DESIGN SUMMARY

Span of plate girder: 12 m
Design moment: 1800 kNm
All steel to be: Grade S 275

End stiffener: c1---ai---ai---

Posts 1 is a double-sided stiffener at end of girder. c1=100 mm

Double-sided stiffeners: post 1 2No/150 mm x 20 mm flats

Intermediate stiffeners: ai=3000 mm

Intermediate stiffeners:
Arrangement (1) Double-sided stiffeners
2No/100 mm x 15 mm flats spaced at 3000 mm centres

b=400 mm
h=1200 mm
tf=20 mm
tw=12.5 mm

• Fillet welds to be used for connecting stiffeners to girder web & flanges
• Weld sizes as detailed in calculations
• Weld design strength to be 222 N/mm²

Assume non-rigid end posts to EN 1993-1-5, Figure 5.1 & Table 5.1.
Location: Ex4 - Intermediate stiffeners and non-rigid end posts

Stiffened plate girder

The girder is fully restrained along its length. The design calculations are in accordance with BS EN 1993-1-1 and BS EN 1993-1-5. Loads and moments are factored.

Assume non-rigid end posts to BS EN 1993-1-5, Figure 5.1 & Table 5.1.

Span of girder \( L = 12 \text{ m} \)
Maximum design bending moment \( M_{yEd} = 2800 \text{ kNm} \)
Design bearing reaction \( N_{bEd} = 1450 \text{ kN} \)
Depth of girder \( h = 1240 \text{ mm} \)
Web thickness \( t_w = 12 \text{ mm} \)
Stiffener corner snipe \( snp = 15 \text{ mm} \)

Dimensions of web and flanges

Stiffener spacing of first panel \( a_e = 1550 \text{ mm} \)
Intermediate stiffener spacing \( a_i = 5000 \text{ mm} \)
Accompanying design shear \( V_{zEd'} = 0 \text{ kN} \)

Shear buckling resistance - EN 1993-1-1, Clause 6.2.6(6)

As \( hw/tw > 72*ew \) ( 99.167 > 66.558 ), the web shear buckling resistance needs to be checked (EN 1993-1-5 Clause 5.2 and 5.3).

Buckling coefficient (Annex A) \( k_t = 5.34 + 4*(hw/a)^2 = 7.6977 \)
Modified slenderness \( \lambda \) \( \lambda_{mw} = hw/(37.4*tw*ew*SQR(k_t)) = 1.0338 \)
Shear resistance of web \( V_{plRd} = 2184.8 \text{ kN} \)
Reduced design shear resistance at support (web contribution only will be considered):

\[ V_{bwRd} = \chi_{w}f_{yw}hw*tw/(3^0.5*\gamma_{M1}*1000) = 1820.3 \text{ kN} \]

Design shear at support \( V_{Ed(0)} = N_{bEd} = 1450 \text{ kN} \)
As \( V_{Ed(0)} \leq V_{bwRd} \) ( 1450 kN \( \leq 1820.3 \text{ kN} \) ), the shear force is less than the shear resistance. Hence section OK.

compute \( \text{comp} = \eta_1 + (1-MfRd/MplRd)*(2*\eta_3 -1)^2 = 0.78202 \)
As \( \text{comp} \leq 1 \) ( 0.78202 \( \leq 1 \) ), interaction equation is satisfied.
**Intermediate transverse web stiffeners - Arrangement (1)**

![Diagram](image)

Elevation on web without longitudinal stiffening

- Panel length 1: \(a(1)=5000\) mm
- Length of stiffener: \(l_s=1190\) mm

Longitudinal stresses in web with transverse stiffeners

- \(l_s=1190\) mm

Compression stresses are positive

Stress at top of web plate (\(\sigma_{\text{top}}\)) \(\sigma_{\text{top}}=230.45\) N/mm²
Stress at btm of web plate (\(\sigma_{\text{btm}}\)) \(\sigma_{\text{btm}}=-230.45\) N/mm²

**Design parameters**

- Stiffener outstand: \(h_{s1}=150\) mm
- Stiffener thickness: \(t_{s1}=15\) mm

**Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)**

- Yield strength to be adopted: \(f_y=275\) N/mm²
- Ratio \((h_{s1}/t_{s1})\): \(p=h_{s1}/t_{s1}=10\)
- Limit to ratio \(p=(h_{s1}/t_{s1})\) is \(13\pi=12.017\).
- Ratio \((h_{s1}/t_{s1})=10\) is not greater than limit \(13\pi=12.017\).
- Stiffener complies with Clause 9.2.1(8).
Design shear resistance (single-sided transverse stiffener)

The effective cross section of the intermediate single-sided transverse stiffener is as shown below:

![Diagram of the effective cross section]

2nd moment of area yy axis: \( I_{yy} = I_{pro} = 13.86E6 \text{ mm}^4 \)

Design shear resistance: \( V_{bRd} = \chi_i A_e f_{yw} / (\gamma M1 \times 1000) = 1747.2 \text{ kN} \)

Axial force in the stiffener due to shear - BS EN 1993-1-5

Shear buckling coefficient for web panel \( k_t \) is derived from Clause 5.2.
Buckling coefficient (Annex A) \( k_t = 5.34 + 4 \times (h_w / a)^2 = 5.5666 \)
Modified slenderness \( \lambda_w \):
\( \lambda_w = 0.76 \times (f_{yw} / t_{cr})^{0.5} = 1.2159 \)
Max design shear force in panel \( V_{Ed1} = 1200 \text{ kN} \)
Externally applied design load \( P_{ext1} = 975 \text{ kN} \)

Option 1:
Longitudinal compressive stress \( \sigma_{xEd} = 0 \) for symmetrical sections.
Vertical force generated in stiffener arising from the shear induced tension field (see older version of NA to BS EN 1993-1-5:2006):
\( P_{Ed1}' = V_{Ed1} - h_w \times t_w \times 0.8 \times t_{cr} / 1000 = -27.358 \text{ kN} \)

Option 2:
Vertical force generated in the stiffener as per BS EN 1993-1-5 (see NOTE, Clause 9.3.3(3)):
\( P_{Ed1} = V_{Ed1} - f_{yw} \times h_w \times t_w \times ( \text{SQR}(3) \times \gamma M1 \times \lambda_w^2 \times 1000) = -333.53 \text{ kN} \)
Design axial load in stiffener \( P_{Ed} = P_{Ed1} + P_{ext1} = 975 \text{ kN} \)
As \( P_{Ed} \leq V_{bRd} \) (975 kN \( \leq 1747.2 \text{ kN} \)), the design shear force does not exceed the shear resistance. Hence OK.

Connection to the web

Design shear load on weld:
\( F_{wEd} = t_w^2 / (5 \times h_{s1}) + P_{Ed} / (h_w - 2 \times \text{snp}) = 1.0325 \text{ kN/mm} \)
Weld size provided:
\( s_{w1} = 6 \text{ mm} \)

Stiffness check - Clause 9.3.3(3)

2nd moment of area (effe. section):
\( I_{pro} = 13.86E6 \text{ mm}^4 \)
2nd moment of area required:
\( I_{req} = 0.75 \times h_w \times t_w^3 = 1.5422E6 \text{ mm}^4 \)
As \( I_{req} \leq I_{pro} \) (1.5422E6 mm\(^4\) \( \leq 13.86E6 \text{ mm}^4 \)), the stiffener is OK.
Web check between stiffeners

\[ w' \text{ kN/m} \]

Girder assumed to have non-rigid end posts.

UDL applied between stiffeners \( w'=100 \text{ kN/m} \) (factored load)
Largest panel length \( a'=5000 \text{ mm} \)
Compressive stress of web \( \text{sed}=w'/tw=8.3333 \text{ N/mm}^2 \)
Compressive strength of web \( \text{fed}=(2.75+2/(a'/hw)^2)*E/(C/tw)^2 \)
\[ =63.687 \text{ N/mm}^2 \]
Since \( \text{sed} \leq \text{fed} \) (8.3333 N/mm\(^2\) \leq 63.687 N/mm\(^2\)), the web is OK.
Selected fillet weld size \( s=6 \text{ mm} \)

Intermediate transverse web stiffeners - Arrangement (2)

Panel length 1 \( a(3)=4000 \text{ mm} \)
Stiffener outstand \( hs2=100 \text{ mm} \)
Stiffener thickness \( ts2=10 \text{ mm} \)

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)

Yield strength to be adopted \( fy=275 \text{ N/mm}^2 \)
Ratio \( (hs2/ts2) \)
\[ p=hs2/ts2=10 \]
Limit to ratio \( p=(hs2/ts2) \) is 13\( \pi=12.017 \).
Ratio \( (hs2/ts2)=10 \) is not greater than limit 13\( \pi=12.017 \).
Stiffener complies with Clause 9.2.1(8).

Design shear resistance (single-sided transverse stiffener)

The effective cross section of the intermediate single-sided transverse stiffener is as shown below:

\[ \text{ PLAN ON INTERMEDIATE STIFFENER } \]

2nd moment of area yy axis \( I_{yy}=I_{pro}=3.4054E6 \text{ mm}^4 \)
Design shear resistance \( V_{bd}=\chi A e fyw/(\gamma M1*1000)=1263 \text{ kN} \)
Axial force in the stiffener due to shear

Max design shear force in panel\( V_{Ed2} = 1500 \text{ kN} \)
Externally applied design load \( P_{ext2} = 800 \text{ kN} \)
Generated force to be adopted \( P_{Ed2} = 244.62 \text{ kN} \)
Design axial load in stiffener \( P_{Ed'} = P_{Ed2} + P_{ext2} = 1044.6 \text{ kN} \)
As \( P_{Ed'} \leq V_{bRd} \) (1044.6 kN \( \leq 1263 \text{ kN} \)), the design shear force does not exceed the shear resistance. Hence OK.

Connection to the web

Design shear load on weld \( F_{wEd} = \frac{t_w^2}{5*hs^2} + \frac{P_{Ed'}}{h_w - 2*snp} \)
= 1.1885 kN/mm
Weld size provided \( s_w^2 = 6 \text{ mm} \)

Stiffness check - Clause 9.3.3(3)

2nd moment of area (eff.section) \( I_{pro} = 3.4054E6 \text{ mm}^4 \)
2nd moment of area required \( I_{req} = 0.75*h_w*t_w^3 = 1.5422E6 \text{ mm}^4 \)
As \( I_{req} \leq I_{pro} \) (1.5422E6 mm\(^4\) \( \leq 3.4054E6 \text{ mm}^4 \)), the stiffener is OK.

Bearing stiffener (double sided non-rigid end post)

It is assumed that the support reaction acts at the centroid of the effective stiffener section, such that there is no bending moment induced. Bearing stiffener consists a single double-sided stiffener. The stiffener effective cross section is as shown below:

Depth of bearing stiffener \( h_{sb} = 150 \text{ mm} \)
Thickness of bearing stiffener \( t_{sb} = 20 \text{ mm} \)
Distance \( c_1 = 100 \text{ mm} \)
Design buckling resistance \( N_{bRd} = \frac{\chi * A_{st} * f_{ysb}}{(\gamma M_1 * 1000)} = 2500.7 \text{ kN} \)
As \( N_{bEd} \leq N_{bRd} \) (1450 kN \( \leq 2500.7 \text{ kN} \)), the design bearing reaction at the support is less than the design buckling resistance. Hence satisfactory.

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)

Ratio \( (h_{sb}/t_{sb}) \) \( p = h_{sb}/t_{sb} = 7.5 \)
Limit to ratio \( p = (h_{sb}/t_{sb}) \) is 13\( \varepsilon = 12.242 \).
Ratio \( (h_{sb}/t_{sb}) = 7.5 \) is not greater than limit 13\( \varepsilon = 12.242 \).
Stiffener complies with Clause 9.2.1(8).
DESIGN SUMMARY

Dimensions of web and flanges

Stiffener spacing of first panel: ae = 2400 mm
Intermediate stiffener spacing: ai = 2400 mm
Accompanying design shear: VzEd' = 0 kN

Shear buckling resistance - EN 1993-1-1, Clause 6.2.6(6)

As hw/tw > 72*ew (68.286 > 67.802), the web shear buckling resistance needs to be checked (EN 1993-1-5 Clause 5.2 and 5.3).

Buckling coefficient (Annex A): kt = 5.34 + 4*(hw/a)^2 = 9.3067
Modified slenderness λ: lamw = hw/(37.4*tw*ew*SQR(kt)) = 0.63555
Shear resistance of web: VplRd = 12315 kN
Reduced design shear resistance at support (web contribution only will be considered):

VbwRd = χiw*fyw*hw*tw/(3^0.5*γM1*1000) = 12798 kN

Design shear at support: VEd(0) = NbEd = 6281 kN
As VEd(0) ≤ VbwRd (6281 kN ≤ 12798 kN), the shear force is less than the shear resistance. Hence section OK.
Intermediate transverse web stiffeners - Arrangement (1)

Panel length 1 \( a(1) = 2400 \text{ mm} \)
Length of stiffener \( l_s = 2390 \text{ mm} \)

Longitudinal stresses in web with transverse stiffeners

Stress at top of web plate \( \sigma_{\text{top}} \) \( \sigma_{\text{top}} = 243.87 \text{ N/mm}^2 \)
Stress at btm of web plate \( \sigma_{\text{btm}} \) \( \sigma_{\text{btm}} = -243.87 \text{ N/mm}^2 \)

Design parameters

Stiffener outstand \( h_{s1} = 250 \text{ mm} \)
Stiffener thickness \( t_{s1} = 25 \text{ mm} \)

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)

Yield strength to be adopted \( f_y = 265 \text{ N/mm}^2 \)
Ratio \( \frac{h_{s1}}{t_{s1}} \) \( p = \frac{h_{s1}}{t_{s1}} = 10 \)
Limit to ratio \( p = \frac{h_{s1}}{t_{s1}} \) is \( 13p = 12.242 \).
Ratio \( \frac{h_{s1}}{t_{s1}} = 10 \) is not greater than limit \( 13p = 12.242 \).
Stiffener complies with Clause 9.2.1(8).
Design shear resistance (double sided transverse stiffener)

The effective cross section of the intermediate double-sided transverse stiffener is as shown below:

```
  tsi                           z
  _15.r.tw_                   _z_
  
  hsi                           y
  _15.r.tw_                   _hsi_

2nd moment of area yy axis:
\[ I_{yy} = tsi \times (2 \times hsi + tw)^3 / 12 + (30 \times ew \times tw) \times tw^3 / 12 \]
\[ = 322.55 \times 10^6 \text{ mm}^4 \]

Design shear resistance
\[ V_{bRd} = chi \times A_{e} \times f_{yw} / (\gamma_{M1} \times 1000) = 12410 \text{ kN} \]

Axial force in the stiffener due to shear - BS EN 1993-1-5

Shear buckling coefficient for web panel \( k_t \) is derived from Clause 5.2.
Buckling coefficient (Annex A)
\[ k_t = 5.34 + 4 \times (hw/a)^2 = 9.3067 \]
Modified slenderness \( \lambda_w \)
\[ \lambda_w = 0.76 \times (fy/t_{cr})^0.5 = 0.63565 \]
Max design shear force in panel \( V_{Ed1} = 5370 \text{ kN} \)
Externally applied design load \( P_{ext1} = 0 \text{ kN} \)

Option 1:
Longitudinal compressive stress \( ox_{Ed} = 0 \) for symmetrical sections.
Vertical force generated in stiffener arising from the shear induced tension field (see older version of NA to BS EN 1993-1-5:2006):
\[ P_{Ed1} = V_{Ed1} - hw \times tw \times 0.8 \times t_{cr} / 1000 = -19981 \text{ kN} \]

Option 2:
Vertical force generated in the stiffener as per BS EN 1993-1-5 (see NOTE, Clause 9.3.3(3)):
\[ P_{Ed1} = V_{Ed1} - f_{yw} \times hw \times tw / (\text{SQR}(3) \times \gamma_{M1} \times \lambda_w^2 \times 1000) = -26305 \text{ kN} \]
Design axial load in stiffener \( P_{Ed} = P_{Ed1} + P_{ext1} = 0 \text{ kN} \)
As \( P_{Ed} \leq V_{bRd} \) (0 kN \( \leq 12410 \text{ kN} \)), the design shear force does not exceed the shear resistance. Hence OK.

Connection to the web

Design shear load on weld
\[ F_{wEd} = tw^2 / (5 \times hsi) = 0.98 \text{ kN/mm} \]
Weld size provided \( sw_1 = 6 \text{ mm} \)

Stiffness check - Clause 9.3.3(3)

2nd moment of area (effective section)
\[ I_{pro} = 322.55 \times 10^6 \text{ mm}^4 \]
2nd moment of area required
\[ I_{req} = 1.5 \times hw^3 \times tw^3 / a^2 = 152.43 \times 10^6 \text{ mm}^4 \]
As \( I_{req} \leq I_{pro} \) (152.43E6 mm^4 \( \leq 322.55E6 \text{ mm}^4 \)), the stiffener is OK.
Web check between stiffeners

\[ w' \text{ kN/m} \]

Girder assumed to have non-rigid end posts.

UDL applied between stiffeners \( w' = 432 \text{ kN/m} \) (factored load)

Largest panel length \( a' = 2400 \text{ mm} \)

Compressive stress of web \( \text{sed} = w'/tw = 12.343 \text{ N/mm}^2 \)

Compressive strength of web \( \text{fed} = (2.75 + 2/(a'/hw)^2) \times E/(C/tw)^2 = 217.52 \text{ N/mm}^2 \)

Since \( \text{sed} \leq \text{fed} \) (12.343 N/mm² ≤ 217.52 N/mm²), the web is OK.

Selected fillet weld size \( s = 13 \text{ mm} \)

Bearing stiffener (double sided non-rigid end post)

It is assumed that the support reaction acts at the centroid of the effective stiffener section, such that there is no bending moment induced. Bearing stiffener consists a single double-sided stiffener. The stiffener effective cross section is as shown below:

Depth of bearing stiffener \( h_{sb} = 300 \text{ mm} \)

Thickness of bearing stiffener \( t_{sb} = 30 \text{ mm} \)

Distance \( c_1 = 250 \text{ mm} \)

Design buckling resistance \( Nb_{Rd} = \chi * Ast * f_{yw} / (\gamma M_1 * 1000) = 11952 \text{ kN} \)

As \( Nb_{Ed} \leq Nb_{Rd} \) (6281 kN ≤ 11952 kN), the design bearing reaction at the support is less than the design buckling resistance. Hence satisfactory.

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)

Ratio \( (h_{sb}/t_{sb}) = 10 \)

Limit to ratio \( p = (h_{sb}/t_{sb}) \) is \( 13\pi = 12.242 \).

Ratio \( (h_{sb}/t_{sb}) = 10 \) is not greater than limit \( 13\pi = 12.242 \).

Stiffener complies with Clause 9.2.1(8).
DESIGN SUMMARY

Span of plate girder: 23.38 m
Design moment: 29515 kNm
All steel to be: Grade S 275

End stiffener: c1 = 250 mm
Posts 1 is a double-sided stiffener at end of girder.

Double-sided stiffeners: post 1 2No/300 mm x 30 mm flats
Intermediate stiffeners: ai = 2400 mm

Intermediate stiffeners:
Arrangement (1) Double-sided stiffeners
2No/250 mm x 25 mm flats
spaced at 2400 mm centres

Assume non-rigid end posts to EN 1993-1-5, Figure 5.1 & Table 5.1.
The girder is fully restrained along its length. The design calculations are in accordance with BS EN 1993-1-1 and BS EN 1993-1-5.

Loads and moments are factored.

Assume rigid end posts (two double-sided stiffeners at supports).

Span of girder \( L = 25 \text{ m} \)

Maximum design bending moment \( M_{yEd} = 14028 \text{ kNm} \)

Design bearing reaction \( N_{bEd} = 2200 \text{ kN} \)

Depth of girder \( h = 2030 \text{ mm} \)

Web thickness \( t_w = 13 \text{ mm} \)

Stiffener corner snipe \( s_{np} = 15 \text{ mm} \)

Determine the effective section properties - EN 1992-1-5, Cl. 4.4

The process is iterative as the amount of web not considered is a function of the stresses at the top and bottom of the web.

Iteration 1:

Gross area of section \( A = 2btf + hw'tw = 81350 \text{ mm}^2 \)

Gross 2nd moment of area \( I_y = (b'(hw+2tf)^3 - (b-tw)hw^3)/12 = 63.482E9 \text{ mm}^4 \)

Stress at top of web \( s_{1} = M_{yEd} * 10^6 * hw/2/I_y = 215.45 \text{ N/mm}^2 \)

Stress at bottom of web \( s_{2} = -M_{yEd} * 10^6 * hw/2/I_y = -215.45 \text{ N/mm}^2 \)

Iteration 10:

Position of effective centroid:

\[ z_{eff} = \left( A'h/2 - Aw\cdot(z_{effp} + be2 + lw/2) \right) / A_{eff} = 993.96 \text{ mm} \]

Effective 2nd moment of area:

\[ I_{y_{eff}} = I_y + A\cdot(h/2 - z_{eff})^2 - tw\cdot1w^3/12 - Aw\cdot(z_{effp} + be2 + lw/2 - z_{eff})^2 = 62.521E9 \text{ mm}^4 \]

Top of web stress \( s_{1(10)} = M_{yEd} \cdot 10^6 \cdot (h-tf - z_{eff})/I_{y_{eff}} = 223.48 \text{ N/mm}^2 \)

Bottom of web stress \( s_{2(10)} = -M_{yEd} \cdot 10^6 \cdot (z_{eff} - tf)/I_{y_{eff}} = -214.04 \text{ N/mm}^2 \)

Net loss area \( A_{w} = lw'tw = 2977.9 \text{ mm}^2 \)

Effective area of section \( A_{eff} = A - A_{w} = 78372 \text{ mm}^2 \)

Effective section modulus \( W_{effy} = I_{y_{eff}} / (1000 \cdot (h - z_{eff})) = 60346 \text{ cm}^3 \)
Dimensions of web and flanges

Stiffener spacing of first panel  $a_e=2500$ mm
Intermediate stiffener spacing  $a_i=2500$ mm
Accompanying design shear  $V_{zEd}'=0$ kN

**Bearing stiffeners double sided - BS EN 1993-1-5 section 9**

Bearing stiffeners are assumed to be symmetric about the beam web and will be designed as a strut to BS EN 1993-1-5 Clause 9.4(2), resisting the bearing reaction together with any eccentricities.

- Compute $k_t$ from Annex A: $k_t = 5.34 + 4 \times (h_w/a)^2 = 7.7736$
- Design shear resistance: $V_{bRd} = \chi_i w \times f_y \times h_w \times t_w / (SQR(3) \times \gamma_{M1} \times 1000) = 2355.2$ kN
- Design shear at the support: $V_{Ed(0)} = N_{bRd} = 2200$ kN

As $V_{Ed(0)} \leq V_{bRd}$ (2200 kN ≤ 2355.2 kN), the design shear at the support is less than the design shear resistance. Hence OK.

**Action as a bearing stiffener**

Compute $kt$ from Annex A: $k_t = 5.34 + 4 \times (h_w/a)^2 = 7.7736$

Design shear resistance: $V_{bRd} = \chi_i w \times f_y \times h_w \times t_w / (SQR(3) \times \gamma_{M1} \times 1000) = 2355.2$ kN

Design shear at the support: $V_{Ed(0)} = N_{bRd} = 2200$ kN

As $V_{Ed(0)} \leq V_{bRd}$ (2200 kN ≤ 2355.2 kN), the design shear at the support is less than the design shear resistance. Hence OK.

**Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)**

Ratio $(h_{sb}/t_{sb}) = h_{sb}/t_{sb} = 10$
Limit to ratio $p=(h_{sb}/t_{sb})$ is $13r=12.242$.
Ratio $(h_{sb}/t_{sb})=10$ is not greater than limit $13r=12.242$.
Stiffener complies with Clause 9.2.1(8).
**Action as a rigid end post**

A rigid end post comprise of two double-sided transverse stiffeners that form the flanges of a short beam of length $hw$. The effective section below will be taken to exclude the outer parts of web plate.

![Diagram of two double-sided stiffeners at support](image)

Minimum area: $A_{min} = 4 \times hw \times tw^2 / c^2 = 4394 \text{ mm}^2$

Actual area provided: $A_{sp} = 2 \times hsb \times tsb = 12500 \text{ mm}^2$

As $A_{sp} \geq A_{min}$ (12500 mm$^2 \geq 4394$ mm$^2$), stiffener area is adequate.

In-plane moment: $M_{zEdm} = N \times hw / (8 \times 1E3) = 513.98 \text{ kNm}$

End post 2nd moment of area: $I_{ze} = 2 \times (A_{sp} \times (c^2 / 2)^2) = 562.5E6 \text{ mm}^4$

Worst stiffener stress from membrane action will be calculated below.

Stress due to membrane action:

$$s_{stm} = M_{zEdm} \times 1E6 / (I_{ze} / (c^2 / 2 + tsb / 2))$$

$$= 148.48 \text{ N/mm}^2$$

**Cross-section resistance check**

The maximum stresses from membrane action and bearing reaction will be added together here for simplicity, even though they occur at different heights on the stiffener.

Total stress: $s_{stT} = s_{st} + s_{stm} = 233.3 \text{ N/mm}^2$

As $s_{stT} \leq f_y$ (233.3 N/mm$^2 \leq 265$ mm$^2$), stiffener is OK.

**Buckling check under combined bending and axial load**

The stiffener will be checked for buckling under combined bending and axial load in accordance with BS EN 1993-1-1, Clause 6.3.3.

Critical load: $N_{cry} = \frac{\pi^2 \times E \times I_{yy}}{L_{cry}^2 \times 1000}$

$$= 306613 \text{ kN}$$

Slenderness of the stiffener: $\lambda_{mb} = (A \times f_y / (N_{cry} \times 1E3))^{0.5} = 0.16518$

Design axial load resistance: $N_{plRd} = A \times f_y / (\gamma_{M1} \times 1000) = 8365.6 \text{ kN}$

Design moment resistance yy axis: $M_{yb} = W_{ely} \times f_y / (\gamma_{M1} \times 1E6) = 581.16 \text{ kNm}$

Design moment resistance zz axis: $M_{zbb} = W_{elzb} \times f_y / (\gamma_{M1} \times 1E6)$

$$= 1145.2 \text{ kNm (bearing)}$$

Design moment resistance zz axis:

$$M_{zRdm} = W_{elzm} \times f_y / (\gamma_{M1} \times 1E6) = 917.31 \text{ kNm (membrane)}$$

Interaction equation:

$$Uni = \frac{N_{Ed} / (\chi_{yy} \times N_{plRd}) + \text{ratio} \times (M_{yEd} / M_{yRd}) + (M_{zEdb} / M_{zRdb} + M_{Edm} / M_{Rdm})}{0.88064}$$

As $Uni \leq 1.0$ (0.88064 ≤ 1.0), the interaction equation is OK.
Connection of stiffeners to girder web

Net stiffener length \( L_{sn} = hw - 2snp = 1920 \text{ mm} \)
Assumed weld size \( ss' = 6 \text{ mm} \)
Effective length of weld \( L_w = 8(Lsn - 2ss') = 15264 \text{ mm} \)
Design load on weld \( F_{wEd} = NbEd 	imes 10^3 / Lw = 144.13 \text{ N/mm} \)
Design weld resistance \( F_{wRd} = 0.7ss'fvwd = 935.71 \text{ N/mm} \)

Shear buckling resistance - EN 1993-1-1, Clause 6.2.6(6)

As \( hw/tw > 72\cdot ew \) (150 > 66.558), the web shear buckling resistance needs to be checked (EN 1993-1-5 Clause 5.2 and 5.3).
Buckling coefficient (Annex A) \( k_t = 5.34 + 4(hw/a)^2 = 7.7736 \)
Modified slenderness \( \lambda = \frac{hw}{(37.4\cdot tw\cdot ew\cdot SQR(kt))} = 1.5561 \)
Shear resistance of web \( V_{plRd} = 3878.5 \text{ kN} \)
Reduced design shear resistance at support (web contribution only will be considered):
\[ V_{bwRd} = \chi_{w} f_{yw} hw tw / (3^0.5 \cdot \gamma_{M1} \cdot 1000) = 2444 \text{ kN} \]

Design shear at support \( V_{Ed}(0) = NbEd = 2200 \text{ kN} \)
As \( V_{Ed}(0) \leq V_{bwRd} \) (2200 kN \( \leq 2444 \) kN), the shear force is less than the shear resistance. Hence section OK.
compute \( \text{comp} = \eta_1 + (1 - M_{Rd}/M_{plRd}) \cdot (2 \cdot \eta_3 - 1)^2 = 0.9263 \)
As \( \text{comp} \leq 1 \) (0.9263 \( \leq 1 \)), interaction equation is satisfied.

Intermediate transverse web stiffeners - Arrangement (1)

Intermediate transverse web stiffeners - Arrangement (1)

Elevation on web without longitudinal stiffening
Panel length 1 \( a(1) = 2500 \text{ mm} \)
Length of stiffener \( l_s = 1950 \text{ mm} \)

Longitudinal stresses in web with transverse stiffeners
\( l_s = 1950 \text{ mm} \)

Compression stresses are positive
Stress at top of web plate (\(\sigma_{\text{top}}\)) \(=251.76\) N/mm\(^2\)
Stress at btm of web plate (\(\sigma_{\text{btm}}\)) \(=251.76\) N/mm\(^2\)

**Design parameters**

Stiffener outstand \(h_{s1}=150\) mm
Stiffener thickness \(t_{s1}=20\) mm

**Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)**

Yield strength to be adopted \(f_y=275\) N/mm\(^2\)
Ratio \((h_{s1}/t_{s1})\) \(=h_{s1}/t_{s1}=7.5\)
Limit to ratio \(p=(h_{s1}/t_{s1})\) is \(13\pi=12.017\).
Ratio \(h_{s1}/t_{s1}=7.5\) is not greater than limit \(13\pi=12.017\).
Stiffener complies with Clause 9.2.1(8).

**Design shear resistance (double sided transverse stiffener)**

The effective cross section of the intermediate double-sided transverse stiffener is as shown below:

2nd moment of area \(y\) axis:
\[I_{yy}=t_{si}*(2*h_{si}+t_{w})^3/12+(30*e_{w}*t_{w})*t_{w}^3/12\]
\[=51.173E6\] mm\(^4\)

Design shear resistance \(V_{bRd}=\chi*AE*f_{ysi}/(\gamma M_1*1000)\)
\[=2839.1\] kN

**Axial force in the stiffener due to shear - BS EN 1993-1-5**

Shear buckling coefficient for web panel \(k_t\) is derived from Clause 5.2.
Buckling coefficient (Annex A) \(k_t=5.34+4*(h/w/a)^2=7.7736\)
Modified slenderness \(\lambda_w\) \(=0.76*(f_y/t_{cr})^0.5=1.5564\)
Max design shear force in panel \(V_{Ed1}=2000\) kN
Externally applied design load \(P_{ext1}=0\) kN

Option 1:
Longitudinal compressive stress \(\sigma_{xEd}=0\) for symmetrical sections.
Vertical force generated in stiffener arising from the shear induced tension field (see older version of NA to BS EN 1993-1-5:2006):
\[P_{Ed1}'=V_{Ed1}-h*w*tw*0.8*t_{cr}/1000=670.15\] kN

Option 2:
Vertical force generated in the stiffener as per BS EN 1993-1-5
(see NOTE, Clause 9.3.3(3)):
\[P_{Ed1}=V_{Ed1}-f_y*w*h*w/(SQR(3)*\gamma M_1*\lambda_w^2*1000)=338.4\] kN
Generated force to be adopted \(P_{Ed1}=670.15\) kN
Design axial load in stiffener  \( P_{Ed} = P_{Ed1} + P_{ext1} = 670.15 \text{ kN} \)

As \( P_{Ed} \leq V_{bRd} \) (670.15 kN \( \leq 2839.1 \text{ kN} \)), the design shear force does not exceed the shear resistance. Hence OK.

**Connection to the web**

Design shear load on weld  \( F_{wEd} = \frac{t_w^2}{5 \times h_s1} + \frac{P_{Ed}}{2 \times (h_w - 2 \times s_{np})} \)

= 0.39985 kN/mm

Weld size provided  \( s_{w1} = 6 \text{ mm} \)

**Stiffness check - Clause 9.3.3(3)**

2nd moment of area (effe. section)  \( I_{pro} = 5.1.173E6 \text{ mm}^4 \)

2nd moment of area required  \( I_{req} = 1.5 \times h_w^3 \times t_w^3 / a^2 = 3.9097E6 \text{ mm}^4 \)

As \( I_{req} \leq I_{pro} \) (3.9097E6 mm\(^4\) \( \leq 5.1.173E6 \text{ mm}^4 \)), the stiffener is OK.

**Web check between stiffeners**

\( w' \) kN/m

\[ w' = 92 \text{ kN/m (factored load)} \]

\( a' = 2500 \text{ mm} \)

Compressive stress of web  \( s_{ed} = w' / t_w = 7.0769 \text{ N/mm}^2 \)

Compressive strength of web  \( s_{ed} = (2.75 + 2 / (a' / h_w)^2) \times E / (C / t_w)^2 \)

= 37.952 N/mm\(^2\)

Since \( s_{ed} \leq s_{ed} \) (7.0769 N/mm\(^2\) \( \leq 37.952 \text{ N/mm}^2 \)), the web is OK.

Selected fillet weld size  \( s = 12 \text{ mm} \)

**Intermediate transverse web stiffeners - Arrangement (2)**

Panel length 1  \( a(3) = 2800 \text{ mm} \)

Stiffener outstand  \( h_s2 = 200 \text{ mm} \)

Stiffener thickness  \( t_s2 = 20 \text{ mm} \)

**Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)**

Yield strength to be adopted  \( f_y = 265 \text{ N/mm}^2 \)

Ratio \( (h_s2 / t_s2) \)  \( p = h_s2 / t_s2 = 10 \)

Limit to ratio \( p = (h_s2 / t_s2) \) is 13\( r = 12.242 \).

Ratio \( (h_s2 / t_s2) = 10 \) is not greater than limit 13\( r = 12.242 \).

Stiffener complies with Clause 9.2.1(8).
Design shear resistance (double sided transverse stiffener)

The effective cross section of the intermediate double-sided transverse stiffener is as shown below:

```
  tsi                           z
  -----------------------------
  15.ε.tw                      15.ε.tw
  --------------------
  hsi                         15.ε.tw
  -----------------------------
  tw                         PLAN ON INTERMEDIATE
  hsi       STIFFENER
```

2nd moment of area yy axis:

\[ I_{yy} = tsi \times (2 \times hsi + tw)^3/12 + (30 \times ew \times tw) \times tw^3/12 \]

= \( 117.47E6 \) mm\(^4\)

Design shear resistance

\[ V_{bRd} = \frac{chi \times Ae \times fysi}{\gamma_M1 \times 1000} \]

= \( 3430.9 \) kN

Axial force in the stiffener due to shear

Max design shear force in panel \( V_{Ed2} = 2200 \) kN

Externally applied design load \( P_{ext2} = 0 \) kN

Generated force to be adopted \( P_{Ed2} = 954.56 \) kN

Design axial load in stiffener \( P_{Ed'} = P_{Ed2} + P_{ext2} = 954.56 \) kN

As \( P_{Ed'} \leq V_{bRd} \) (954.56 kN \( \leq 3430.9 \) kN), the design shear force does not exceed the shear resistance. Hence OK.

Connection to the web

Design shear load on weld \( F_{wEd} = tw^2/(5 \times hs2) + P_{Ed'}/(2 \times (hw-2 \times snp)) = 0.41758 \) kN/mm

Weld size provided \( sw2 = 6 \) mm

Stiffness check - Clause 9.3.3(3)

2nd moment of area (eff. section) \( I_{pro} = 117.47E6 \) mm\(^4\)

2nd moment of area required \( I_{req} = 0.75 \times hw \times tw^3 = 3.2131E6 \) mm\(^4\)

As \( I_{req} \leq I_{pro} \) (3.2131E6 mm\(^4\) \( \leq 117.47E6 \) mm\(^4\)), the stiffener is OK.
DESIGN SUMMARY

Span of plate girder: 25 m
Design moment: 14028 kNm
All steel to be: Grade S 275

End stiffeners:

- Posts 1 & 2 are double-sided stiffeners at end of girder.
  - Post 1: 2No/250 mm x 25 mm flats
  - Post 2: 2No/250 mm x 25 mm flats

Intermediate stiffeners:

- Arrangement (1): Double-sided stiffeners
  - 2No/150 mm x 20 mm flats
  - spaced at 2500 mm centres

- Arrangement (2): Double-sided stiffeners
  - 2No/200 mm x 20 mm flats
  - spaced at 2800 mm centres

- b=700 mm
- h=2030 mm
- tw=13 mm
- tf=40 mm

Fillet welds to be used for connecting stiffeners to girder web & flanges.
Weld sizes as detailed in calculations.
Weld design strength to be 222 N/mm².

Assume rigid end posts to BS EN 1993-1-5, Figure 5.1 & Table 5.1.
Stiffened plate girder

The girder is fully restrained along its length. The design calculations are in accordance with BS EN 1993-1-1 and BS EN 1993-1-5. Loads and moments are factored.

Assume non-rigid end posts to BS EN 1993-1-5, Figure 5.1 & Table 5.1.

Span of girder \( L = 30 \text{ m} \)

Maximum design bending moment \( M_y = 18909 \text{ kNm} \)

Design bearing reaction \( N_b = 2293 \text{ kN} \)

Depth of girder \( h = 2100 \text{ mm} \)

Web thickness \( t_w = 15 \text{ mm} \)

Stiffener corner snipe \( s_n = 15 \text{ mm} \)

Determine the effective section properties – EN 1992-1-5, Cl. 4.4

The process is iterative as the amount of web not considered is a function of the stresses at the top and bottom of the web.

Iteration 1:

Gross area of section \( A = 2b \times t_f + h_w \times t_w = 105000 \text{ mm}^2 \)

Gross 2nd moment of area \( I_y = \frac{b \times (h_w + 2 \times t_f - t_w)^3 - (b - t_w) \times h_w^3}{12} = 88.813E9 \text{ mm}^4 \)

Stress at top of web \( s_1 = \frac{M_y \times 10^6 \times h_w}{2 \times I_y} = 212.91 \text{ N/mm}^2 \)

Stress at bottom of web \( s_2 = \frac{-M_y \times 10^6 \times h_w}{2 \times I_y} = -212.91 \text{ N/mm}^2 \)

Iteration 10:

Position of effective centroid:
\[
zeff = \frac{(A \times h/2 - Aw \times (zeffp + be2 + lw/2))}{Aeff} = 1039.7 \text{ mm}
\]

Effective 2nd moment of area:
\[
I_{yeff} = I_y + A \times (h/2 - zeff)^2 - tw \times lw^3/12 - Aw \times (zeffp + be2 + lw/2 - zeff)^2 = 88.178E9 \text{ mm}^4
\]

Top of web stress \( s_1(10) = \frac{M_y \times 10^6 \times (h - tf - zeff)}{I_{yeff}} = 216.65 \text{ N/mm}^2 \)

Bottom of web stress \( s_2(10) = -\frac{M_y \times 10^6 \times zeff - tf}{I_{yeff}} = -212.23 \text{ N/mm}^2 \)

Net loss area \( Aw = lw \times tw = 1823.4 \text{ mm}^2 \)

Effective area of section \( A_{eff} = A - Aw = 103177 \text{ mm}^2 \)

Effective section modulus \( W_{yeff} = I_{yeff} / (1000 \times (h - zeff)) = 83162 \text{ cm}^3 \)
Dimensions of web and flanges

Stiffener spacing of first panel  \( ae = 1550 \text{ mm} \)
Intermediate stiffener spacing  \( ai = 3900 \text{ mm} \)
Accompanying design shear  \( V_{zEd'} = 0 \text{ kN} \)

Shear buckling resistance - EN 1993-1-1, Clause 6.2.6(6)

As \( hw/tw > 72*ew \) (133.33 > 66.558), the web shear buckling resistance needs to be checked (EN 1993-1-5 Clause 5.2 and 5.3).
Buckling coefficient (Annex A)  \( kt = 4 + 5.34*(hw/a)^2 = 12.891 \)
Modified slenderness \( \lambda \)  \( lamw = hw/(37.4*tw*ew*SQR(kt)) = 1.0741 \)
Shear resistance of web  \( V_{plRd} = 4416.7 \text{ kN} \)
Reduced design shear resistance at support (web contribution only will be considered):
\[
V_{bwRd} = \chi_{iw} * f_{yw} * hw*tw/(3^0.5*\gamma_{M1}*1000) = 3680.5 \text{ kN}
\]

Design shear at support  \( V_{Ed(0)} = Nb_{Ed} = 2293 \text{ kN} \)
As \( V_{Ed(0)} \leq V_{bwRd} \) (2293 kN ≤ 3680.5 kN), the shear force is less than the shear resistance. Hence section OK.
compute  \( \text{comp} = \eta_1 + (1-M_{Rd}/M_{plRd})*(2*\eta_3 -1)^2 = 0.89624 \)
As \( \text{comp} \leq 1 \) (0.89624 ≤ 1), interaction equation is satisfied.

Intermediate transverse web stiffeners - Arrangement (1)

Elevation on web without longitudinal stiffening

Panel length 1  \( a(1) = 3900 \text{ mm} \)
Length of stiffener  \( ls = 2000 \text{ mm} \)

Longitudinal stresses in web with transverse stiffeners
Compression stresses are positive
Stress at top of web plate (σtop) stop=245.97 N/mm²
Stress at btm of web plate (σbtm) sbtm=-245.97 N/mm²

Design parameters

Stiffener outstand       hsl=80 mm
Stiffener thickness      tsl=15 mm

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)

Yield strength to be adopted      fy=275 N/mm²
Ratio (hsl/tsl)                   p=hsl/tsx=5.3333
Limit to ratio p=(hsl/tsx) is 13ε=12.017.
Ratio (hsl/tsx)=5.3333 is not greater than limit 13ε=12.017.
Stiffener complies with Clause 9.2.1(8).

Design shear resistance (double sided transverse stiffener)

The effective cross section of the intermediate double-sided transverse stiffener is as shown below:

\[
\begin{align*}
\text{tsi} & \quad 15.0.\text{tw} \quad 15.0.\text{tw} \\
\text{hsi} & \quad \text{tw} \quad \text{PLAN ON INTERMEDIATE STIFFENER} \\
\text{tw} & \quad \text{PLAN ON INTERMEDIATE STIFFENER}
\end{align*}
\]

2nd moment of area yy axis:
\[
I_{yy}=\text{tsi} \cdot (2 \times \text{hsi}+\text{tw})^3/12+(30 \times \text{ew} \times \text{tw}) \times \text{tw}^3/12 =6.8162E6 \text{ mm}^4
\]
Design shear resistance \( V_{bRd}=\chi \cdot A_{e} \cdot f_{yw}/(\gamma_{M1} \times 1000) =1880.9 \text{ kN} \)

Axial force in the stiffener due to shear - BS EN 1993-1-5

Shear buckling coefficient for web panel \( k_t \) is derived from Clause 5.2.
Buckling coefficient (Annex A) \( k_t=5.34+4 \times (h/w/a)^2=6.3919 \)
Modified slenderness \( \lambda w \) \( \lambda w=0.76 \times (f/y/tcr)^0.5=1.5256 \)
Max design shear force in panel \( V_{Ed1}=2152 \text{ kN} \)
Externally applied design load \( P_{ext1}=0 \text{ kN} \)

Option 1:
Longitudinal compressive stress \( \sigma_{xEd}=0 \) for symmetrical sections.
Vertical force generated in stiffener arising from the shear induced tension field (see older version of NA to BS EN 1993-1-5:2006):
\[
P_{Ed1}'=V_{Ed1}-hw\times tw\times 0.8\times tcr/1000=514.19 \text{ kN}
\]

Option 2:
Vertical force generated in the stiffener as per BS EN 1993-1-5 (see NOTE, Clause 9.3.3(3)):
\[
P_{Ed1}=V_{Ed1}-f_{yw} \times hw\times tw/(\sqrt{3} \times \gamma_{M1} \times \lambda w^2 \times 1000)=105.63 \text{ kN}
\]
Generated force to be adopted \( P_{Ed1}=514.19 \text{ kN} \)
Design axial load in stiffener \( P_{Ed}=P_{Ed1}+P_{ext1}=514.19 \text{ kN} \)
As $P_{Ed} \leq V_{bRd}$ (514.19 kN $\leq$ 1880.9 kN), the design shear force does not exceed the shear resistance. Hence OK.

**Connection to the web**

Design shear load on weld

$$F_{wEd} = \frac{tw^2}{5*hs1} + \frac{P_{Ed}}{2*(hw-2*snp)} = 0.69301 \text{ kN/mm}$$

Weld size provided

$s_{w1} = 6 \text{ mm}$

**Stiffness check - Clause 9.3.3(3)**

2nd moment of area (effe. section) $I_{pro} = 6.8162E6 \text{ mm}^4$

2nd moment of area required

$I_{req} = 0.75*hw*tw^3 = 5.0625E6 \text{ mm}^4$

As $I_{req} \leq I_{pro}$ ($5.0625E6 \text{ mm}^4 \leq 6.8162E6 \text{ mm}^4$), the stiffener is OK.

**Web check between stiffeners**

Girder assumed to have non-rigid end posts.

UDL applied between stiffeners

$w' = 91.2 \text{ kN/m}$ (factored load)

Largest panel length

$a' = 3900 \text{ mm}$

Compressive stress of web

$sed = w'/tw = 6.08 \text{ N/mm}^2$

Compressive strength of web

$fed = \left(2.75 + \frac{2}{(a'/hw)^2}\right)E/(C/tw)^2 = 39.643 \text{ N/mm}^2$

Since $sed \leq fed$ ($6.08 \text{ N/mm}^2 \leq 39.643 \text{ N/mm}^2$), the web is OK.

Selected fillet weld size

$s = 8 \text{ mm}$

**Intermediate transverse web stiffeners - Arrangement (2)**

Panel length 1

$a(3) = 5650 \text{ mm}$

Stiffener outstand

$hs2 = 80 \text{ mm}$

Stiffener thickness

$ts2 = 15 \text{ mm}$

**Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)**

Yield strength to be adopted

$fy = 275 \text{ N/mm}^2$

Ratio ($hs2/ts2$)

$p = hs2/ts2 = 5.3333$

Limit to ratio $p = (hs2/ts2)$ is $13\varepsilon = 12.017$. Ratio ($hs2/ts2$) = 5.3333 is not greater than limit $13\varepsilon = 12.017$.

Stiffener complies with Clause 9.2.1(8).

**Axial force in the stiffener due to shear**

Max design shear force in panel

$V_{Ed2} = 1440 \text{ kN}$

Externally applied design load

$P_{ext2} = 925 \text{ kN}$

Design axial load in stiffener

$P_{Ed'} = P_{Ed2} + P_{ext2} = 925 \text{ kN}$
As $P_{Ed}' \leq V_{bRd}$ ($925 \text{ kN} \leq 1880.9 \text{ kN}$), the design shear force does not exceed the shear resistance. Hence OK.

**Connection to the web**

Design shear load on weld

$$F_{wEd} = \frac{tw^2}{5*(hs^2)} + \frac{P_{Ed}'}{2*(hw-2*snp)} = 0.79727 \text{ kN/mm}$$

Weld size provided

$$sw^2 = 6 \text{ mm}$$

**Stiffness check - Clause 9.3.3(3)**

2nd moment of area (eff. section) $I_{pro} = 6.8162E6 \text{ mm}^4$

2nd moment of area required $I_{req} = 0.75*hw*tw^3 = 5.0625E6 \text{ mm}^4$

As $I_{req} \leq I_{pro}$ ($5.0625E6 \text{ mm}^4 \leq 6.8162E6 \text{ mm}^4$), the stiffener is OK.

**Bearing stiffener (double sided non-rigid end post)**

It is assumed that the support reaction acts at the centroid of the effective stiffener section, such that there is no bending moment induced. Bearing stiffener consists a single double-sided stiffener. The stiffener effective cross section is as shown below:

![Diagram of bearing stiffener](image)

Depth of bearing stiffener $h_{sb} = 280 \text{ mm}$

Thickness of bearing stiffener $t_{sb} = 24 \text{ mm}$

Distance $c_1 = 0 \text{ mm}$

Design buckling resistance

$$N_{bRd} = \frac{\chi_1*A_{stf}*f_{ysb}}{\gamma_{M1}*1000} = 4483.8 \text{ kN}$$

As $N_{bEd} \leq N_{bRd}$ ($2293 \text{ kN} \leq 4483.8 \text{ kN}$), the design bearing reaction at the support is less than the design buckling resistance. Hence satisfactory.

**Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)**

Ratio $(h_{sb}/t_{sb}) = h_{sb}/t_{sb} = 11.667$

Limit to ratio $p = (h_{sb}/t_{sb})$ is $13\varepsilon = 12.242$.

Ratio $(h_{sb}/t_{sb}) = 11.667$ is not greater than limit $13\varepsilon = 12.242$.

Stiffener complies with Clause 9.2.1(8).
DESIGN SUMMARY

Span of plate girder              30 m
Design moment                     18909 kNm
All steel to be                   Grade S 275

End stiffener:

Posts 1 is a double-sided stiffener at end of girder.

Double-sided stiffeners: post 1 2No/280 mm x 24 mm flats

Intermediate stiffeners:

Intermediate stiffeners:
Arrangement (1) Double-sided stiffeners
2No/80 mm x 15 mm flats
spaced at 3900 mm centres

Intermediate stiffeners:
Arrangement (2) Double-sided stiffeners
2No/80 mm x 15 mm flats
spaced at 5650 mm centres

Assume non-rigid end posts to EN 1993-1-5, Figure 5.1 & Table 5.1.
Location: Ex8 - Single-sided intermediate stiffeners

Stiffened plate girder

The girder is fully restrained along its length. The design calculations are in accordance with BS EN 1993-1-1 and BS EN 1993-1-5. Loads and moments are factored.

Assume non-rigid end posts to BS EN 1993-1-5, Figure 5.1 & Table 5.1.
Span of girder L=12 m
Maximum design bending moment MyEd=2800 kNm
Design bearing reaction NbEd=1450 kN
Depth of girder h=1240 mm
Web thickness tw=12 mm
Stiffener corner snipe snp=15 mm

Dimensions of web and flanges

Stiffener spacing of first panel ae=1550 mm
Intermediate stiffener spacing ai=5000 mm
Accompanying design shear VzEd'=0 kN

Shear buckling resistance - EN 1993-1-1, Clause 6.2.6(6)

As hw/tw > 72*ew (99.167 > 66.558), the web shear buckling resistance needs to be checked (EN 1993-1-5 Clause 5.2 and 5.3).
Buckling coefficient (Annex A) kt=5.34+4*(hw/a)^2=7.6977
Modified slenderness λ lamw=hw/(37.4*tw*ew*SQR(kt))=1.0338
Shear resistance of web VplRd=2184.8 kN
Reduced design shear resistance at support (web contribution only will be considered):

VbwRd=chiw*fyw*hw*tw/(3^0.5*gamM1*1000)=1820.3 kN

Design shear at support VEd(0)=NbEd=1450 kN
As VEd(0) ≤ VbwRd (1450 kN ≤ 1820.3 kN), the shear force is less than the shear resistance. Hence section OK.
compute comp=eta1+(1-MfRd/MplRd)*(2*eta3 -1)^2=0.78202
As comp ≤ 1 (0.78202 ≤ 1), interaction equation is satisfied.
Intermediate transverse web stiffeners - Arrangement (1)

Panel length 1 \( a(1) = 5000 \text{ mm} \)
Length of stiffener \( ls = 1190 \text{ mm} \)

Stress at top of web plate \( \sigma_{\text{top}} = 230.45 \text{ N/mm}^2 \)
Stress at btm of web plate \( \sigma_{\text{btm}} = -230.45 \text{ N/mm}^2 \)

Design parameters
Stiffener outstand \( hs_1 = 150 \text{ mm} \)
Stiffener thickness \( ts_1 = 15 \text{ mm} \)

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)
Yield strength to be adopted \( f_y = 275 \text{ N/mm}^2 \)
Ratio \( p = \frac{hs_1}{ts_1} = 10 \)
Limit to ratio \( p = \frac{hs_1}{ts_1} = 13r = 12.017 \).
Ratio \( p = 10 = 13r = 12.017 \).
Stiffener complies with Clause 9.2.1(8).

Ref No: SC470 EC

**Design shear resistance (single-sided transverse stiffener)**

The effective cross section of the intermediate single-sided transverse stiffener is as shown below:

```
  tsi                  z
  15.ê.tw             15.ê.tw
    tw
    hsi

PLAN ON INTERMEDIATE STIFFENER
```

2nd moment of area yy axis \( I_{yy} = I_{pro} = 13.86 \times 10^6 \text{ mm}^4 \)

Design shear resistance \( V_{b,Rd} = \chi A_e f_{yw}/(\gamma_M 1 \times 1000) = 1747.2 \text{ kN} \)

**Axial force in the stiffener due to shear - BS EN 1993-1-5**

Shear buckling coefficient for web panel \( k_t \) is derived from Clause 5.2.

Buckling coefficient (Annex A) \( k_t = 5.34 + 4 \times (h_{w/a})^2 = 5.5666 \)

Modified slenderness \( \lambda_w \) \( \lambda_w = 0.76 \times (f_{yw}/t_{cr})^{0.5} = 1.2159 \)

Max design shear force in panel \( V_{Ed1} = 1200 \text{ kN} \)

Externally applied design load \( P_{ext1} = 975 \text{ kN} \)

Option 1:

Longitudinal compressive stress \( \sigma_{x,Ed} = 0 \) for symmetrical sections.

Vertical force generated in stiffener arising from the shear induced tension field (see older version of NA to BS EN 1993-1-5:2006):

\( P_{Ed1}' = V_{Ed1} - h_w \times t_w \times 0.8 \times t_{cr}/1000 = -27.358 \text{ kN} \)

Option 2:

Vertical force generated in the stiffener as per BS EN 1993-1-5 (see NOTE, Clause 9.3.3(3)):

\( P_{Ed} = V_{Ed1} - f_{yw} \times h_w \times t_w / (SQR(3) \times \gamma_M \times \lambda_w^2 \times 1000) = -333.53 \text{ kN} \)

Design axial load in stiffener \( P_{Ed} = P_{Ed1} + P_{ext1} = 975 \text{ kN} \)

As \( P_{Ed} \leq V_{b,Rd} \) (975 kN \( \leq 1747.2 \text{ kN} \)), the design shear force does not exceed the shear resistance. Hence OK.

**Connection to the web**

Design shear load on weld \( F_{w,Ed} = t_w^2/(5 \times h_{s1}) + P_{Ed}/(h_w - 2 \times s_{np}) = 1.0325 \text{ kN/mm} \)

Weld size provided \( s_{w1} = 6 \text{ mm} \)

**Stiffness check - Clause 9.3.3(3)**

2nd moment of area (effe. section) \( I_{pro} = 13.86 \times 10^6 \text{ mm}^4 \)

2nd moment of area required \( I_{req} = 0.75 \times h_w \times t_w^3 = 1.5422 \times 10^6 \text{ mm}^4 \)

As \( I_{req} \leq I_{pro} \) (1.5422 \times 10^6 \text{ mm}^4 \( \leq 13.86 \times 10^6 \text{ mm}^4 \)), the stiffener is OK.
Web check between stiffeners

\[ w' \text{ kN/m} \]

Girder assumed to have non-rigid end posts.

UDL applied between stiffeners \( w'=100 \text{ kN/m} \) (factored load)

Largest panel length \( a'=5000 \text{ mm} \)

Compressive stress of web \( \text{sed}=w'/tw=8.3333 \text{ N/mm}^2 \)

Compressive strength of web \( \text{fed}=(2.75+2/(a'/hw)^2)*E/(C/tw)^2 \)

\( =63.687 \text{ N/mm}^2 \)

Since \( \text{sed} \leq \text{fed} \) (8.3333 N/mm\(^2\) \leq 63.687 N/mm\(^2\)), the web is OK.

Selected fillet weld size \( s=6 \text{ mm} \)

Intermediate transverse web stiffeners - Arrangement (2)

Panel length 1 \( a(3)=4000 \text{ mm} \)

Stiffener outstand \( hs2=100 \text{ mm} \)

Stiffener thickness \( ts2=10 \text{ mm} \)

Limiting outstand to prevent torsional buckling - Clause 9.2.1(8)

Yield strength to be adopted \( f_y=275 \text{ N/mm}^2 \)

Ratio \( (hs2/ts2) \)

\( p=hs2/ts2=10 \)

Limit to ratio \( p=(hs2/ts2) \) is 13\( r=12.017 \).

Ratio \( (hs2/ts2)=10 \) is not greater than limit 13\( r=12.017 \).

Stiffener complies with Clause 9.2.1(8).

Design shear resistance (single-sided transverse stiffener)

The effective cross section of the intermediate single-sided transverse stiffener is as shown below:

2nd moment of area yy axis \( I_{yy}=I_{pro}=3.4054E6 \text{ mm}^4 \)

Design shear resistance \( V_{bRd}=\chi f_{yw}/(\gamma M1*1000)=1263 \text{ kN} \)
Axial force in the stiffener due to shear

Max design shear force in panel \( V_{Ed2} = 1500 \text{ kN} \)
Externally applied design load \( P_{ext2} = 800 \text{ kN} \)
Generated force to be adopted \( P_{Ed2} = 244.62 \text{ kN} \)
Design axial load in stiffener \( P_{Ed} = P_{Ed2} + P_{ext2} = 1044.6 \text{ kN} \)
As \( P_{Ed} \leq V_{bRd} (1044.6 \text{ kN} \leq 1263 \text{ kN}) \), the design shear force does not exceed the shear resistance. Hence OK.

Connection to the web

Design shear load on weld \( F_{wEd} = \frac{t_w^2}{5*hs} + \frac{P_{Ed}}{(hw-2*snp)} = 1.1885 \text{ kN/mm} \)
Weld size provided \( sw^2 = 6 \text{ mm} \)

Stiffness check - Clause 9.3.3(3)

2nd moment of area (eff.section) \( I_{pro} = 3.4054E6 \text{ mm}^4 \)
2nd moment of area required \( I_{req} = 0.75*hw*t_w^3 = 1.5422E6 \text{ mm}^4 \)
As \( I_{req} \leq I_{pro} (1.5422E6 \text{ mm}^4 \leq 3.4054E6 \text{ mm}^4) \), the stiffener is OK.

DESIGN SUMMARY

Span of plate girder \( 12 \text{ m} \)
Design moment \( 2800 \text{ kNm} \)
All steel to be \( \text{Grade S 275} \)

Intermediate stiffeners
\( ai = 5000 \text{ mm} \)

Intermediate stiffeners:
Arrangement (1) Single-sided stiffeners
150 mm x 15 mm flats
spaced at 5000 mm centres

Intermediate stiffeners:
Arrangement (2) Single-sided stiffeners
100 mm x 10 mm flats
spaced at 4000 mm centres

- Fillet welds to be used for connecting stiffeners to girder web & flanges
- Weld sizes as detailed in calculations
- Weld design strength to be 222 N/mm²

Assume non-rigid end posts to EN 1993-1-5, Figure 5.1 & Table 5.1.
Location: Ex1 - Based on Example 14 Guide to BS5950 - end bay

Design of Structural Tee

Calculations are in accordance with BS5950-1:2000.

All loads and moments are factored.

Factored moment about x-x axis \( M_x = 6 \, \text{kNm} \)
Factored axial load (+ comp) \( F_{ax} = 200 \, \text{kN} \)
Factored shear force \( F_v = 22 \, \text{kN} \)
Length of member \( L = 2.83 \, \text{m} \)
146 x 127 x 22 UKB.
Young's Modulus \( E = 205 \, \text{kN/mm}^2 \)

Length between restraints x-axis \( L_x = 2830 \, \text{mm} \)
Length between restraints y-axis \( L_y = 1780 \, \text{mm} \)
Length of beam between restraints \( L_T = 1.05 \, \text{m} \)
Quarter point \( m_{x2} = 0.5 \, \text{kNm} \)
Mid-span \( m_{x3} = 3.2 \, \text{kNm} \)
Three quarter point \( m_{x4} = 1.6 \, \text{kNm} \)
Maximum moment on central half \( M_{24} = 4 \, \text{kNm} \)

DESIGN SUMMARY

Factored axial load \( 200 \, \text{kN} \)
Compress. resistance \( 441.44 \, \text{kN} \)
Local capacity check \( 0.92394 \leq 1 \)
Maximum moment \( 6 \, \text{kNm} \)
Moment capacity \( 9.1171 \, \text{kNm} \)
Buckling resistance \( 9.1171 \, \text{kNm} \)
Overall buckling chk. \( 0.81831 \leq 1 \)
\( 0.99157 \leq 1 \)
Location: Ex2 - Simply supported beam

Design of Structural Tee

Calculations are in accordance with BS5950-1:2000.

All loads and moments are factored.

Length of member \( L = 4 \text{ m} \)

Dead UDL (including S.W) \( w_d = 8 \text{ kN/m} \)
Imposed UDL \( w_i = 6 \text{ kN/m} \)

229 x 305 x 70 UKB.
Young's Modulus \( E = 205 \text{ kN/mm}^2 \)

Length of beam between restraints \( L_T = 4 \text{ m} \)

DESIGN SUMMARY

- Maximum moment \( 41.6 \text{ kNm} \)
- Moment capacity \( 53.508 \text{ kNm} \)
- Buckling resistance \( 53.508 \text{ kNm} \)
Location: Ex1 - Continuous tee beam

Design of Structural Tee

Calculations are in accordance with BS EN 2003-1-1:2005.

All loads and moments are factored.

Design moment about y-y axis \[ M_{Ed} = 6 \text{ kNm} \]
Design shear force \[ V_{zEd} = 22 \text{ kN} \]
Design axial load (+ comp) \[ N_{Ed} = 200 \text{ kN} \]
Length of member \[ L = 2.83 \text{ m} \]
146 x 127 x 22 Advance UKT split from Advance UKB
Length between restraints \[ L_{T} = 1.05 \text{ m} \]
Far end bending moment \[ pM(1) = 0 \text{ kNm} \]
Far end bending moment \[ pM(2) = 0 \text{ kNm} \]

DESIGN SUMMARY

Design axial load \[ 200 \text{ kN} \]
Buckling resistance \[ 442.13 \text{ kN} \]
Maximum moment \[ 6 \text{ kNm} \]
Moment resistance \[ 9.1312 \text{ kNm} \]

Wind-moment design of low rise frames

Calculations are in accordance with BS5950 and SCI publication P-263 entitled 'Wind-moment Design of Low Rise Frames'. The wind-moment design method will be adopted here which applies to low rise frames of four storeys or less and assumes that:

- under vertical loads the connections act as simple nominally pinned connections
- under wind loads the connections behave as nominally rigid joints. Points of contraflexure are assumed to occur at the mid-height of the columns and the mid-length of the beams
- with the wind-moment design method the end-plate connections should be sufficiently ductile to accommodate large rotations. Connections are required to resist the moments due to wind loading as well as the shear forces due to vertical loading
- typical connections with sufficient ductility are given in the BCSA/SCI publication 'Joints in steel construction: Moment connections'. Capacity tables have been reproduced in Appendix D of SCI-P-263
- second order effects due to frame sway (i.e. P-Δ effects) are allowed for by using effective lengths for the columns that are greater than the lengths between floor levels
- columns should be rigidly connected to the foundations, by bases that are designed to resist moments
- any recognised method could be used to determine the sway deflections (see design summary). Sway deflections in each storey should be within the limit of Height/300.

Loading

Dead load on floors \( \text{deadf}=4.5 \text{ kN/m}^2 \)
Imposed load on floors \( \text{impf}=5 \text{ kN/m}^2 \)
Dead load on roof \( \text{deadr}=4 \text{ kN/m}^2 \)
Imposed load on roof \( \text{impr}=1.5 \text{ kN/m}^2 \)

Dynamic augmentation factor

Chosen site is the Town; built up areas with an average level of roof tops at least \( H_o=5.0 \text{ m} \) above ground level.
The building needs to consider the effects of obstruction height and other buildings proximity.

\[
\begin{align*}
\text{Ho} &= \text{Mean height of other buildings or trees.} \\
X &= \text{Distance to next building} \\
\text{Ho} &= \text{Average adjacent building height} \\
\text{Cr} &= \left( \frac{K_b(H/ho)^{0.75}}{800/lh} \right) = 0.0277 \\
\text{Cr} &< 0.25 \text{ then this structure is not dynamic.}
\end{align*}
\]

Standard wind loads

Basic wind speed \( \text{Vb}=20 \text{ m/s} \)
Site altitude above mean sea level \( \Delta S=112 \text{ m} \)
Directional factor \( \text{Sd}=1 \)
Probability factor \( \text{Sp}=1 \)
From Table 4 terrain & building factor \( \text{Sb}=1.55 \)
Site wind speed @ height \( \text{He} \)

\[
\begin{align*}
\text{Vs} &= \text{Vb} \times \text{Sa} \times \text{Sd} \times \text{Ss} \times \text{Sp} = 22.24 \text{ m/s} \\
\text{Effective height} &= \text{He} = 7.42 \text{ m} \\
\text{Altitude factor} &= \text{Sa} = 1.112 \\
\text{Direction factor} &= \text{Sd} = 1 \\
\text{Seasonal factor} &= \text{Ss} = 1 \\
\text{Probability factor} &= \text{Sp} = 1 \\
\text{Dynamic wind pressure} &= q_S = 0.7284 \text{ kN/m}^2
\end{align*}
\]
I-column design

Section suitability based on the following loading combinations:

- 1.4(DL) + 1.6(LL) + 1.0(NHF)
- 1.2(DL + LL + WL)
- 1.4(DL + WL)

The effects of patterned loading variations in beam spans and column S.W are ignored.

Loads and moments considered are: Beam loading, moment due to rigid column/beam connection, moment due to beam eccentricity, and moment due to NHF where applicable.

254 x 254 x 89 UC.  
Young's Modulus  E=205 kN/mm²

**UNIVERSAL COLUMN**

Design strength \(py=275 \text{ N/mm}^2\)

Check section for moment and shear

Shear capacity \(P_v=0.6*py*Av/10^3=647.1 \text{ kN}\)
Design shear force \(F_v=257.4 \text{ kN}\)
Moment capacity for compact sec \(M_c=0.9*py*S_x/10^3=371.3 \text{ kNm}\)

Since \(M \leq M_c\) (347.5 kNm \leq 371.3 kNm), design moment within moment capacity.

Check for deflection

UDL for deflection calculation \(w_u=\text{impf*crs}=30 \text{ kN/m}\)
Total deflection \(D E L=(5*w_u*L_b^4/384)*10^5/(E*I_x) = 9.046 \text{ mm}\)
Limiting deflection \(D E L_{lim}=L_b*10^3/360=16.67 \text{ mm}\)

Since \(D E L \leq D E L_{lim}\) (9.046 mm \leq 16.67 mm), deflection is within the limiting value.

UNIVERSAL BEAM 406 x 178 x 74 UB Grade S 275
Design shear force 257.4 kN
Shear capacity 647.1 kN
Design moment 347.5 kNm
Moment capacity 371.3 kNm
Deflection 9.046 mm
Limiting deflection 16.67 mm

The frame should now be checked for sidesway using unfactored wind loads only and rigidly connected columns to the foundations. The calculated rigid frame deflections should then be increased by 50% (i.e. multiplied by a factor of 1.5) to allow for the flexibility of standard wind-moment connections (provided that the average bay width is at least 6.0 m). For an average bay width of 4.5 m, the deflections from the rigid frame analysis should be multiplied by a factor of 2.0. For bay widths between 4.5 m and 6.0 m, linear interpolation between 2.0 and 1.5 should be used. If the increased values are acceptable, then the design is considered complete.
Location: Ex2 - End column

Wind-moment design of low rise frames

Calculations are in accordance with BS5950 and SCI publication P-263 entitled 'Wind-moment Design of Low Rise Frames'. The wind-moment design method will be adopted here which applies to low rise frames of four storeys or less and assumes that:

- under vertical loads the connections act as simple nominally pinned connections
- under wind loads the connections behave as nominally rigid joints. Points of contraflexure are assumed to occur at the mid-height of the columns and the mid-length of the beams
- with the wind-moment design method the end-plate connections should be sufficiently ductile to accommodate large rotations. Connections are required to resist the moments due to wind loading as well as the shear forces due to vertical loading
- typical connections with sufficient ductility are given in the BCSA/SCI publication 'Joints in steel construction: Moment connections'. Capacity tables have been reproduced in Appendix D of SCI-P-263
- second order effects due to frame sway (i.e. P-Δ effects) are allowed for by using effective lengths for the columns that are greater than the lengths between floor levels
- columns should be rigidly connected to the foundations, by bases that are designed to resist moments
- any recognised method could be used to determine the sway deflections (see design summary). Sway deflections in each storey should be within the limit of Height/300.

Frame dimensions - Table 1.1 SCI-P-263

Loading

Dead load on floors \( \text{deadf}=4.5 \text{ kN/m}^2 \)
Imposed load on floors \( \text{impf}=5 \text{ kN/m}^2 \)
Dead load on roof \( \text{deadr}=4 \text{ kN/m}^2 \)
Imposed load on roof \( \text{impr}=1.5 \text{ kN/m}^2 \)

Dynamic augmentation factor

Chosen site is the Town; built up areas with an average level of roof tops at least \( Ho=5.0 \text{ m} \) above ground level.
The building needs to consider the effects of obstruction height and other buildings proximity.

\[ Ho=\text{Mean height of other buildings or trees.} \]

Distance to next building \( X=8 \text{ m} \)
Average adjacent building height \( Ho=15 \text{ m} \)
Dynamic Augmentation Factor \( Cr=(Kb*(H/ho)^{0.75})/800/lh=0.0277 \)
Since Dynamic Augmentation Factor \( Cr \) is less than or equal to 0.25 then this structure is not dynamic.

Standard wind loads

Basic wind speed \( Vb=20 \text{ m/s} \)
Site altitude above mean sea level \( \delta S=112 \text{ m} \)
Directional factor \( Sd=1 \)
Probability factor \( Sp=1 \)
From Table 4 terrain & building factor \( Sb=1.55 \)
Site wind speed @ height \( He \)
\[ Vs=Vb*Sa*Sp*Sp=22.24 \text{ m/s} \]

Unity factor Comb3 $0.7942 \leq 1$

Floor beam design

Beam span $L_b = 6$ m
Design permanent plus imposed loading

Distributed floor load \( w'=(\gamma G\cdot G_kf+\gamma Q\cdot Q_kf)\cdot c_{rs}=81.45 \text{ kN/m} \)
Assume the end restraint moment due to gravity load is equal to 10% of the "free" moment.
Design moment @ beam mid-span \( M_{Ed}=0.9\cdot w'\cdot L_b^2/8=329.9 \text{ kNm} \)
Design shear force \( V_{zEd}=w'\cdot L_b/2=244.4 \text{ kN} \)

Steel beam section properties

406 x 178 x 74 UKB
Dimensions (mm): \( h=412.8 \text{ b}=179.5 \text{ tw}=9.5 \text{ tf}=16 \text{ r}=10.2 \)
Properties (cm): \( I_y=27300 \text{ I}_z=1550 \text{ W}_{ply}=1500 \text{ I}_t=62.8 \text{ A}=94.5 \)

Strength of steel beam

For material thickness 16 mm and steel grade S 275.
Design strength \( f_y=275 \text{ N/mm}^2 \)

Check section for moment and shear

Shear resistance \( V_{plRd}=A_{pz}\cdot f_y/SQR(3)/(\gamma M_0\cdot 10^3) \)
\( =664.4 \text{ kN} \)
Design shear force \( V_{zEd}=244.4 \text{ kN} \)
Moment resistance \( M_{cRd}=0.9\cdot f_y\cdot W_{ply}/(\gamma M_0\cdot 10^3) \)
\( =371.3 \text{ kNm} \)
Since \( M_{Ed} \leq M_{cRd} \) (329.9 kNm \( \leq 371.3 \text{ kNm} \)), design moment within moment resistance.

Check for deflection

UDL for deflection calculation \( w_u=Q_kf\cdot c_{rs}=30 \text{ kN/m} \)
Total deflection \( \Delta L=(5\cdot w_u\cdot L_b^4/384)*10^5/(E\cdot I_y) \)
\( =8.83 \text{ mm} \)
Limiting deflection \( \Delta L_{lim}=L_b\cdot 10^3/360=16.67 \text{ mm} \)
As \( \Delta L \leq \Delta L_{lim} \) (8.83 mm \( \leq 16.67 \text{ mm} \)), deflection is OK.

The frame should now be checked for sidesway using unfactored wind loads only and rigidly connected columns to the foundations. The calculated rigid frame deflections should then be increased by 50% (i.e. multiplied by a factor of 1.5) to allow for the flexibility of standard wind-moment connections (provided that the average bay width is at least 6.0 m). For an average bay width of 4.5 m, the deflections from the rigid frame analysis should be multiplied by a factor of 2.0. For bay widths between 4.5 m and 6.0 m, linear interpolation between 2.0 and 1.5 should be used. If the increased values are acceptable, then the design is considered complete.

Brace member 1 details:
114.3 dia x 5 thick CHS - Hot finished.
Properties (cm): A=17.169 \( iy = 3.8684 \) Wely=44.955 Wply=59.774 Iy=256.92 It=513.84

Brace member 2 details:
76.1 dia x 4 thick CHS - Hot finished.
Properties (cm): A=9.0604 \( iy = 2.553 \) Wely=15.52 Wply=20.815 Iy=59.055 It=118.11

Young's Modulus E=210 kN/mm²

Angle of brace 01 \( \theta_1 = 40^\circ \)
Angle of brace 02 \( \theta_2 = 90^\circ \)
Gap between bracing elements \( g = 20 \text{ mm} \)
Chord axial load 1 \( N_c1 = -650 \text{ kN} \)
Chord axial load 2 \( N_c2 = -600 \text{ kN} \)
Brace 1 axial load \( N_b1 = -200 \text{ kN} \)
Brace 2 axial load \( N_b2 = 150 \text{ kN} \)
Bracing in-plane moment \( M_y1 = 9.6 \text{ kNm} \)
Bracing out-of-plane moment \( M_z1 = 0.7 \text{ kNm} \)
Bracing in-plane moment \( M_y2 = 2 \text{ kNm} \)
Bracing out-of-plane moment \( M_z2 = 0.5 \text{ kNm} \)

LOAD SUMMARY - welded K & N gap joints

Brace member 1 axial load \( N_b1 = -200 \text{ kN} \)
Load within resistance Pass
Chord face failure \( N_1 = 568.3 \text{ kN} \)
Chord punching shear \( N_{PS1} = 1170.5 \text{ kN} \)

Brace member 2 axial load \( N_b2 = 150 \text{ kN} \)
Load within resistance Pass
Chord punching shear \( N_{PS2} = 392.01 \text{ kN} \)

Welding

Prequalified weld throat thickness size:
Based on brace member 1 thickness and steel Grade S 355.
Minimum throat thickness \( a = 1.11 \times t_1 = 5.55 \text{ mm} \)
CHS bracing requires partial end profiling to achieve the weld fit up.
Based on brace member 2 thickness and steel Grade S 355.
Minimum throat thickness \( a_2 = 1.11 \times t_2 = 4.44 \text{ mm} \)
CHS bracing requires partial end profiling to achieve the weld fit up.
Further details on welding can be obtained from TATA Steel publication entitled 'Design of Welded Joints'.

**SCALE 5.48** Office 1007 Proforma 480
Location: Flowdrill bolts - Tie force

Double angle web cleat connection

Analysis of the connection follows the treatment in the BCSA publication entitled 'Manual on Connections Volume 1 - Joints in simple construction' amended to comply with the requirements of BS5950-1:2000.

Universal section beam to RHS column connection using standard bolts connecting the beam to the web cleats. Flowdrill bolts will be utilised for connecting cleats to the column. Structural integrity tie force \( T_f = 75 \) kN

Supporting member details

250 x 250 x 12.5 SHS - Hot finished. Properties (cm): \( A = 117 \), \( r_x = 9.66 \), \( Z_x = 873 \), \( S_x = 1040 \), \( I_x = 10900 \), \( J = 17200 \), \( C = 1280 \)

Supported beam details

406 x 178 x 74 UB.

Distance top of beam/top of cleat \( n = 50 \) mm

Thickness of angle cleats \( t_p = 10 \) mm
Length of angle cleat leg \( l_c = 90 \) mm
Backmark \( b_m = 50 \) mm
Diameter of bolts (double shear) \( d_b = 20 \) mm
Provide 1 line/s of fasteners.
Provide 4 rows of fasteners in each line.
Supported beam end clearance \( e_c = 10 \) mm
Diameter of Flowdrill bolts \( d_b = 1 = 20 \) mm

Pitch of bolts \( p' = 70 \) mm
No. of bolts in supporting memb \( b_n = 1 = 8 \)
As \( T_f \leq T_{rhs} \) (75 kN \( \leq 108.07 \) kN), tie force within the tying capacity of the RHS column wall.

Double angle web cleat connection

Analysis of the connection follows the treatment in the BCSA publication entitled 'Manual on Connections Volume 1 - Joints in simple construction' amended to comply with the requirements of BS5950-1:2000.

Universal section beam to RHS column connection using standard bolts connecting the beam to the web cleats. Hollo-Bolts will be utilised for connecting cleats to the column. Structural integrity tie force $T_f = 75$ kN

Supporting member details

250 x 250 x 12.5 SHS - Hot finished. Properties (cm): $A = 117 \text{ rx}=9.66 \text{ Zx}=873 \text{ Sx}=1040 \text{ Ix}=10900 \text{ J}=17200 \text{ C}=1280$

Supported beam details

406 x 178 x 74 UB.

Distance top of beam/top of cleat $n=50$ mm

Thickness of angle cleats $t_p=10$ mm
Length of angle cleat leg $l_c=90$ mm
Backmark $b_m=k=50$ mm
Diameter of bolts (double shear) $d_b=20$ mm
Provide 1 line/s of fasteners.
Provide 4 rows of fasteners in each line.
Supported beam end clearance $e_c=10$ mm
Diameter of Hollo-Bolts $d_{b1}=16$ mm

Pitch of bolts $p'=70$ mm
No. of bolts in supporting memb $b_{n1}=8$
As $T_f \leq \text{ Trhs ( } 75 \text{ kN } \leq 119.47 \text{ kN })$, tie force within the tying capacity of the RHS column wall.

FIN PLATE SUMMARY

Plate size: 380 mm x 100 mm x 10 mm
Grade: S 275
Number of bolts: 5
Diameter of bolts: M 20 Grade 8.8
Fillet weld size: 10 mm
Location: Example 8.3.1, 'Manual on Connections'

**Seating bracket**

The analysis of the connection is based on the procedure used in the BCSA publication 'Manual on connections'. Standard angle section is used for the seating bracket.

---

**Stability cleat**

Calculations are in accordance with BS5950-1:2000 Section 6.

Factored vertical load on bracket V=254 kN
150 x 90 x 10 mm Unequal Angle.

**Bolt group connecting the angle seat to supporting member**

<table>
<thead>
<tr>
<th>Diameter of bolts</th>
<th>db=20 mm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of bolts to be used</td>
<td>bn=4</td>
</tr>
</tbody>
</table>

Pitch of bolts vertically pitch=55 mm
End distance e2=55 mm
Clearance hole diameter Dh=db+2=22 mm

**Column details**

254 x 254 x 73 UC.
Supported beam details

533 x 210 x 92 UB.

Bearing strength of the seating bracket

This is investigated at the root of the angle seat. A 45 degree load dispersion from the supported beam root is used.

Dispersion length at U/S of beam \( T_u = T_c + T + r = 37.6 \) mm
Dispersion length at seat root \( L_{eb} = 2T_u + t_c + 1.172r_c = 100.18 \) mm
Length of seating bracket \( l_s = 120 \) mm
Dispersion length less than seat length.

As \( V \leq P_{cr} \) (254 kN \leq 275.51 kN), shear force within bearing capacity at root of seat.

Hence the design of the seating bracket connection is OK.

SUPPORTING COLUMN

254 x 254 x 73 UC
**Location: Welded connection**

**Seating bracket**

The analysis of the connection is based on the procedure used in the BCSA publication 'Manual on connections'. Standard angle section is used for the seating bracket.

- Stability cleat
- Calculations are in accordance with BS5950-1:2000 Section 6.

Factored vertical load on bracket $V=156$ kN
Fillet weld leg length $s=6$ mm
150 x 90 x 10 mm Unequal Angle.

**Weld connecting seat to supporting member**

- Design strength of weld per mm $pw=0.7s*pw=924$ N/mm
- Total value of end plate weld $Pw=1e*pw/1000=266.11$ kN
Since $V \leq Pw$ (156 kN $\leq 266.11$ kN), shear on bracket is within allowable and the 6 mm fillet weld is suitable.

**Supported beam details**

457 x 152 x 67 UB.

**Bearing strength of the seating bracket**

This is investigated at the root of the angle seat. A 45 degree load dispersion from the supported beam root is used.
- Dispersion length at U/S of beam $Tus=Tc+T+r=37$ mm
- Dispersion length at seat root $Leb=2*Tus+tc+1.172*rc=94.954$ mm
- Length of seating bracket $ls=150$ mm
- Dispersion length less than seat length.
As $V \leq Pcr$ (156 kN $\leq 261.12$ kN), shear force within bearing capacity at root of seat.

Hence the design of the seating bracket connection is OK.

</table>
Location: Ex1 - Welded connection and equal angle

Shelf angle supporting slab

The analysis of the connection assumes that a standard angle section is used for the shelf angle. Distance ecc is from the face of the supporting beam to the point of application of the design vertical load V. The shelf angle vertical leg could be facing up or down. Calculations are in accordance with BS5950-1.

The shelf angle vertical leg is welded at points A and B to the web of the supporting beam. The latter is a UB or UC section. Hit and miss FW will be adopted.

Ultimate load on shelf angle V=60 kN/m
Grade of shelf angle S 275
Grade of supporting member S 275
Yield strength of steel fy=275 N/mm²

Shelf angle details

90 x 90 x 10 mm Equal Angle.

Supporting beam details

457 x 152 x 67 UB.

Weld connecting shelf angle to supporting beam

Supporting beam web thickness tsb=9 mm
Shelf angle thickness T=10 mm
Fillet weld leg length s=6 mm

Normally a hit and miss fillet weld length of hmFWl=100 mm along the length of the shelf angle at top and bottom is specified (i.e. 100 mm weld and then 100 mm miss along the length of the shelf angle). The distance below is from the face of the supporting beam to the point of application of the design vertical load V.

Distance to vertical load ecc=75 mm
Bottom weld shear force governs Fw=0.12 kN/mm
Design strength of weld per mm Pw=0.7*s*pw/1000=0.924 kN/mm

As Fw ≤ Pw (0.12 kN/mm ≤ 0.924 kN/mm), force on shelf angle is within allowable and the 6 mm fillet weld is OK.

Shelf angle bending check

Section modulus Z=1000*T^2/(6*1000)=16.667 cm³
Design moment M=V*ecc/1000=4.5 kNm/m
Moment capacity \( M_c = \frac{Z \cdot f_y}{1000} = 4.5833 \text{ kNm/m} \)

As \( M \leq M_c \) (4.5 kNm/m \( \leq 4.5833 \text{ kNm/m} \)), design moment is OK.

**Deflection check**

| Maximum allowable deflection: \( \Delta \) | 1.5 mm
| Defln at angle toe (support): \( \Delta \) | 1.0396 mm
| Defln at angle toe (midspan): \( \Delta \) | 1.0471 mm
| Maximum allowable deflection: \( \Delta \) | 1.5 mm

Deflection is OK.

The analysis is valid as the longitudinal bending deflection is small relative to the angle deflection (i.e. \( p = 0.6153 \leq 5 \text{ percent} \)).

**DESIGN SUMMARY**

| Shelf angle | 90 mm x 90 mm x 10 mm Angle
| Grade of steel | S 275
| Fillet weld size | 6 mm
| Hit and miss FW length | 100 mm hit, 100 mm miss
| Supporting beam | 457 x 152 x 67 UB
| Applied flange force | 60 kN/m
| Defln at angle toe (support): \( \Delta \) | 1.04 mm
| Defln at angle toe (midspan): \( \Delta \) | 1.05 mm
| Maximum allowable deflection: \( \Delta \) | 1.5 mm
Location: Ex2 - Welded connection and unequal angle

Grade of shelf angle \( S \ 275 \)
Grade of supporting member \( S \ 275 \)
Yield strength of steel \( f_y = 275 \) N/mm²

Shelf angle details

150 x 90 x 10 mm Unequal Angle.

Supporting beam details

457 x 152 x 67 UB.

Weld connecting shelf angle to supporting beam

Supporting beam web thickness \( t_{sb} = 9 \) mm
Shelf angle thickness \( T = 10 \) mm
Fillet weld leg length \( s = 6 \) mm

Normally a hit and miss fillet weld length of \( h m F W l = 100 \) mm along the length of the shelf angle at top and bottom is specified (i.e. 100 mm weld and then 100 mm miss along the length of the shelf angle). The distance below is from the face of the supporting beam to the point of application of the design vertical load V.

Distance to vertical load \( e c c = 75 \) mm
Bottom weld shear force governs \( F_w = 0.12 \) kN/mm
Design strength of weld per mm \( P_w = 0.7 * s * p_w / 1000 = 0.924 \) kN/mm

As \( F_w \leq P_w \) (0.12 kN/mm ≤ 0.924 kN/mm), force on shelf angle is within allowable and the 6 mm fillet weld is OK.

Shelf angle bending check

Section modulus \( Z = 1000 * T^2 / (6 * 1000) = 16.667 \) cm³
Design moment \( M = V * e c c / 1000 = 4.5 \) kNm/m
Moment capacity

\[ Mc = \frac{Z \times fy}{1000} = 4.5833 \text{ kNm/m} \]

As \( M \leq Mc \) (4.5 kNm/m \leq 4.5833 kNm/m), design moment is OK.

**Deflection check**

<table>
<thead>
<tr>
<th>Maximum allowable deflection</th>
<th>delta=1.5 mm</th>
</tr>
</thead>
<tbody>
<tr>
<td>Defln at angle toe (support)</td>
<td>0.98971 mm</td>
</tr>
<tr>
<td>Defln at angle toe (midspan)</td>
<td>1.0133 mm</td>
</tr>
<tr>
<td>Maximum allowable deflection</td>
<td>1.5 mm</td>
</tr>
</tbody>
</table>

Deflection is OK.

The analysis is valid as the longitudinal bending deflection is small relative to the angle deflection (i.e. \( p=0.11969 \leq 5 \text{ percent} \)).

**DESIGN SUMMARY**

| Shelf angle                   | 150 mm x 90 mm x 10 mm Angle |
| Grade of steel                | S 275                        |
| Fillet weld size              | 6 mm                         |
| Hit and miss FW length        | 100 mm hit, 100 mm miss      |
| Supporting beam               | 457 x 152 x 67 UB            |
| Applied flange force          | 60 kN/m                      |
| Defln at angle toe (support)  | 0.99 mm                      |
| Defln at angle toe (midspan)  | 1.01 mm                      |
| Maximum allowable deflection  | 1.5 mm                       |
Shelf angle supporting slab

The analysis of the connection assumes that a standard angle section is used for the shelf angle. Distance ecc is from the face of the supporting beam to the point of application of the design vertical load VEd. The shelf angle vertical leg could be facing up or down. Calculations are in accordance with EC3 Part 1-1 & EC3 Part 1-8.

The shelf angle vertical leg is welded at points A and B to the web of the supporting beam. The latter is a UB or UC section. Hit and miss FW will be adopted.

Design load on shelf angle VEd=60 kN/m
Grade of angle seat S 275
Grade of supporting member S 275
Yield strength of steel fy=275 N/mm^2

Shelf angle details

90 x 90 x 10 mm Equal Angle (Advance UKA)

Supporting beam details

457 x 152 x 67 UKB

Weld connecting shelf angle to supporting member

Supporting beam web thickness twsb=9 mm
Shelf angle thickness t=10 mm
Fillet weld leg length s=6 mm
The distance below is from the face of the supporting beam to the point of application of the design vertical load VEd.
Distance to vertical load ecc=75 mm
Bottom weld shear force governs FwEd=0.12 kN/mm
Design strength of weld per mm FwRd=0.7*s*fvwd/1000=0.9324 kN/mm
As FwEd ≤ FwRd ( 0.12 kN/mm ≤ 0.9324 kN/mm ), force on shelf angle is within allowable and the 6 mm fillet weld is OK.

Shelf angle bending check

Section modulus Wel=1000*t^2/(6*1000)=16.667 cm^3
Design moment MEEd=VEd*ecc/1000=4.5 kNm/m
Partial factor for resistance gamM0=1.0
Moment resistance per m McRd=Wel*fy/(gamM0*1000)=4.5833 kNm/m
As MEEd ≤ McRd ( 4.5 kNm/m ≤ 4.5833 kNm/m ), design moment is OK.
Deflection check

Maximum allowable deflection \( \delta = 1.5 \text{ mm} \)
Defln at angle toe (support) \( 1.0396 \text{ mm} \)
Defln at angle toe (midspan) \( 1.0471 \text{ mm} \)
Maximum allowable deflection \( 1.5 \text{ mm} \)

Deflection is OK.

The analysis is valid as the longitudinal bending deflection is small relative to the angle deflection \( (i.e., \ p = 0.6153 \leq 5 \text{ percent}) \).
