Number of bolts 6
Bolt diameter 24 mm
Bolt grade 8.8
Welds
- Tension flange fillet weld 9 mm
- Web fillet weld 8 mm
- Compression flange fillet weld 8 mm

Supporting column section 457 x 191 x 98 UB
Beam / Rafter section 305 x 165 x 46 UB
Haunch section 356 x 171 x 51 UB

Column stiffener details

No enhancement of the column is required.
Bolted flush end plate eaves connection - beam to column

The connection under consideration is assumed to be attached to the supporting column flange. The calculations are in accordance with EC3 Parts 1-1, 1-5, 1-8 and follow the procedure in 'Joints in Steel Construction Moment Connections' by SCI.

The connection is one sided. The web panel shear cannot be discounted in the determination of the compressive force.

Factored moment $\text{MyEd}'=724$ kNm
Factored shear force $\text{VED}'=304$ kN
Axial force (+ve compression) $\text{NEd}'=102$ kN

Supporting column details

$610 \times 229 \times 101$ UKB

Supported rafter section details - parent section

$457 \times 191 \times 74$ UKB

Section properties - haunch cutting

$533 \times 210 \times 82$ UKB

Combined properties and restrictions

Pitch of rafter $\theta = 10^\circ$
Vertical overall depth $h_o = 900$ mm
Haunch angle to end plate $\phi = 78^\circ$
Bolt details

Diameter of bolts db=24 mm
Tensile resistance (EC3 Part 1-8) \( F_{Rd} = k_2 f_{ub} A_t / (\gamma_M 2 \times 10^3) = 203.33 \text{ kN} \)

End plate details

Thickness of plate tp=20 mm
Total number of bolts bn=12
Number of shear bolts ns=4
Distance to beam flange x1=15 mm
Distance to first row of bolts e1=75 mm
Pitch of tension bolts p1=75 mm
Edge distance for shear bolts e1'=110 mm
Over-all length of end plate hp=965 mm
Bolt cross-centres p3=90 mm
Width of end plate bp=200 mm
Assumed web fillet weld size sww=8 mm
Assumed flange fillet weld size swf=10 mm

SUMMARY OF BOLT POTENTIAL RESISTANCES

Top row of bolts \( P_{r1} = 310.03 \text{ kN} \)
Row 2 \( P_{r2} = 258.66 \text{ kN} \)
Row 3 \( P_{r3} = 152.68 \text{ kN} \)
Row 4 \( P_{r4} = 152.68 \text{ kN} \)

Design axial load on column \( N_{Edc} = 500 \text{ kN} \)
Weld size (leg length) ss=8 mm

As \( M_{Ed} > M_{Rd} \) (656.61 kNm > 638.57 kNm), the applied moment exceeds the moment resistance. Tension stiffeners are required.

Stiffener width bsgt=90 mm
Proposed rib stiffener thickness tsr=15 mm
Proposed weld size ssr=12 mm

Selected fillet weld size swt=12 mm
Selected fillet weld size sfw=8 mm

REVERSED MOMENT CONDITION

Factored moment \( M_{rEd} = 237 \text{ kNm} \)
Factored shear force \( V_{rEd} = 43 \text{ kN} \)
Axial force (+ve compression) \( N_{rEd} = -56 \text{ kN} \)
CONNECTION SUMMARY - all dimensions in diagram are in mm

Axial force (+ve compression) \( Na = 27 \text{ kN} \)

Supporting column details

406 x 178 x 54 UB.

Supported rafter section properties - parent section

254 x 146 x 37 UB.

Section properties - haunch cutting

305 x 165 x 46 UB.

Combined properties & restrictions

Pitch of rafter (in degrees) \( \Theta = 8 \)
Vertical overall depth \( Do = 450 \text{ mm} \)
Haunch angle to end plate \( \phi' = 65^\circ \)
Steel design to BS5950-1:2000 and Eurocode 3
Extended end plate haunched connection
Made by: IFB
Date: 02/12/19
Ref No: SC487 BS

Diameter of bolts        bd=24 mm
Thickness of plate       tp=20 mm
Total number of bolts    bn=8
Number of shear bolts    ns=4
Distance to first row of bolts  ex=50 mm
Distance to beam flange  x=40 mm
Pitch to second row of bolts  p1=100 mm
Pitch of shear bolts     p2=90 mm
Distance tension to shear bolts  p3=220 mm
Edge distance for shear bolts  pes=130 mm
Bolt cross-centres       g=90 mm
Width of end plate       bp=180 mm
Assumed web fillet weld size  sww=8 mm
Assumed flange fillet weld size  swf=8 mm

SUMMARY OF BOLT POTENTIAL RESISTANCES

Top row of bolts        Pr1=184.98 kN
Row 2                    Pr2=99.038 kN
Weld size                ss=8 mm
Selected fillet weld size swt=8
Selected fillet weld size sfw=8 mm
Factored moment          Mr=68 kNm
Factored shear force     Vr=37 kN
Axial force (+ve compression) Nr=-34 kN
CONNECTION SUMMARY - all dimensions in diagram are in mm

Number of bolts 8
Bolt diameter 24 mm
Bolt grade 8.8
Welds
- Tension flange fillet weld 8 mm
- Web fillet weld 8 mm
- Compression flange fillet weld 8 mm
Supporting column section 406 x 178 x 54 UB
Beam / Rafter section 254 x 146 x 37 UB
Haunch section 305 x 165 x 46 UB

Column stiffener details

Compression stiffeners 2/80 mm x 10 mm Grade S 275
connected by 4/8 mm fillet welds.
Location: Ex3 - Double sided connection, HSFG bolts, heavy shear

Bolted extended end plate eaves connection - beam to column

Calculations are in accordance with BS5950-1:2000 and follow the procedure given in the SCI publication entitled 'Joints in Steel Construction Moment Connections'.

Beams are connected to both column flanges. The web panel shear can be discounted in the determination of the compressive force as the connection is assumed to have balanced moments.

Factored moment \( Ma = 328 \text{ kNm} \)
Factored shear force \( Va = 487 \text{ kN} \)
Axial force (+ve compression) \( Na = -34 \text{ kN} \)

Supporting column details

254 x 254 x 89 UC.

Supported rafter section properties - parent section

356 x 127 x 33 UB.

Section properties - haunch cutting

406 x 140 x 39 UB.

Combined properties & restrictions

Pitch of rafter (in degrees) \( \Theta = 0 \)
Vertical overall depth \( Do = 710 \text{ mm} \)
Haunch angle to end plate \( \phi' = 50^\circ \)

on line between the beam tension and compression surfaces
connected by 4/8 mm fillet welds.

Compression stiffeners 2/100 mm x 20 mm Grade S 275
connected by 4/8 mm fillet welds.
Location: Example 8 - Baseplate 1

Axial compressive load \( N = 1500 \text{ kN} \)
Shear on the base in Y direction \( F_y = 40 \text{ kN} \)
254 x 254 x 73 UKC
Length of baseplate \( h_p = 500 \text{ mm} \)
Breadth of baseplate \( b_p = 500 \text{ mm} \)
Edge distance to bolt centre line \( k = 50 \text{ mm} \)

Assumed fillet weld size \( s_w = 8 \text{ mm} \)
Bolt grade (4.6 or 8.8) \( b_{\text{grade}} = 4.6 \)
Grade of concrete \( g_{\text{dec}} = 30 \text{ N/mm}^2 \)

Selected baseplate thickness \( t_p = 20 \text{ mm} \)
Number of bolts to be used \( n = 4 \)
Bolt diameter \( d = 20 \text{ mm} \)

Column to baseplate welds

Compression flange welds

Surfaces of baseplate and end of column are machined square to comply with Clause 4.13.3 to give bearing contact, nominal welds only are required. Only a nominal weld size need be specified.
Selected fillet weld size \( s_{cw} = 8 \text{ mm} \)

Web welds

Web welds are assumed to carry the shear force.
Weld size required \( s_{w} = F_{yw}/(0.7*p_{w}) = 0.64838 \text{ mm} \)
Selected fillet weld size \( s_{fw} = 8 \text{ mm} \)

SUMMARY OF BASEPLATE REQUIREMENTS

Size 500 mm x 20 mm x 500 mm
Grade S 275 steel
Edge distance 50 mm
Number of H.D. bolts 4
Diameter of bolts M 20
Grade 4.6
Concrete/Grout Grade 30
Web weld 8 mm
Contact areas on the baseplate and column are machined to give a tight bearing contact.
Location: Example 9 - Baseplate 2

Axial compressive load \( N = 3400 \text{ kN} \)
Shear on the base in Y direction \( F_y = 40 \text{ kN} \)
254 x 254 x 107 UKC
Length of baseplate \( h_p = 600 \text{ mm} \)
Breadth of baseplate \( b_p = 600 \text{ mm} \)
Edge distance to bolt centre line \( k = 50 \text{ mm} \)

Assumed fillet weld size \( s_w = 8 \text{ mm} \)
Bolt grade (4.6 or 8.8) \( b_{\text{grade}} = 4.6 \)
Grade of concrete \( g_{\text{dec}} = 20 \text{ N/mm}^2 \)

Selected baseplate thickness \( t_p = 50 \text{ mm} \)
Number of bolts to be used \( n = 4 \)
Bolt diameter \( b_d = 20 \text{ mm} \)

Column to baseplate welds

Compression flange welds

Surfaces of baseplate and end of column are machined square to comply with Clause 4.13.3 to give bearing contact, nominal welds only are required. Only a nominal weld size need be specified.

Selected fillet weld size \( s_{cw} = 8 \text{ mm} \)

Web welds

Web welds are assumed to carry the shear force.

Weld size required \( s_{wc} = F_{yw}/(0.7*p_w) = 0.64838 \text{ mm} \)
Selected fillet weld size \( s_{fw} = 8 \text{ mm} \)

- Height: 370 mm
- Allowance for gap: 10 mm

Number of bolts: 2/ 4 (Total No of bolts=8)
Location: Ex3 - Bearing column splice with HSFG bolts

Bolted column splice

Bearing connection

Calculations are in accordance with EC3 Parts 1-1, 1-5 and 1-8.

Design assumptions:

- the column splice is about 500 mm above the floor level and hence the moment due to strut action is considered to be insignificant
- the centroidal axis of the splice is coincident with the centroidal axis of the members.

Factored loads

Permanent compressive axial load  \( N_{EdG} = 700 \text{ kN} \)
Variable compressive axial load  \( N_{EdQ} = 1000 \text{ kN} \)
Design bending moment  \( M_{yEd} = 150 \text{ kNm} \)
Design shear force  \( V_{Ed} = 60 \text{ kN} \)
Load from floor below splice  \( F_{stEd} = 340 \text{ kN} \)

Upper column

254 x 254 x 73 UKC

Lower column

305 x 305 x 118 UKC
Division plate thickness  \( t_{dp} = 25 \text{ mm} \)
Thickness of flange cover plate  \( t_{fp} = 12 \text{ mm} \)
Width of flange cover plate  \( b_{fp} = 250 \text{ mm} \)
Bolt diameter  \( d_b = 20 \text{ mm} \)
Total no. of bolts in cover plate  \( n_t = 12 \)
Pitch of bolts (vertically)  \( p_{1fp} = 160 \text{ mm} \)
Spacing of bolts across columns  \( s_pac = 125 \text{ mm} \)
End distance  \( e_{1fp} = 40 \text{ mm} \)
Bolt spacing (horizontally)  \( p_{2fp} = 150 \text{ mm} \)

As the thickness of packing plate (30 mm) exceeds 26.667 mm, the packs need to be fillet welded to the column flange.

Slip resistance  \( F_{sRd} = k_s \cdot n_f_s \cdot \mu \cdot F_{pc} / 1.25 = 54.88 \text{ kN} \)
Coefficient of friction  \( \mu = 0.2 \)
SPLICE SUMMARY - all dimensions in diagram are in mm

Bolt details

Diameter of bolts: $d_b = 24 \text{ mm}$
Tensile resistance (EC3 Part 1-8): $F_{tRd} = k_2*f_{ub}*A_t/(\gamma_M^2*10^3) = 203.33 \text{ kN}$

End plate details

Thickness of plate: $t_p = 30 \text{ mm}$
Total number of bolts: $b_n = 8$
Length of end plate: $h_p = 550 \text{ mm}$
Distance to first row of bolts: $e_x = 75 \text{ mm}$
Width of end plate: $b_p = 550 \text{ mm}$
Assumed web fillet weld size: $s_{ww} = 8 \text{ mm}$
Assumed flange fillet weld size: $s_{wf} = 12 \text{ mm}$
Column tension flange welds

Weld design strength \( fvwd = \frac{fu}{\sqrt{3}} \cdot \text{(betaw*gamM2)} \)

=222.79 N/mm²

Weld size required \( swfr = \frac{FwEdf \cdot 10^3}{0.7 \cdot fvwd} = 15.542 \text{ mm} \)

Selected fillet weld size \( swt = 16 \text{ mm} \)

Column web welds

Full strength weld used

Selected fillet weld size \( sfw = 8 \text{ mm} \)

Compression welds

### CONNECTION SUMMARY - all dimensions in diagram are in mm

- Number of bolts: 8
- Bolt diameter: 24 mm
- Bolt grade: 8.8
- Welds:
  - Tension flange fillet weld: 16 mm
  - Web fillet weld: 8 mm
  - Compression flange fillet weld: 16 mm
- Column section: 300 x 300 x 10 Hot Finished SHS
Location: Ex5 - Moment connection outside middle third - RHS

Calculations are in accordance with EC3 Parts 1-1, 1-5, 1-8 and follow the procedure given in the SCI publication entitled 'Joints in Steel Construction Moment Connections'.

---

Design assumptions:
- the bolt arrangement is symmetrical about the centre line (y-y axis) of column
- any applied moment is reversible and is carried by half the bolts
- the connection consists of two columns having the same serial size and end plate arrangement.

Factored moment $M_{Ed}=190$ kNm
Factored shear force $V_{Ed}=75$ kN
Axial force (+ve compression) $N_{Ed}=700$ kN
Load from floor below splice $F_{stEd}=250$ kN

Grade details

Supported column details

300 x 300 x 10 SHS - Hot finished.
Properties (cm): $A=115$ iy=11.8 Wely=1070 Wply=1250 Iy=16000 It=24800 Wt=1580

Bolt details

Diameter of bolts $d_b=20$ mm
Tensile resistance (EC3 Part 1-8) $F_{tRd}=k_2*f_{ub}*A_t/(\gamma_m M_2*10^3)=141.12$ kN

End plate details

Thickness of plate $t_p=20$ mm
Total number of bolts $b_n=4$
Length of end plate $h_p=550$ mm
Distance to first row of bolts $e_x=75$ mm
Width of end plate $b_p=550$ mm
Assumed web fillet weld size $s_{ww}=8$ mm
Assumed flange fillet weld size $s_{wf}=12$ mm
Column tension flange welds

Weld design strength \[ \text{fvwd} = \frac{\text{fu}}{\sqrt{3}} \left( \frac{1}{\text{betaw}} \right) \text{gamM2} \]
= 222.79 kN/mm²

Weld size required \[ \text{swfr} = \frac{\text{FwEdf} \times 10^3}{0.7 \times \text{fvwd}} = 10.101 \text{ mm} \]
Selected fillet weld size \[ \text{swt} = 12 \text{ mm} \]

Column web welds

Selected fillet weld size \[ \text{sfw} = 8 \text{ mm} \]
Resistance of weld for shear \[ \text{FwRds} = 2 \times 0.7 \times \text{sfw} \times \text{fvwd} \times \text{Lws} / 10^3 \]
= 673.71 kN

Compression welds

CONNECTION SUMMARY - all dimensions in diagram are in mm

Number of bolts 4
Bolt diameter 20 mm

Welds
- Tension flange fillet weld 12 mm
- Web fillet weld 8 mm
- Compression flange fillet weld 12 mm
Column section 300 x 300 x 10 Hot Finished SHS
Location: Ex6 - Axial load only

Calculations are in accordance with EC3 Parts 1-1, 1-5, 1-8 and follow the procedure given in the SCI publication entitled 'Joints in Steel Construction Moment Connections'.

Design assumptions:
- the bolt arrangement is symmetrical about the centre line (y-y axis) of column
- any applied moment is reversible and is carried by half the bolts
- the connection consists of two columns having the same serial size and end plate arrangement.

Factored moment \( M_{Ed} = 0 \) kNm
Factored shear force \( V_{Ed} = 75 \) kN
Axial force (+ve compression) \( N_{Ed} = 2000 \) kN
Load from floor below splice \( F_{stEd} = 540 \) kN

Grade details

Supported column details
305 x 305 x 97 UKC

Bolt details
Diameter of bolts \( d_b = 20 \) mm
Tensile resistance (EC3 Part 1-8) \( F_{tRd} = k_2 f_{ub} A_t / (\gamma M_2 10^3) = 141.12 \) kN

End plate details
Thickness of plate \( t_p = 24 \) mm
Total number of bolts \( b_n = 4 \)
Length of end plate \( h_p = 600 \) mm
Distance to first row of bolts \( e_x = 75 \) mm
Width of end plate \( b_p = 600 \) mm
Assumed web fillet weld size \( s_{ww} = 8 \) mm
Assumed flange fillet weld size \( s_{wf} = 12 \) mm
Column tension flange welds

Weld design strength \( f_{vwd} = \frac{f_u}{\sqrt{3}} \left( \frac{\beta \omega \gamma}{M_2} \right) \)
\[
= 222.79 \text{ N/mm}^2
\]

Selected fillet weld size \( s_{wt} = 8 \text{ mm} \)

Column web welds

Selected fillet weld size \( s_{fw} = 8 \text{ mm} \)

Resistance of weld for shear \( F_{wRds} = 2 \times 0.7 \times s_{fw} \times f_{vwd} \times L_{ws} / 10^3 \)
\[
= 615.58 \text{ kN}
\]

Compression welds

Connection summary - all dimensions in diagram are in mm

Number of bolts 4
Bolt diameter 20 mm
Bolt grade 8.8
Welds
- Tension flange fillet weld 8 mm
- Web fillet weld 8 mm
- Compression flange fillet weld 8 mm
Column section 305 x 305 x 97 UKC
Bolted beam splice

Design assumptions:

- the flange plates resist the full bending moment & axial loading
- the web splice resists the vertical shear and torsional moment induced by the eccentricity of this loading on the bolt groups on each side of the joint
- the splice uses HSFG bolts to avoid producing bolt slip and consequent additional beam deflection.

Design of splice plate subjected to an applied moment, shear force and axial load to BS5950.

All loads and moment are factored.

Shear force \( F_v = 250 \text{ kN} \)
Bending moment \( M = 150 \text{ kNm} \)
Axial force (+ve compression) \( N = 0 \text{ kN} \)

457 x 152 x 60 UB.
Total number of bolts \( n = 8 \)
Diameter of web bolts \( b_d = 20 \text{ mm} \)
Bolt pitch \( p = 90 \text{ mm} \)
Vertical edge distance \( e_d 1 = 35 \text{ mm} \)
Horizontal edge distance \( e_d 2 = 35 \text{ mm} \)
Distance between bolt centres \( g = 70 \text{ mm} \)
Thickness of web plate \( t_{wp} = 8 \text{ mm} \)
Slip factor for preloaded bolts \( \mu = 0.5 \)
Coefficient for type of hole \( K_s = 1 \)
Allowance for clearance between ends \( c_l = 6 \text{ mm} \)
WEB COVER PLATE SUMMARY - all dimensions in diagram are in mm

Geometry

Angle of brace θ1 = 45°
Angle of brace θ2 = 45°

Factored axial load details - compression is negative

Chord (axial load 1)  Fc1 = -1200 kN
Chord (axial load 2)  Fc2 = -1500 kN
Brace member 1 (axial load)  Fb1 = -450 kN
Brace member 1 (in-plane moment)  Mi1 = 20 kNm
Brace member 2 (axial load)  Fb2 = -350 kN
Brace member 2 (in-plane moment)  Mi2 = 10 kNm

CAPACITY SUMMARY

Brace member 1:
Applied brace 1 axial loading  Fb1 = -450 kN
Load within capacity  Pass
Load capacities:
Chord web yielding  N1 = 1986 kN
Bracing effective width  NE1 = 1204.3 kN
In-plane moment  Mi1 = 20 kNm
Moment within capacity  Pass
In-plane moment capacities:
Chord web yielding  Mic1 = 77.237 kNm
Bracing effective width  Mib1 = 66.234 kNm
The load and moment interaction formula for universal section chord joints is not specified in the 'Design of SHS Welded Joints' publication. The formula below has been assumed based on the interaction equation for RHS chord joints.

\[
\frac{F_{b1}}{N_{crit}} + \frac{M_{i1}}{M_{c1}} \leq 1.0
\]

Critical load capacity \( N_{crit} = 1204.3 \text{ kN} \)
Critical moment capacity \( M_{c1} = 66.234 \text{ kNm} \)
Absolute value of brace force \( F_{b1} = -F_{b1} = 450 \text{ kN} \)
Interaction \( \text{unity} = F_{b1}/N_{crit} + M_{i1}/M_{c1} = 0.67564 \)

The interaction formula is satisfied, joint arrangement suitable.

Brace member 2:
Applied brace 2 axial loading \( F_{b2} = -350 \text{ kN} \)
Load within capacity Pass
Load capacities:
Chord web yielding \( N_{2} = 1820.4 \text{ kN} \)
Bracing effective width \( N_{E2} = 963.4 \text{ kN} \)
In-plane moment \( M_{i2} = 10 \text{ kNm} \)
Moment within capacity Pass
In-plane moment capacities:
Chord web yielding \( M_{ic2} = 59.212 \text{ kNm} \)
Bracing effective width \( M_{ib2} = 44.316 \text{ kNm} \)

\[
\frac{F_{b2}}{N_{crit2}} + \frac{M_{i2}}{M_{c2}} \leq 1.0
\]

Critical load capacity \( N_{crit2} = 963.4 \text{ kN} \)
Critical moment capacity \( M_{c2} = 44.316 \text{ kNm} \)
Absolute value of brace force \( F_{b2} = -F_{b2} = 350 \text{ kN} \)
Interaction \( \text{unity} = F_{b2}/N_{crit2} + M_{i2}/M_{c2} = 0.58895 \)

The interaction formula is satisfied, joint arrangement suitable.
Location: Ex2 - K gap joint with CHS braces

Angle of brace \(\theta_2\) \(\theta_2=45^\circ\)
Gap between bracing elements \(g=80\) mm

Factored axial load details - compression is negative

Chord (axial load 1) \(F_{c1}=-1200\) kN
Chord (axial load 2) \(F_{c2}=-1500\) kN
Brace member 1 (axial load) \(F_{b1}=-650\) kN
Brace member 2 (axial load) \(F_{b2}=450\) kN

CAPACITY SUMMARY

Brace member 1:
Applied brace 1 axial loading \(F_{b1}=-650\) kN
Load within capacity Pass

Load capacities brace 1:
Chord web yielding capacity \(N_1=1706.9\) kN
Chord shear capacity \(N_{S1}=1062.6\) kN
Bracing effective width \(N_{W1}=792.54\) kN

Brace member 2:
Applied brace 2 loading \(F_{b2}=450\) kN
Load within capacity Pass

Load capacities:
Chord web yielding capacity \(N_2=1706.9\) kN
Chord shear capacity \(N_{S2}=1062.6\) kN
Bracing effective width \(N_{W2}=624.13\) kN
**Location:** Ex3 - K overlap joint with RHS braces

Calculations are in accordance with BS5950 and ENV 1993-1-1-ANNEX K using the procedure of Section 5.4 of 'Design of SHS Welded Joints' published by British Steel Tubes & Pipes.

**Steel section properties**

Chord details:
203 x 203 x 71 UC.

Geometry

Angle of brace 1: $\theta_1 = 45^\circ$
Angle of brace 2: $\theta_2 = 45^\circ$

Factored axial load details - compression is negative

Chord (axial load 1) $N_{c1} = -1200$ kN
Chord (axial load 2) $N_{c2} = -1500$ kN
Brace member 1 (axial load) $N_{b1} = -450$ kN
Brace member 1 (in-plane moment) $M_{i1} = 20$ kNm
Brace member 2 (axial load) $N_{b2} = -350$ kN
Brace member 2 (in-plane moment) $M_{i2} = 10$ kNm

DESIGN RESISTANCE SUMMARY

Brace member 1:
Applied brace 1 axial loading $N_{b1} = -450$ kN
Load within resistance Pass
Load resistances:
Chord web yielding $N_1 = 1986$ kN
Bracing effective width $N_{E1} = 1204.3$ kN
In-plane moment $M_{i1} = 20$ kNm
Moment within resistance Pass
In-plane moment resistances:
Chord web failure $M_{ic1} = 77.237$ kNm
Bracing effective width $M_{ib1} = 66.234$ kNm
The load and moment interaction formula for universal section chord joints is not specified in the 'Design of Welded Joints' publication. The formula below has been assumed based on the interaction equation for RHS chord joints.

\[
\frac{Nb1}{N_{crit1}} + \frac{Mi1}{Mc1} \leq 1.0
\]

Critical load resistance \( N_{crit1} = 1204.3 \) kN
Critical moment resistance \( Mc1 = 66.234 \) kNm
Interaction \( unity = \text{ABS}(Nb1)/N_{crit1} + Mi1/Mc1 = 0.67564 \)

The interaction formula is satisfied, joint arrangement suitable.

Brace member 2:
Applied brace 2 axial loading \( Nb2 = -350 \) kN
Load within resistance Pass
Load resistances:
- Chord web yielding \( N2 = 1820.4 \) kN
- Bracing effective width \( NE2 = 963.4 \) kN
- In-plane moment \( Mi2 = 10 \) kNm

Moment within resistance Pass
In-plane moment resistances:
- Chord web failure \( Mic2 = 59.212 \) kNm
- Bracing effective width \( Mib2 = 44.316 \) kNm

\[
\frac{Nb2}{N_{crit2}} + \frac{Mi2}{Mc2} \leq 1.0
\]

Critical load resistance \( N_{crit2} = 963.4 \) kN
Critical moment resistance \( Mc2 = 44.316 \) kNm
Interaction \( unity = \text{ABS}(Nb2)/N_{crit2} + Mi2/Mc2 = 0.58895 \)

The interaction formula is satisfied, joint arrangement suitable.
Location: Ex2 - K gap joint with CHS braces

Grade S 275
General design information

The shear stud resistance check will be as per EC4 Part 1-1. The shear force is transferred to the fin plate by bolts. The cast-in plate and its welded connection to the fin plate will resist the eccentricity moment due to the offset of the bolt group from the face of the plate. The standard arrangement for fin plates in the Green Book (i.e., SCI publication P358) is 10 mm thick fin plate using S275 material, with two 8 mm FW. This will eliminate the possibility of weld failure. The face of the cast-in plate is normally inset to allow for the sliding form.

Both the cast-in plate and fin plate will need site-applied corrosion protection system if corrosion protection of steelwork is specified. Furthermore parts of the connection plate (e.g., the fin plate) will also require fire protection as for the connecting beam.

Design shear (+ve value) \( V_{Ed}=570 \) kN
Design tying force (+ve value) \( F_{tEd}=500 \) kN

Fin plate arrangement

</tbody>
</table>
Initial reinforcement arrangement

Reinforcement welded to cast-in plate for bending and tying resistance will need to be provided.
Bar diameter (top & bottom bars)  dr=25 mm
Total number of bars              nb=4
Tension resistance (bar group)    PtRd=TABLE 3 for nb=4, dr=25 =982 kN
Design tying force                FtEd=500 kN
As PtRd ≥ FtEd ( 982 kN ≥ 500 kN ), the tension resistance exceeds the design tying force.

Confirm the shear stud arrangement - EC4 Part 1-1 Cl. 6.6.3.1

Governing group shear resistance  PRd=PRd1=848 kN
As PRd ≥ VEd ( 848 kN ≥ 570 kN ), the shear resistance exceeds the design shear and hence studs provided are satisfactory.
Horizontal deviation              ecc=35 mm
Angle β (rotational deviation)    beta=5.71°
Maximum shear in corner stud      Vmax2=SQR((VEd/ns+V2)^2+V1^2)=116 kN
Shear resistance per stud         PRd1=PRd/ns=141 kN
As Vmax2 ≤ PRd1 ( 116 kN ≤ 141 kN ), corner stud shear OK.

Reinforcement arrangement and bar size

(A) Eccentricity moment on the cast-in plate
Maximum eccentricity              ep=150 mm
Design moment due to eccentricity Md=VEd*ep/1000=85.5 kNm

(B) Vertical lever arm for tension - compression couple
Design tension force              T=Md/l=202 kN
Design compression force          C=T2=202 kN

(C) Confirm the bar size
Top bar spacing (laterally)       bsp=155 mm
As T ≤ FtRd ( 202 kN ≤ 427 kN ), bars provided are OK.
As FtEd' ≤ FtRd1 ( 147 kN ≤ 213 kN ), maximum tensile force due to eccentricity of loading is less than the bar resistance.

Bending of the cast-in plate

The following calculations will check the resistance of the cast-in plate in bending for the eccentricity moment tension. The resistance model for end-plate from BS EN 1993-1-8 Clause 6.2.4 will be used.

(A) Check Mode 2 failure: bolt failure with yielding of the flange. In this case the bars are substituted for bolts.

Plan on cast-in plate  
ecc is the eccentricity to the centre line (CL) of the cast-in plate.  
This was defined earlier as 35 mm.  
fin = fin plate

**Equation 1:**  
\[ M_c + R_a((n+(m+ecc))) - aF_t(m+ecc) = 0 \]

**Equation 2:**  
\[ M_c + R_b((n+(m-ecc))) - F_t(m-ecc) = 0 \]

**Bar end distance**  
ex = 70 mm

**Cast-in plate thickness**  
\( tp = 25 \text{ mm} \)

**Force**  
\( F_t = \frac{F_tR_d}{n_t} = 213 \text{ kN} \)

**Moment**  
\( M_c = M_{plR_d} = 12.5 \text{ kNm} \)

**From equation 2**  
\[ R_b = \frac{(F_t \times (m-ecc)-M_c \times 1E3)}{(n+(m-ecc))} = -74.6 \text{ kN} \]

**Design tension force**  
\( T = \frac{M_d}{l} = 202 \text{ kN} \)

As \( T \leq F_T \ (202 \text{ kN} \leq 285 \text{ kN}) \), Mode 2 failure check OK.

**Bending moment at fin plate face**  
\( M = F_t \times (m-ecc)/1E3 = 6.64 \text{ kNm} \)

As \( M \leq M_{plR_d} \ (6.64 \text{ kNm} \leq 12.5 \text{ kNm}) \), bending moment at the face of the fin plate is less than the cast-in plate moment resistance.

(B) Check Mode 1 failure: consider a vertical centre line through the cast-in plate and fin plate.

**Total resistance force**  
\( F_{RdT1} = F_{RdT1A} + F_{RdT1B} = 1197 \text{ kN} \)

As \( T \leq F_{RdT1} \ (202 \text{ kN} \leq 1197 \text{ kN}) \), Mode 1 failure check OK.
CAST-IN PLATE      Depth     560 mm  
DETAILS            Breadth   250 mm     
Thickness 25 mm

(C) Check the cast-in plate under the tying load case
Tension resistance    FT=Ft*(a*n+(n+bsp))/com1=328 kN
As FT ≥ 2*FtEd/nb ( 328 kN ≥ 250 kN ), tension resistance exceeds
the design tying force.
As M ≤ MplRd ( 7.63 kNm ≤ 15.5 kNm ), bending moment in cast-in
plate is less than the cast-in plate moment resistance. Hence the
25 mm thick cast-in plate is acceptable for the tying load case.

Resistance of the combined cast-in plate and fin plate

The resistance of the combined cast-in plate and fin plate to bending
in the vertical plane will be considered. The fin plate will need to
be checked in bending at the face of the cast-in plate. The nominal
eccentricity moment at the back of the plate calculated previously for
determining the bar sizes is Md=85.5 kNm. The latter will be reduced
by the assumed plate thickness.
As M ≤ MRd ( 71.7 kNm ≤ 115 kNm ), the reduced bending moment is
less than the fin plate moment resistance.

(A) Tying load case
The fin plate and cast-in plate acting as a Tee section spans between
the top and bottom tie bars to resist tie forces. The span of the Tee
section is the distance

Consider the cast-in plate and fin plate
acting as a Tee section.

Assumed Tee section flange width b=100 mm
Length of Tee stem ls=100 mm
Span of Tee section L=0.44 m

(B) Plastic modulus
Plastic modulus of Tee section Z=z1+z2+z3=75625 mm³
Moment resistance MRd=fufp*Z/(gammu*1E6)=28.2 kNm
As M ≤ MRd ( 27.5 kNm ≤ 28.2 kNm ), the bending moment is less
than the Tee section moment resistance.

Welding reinforcement to cast-in plate

Bar strength          Ft=245 kN
Partial factor (cast-in plate) gamm=1.1
Weld coefficient betaw=0.9
Design strength of weld

\[ fvwd = \frac{f_{up}}{\beta \omega \gamma(3)^{0.5}} \]

\[ = 274 \text{ N/mm}^2 \]

Two welds round the bar will need to be provided as shown in diagram.

Throat length required

\[ a = \frac{F_t \cdot 1E3}{2 \cdot fvwd \cdot PI \cdot d_r} = 5.7 \text{ mm} \]

Weld leg length (reinf'ment)

\[ sr = \frac{a}{0.7071} = 8.06 \text{ mm} \]

Weld leg length to be adopted

\[ sr = 10 \text{ mm} \]

**PUNCHING SHEAR**

The shear stress expression below is as per Clause 6.4.4(2).

\[ v_{Ed} = \frac{V_{Ed}}{u_i \cdot d} + \frac{k \cdot M_{Ed}}{W_i \cdot d} \]

Consider the bending component only for the eccentricity moment and the direct component only for the tie force as these are separate load cases.

Definitions:

- loaded area refers to the cross-sectional area of the stiff bearing
- load perimeter refers to the stiff bearing plate perimeter
- load face refers to the stiff bearing plate face
- face of the load refers to the face of the stiff bearing plate
- loaded area dimensions refers to stiff bearing area dimensions
(A) **Shear stress on plate perimeter due to eccentricity moment**

First link perimeter at ≤ 0.5d from face of loaded area.

Link perimeters at ≤ 0.75d apart.

\[
\text{cx} \text{ and } \text{cy} \text{ are the loaded area dimensions.}
\]

Basic control perimeter is at 2d from the face of the loaded area.

\[
\text{Sr} = \text{spacing of links in the radial direction.}
\]

Average effective depth \( d = 170 \text{ mm} \)
Dimension of loaded area \( \text{cx} = 250 \text{ mm} \)
Dimension of loaded area \( \text{cy} = 560 \text{ mm} \)

As \( v_{Ed} \leq v_{Rdmax} \) (1.227 N/mm² ≤ 5.712 N/mm²), shear stress at load perimeter is within the maximum punching shear resistance.

Shear stress on the basic control perimeter \( u_1 \) due to bending

Determine the value of the shear resistance assuming there is no shear reinforcement as per EC2 Clause 6.4.4(1).

Reinforcement ratio in x-dir \( p_{1x} = 0.004 \)
Reinforcement ratio in y-dir \( p_{1y} = 0.0023 \)
Design punching shear resistance \( v_{Rdc} = (0.18/\gamma_{mc}) \cdot k \cdot (100 \cdot p_{1x} \cdot f_{ck})^{0.333} = 0.551 \text{ N/mm²} \)
Min punching shear resistance \( v_{min} = 0.035 \cdot k \cdot 1.5 \cdot f_{ck} \cdot 0.5 = 0.6261 \text{ N/mm²} \)

Hence, the minimum design punching shear resistance governs.

Design punching shear resistance \( v_{Rdc} = 0.6261 \text{ N/mm²} \)
As \( v_{Ed} \leq v_{Rdc} \) \( 0.2384 \text{ N/mm²} \leq 0.6261 \text{ N/mm²} \), punching shear reinforcement is not necessary for this load case.

(B) **Shear stress on plate perimeter due to tie force**

An estimate of the shear reinforcement required for tying action will be made, assuming the tie force is carried into the wall through the cast-in plate (no bending checks on the wall will be carried out).

The tie force is a direct force \( V_{Ed}'' = F_{tEd} = 500 \text{ kN} \)
Partial safety factor (concrete) \( \gamma_{mc} = 1.2 \) (accidental load case)
Load perimeter \( u_0 = 2 \cdot (\text{cx} + \text{cy}) = 1620 \text{ mm} \)
Shear stress at load perimeter \( v_{Ed} = V_{Ed}'' \cdot 1000 / (u_0 \cdot d) = 1.816 \text{ N/mm²} \)
Maximum punching shear resistance \( v_{Rdmax} = 0.5 \cdot v \cdot f_{cd} = 7.14 \text{ N/mm²} \)
As \( v_{Ed} \leq v_{Rdmax} \) \( 1.816 \text{ N/mm²} \leq 7.14 \text{ N/mm²} \), shear stress at load perimeter is within the maximum punching shear resistance.
Check shear stress at control perimeter $u_1$ at 2d from load face

Basic control perimeter at 2d

$$u_1 = 2(c_x + c_y) + 4 \pi d = 3756 \text{ mm}$$

Design punching shear resistance

$$v_{Rdc} = (0.18 / \gamma_{mc}) \cdot k \cdot (100 \cdot p_1 \cdot f_{ck})^{0.333} = 0.6888 \text{ kN/mm}$$

Min punching shear resistance

$$v_{min} = 0.035 \cdot k^{1.5} \cdot f_{ck}^{0.5} = 0.6261 \text{ kN/mm}$$

As $v_{Ed} > v_{Rdc}$ ($0.783 \text{ kN/mm}^2 > 0.6888 \text{ kN/mm}^2$), punching shear reinforcement needs to be provided.

Outer control perimeter where shear links are no longer required

Outer control perimeter

$$U_{out} = V_{Ed} \cdot 1000 / (d \cdot v_{Rdc}) = 4270 \text{ mm}$$

Radius to $U_{out}$

$$r_{out} = (U_{out} - lcf) / (2 \pi) = 421.8 \text{ mm}$$

The outer perimeter of shear reinforcement should be at a distance not greater than 1.5d from the outer control perimeter $U_{out}$. Radius to outer perimeter of shear reinforcement $Outper = r_{out} - 1.5d = 166.8 \text{ mm from load face}$.

Shear links on basic control perimeter $u_1$

The partial safety factor for reinforcement will be taken as $\gamma_{ms} = 1.15$.

Spac.inside 2d control perimeter

$$s_t = 255 \text{ mm}$$

Spac.outside control perimeter $u_1$

$$s_t' = 340 \text{ mm}$$

Char yield strength of reinft.

$$f_{yk} = 500 \text{ N/mm}^2$$

Diameter of shear reinforcement

$$d_{al} = 6 \text{ mm}$$

Spacing of links to be used

$$s_{pc} = 255 \text{ mm}$$

Use minimum H 6 (28.27 mm$^2$) legs of links @ 255 mm c/c around perimeter $u_1$ (i.e. in the tangential direction).

NOTE:

Punching shear links on perimeter 3 (i.e. at 2d from the load face) shown below are optional and could be omitted. This is because the radius $Outper < 1.25d$ (166.8 mm < 212.5 mm).

Summary of punching shear links

In the following calculation the first perimeter will be taken at 0.5d from the face of the load and subsequent perimeters will be spaced at 0.75d apart.

Use minimum H 6 (28.27 mm$^2$) legs of links @ 210 mm c/c in the tangential direction and 125 mm c/c in the radial direction.

Links on perimeter 2:
Use minimum H 6 (28.27 mm$^2$) legs of links @ 255 mm c/c in the tangential direction and 125 mm c/c in the radial direction.

Links on perimeter 3:
Use minimum H 6 (28.27 mm$^2$) legs of links @ 255 mm c/c in the tangential direction and 125 mm c/c in the radial direction.

DESIGN SUMMARY - nominally pinned joint

Design loads:
- Design shear: 570 kN
- Shear resistance: 848.2 kN (stud group)
- Shear resistance: 141.4 kN (per stud)
- Design tying force: 500 kN
- Tension resistance: 982 kN (bar group)
- Tension resistance: 213.4 kN (per bar)

Grade/strength:
- Concrete: 40 N/mm$^2$
- Fin plate: S 275
- Cast-in plate: S 355
- M20 bolts: 8.8

FP = fin plate
CP = cast-in plate
tb = top bars
bb = bottom bars
ss = shear stud

Fin plate:
- No. of bolts: 7
- Plate depth: 500 mm
- Plate width: 140 mm
- Plate thickness: 10 mm

Cast-in plate:
- Plate depth: 560 mm
- Plate width: 250 mm
- Plate thickness: 25 mm
Weld leg length: Fin to cast-in plate 2 No/8 mm FW need to be provided for connecting the fin plate to cast-in plate to eliminate the possibility of weld failure.

Stud welding: It is assumed that studs will be welded using electric arc stud-welding equipment. See SCI publication P300 for further information.

Weld leg length: Reinforcement 10 mm FW with two welds round the bar as shown in the diagram. PPFW is a partial penetration fillet weld (FW) in countersunk hole.

\[
\text{dr}=25 \text{ mm (bar diameter)} \\
\text{tp}=25 \text{ mm (plate thickness)}
\]

Shear studs: No. and diameter 6 No/25 mm
Height 100 mm
Spacing vertically 125 mm
Spacing horizontally 130 mm
Vertical edge distance 155 mm
Horiz. edge distance 60 mm

Shear studs:
2x3 shear stud array
Total 6 studs
All dimensions in mm

Reinforcement: Top bars 2 No/25 mm diameter
Bottom bars 2 No/25 mm diameter
Top bar spacing (bsp) 155 mm (laterally)
Bar edge distance (n') 47.5 mm (top & bottom bars)
Bar end distance (ex) 70 mm (top & bottom bars)
Bend bars mandrel 263.3 mm diameter
Bar anchorage length 1052 mm
Punching shear links are required, refer to the punching shear section of the calculations for diameter & spacing of links.

Punching shear links on perimeter 3 are optional.
General design information

The shear stud resistance check will be as per EC4 Part 1-1. The shear force is transferred to the fin plate by bolts. The cast-in plate and its welded connection to the fin plate will resist the eccentricity moment due to the offset of the bolt group from the face of the plate. The standard arrangement for fin plates in the Green Book (i.e. SCI publication P358) is 10 mm thick fin plate using S275 material, with two 8 mm FW. This will eliminate the possibility of weld failure. The face of the cast-in plate is normally inset to allow for the sliding form.

Both the cast-in plate and fin plate will need site-applied corrosion protection system if corrosion protection of steelwork is specified. Furthermore parts of the connection plate (e.g. the fin plate) will also require fire protection as for the connecting beam.

Design shear (+ve value) $V_{Ed}=570\ kN$
Design tying force (+ve value) $F_{tEd}=500\ kN$

Initial reinforcement arrangement

Reinforcement welded to cast-in plate for bending and tying resistance will need to be provided.
Bar diameter (top & bottom bars) \( dr=25 \text{ mm} \)
Total number of bars \( nb=4 \)
Tension resistance (bar group) \( PtRd=\text{TABLE 3 for nb=4, } dr=25=982 \text{ kN} \)
Design tying force \( FtEd=500 \text{ kN} \)
As \( PtRd \geq FtEd \) (982 kN ≥ 500 kN), the tension resistance exceeds the design tying force.

Confirm the shear stud arrangement - EC4 Part 1-1 Cl. 6.6.3.1

Governing group shear resistance \( PRd=PRd1=980 \text{ kN} \)
As \( PRd \geq VEd \) (980 kN ≥ 570 kN), the shear resistance exceeds the design shear and hence studs provided are satisfactory.
Horizontal deviation \( \text{ecc}=35 \text{ mm} \)
Angle \( \beta \) (rotational deviation) \( \beta=5.71^\circ \)
Maximum shear in corner stud \( Vmax2=\sqrt{(VEd/ns+V2)^2+V1^2)}=57.7 \text{ kN} \)
Shear resistance per stud \( PRd1=PRd/ns=81.7 \text{ kN} \)
As \( Vmax2 \leq PRd1 \) (57.7 kN ≤ 81.7 kN), corner stud shear OK.

Reinforcement arrangement and bar size

(A) Eccentricity moment on the cast-in plate
Maximum eccentricity \( ep=150 \text{ mm} \)
Design moment due to eccentricity \( Md=VEd*ep/1000=85.5 \text{ kNm} \)

(B) Vertical lever arm for tension - compression couple
Design tension force \( T=Md/l=202 \text{ kN} \)
Design compression force \( C=T2=202 \text{ kN} \)

(C) Confirm the bar size
Top bar spacing (laterally) \( bsp=150 \text{ mm} \)
As \( T \leq FtRd \) (202 kN ≤ 427 kN), bars provided are OK.
As \( FtEd' \leq FtRd1 \) (148 kN ≤ 213 kN), maximum tensile force due to eccentricity of loading is less than the bar resistance.

Bending of the cast-in plate

The following calculations will check the resistance of the cast-in plate in bending for the eccentricity moment tension. The resistance model for end-plate from BS EN 1993-1-8 Clause 6.2.4 will be used.

(A) Check Mode 2 failure: bolt failure with yielding of the flange. In this case the bars are substituted for bolts.
Steel design to Eurocode 3

Cast-in plate to connect structural steel beam to

Copyright 1986-2019 Fitzroy Systems Ltd.

Plan on cast-in plate

ecc is the eccentricity to the centre line (CL) of the cast-in plate.

This was defined earlier as 35 mm.

fin = fin plate

---

Equation 1: \[ M_c + R_a((n+(m+ecc))) - aF_t(m+ecc) = 0 \]

Equation 2: \[ M_c + R_b((n+(m-ecc))) - F_t(m-ecc) = 0 \]

---

Bar end distance \( ex = 70 \text{ mm} \)

Cast-in plate thickness \( tp = 25 \text{ mm} \)

Force \( F_t = F_{tRd}/ntb = 213 \text{ kN} \)

Moment \( M_c = M_{plRd} = 12.3 \text{ kNm} \)

From equation 2

\[ R_b = (F_t^*(m-ecc)-M_c*1E3)/(n+(m-ecc)) 
\]

\[ = -79 \text{ kN} \]

---

Tension resistance

\[ F_t^* = F_{tRd}/(a*n+(n+bsp))/(n+(bsp/2+ecc)) \]

\[ = 283 \text{ kN} \]

Design tension force \( T = M_d/l = 202 \text{ kN} \)

As \( T \leq F_t \ (202 \text{ kN} \leq 283 \text{ kN}) \), Mode 2 failure check OK.

Bending moment at fin plate face

\[ M = F_t^* (m-ecc) / 1E3 = 6.1 \text{ kNm} \]

As \( M \leq M_{plRd} \ (6.1 \text{ kNm} \leq 12.3 \text{ kNm}) \), bending moment at the face of the fin plate is less than the cast-in plate moment resistance.

(B) Check Mode 1 failure: consider a vertical centre line through the cast-in plate and fin plate.

---

Total resistance force

\[ F_{RdT1} = F_{RdT1A} + F_{RdT1B} = 1274 \text{ kN} \]

As \( T \leq F_{RdT1} \ (202 \text{ kN} \leq 1274 \text{ kN}) \), Mode 1 failure check OK.
CAST-IN PLATE
DETAILS
Depth  560 mm
Breadth  250 mm
Thickness  25 mm

(C) Check the cast-in plate under the tying load case
Tension resistance FT=Ft*(a*n+(n+bsp))/com1=326 kN
As FT ≥ 2*FtEd/nb ( 326 kN ≥ 250 kN ), tension resistance exceeds
the design tying force.
As M ≤ MplRd ( 7.02 kNm ≤ 15.3 kNm ), bending moment in cast-in
plate is less than the cast-in plate moment resistance. Hence the
25 mm thick cast-in plate is acceptable for the tying load case.

Resistance of the combined cast-in plate and fin plate

The resistance of the combined cast-in plate and fin plate to bending
in the vertical plane will be considered. The fin plate will need to
be checked in bending at the face of the cast-in plate. The nominal
eccentricity moment at the back of the plate calculated previously for
determining the bar sizes is Md=85.5 kNm. The latter will be reduced
by the assumed plate thickness.
As M ≤ MRd ( 71.3 kNm ≤ 115 kNm ), the reduced bending moment is
less than the fin plate moment resistance.

(A) Tying load case
The fin plate and cast-in plate acting as a Tee section spans between
the top and bottom tie bars to resist tie forces. The span of the Tee
section is the distance
\[ b \]
\[ \text{between the top & bottom tie bars.} \]
\[ ls \]
\[ \text{= length of stem} \]
\[ y \]
\[ \text{= depth to NA} \]
\[ tp \]
\[ =25 \text{ mm} \]
\[ tfp=10 \text{ mm} \]

Consider the cast-in plate and fin plate acting as a Tee section.

Assumed Tee section flange width b=100 mm
Length of Tee stem ls=100 mm
Span of Tee section L=0.42 m

(B) Plastic modulus
Plastic modulus of Tee section \[ Z=z1+z2+z3=75625 \text{ mm}^3 \]
Moment resistance \[ MRd=fufp*Z/(gammu*1E6)=28.2 \text{ kN} \]
As M ≤ MRd ( 26.3 kNm ≤ 28.2 kNm ), the bending moment is less
than the Tee section moment resistance.

Welding reinforcement to cast-in plate

Bar strength Ft=245 kN
Partial factor (cast-in plate) gamm=1.1
Weld coefficient betaw=0.9
Design strength of weld \[ fvwd = \frac{f_{up}}{\beta_{w} \gamma_{w} (3)^{0.5}} \]
\[ = 274 \text{ N/mm}^2 \]

Two welds round the bar will need to be provided as shown in diagram.

Throat length required \[ a = \frac{F_{t} \cdot 1E3}{2 \cdot fvwd \cdot \pi \cdot dr} = 5.7 \text{ mm} \]
Weld leg length (reinf'ment) \[ sr = \frac{a}{0.7071} = 8.06 \text{ mm} \]
Weld leg length to be adopted \[ sr = 10 \text{ mm} \]

**PUNCHING SHEAR**

The shear stress expression below is as per Clause 6.4.4(2).

\[ \nu_{Ed} = \frac{V_{Ed}}{u_{i} \cdot d} + \frac{k \cdot M_{Ed}}{W_{i} \cdot d} \]

Consider the bending component only for the eccentricity moment and the direct component only for the tie force as these are separate load cases.

Definitions:
- loaded area refers to the cross-sectional area of the stiff bearing
- load perimeter refers to the stiff bearing plate perimeter
- load face refers to the stiff bearing plate face
- face of the load refers to the face of the stiff bearing plate
- loaded area dimensions refers to stiff bearing area dimensions
(A) Shear stress on plate perimeter due to eccentricity moment

\[ \text{cx} \text{ and } \text{cy} \text{ are the loaded area dimensions.} \]

First link perimeter at \( \leq 0.5d \) from face of loaded area.

Link perimeters at \( \leq 0.75d \) apart.

\[ \leq 1.5d \quad \leq 0.5d \]

Average effective depth \( d = 170 \text{ mm} \)
Dimension of loaded area \( cx = 250 \text{ mm} \)
Dimension of loaded area \( cy = 560 \text{ mm} \)
As \( v_{Ed} \leq v_{Rdmax} (1.227 \text{ N/mm}^2 \leq 5.712 \text{ N/mm}^2) \), shear stress at load perimeter is within the maximum punching shear resistance.

Shear stress on the basic control perimeter \( u_1 \) due to bending

Determine the value of the shear resistance assuming there is no shear reinforcement as per EC2 Clause 6.4.4(1).

Reinforcement ratio in x-dir \( p_{lx} = 0.004 \)
Reinforcement ratio in y-dir \( p_{ly} = 0.0023 \)
Design punching shear resistance \( v_{Rdc} = (0.18/\gamma_{mc}) \ast k \ast (100 \ast p_1 \ast f_{ck})^{0.333} = 0.551 \text{ N/mm}^2 \)

Min punching shear resistance \( v_{min} = 0.035 \ast k \ast 1.5 \ast f_{ck} \ast 0.5 = 0.6261 \text{ N/mm}^2 \)

Hence, the minimum design punching shear resistance governs.

Design punching shear resistance \( v_{Rdc} = 0.6261 \text{ N/mm}^2 \)
As \( v_{Ed} \leq v_{Rdc} (0.2384 \text{ N/mm}^2 \leq 0.6261 \text{ N/mm}^2) \), punching shear reinforcement is not necessary for this load case.

(B) Shear stress on plate perimeter due to tie force

An estimate of the shear reinforcement required for tying action will be made, assuming the tie force is carried into the wall through the cast-in plate (no bending checks on the wall will be carried out).

The tie force is a direct force \( V_{Ed}' = F_{tEd} = 500 \text{ kN} \)
Partial safety factor (concrete) \( \gamma_{mc} = 1.2 \) (accidental load case)
Load perimeter \( u_0 = 2 \ast (cx + cy) = 1620 \text{ mm} \)
Shear stress at load perimeter \( v_{Ed} = V_{Ed}' \ast 1000 / (u_0 \ast d) = 1.816 \text{ N/mm}^2 \)
Maximum punching shear resistance \( v_{Rdmax} = 0.5 \ast v \ast f_{cd} = 7.14 \text{ N/mm}^2 \)
As \( v_{Ed} \leq v_{Rdmax} (1.816 \text{ N/mm}^2 \leq 7.14 \text{ N/mm}^2) \), shear stress at load perimeter is within the maximum punching shear resistance.
Check shear stress at control perimeter $u_1$ at 2d from load face

Basic control perimeter at 2d $u_1=2*(cx+cy)+4*\pi*d=3756$ mm

Design punching shear resistance $V_Rdc=(0.18/\gamma_c)*k^*(100*p_1^*f_{ck})^0.333=0.6888$ N/mm²

Min punching shear resistance $v_{min}=0.035*k^1.5*f_{ck}^0.5=0.6261$ N/mm²

As $V_{Ed} > V_Rdc$, punching shear reinforcement needs to be provided.

Outer control perimeter where shear links are no longer required

Outer control perimeter $U_{out}=V_{Ed}^'*1000/(d^*V_{Rdc})=4270$ mm

Radius to $U_{out}$ $r_{out}=(U_{out}-lcf)/(2*\pi)=421.8$ mm

The outer perimeter of shear reinforcement should be at a distance not greater than 1.5d from the outer control perimeter $U_{out}$. Radius to outer perimeter of shear reinforcement $Outper=r_{out}-1.5*d=166.8$ mm from load face

Shear links on basic control perimeter $u_1$

The partial safety factor for reinforcement will be taken as $\gamma_m=1.15$.

Spacing inside 2d control perimeter $St=255$ mm

Spacing outside control perimeter $u_1$ $St'=340$ mm

Char yield strength of reinft. $f_{yk}=500$ N/mm²

Diameter of shear reinforcement $dia=6$ mm

Spacing of links to be used $spac=255$ mm

Use minimum H 6 (28.27 mm²) legs of links @ 255 mm c/c around perimeter $u_1$ (i.e. in the tangential direction).

NOTE:
Punching shear links on perimeter 3 (i.e. at 2d from the load face) shown below are optional and could be omitted. This is because the radius $Outper < 1.25*d$ (166.8 mm < 212.5 mm).

Summary of punching shear links

In the following calculation the first perimeter will be taken at 0.5d from the face of the load and subsequent perimeters will be spaced at 0.75d apart.
Links on perimeter 1:
Use minimum H 6 (28.27 mm²) legs of links @ 210 mm c/c in the tangential direction and 125 mm c/c in the radial direction.

Links on perimeter 2:
Use minimum H 6 (28.27 mm²) legs of links @ 255 mm c/c in the tangential direction and 125 mm c/c in the radial direction.

Links on perimeter 3:
Use minimum H 6 (28.27 mm²) legs of links @ 255 mm c/c in the tangential direction and 125 mm c/c in the radial direction.

Punching shear links on perimeter 3 are optional.
Location: Ex3 - Cast-in plate design (2x3 Shear stud Array)

General design information

The shear stud resistance check will be as per EC4 Part 1-1. The shear force is transferred to the fin plate by bolts. The cast-in plate and its welded connection to the fin plate will resist the eccentricity moment due to the offset of the bolt group from the face of the plate. The standard arrangement for fin plates in the Green Book (i.e. SCI publication P358) is 10 mm thick fin plate using S275 material, with two 8 mm FW. This will eliminate the possibility of weld failure. The face of the cast-in plate is normally inset to allow for the sliding form.

Both the cast-in plate and fin plate will need site-applied corrosion protection system if corrosion protection of steelwork is specified. Furthermore parts of the connection plate (e.g. the fin plate) will also require fire protection as for the connecting beam.

Design shear (+ve value) \( V_{Ed} = 702 \) kN

Design tying force (+ve value) \( F_{tEd} = 700 \) kN

Fin plate arrangement

No. of rows of M20 bolts \( n_{br} = 7 \)

Fin plate depth \( h_{fp} = 500 \) mm

Fin plate width \( b_{fp} = 140 \) mm

Choose initial shear stud arrangement

Stud diameter \( d_{s} = 25 \) mm

Stud height \( h_{s} = 100 \) mm

Concrete strength \( f_{ck} = 40 \) N/mm²

Spacing of studs (vertically) \( d_{1} = 125 \) mm

Spacing of studs (horizontally) \( d_{2} = 130 \) mm

Edge distance (vertically) \( e_{1} = 155 \) mm

Edge distance (horizontally) \( e_{2} = 60 \) mm
**Initial reinforcement arrangement**

Reinforcement welded to cast-in plate for bending and tying resistance will need to be provided.

- **Bar diameter (top & bottom bars)**: $d_r = 25$ mm
- **Total number of bars**: $n_b = 6$
- **Tension resistance (bar group)**: $P_{tRd} = TABLE\ 3\ for\ n_b = 6,\ d_r = 25$
  
  
  = 1473 kN
- **Design tying force**: $F_{tEd} = 700$ kN

As $P_{tRd} \geq F_{tEd}$ (1473 kN $\geq$ 700 kN), the tension resistance exceeds the design tying force.

**Confirm the shear stud arrangement - EC4 Part 1-1 Cl. 6.6.3.1**

- **Governing group shear resistance**: $P_{Rd} = P_{Rd1} = 848$ kN
- **As $P_{Rd} \geq V_{Ed}$ (848 kN $\geq$ 702 kN)**, the shear resistance exceeds the design shear and hence studs provided are satisfactory.

  - **Horizontal deviation**: $e_{cc} = 35$ mm
  - **Angle $\beta$ (rotational deviation)**: $\beta = 1^\circ$
  - **Maximum shear in corner stud**: $V_{max2} = \sqrt{\left(V_{Ed}/n_s + V_2\right)^2 + V_1^2} = 140$ kN
  - **Shear resistance per stud**: $P_{Rd1} = P_{Rd}/n_s = 141$ kN

As $V_{max2} \leq P_{Rd1}$ (140 kN $\leq$ 141 kN), corner stud shear OK.

**Reinforcement arrangement and bar size**

- **(A) Eccentricity moment on the cast-in plate**
  - **Maximum eccentricity**: $e_p = 150$ mm
  - **Design moment due to eccentricity**: $M_d = V_{Ed}e_p/1000 = 105$ kNm

- **(B) Vertical lever arm for tension - compression couple**
  - **Design tension force**: $T = M_d/l = 255$ kN
  - **Design compression force**: $C = T_2 = 255$ kN

- **(C) Confirm the bar size**
  - **Top bar spacing (laterally)**: $b_{sp} = 150$ mm
  - **As $T \leq F_{tRd}$ (255 kN $\leq$ 427 kN)**, bars provided are OK.
  - **As $F_{tEd}' \leq F_{tRd1}$ (187 kN $\leq$ 213 kN)**, maximum tensile force due to eccentricity of loading is less than the bar resistance.

**Bending of the cast-in plate**

The following calculations will check the resistance of the cast-in plate in bending for the eccentricity moment tension. The resistance model for end-plate from BS EN 1993-1-8 Clause 6.2.4 will be used.

- **(A) Check Mode 2 failure: bolt failure with yielding of the flange. In this case the bars are substituted for bolts.**
Equation 1: \[ M_c + R_a((n+(m+ecc))) - aF_t(m+ecc) = 0 \]
Equation 2: \[ M_c + R_b((n+(m-ecc))) - F_t(m-ecc) = 0 \]

Bar end distance: \( ex = 70 \text{ mm} \)
Cast-in plate thickness: \( tp = 25 \text{ mm} \)
Force: \( F_t = F_{tRd}/ntb = 213 \text{ kN} \)
Moment: \( M_c = M_{plRd} = 12.3 \text{ kNm} \)
From equation 2: \( R_b = (F_t*(m-ecc)-M_c*1E3)/(n+(m-ecc)) = -79 \text{ kN} \)

Tension resistance: \( F_T = F_{tRd}*(a*n+(n+bsp))/(n+(bsp/2+ecc)) = 283 \text{ kN} \)
Design tension force: \( T = M_d/l = 255 \text{ kN} \)
As \( T \leq F_T \) (255 kN \leq 283 kN), Mode 2 failure check OK.
Bending moment at fin plate face: \( M = F_t*(m-ecc)/1E3 = 6.1 \text{ kNm} \)
As \( M \leq M_{plRd} \) (6.1 kNm \leq 12.3 kNm), bending moment at the face of the fin plate is less than the cast-in plate moment resistance.

(B) Check Mode 1 failure: consider a vertical centre line through the cast-in plate and fin plate.

Total resistance force: \( F_{RdT1} = F_{RdT1A} + F_{RdT1B} = 1274 \text{ kN} \)
As \( T \leq F_{RdT1} \) (255 kN \leq 1274 kN), Mode 1 failure check OK.
CAST-IN PLATE DETAILS
Depth 560 mm                 Breadth 250 mm
Thickness 25 mm

(C) Check the cast-in plate under the tying load case
Tension resistance
FT=Ft*(a*n+(n+bsp))/com1=326 kN
As FT ≥ 2*FtEd/nb (326 kN ≥ 233 kN), tension resistance exceeds the design tying force.
As M ≤ MplRd (7.02 kNm ≤ 15.3 kNm), bending moment in cast-in plate is less than the cast-in plate moment resistance. Hence the 25 mm thick cast-in plate is acceptable for the tying load case.

Resistance of the combined cast-in plate and fin plate

The resistance of the combined cast-in plate and fin plate to bending in the vertical plane will be considered. The fin plate will need to be checked in bending at the face of the cast-in plate. The nominal eccentricity moment at the back of the plate calculated previously for determining the bar sizes is Md=105 kNm. The latter will be reduced by the assumed plate thickness.
As M ≤ MRd (87.8 kNm ≤ 115 kNm), the reduced bending moment is less than the fin plate moment resistance.

(A) Tying load case
The fin plate and cast-in plate acting as a Tee section spans between the top and bottom tie bars to resist tie forces. The span of the Tee section is the distance between the top & bottom tie bars.
ls = length of stem
y = depth to NA
tp =25 mm
tfp=10 mm
Consider the cast-in plate and fin plate acting as a Tee section.

Assumed Tee section flange width b=150 mm
Length of Tee stem ls=110 mm
Span of Tee section L=0.42 m

(B) Plastic modulus
Plastic modulus of Tee section Z=z1+z2+z3=117671 mm³
Moment resistance MRd=fufp*Z/(gammu*1E6)=43.9 kNm
As M ≤ MRd (36.8 kNm ≤ 43.9 kNm), the bending moment is less than the Tee section moment resistance.

Welding reinforcement to cast-in plate

Bar strength Ft=245 kN
Partial factor (cast-in plate) gamm=1.1
Weld coefficient betaw=0.9
Design strength of weld \[ f_{vwd} = \frac{f_{up}}{(\beta_{aw} \gamma_{aw} (3)^{0.5})} \]

\[ = 274 \text{ N/mm}^2 \]

Two welds round the bar will need to be provided as shown in diagram.

Throat length required \[ a = \frac{F_t \cdot 1 \times 10^3}{2 \cdot f_{vwd} \cdot \pi \cdot d_r} = 5.7 \text{ mm} \]

Weld leg length (reinf’ment) \[ s_r = \frac{a}{0.7071} = 8.06 \text{ mm} \]

Weld leg length to be adopted \[ s_r = 10 \text{ mm} \]

**PUNCHING SHEAR**

The shear stress expression below is as per Clause 6.4.4(2).

\[ \frac{v_{Ed}}{\mu_i \cdot d} = \frac{V_{Ed}}{\mu_i \cdot d} + \frac{k \cdot M_{Ed}}{\mu_i \cdot d} \]

Consider the bending component only for the eccentricity moment and the direct component only for the tie force as these are separate load cases.

Definitions:
- loaded area refers to the cross-sectional area of the stiff bearing
- load perimeter refers to the stiff bearing plate perimeter
- load face refers to the stiff bearing plate face
- face of the load refers to the face of the stiff bearing plate
- loaded area dimensions refers to stiff bearing area dimensions
(A) Shear stress on plate perimeter due to eccentricity moment

First link perimeter at ≤ 0.5d from face of loaded area.

Link perimeters at ≤ 0.75d apart.

Average effective depth d = 170 mm
Dimension of loaded area cx = 250 mm
dimension of loaded area cy = 560 mm
As vEd ≤ vRdmax (1.511 N/mm² ≤ 5.712 N/mm²), shear stress at load perimeter is within the maximum punching shear resistance.

Shear stress on the basic control perimeter u₁ due to bending

Determine the value of the shear resistance assuming there is no shear reinforcement as per EC2 Clause 6.4.4(1).

Reinforcement ratio in x-dir plx = 0.004
Reinforcement ratio in y-dir ply = 0.0023
Design punching shear resistance VRdc = (0.18/gamc)*k*(100*p1 *fck)^0.333 = 0.551 N/mm²
Min punching shear resistance vmin = 0.035*k*1.5*fck*0.5 = 0.6261 N/mm²
Hence, the minimum design punching shear resistance governs.

Design punching shear resistance VRdc = 0.6261 N/mm²
As vEd ≤ VRdc (0.2936 N/mm² ≤ 0.6261 N/mm²), punching shear reinforcement is not necessary for this load case.

(B) Shear stress on plate perimeter due to tie force

An estimate of the shear reinforcement required for tying action will be made, assuming the tie force is carried into the wall through the cast-in plate (no bending checks on the wall will be carried out).

The tie force is a direct force VEd’ = FtEd = 700 kN
Partial safety factor (concrete) gamc = 1.2 (accidental load case)
Load perimeter uo = 2*(cx + cy) = 1620 mm
Shear stress at load perimeter vEd = VEd’*1000/(uo*d) = 2.542 N/mm²
Maximum punching shear resistance VRdmax = 0.5*v*fcd = 7.14 N/mm²
As vEd ≤ VRdmax (2.542 N/mm² ≤ 7.14 N/mm²), shear stress at load perimeter is within the maximum punching shear resistance.
Check shear stress at control perimeter $u_1$ at 2d from load face

Basic control perimeter at 2d

$$u_1 = 2(cx + cy) + 4\pi d = 3756 \text{ mm}$$

Design punching shear resistance

$$\nu_{Rdc} = (0.18/\gamma_{Mc}) \times k \times (100 \times p_1 \times f_{ck})^{0.333} = 0.6888 \text{ N/mm}^2$$

Min punching shear resistance

$$\nu_{min} = 0.035 \times k^{1.5} \times f_{ck}^{0.5} = 0.6261 \text{ N/mm}^2$$

As $\nu_{Ed} > \nu_{Rdc}$ ($1.096 \text{ N/mm}^2 > 0.6888 \text{ N/mm}^2$), punching shear reinforcement needs to be provided.

Outer control perimeter where shear links are no longer required

Outer control perimeter

$$U_{out} = \frac{V_{Ed} \times 1000}{d \times \nu_{Rdc}} = 5978 \text{ mm}$$

Radius to $U_{out}$

$$r_{out} = \frac{U_{out} - lcf}{2\pi} = 693.6 \text{ mm}$$

The outer perimeter of shear reinforcement should be at a distance not greater than 1.5d from the outer control perimeter $U_{out}$. Radius to outer perimeter of shear reinforcement

$$Out_{per} = r_{out} - 1.5 \times d = 438.6 \text{ mm from load face}$$

Shear links on basic control perimeter $u_1$

The partial safety factor for reinforcement will be taken as $\gamma_{Ms} = 1.15$.

Spac. inside 2d control perimeter $St = 255 \text{ mm}$

Spac. outside control perimeter $u_1$ $St' = 340 \text{ mm}$

Char yield strength of reinf. $f_{yk} = 500 \text{ N/mm}^2$

Diameter of shear reinforcement $d_{al} = 6 \text{ mm}$

Spacing of links to be used $spac = 170 \text{ mm}$

Use minimum H 6 (28.27 mm$^2$) legs of links @ 170 mm c/c around perimeter $u_1$ (i.e. in the tangential direction).

Summary of punching shear links

In the following calculation the first perimeter will be taken at 0.5d from the face of the load and subsequent perimeters will be spaced at 0.75d apart.
Links on perimeter 1:
Use minimum H 6 (28.27 mm²) legs of links @ 95 mm c/c in the tangential direction and 125 mm c/c in the radial direction.

Links on perimeter 2:
Use minimum H 6 (28.27 mm²) legs of links @ 130 mm c/c in the tangential direction and 125 mm c/c in the radial direction.

Links on perimeter 3:
Use minimum H 6 (28.27 mm²) legs of links @ 170 mm c/c in the tangential direction and 125 mm c/c in the radial direction.

Links on perimeter 4:
Use minimum H 6 (28.27 mm²) legs of links @ 205 mm c/c in the tangential direction and 125 mm c/c in the radial direction.

DESIGN SUMMARY - nominally pinned joint

Design loads:
- Design shear: 702 kN
- Shear resistance: 848.2 kN (stud group)
- Shear resistance: 141.4 kN (per stud)

General design information

The shear stud resistance check will be as per EC4 Part 1-1. The shear force is transferred to the fin plate by bolts. The cast-in plate and its welded connection to the fin plate will resist the eccentricity moment due to the offset of the bolt group from the face of the plate. The standard arrangement for fin plates in the Green Book (i.e. SCI publication P358) is 10 mm thick fin plate using S275 material, with two 8 mm FW. This will eliminate the possibility of weld failure. The face of the cast-in plate is normally inset to allow for the sliding form.

Both the cast-in plate and fin plate will need site-applied corrosion protection system if corrosion protection of steelwork is specified. Furthermore parts of the connection plate (e.g. the fin plate) will also require fire protection as for the connecting beam.

Design shear (+ve value) $V_{Ed}=725$ kN
Design tying force (+ve value) $F_{tEd}=700$ kN

**Initial reinforcement arrangement**

Reinforcement welded to cast-in plate for bending and tying resistance will need to be provided.
- Bar diameter (top & bottom bars): $d_r = 25$ mm
- Total number of bars: $n_b = 6$
- Tension resistance (bar group): $P_{trd} = $ TABLE 3 for $n_b = 6, d_r = 25$
  
  $= 1473$ kN
- Design tying force: $F_{ted} = 700$ kN

As $P_{trd} \geq F_{ted}$ ($1473$ kN $\geq 700$ kN), the tension resistance exceeds the design tying force.

**Confirm the shear stud arrangement - EC4 Part 1-1 Cl. 6.6.3.1**

- Governing group shear resistance: $P_{rd} = P_{rd1} = 1272$ kN
- As $P_{rd} \geq V_{Ed}$ ($1272$ kN $\geq 725$ kN), the shear resistance exceeds the design shear and hence studs provided are satisfactory.
- Horizontal deviation: $e_{cc} = 35$ mm
- Angle $\beta$ (rotational deviation): $\beta = 3.81^\circ$
- Maximum shear in corner stud: $V_{max2} = \sqrt{(V_{Ed}/n_s + V_2)^2 + V_1^2} = 100$ kN
- Shear resistance per stud: $P_{rd1} = P_{rd}/n_s = 141$ kN

As $V_{max2} \leq P_{rd1}$ ($100$ kN $\leq 141$ kN), corner stud shear OK.

**Reinforcement arrangement and bar size**

- (A) Eccentricity moment on the cast-in plate
  - Maximum eccentricity: $e_p = 150$ mm
  - Design moment due to eccentricity: $M_d = V_{Ed} * e_p / 1000 = 109$ kNm

- (B) Vertical lever arm for tension - compression couple
  - Design tension force: $T = M_d / l = 264$ kN
  - Design compression force: $C = T_2 = 264$ kN

- (C) Confirm the bar size
  - Top bar spacing (laterally): $b_{sp} = 150$ mm

As $T \leq F_{td}$ ($264$ kN $\leq 427$ kN), bars provided are OK.
As $F_{ted}' \leq F_{td1}$ ($194$ kN $\leq 213$ kN), maximum tensile force due to eccentricity of loading is less than the bar resistance.

**Bending of the cast-in plate**

The following calculations will check the resistance of the cast-in plate in bending for the eccentricity moment tension. The resistance model for end-plate from BS EN 1993-1-8 Clause 6.2.4 will be used.

- (A) Check Mode 2 failure: bolt failure with yielding of the flange. In this case the bars are substituted for bolts.
Steel design to Eurocode 3  
Cast-in plate to connect structural steel beam to

Date: 02/12/19  
Ref No: SC495 EC

Equation 1: \[ M_c + R_a((n+(m+ecc))) - aF_t(m+ecc) = 0 \]
Equation 2: \[ M_c + R_b((n+(m-ecc))) - F_t(m-ecc) = 0 \]

Bar end distance \( e_x = 70 \text{ mm} \)
Cast-in plate thickness \( t_p = 25 \text{ mm} \)
Force \( F_t = FtRd/ntb = 213 \text{ kN} \)
Moment \( M_c = MplRd = 13.5 \text{ kNm} \)
From equation 2 \[ R_b = (F_t*(m-ecc)-M_c*1E3)/(n+(m-ecc)) = -68.4 \text{ kN} \]

Tension resistance \[ F_T = F_t*(a*n+(n+bsp))/(n+(bsp/2+ecc)) = 289 \text{ kN} \]
Design tension force \( T = M_d/l = 264 \text{ kN} \)
As \( T \leq F_T \) (264 kN \( \leq 289 \text{ kN} \)), Mode 2 failure check OK.
Bending moment at fin plate face \( M = F_t*(m-ecc)/1E3 = 6.1 \text{ kNm} \)
As \( M \leq MplRd \) (6.1 kNm \( \leq 13.5 \text{ kNm} \)), bending moment at the face of the fin plate is less than the cast-in plate moment resistance.

(B) Check Mode 1 failure: consider a vertical centre line through the cast-in plate and fin plate.

Total resistance force \( F_{RdT1} = F_{RdT1A} + F_{RdT1B} = 1375 \text{ kN} \)
As \( T \leq F_{RdT1} \) (264 kN \( \leq 1375 \text{ kN} \)), Mode 1 failure check OK.
CAST-IN PLATE                          Details
Depth  560 mm                      Breadth  320 mm
Thickness 25 mm

(C) Check the cast-in plate under the tying load case
Tension resistance  \( FT=2\times F_t (a\times n+(n+b/np))/\text{com1}=333 \text{ kN} \)
As \( FT \geq 2\times F_t E_d/\text{nb} \) (333 kN \( \geq \) 233 kN), tension resistance exceeds the design tying force.
As \( M \leq M_{pl,Rd} \) (7.02 kNm \( \leq \) 16.7 kNm), bending moment in cast-in plate is less than the cast-in plate moment resistance. Hence the 25 mm thick cast-in plate is acceptable for the tying load case.

Resistance of the combined cast-in plate and fin plate

The resistance of the combined cast-in plate and fin plate to bending in the vertical plane will be considered. The fin plate will need to be checked in bending at the face of the cast-in plate. The nominal eccentricity moment at the back of the plate calculated previously for determining the bar sizes is \( M_d=109 \text{ kNm} \). The latter will be reduced by the assumed plate thickness.
As \( M \leq M_{Rd} \) (90.6 kNm \( \leq \) 115 kNm), the reduced bending moment is less than the fin plate moment resistance.

(A) Tying load case
The fin plate and cast-in plate acting as a Tee section spans between the top and bottom tie bars to resist tie forces. The span of the Tee section is the distance between the top & bottom tie bars.
\[
\begin{align*}
\text{tp} & = \text{length of stem} \\
\text{y} & = \text{depth to NA} \\
\text{tp} & = 25 \text{ mm} \\
\text{tfp} & = 10 \text{ mm}
\end{align*}
\]
Consider the cast-in plate and fin plate acting as a Tee section.

Assumed Tee section flange width \( b=150 \text{ mm} \)
Length of Tee stem \( l_s=110 \text{ mm} \)
Span of Tee section \( L=0.42 \text{ m} \)

(B) Plastic modulus
Plastic modulus of Tee section \( Z=z_1+z_2+z_3=117671 \text{ mm}^3 \)
Moment resistance \( M_{Rd}=f_{ufp}\times Z/(\gamma_m\times 1\times 10^6)=43.9 \text{ kNm} \)
As \( M \leq M_{Rd} \) (36.8 kNm \( \leq \) 43.9 kNm), the bending moment is less than the Tee section moment resistance.

Welding reinforcement to cast-in plate

Bar strength \( F_t=245 \text{ kN} \)
Partial factor (cast-in plate) \( \gamma_m=1.1 \)
Weld coefficient \( \beta_{aw}=0.9 \)
Design strength of weld:

\[ f_{vwd} = \frac{f_{up}}{(\beta_{w} \gamma_{w} (3)^{0.5})} \]

\[ = 274 \text{ N/mm}^2 \]

Two welds round the bar will need to be provided as shown in diagram.

Throat length required:

\[ a = \frac{F_t \times 1E3}{2 \times f_{vwd} \pi \times d} = 5.7 \text{ mm} \]

Weld leg length (reinf'ment):

\[ s_r = a / 0.7071 = 8.06 \text{ mm} \]

Weld leg length to be adopted:

\[ s_r = 10 \text{ mm} \]

**PUNCHING SHEAR**

The shear stress expression below is as per Clause 6.4.4(2).

\[ \frac{V_{Ed}}{u_i \cdot d} + \frac{k \cdot M_{Ed}}{W_i \cdot d} \]

Consider the bending component only for the eccentricity moment and the direct component only for the tie force as these are separate load cases.

Definitions:
- loaded area refers to the cross-sectional area of the stiff bearing
- load perimeter refers to the stiff bearing plate perimeter
- load face refers to the stiff bearing plate face
- face of the load refers to the face of the stiff bearing plate
- loaded area dimensions refers to stiff bearing area dimensions
(A) Shear stress on plate perimeter due to eccentricity moment

First link perimeter at ≤ 0.5d from face of loaded area.

Link perimeters at ≤ 0.75d apart.

 cx and cy are the loaded area dimensions.

Basic control perimeter is at 2d from the face of the loaded area.

Sr = spacing of links in the radial direction.

Average effective depth d=170 mm
Dimension of loaded area cx=250 mm
dimension of loaded area cy=560 mm

As vEd ≤ vRdmax (1.56 N/mm² ≤ 5.712 N/mm²), shear stress at load perimeter is within the maximum punching shear resistance.

Shear stress on the basic control perimeter u₁ due to bending

Determine the value of the shear resistance assuming there is no shear reinforcement as per EC2 Clause 6.4.4(1).

Reinforcement ratio in x-dir pl₁ = 0.004
Reinforcement ratio in y-dir ply = 0.0023
Design punching shear resistance vRdc=(0.18/gamc)*k*(100*p₁ *fck)^0.333=0.551 N/mm²

Min punching shear resistance vmin=0.035*k'*fck'*0.5=0.6261 N/mm²

Hence, the minimum design punching shear resistance governs.

Design punching shear resistance vRdc=0.6261 N/mm²

As vEd ≤ vRdc (0.3032N/mm² ≤ 0.6261 N/mm²), punching shear reinforcement is not necessary for this load case.

(B) Shear stress on plate perimeter due to tie force

An estimate of the shear reinforcement required for tying action will be made, assuming the tie force is carried into the wall through the cast-in plate (no bending checks on the wall will be carried out).

The tie force is a direct force VEd'=FtEd=700 kN
Partial safety factor (concrete) gamc=1.2 (accidental load case)
Load perimeter u₀=2*(cx+cy)=1620 mm
Shear stress at load perimeter vEd=VEd'*(uo*d) = 2.542 N/mm²

Maximum punching shear resistance vRdmax=0.5*v*fcd=7.14 N/mm²

As vEd ≤ vRdmax (2.542 N/mm² ≤ 7.14 N/mm²), shear stress at load perimeter is within the maximum punching shear resistance.
Check shear stress at control perimeter \( u_1 \) at 2d from load face

Basic control perimeter at 2d \( u_1 = 2*(c_x + c_y) + 4\pi d = 3756 \text{ mm} \)
Design punching shear resistance \( v_{Rdc} = (0.18/gamc) \cdot k \cdot (100 \cdot p_1 \cdot f_{ck})^{0.333} = 0.6888 \text{ N/mm}^2 \)
Min punching shear resistance \( v_{min} = 0.035 \cdot k^{1.5} \cdot f_{ck}^{0.5} = 0.6261 \text{ N/mm}^2 \)
As \( v_{Ed} > v_{Rdc} \) (1.096 N/mm² > 0.6888 N/mm²), punching shear reinforcement needs to be provided.

Outer control perimeter where shear links are no longer required

Outer control perimeter \( U_{out} = V_{Ed} \cdot 1000 / (d \cdot v_{Rdc}) = 5978 \text{ mm} \)
Radius to \( U_{out} \) \( r_{out} = (U_{out} - lcf) / (2 \cdot \pi) = 693.6 \text{ mm} \)
The outer perimeter of shear reinforcement should be at a distance not greater than 1.5d from the outer control perimeter \( U_{out} \). Radius to outer perimeter of shear reinforcement \( r_{outer} = r_{out} - 1.5 \cdot d \)
\( = 438.6 \text{ mm from load face} \)

Shear links on basic control perimeter \( u_1 \)
The partial safety factor for reinforcement will be taken as \( \gamma_{ms} = 1.15 \).
Spac. inside 2d control perimeter \( S_t = 255 \text{ mm} \)
Spac. outside control perimeter \( u_1 \) \( S_t' = 340 \text{ mm} \)
Char yield strength of reinforcement \( f_{yk} = 500 \text{ N/mm}^2 \)
Diameter of shear reinforcement \( \phi_{dl} = 6 \text{ mm} \)
Spacing of links to be used \( S_p = 170 \text{ mm} \)
Use minimum H 6 (28.27 mm²) legs of links @ 170 mm c/c around perimeter \( u_1 \) (i.e. in the tangential direction).

Summary of punching shear links

In the following calculation the first perimeter will be taken at 0.5d from the face of the load and subsequent perimeters will be spaced at 0.75d apart.
Links on perimeter 1:
Use minimum H 6 (28.27 mm$^2$) legs of links @ 95 mm c/c in the tangential direction and 125 mm c/c in the radial direction.

Links on perimeter 2:
Use minimum H 6 (28.27 mm$^2$) legs of links @ 130 mm c/c in the tangential direction and 125 mm c/c in the radial direction.

Links on perimeter 3:
Use minimum H 6 (28.27 mm$^2$) legs of links @ 170 mm c/c in the tangential direction and 125 mm c/c in the radial direction.

Links on perimeter 4:
Use minimum H 6 (28.27 mm$^2$) legs of links @ 205 mm c/c in the tangential direction and 125 mm c/c in the radial direction.

**Fin plate:**
- No. of bolts: 7
- Plate depth: 500 mm
- Plate width: 140 mm
- Plate thickness: 10 mm

**Cast-in plate:**
- Plate depth: 560 mm
- Plate width: 320 mm
- Plate thickness: 25 mm
Weld leg length: Fin to cast-in plate 2 No/8 mm FW need to be provided for connecting the fin plate to cast-in plate to eliminate the possibility of weld failure.

Stud welding: It is assumed that studs will be welded using electric arc stud-welding equipment. See SCI publication P300 for further information.

Weld leg length: Reinforcement 10 mm FW with two welds round the bar as shown in the diagram. PPFW is a partial penetration fillet weld (FW) in countersunk hole.

\[ \text{dr} = 25 \text{ mm (bar diameter)} \]
\[ \text{tp} = 25 \text{ mm (plate thickness)} \]

Shear studs: 9 No/25 mm

- No. and diameter: 9 No/25 mm
- Height: 100 mm
- Spacing vertically: 125 mm
- Spacing horizontally: 100 mm
- Vertical edge distance: 155 mm
- Horiz. edge distance: 60 mm

\[ \begin{array}{cccc}

\end{array} \]

\[ \begin{array}{cccc}
\text{155} & & & \\
\text{125} & & & \\
\text{125} & & & \\
\text{155} & & & \\
\end{array} \]

Shear studs: 3x3 shear stud array

Total 9 studs

All dimensions in mm

Reinforcement:

- Top bars: 2 No/25 mm diameter
- Bottom bars: 4 No/25 mm diameter
- Top bar spacing (bsp): 150 mm (laterally)
- Bar edge distance (n'): 85 mm (top & bottom bars)
- Bar end distance (ex): 70 mm (top & bottom bars)
- Bend bars mandrel: 266.8 mm diameter
- Bar anchorage length: 1052 mm
Cast-in plate with a total of 6 bars as shown
i.e. 2 top bars and 4 bottom bars.
n' = 85 mm (edge distance)
bsp = 150 mm (top bars)
bp = 320 mm
hp = 560 mm
ex = 70 mm

Punching shear links are required, refer to the punching shear section of the calculations for diameter & spacing of links.
Load bearing stiffener

Calculations are in accordance with BS 5950-1:2000, Clause 4.5.

Force applied through flange  \( F_c = 639.7 \text{ kN} \)

**Section properties**

457 x 191 x 74 UB.  
Young's Modulus  \( E = 205 \text{ kN/mm}^2 \)

**Check for bearing on the web - Clause 4.5.2.1**

\[
\text{Bearing capacity of web } P_{bw} = (b_1 + n \cdot k) \cdot t \cdot \sigma_w / 10^3 = 436.34 \text{ kN}
\]

Since \( F_c > P_{bw} \) (639.7 kN > 436.34 kN) a bearing stiffener is required.

**Check for buckling of the web - Clause 4.5.3.1**

\[
\text{Buckling resistance } P_x = 25 \cdot e \cdot t / ((b_1 + n \cdot k) \cdot d)^{0.5} \cdot P_{bw} = 366.24 \text{ kN}
\]

Since \( F_c > P_x \) (639.7 kN > 366.24 kN) a load carrying stiffener will be required to prevent the web from buckling.

**Stiffener design**

Assuming initially that the stiffener will be less than or equal to 16 mm thick, two stiffeners are to be used and allowing for a cut-back of 13 mm at the root of the member.

Design strength  \( \sigma_s = 275 \text{ N/mm}^2 \)

Minimum area of stiffener  \( A_s = F_s / \sigma_s = 739.48 \text{ mm}^2 \)

Allowable stiffener outstand  \( \text{out} = 13 \cdot t \cdot s = 195 \text{ mm} \)

As \( b_s < \text{out} \) (80 mm < 195 mm) the actual stiffener outstand is less than the allowable, hence OK.

The effective section of the stiffener, is shown.

**Check stiffener as a bearing stiffener**

\[
\text{Force on bearing stiffener } F_{B} = F_c - P_{bw} = 203.36 \text{ kN}
\]

\[
\text{Bearing capacity of stiffener } P_B = \sigma_s \cdot A_{s\text{iff}} / 10^3 = 552.75 \text{ kN}
\]

Since \( F_B \geq P_B \), stiffener is OK for bearing.
Connection of stiffeners to web

Effective length of weld \( lw = D - 2*(\text{cut} + T + 0.7*t) = 389.4 \text{ mm} \)

Weld size \( s = 6 \text{ mm} \)

Capacity of weld \( pws = 0.7*s*pw = 924 \text{ N/mm} \)

6 mm weld is suitable.

DESIGN SUMMARY

457 x 191 x 74 UB

Steel Grade S 275

External load 639.7 kN

Local capacity 436.3 kN

Buckling capacity 1328 kN

STIFFENER DETAILS

Plate 2No/80 mm x 15 mm

Welding 4No/6 mm FW's

Both flanges restrained against rotation in plane of stiffener.
Location: Ex2 - End stiffener (Plate Girder)

Load bearing stiffener

Calculations are in accordance with BS 5950-1:2000, Clause 4.5.

Force applied through flange \( F_c = 1560 \text{ kN} \)

Section properties

Plate Girder
Depth of section \( D = 1500 \text{ mm} \)
Width of section \( B = 450 \text{ mm} \)
Thickness of flange \( T = 40 \text{ mm} \)
Thickness of web \( t = 15 \text{ mm} \)
Dimensions (mm): \( D = 1500 \) \( B = 450 \) \( T = 40 \) \( t = 15 \)

Young's Modulus \( E = 205 \text{ kN/mm}^2 \)

Check for bearing on the web - Clause 4.5.2.1

Stiff bearing length \( b_1 = 75 \text{ mm} \)
from the end of stiff bearing \( b_e = 0 \text{ mm} \)
Design strength \( p_y w = 275 \text{ N/mm}^2 \)
Bearing capacity of web \( P_{bw} = (b_1 + n \cdot k) \cdot t \cdot p_y w / 10^3 = 639.38 \text{ kN} \)

Since \( F_c > P_{bw} \) (1560 kN > 639.38 kN) a bearing stiffener is required.

Check for buckling of the web - Clause 4.5.3.1

Stiff bearing length \( b_1 = 75 \text{ mm} \)
distance \( a_e = 0 \text{ mm} \)
Buckling resistance \( P_x = p_x \cdot 25 \cdot e \cdot t / ((b_1 + n \cdot k) \cdot d)^0.5 \cdot P_{bw} = 255.53 \text{ kN} \)

Since \( F_c > P_x \) (1560 kN > 255.53 kN) a load carrying stiffener will be required to prevent the web from buckling.

Stiffener design

Assuming initially that the stiffener will be less than or equal to 16 mm thick, two stiffeners are to be used and allowing for a cut-back of 15 mm at the root of the member.

Design strength \( p_y s = 275 \text{ N/mm}^2 \)
Minimum area of stiffener \( A_{min} = F_s \cdot 10^3 / p_y s = 3347.7 \text{ mm}^2 \)
Allowable stiffener outstand \( out = 13 \cdot t_s \cdot e = 208 \text{ mm} \)

As \( b_s < out \) (150 mm < 208 mm) the actual stiffener outstand is less than the allowable, hence OK.
The effective section of the stiffener, is shown.
Check stiffener as a bearing stiffener

Force on bearing stiffener \( FB = F_c - P_{bw} = 920.63 \text{ kN} \)
Bearing capacity of stiffener \( PB = p_y s * A_{stiff} / 10^3 = 1188 \text{ kN} \)
Since \( FB \geq PB \), stiffener is OK for bearing.

Connection of stiffeners to web

Effective length of weld \( lw = D - 2 \times (cut + T + 0.7t) = 1369 \text{ mm} \)
Weld size \( s = 6 \text{ mm} \)
Capacity of weld \( p_{ws} = 0.7s p_w = 924 \text{ N/mm} \)
6 mm weld is suitable.

Both flanges restrained against rotation in plane of stiffener.
Location: Ex3 - Check load bearing stiffener (End stiffener)

Load bearing stiffener

Calculations are in accordance with BS 5950-1:2000, Clause 4.5.

Force applied through flange \( F_c = 800 \text{ kN} \)

Section properties

- **254 x 254 x 73 UC.**
- Young's Modulus \( E = 205 \text{ kN/mm}^2 \)

Stiffener design

Assuming initially that the stiffener will be less than or equal to 16 mm thick, two stiffeners are to be used and allowing for a cut-back of 15 mm at the root of the member.

- **Design strength** \( p_{ys} = 275 \text{ N/mm}^2 \)
- **Design strength** \( p_{yw} = 275 \text{ N/mm}^2 \)
- **Bearing capacity** \( P_{bw} = (b_1 + 2k) t p_{yw}/10^3 = 127.24 \text{ kN} \)
- **Minimum area of stiffener** \( A_{s_{min}} = F_s 10^3/p_{ys} = 2446.4 \text{ mm}^2 \)
- **Allowable stiffener outstand** \( o_{ut} = 13 t_s e = 208 \text{ mm} \)

As \( A_s < o_{ut} \) (100 mm < 208 mm) the actual stiffener outstand is less than the allowable, hence OK. The effective section of the stiffener, is shown.

Check stiffener as a bearing stiffener

Assuming a stiff bearing length \( b_1 = 0 \text{ mm} \)

- **Bearing capacity of web** \( P_{bw} = (b_1 + n k) t p_{yw}/10^3 = 254.47 \text{ kN} \)
- **Force on bearing stiffener** \( F_B = F_c - P_{bw} = 545.53 \text{ kN} \)
- **Bearing capacity of stiffener** \( P_B = p_{ys} A_{s_{\text{stiff}}} 10^3 = 748 \text{ kN} \)

Since \( F_B \geq P_B \), stiffener is OK for bearing.

Connection of stiffeners to web

- **Effective length of weld** \( l_w = D - 2(cut + T + 0.7t) = 183.66 \text{ mm} \)
- **Weld size** \( s = 8 \text{ mm} \)
- **Capacity of weld** \( p_{ws} = 0.7s p_{w} = 1232 \text{ N/mm} \)

8 mm weld is suitable.

**DESIGN SUMMARY**

- **Steel Grade**: S 275
- **External load**: 800 kN
- **254 x 254 x 73 UC**

**STIFFENER DETAILS**

- **Plate**: 2No/100 mm x 16 mm
- **Welding**: 4No/8 mm FW's
- **Flanges not restrained against rotation**.
Load bearing stiffener

Calculations are in accordance with BS EN 1993-1-1:2005. References to EC3 Part 1-5 and EC3 Part 1-8 are also made where appropriate.

Force applied through flange $V_{zEd} = 639.7$ kN

Section properties

457 x 191 x 74 UKB
Stiff bearing length $ss = 52.8$ mm
Stiff bearing position $C = 0$ mm

Check for bearing on the web

Design strength of web $f_{yw} = 275$ N/mm$^2$
Bearing resistance of web $FR_{dbr} = \frac{(ss+n*k)*tw*fyw}{(\gamma_{M0}*10^3)}$

$$= 436.34$$ kN

Since $V_{zEd} > FR_{dbr}$ ($639.7$ kN > 436.34 kN) a bearing stiffener is required.

Stiffener design

Assuming initially that the stiffener will be less than or equal to 16 mm thick, two stiffeners are to be used and allowing for a cut-back of 13 mm at the root of the member.

Design strength of stiffener $f_{ys} = 275$ N/mm$^2$
Assumed stiffener thickness $ts = 15$ mm
Assumed stiffener width $bs = 80$ mm
Allowable stiffener outstand $out = 13*ts*e = 180.26$ mm

As $bs \leq out$ (80 mm ≤ 180.26 mm) the actual stiffener outstand is less than the allowable, hence OK.

The effective section of the stiffener, is shown.

Check stiffener as a bearing stiffener

Force on bearing stiffener $F_{EdB} = V_{zEd} - FR_{dbr} = 203.36$ kN
Bearing resistance of stiffener $FR_{dB} = f_{ys}*Astiff/(\gamma_{M0}*10^3) = 552.75$ kN

Since $F_{EdB} \geq FR_{dB}$, stiffener is OK for bearing.

Connection of stiffeners to web

Design strength of fillet weld $f_{wvd} = f_{u}/(\sqrt{3}*betw*\gamma_{M2})$

$$= 222.79$$ N/mm$^2$

Design load on weld $F_{wEd} = F_{EdB}/(4*lw) = 0.13056$ kN/mm
Fillet weld size (leg length) $s = 6$ mm
Design weld resistance $F_{wRd} = 0.7*s*f_{wvd}/1000 = 0.93571$ kN/mm

Hence, 6 mm FW's are suitable and will be adopted.

Check for bearing on the web

Distance to nearer end of the member from the end of stiff bearing \( b_e = 0 \text{ mm} \)

Design strength of web \( f_{yw} = 275 \text{ N/mm}^2 \)

Bearing resistance of web \( F_{Rdbr} = (s_s + n k) * t_w * f_{yw} / (\gamma M_0 * 10^3) = 639.38 \text{ kN} \)

Since \( V_{zEd} > F_{Rdbr} \) (1560 kN > 639.38 kN) a bearing stiffener is required.

Stiffener design

Assuming initially that the stiffener will be less than or equal to 16 mm thick, two stiffeners are to be used and allowing for a cut-back of 15 mm at the root of the member.

Design strength of stiffener \( f_{ys} = 275 \text{ N/mm}^2 \)

Assumed stiffener thickness \( t_s = 16 \text{ mm} \)

Assumed stiffener width \( b_s = 150 \text{ mm} \)

Allowable stiffener outstand \( \text{out} = 13t_s \text{e} = 192.28 \text{ mm} \)

As \( b_s \leq \text{out} \) (150 mm ≤ 192.28 mm) the actual stiffener outstand is less than the allowable, hence OK.

The effective section of the stiffener, is shown.
Check stiffener as a bearing stiffener

Force on bearing stiffener  \[ F_{EdB} = V_{zEd} - F_{RdBr} = 920.63 \text{ kN} \]
Bearing resistance of stiffener  \[ F_{RdB} = f_{ys} \times A_{stiff} / (\gamma M0 \times 10^3) = 1188 \text{ kN} \]
Since \( F_{EdB} \geq F_{RdB} \), stiffener is OK for bearing.

Connection of stiffeners to web

Design strength of fillet weld  \[ f_{wvd} = f_u / (\sqrt{3} \times \beta_{tw} \times \gamma M2) = 222.79 \text{ N/mm}^2 \]
Design load on weld  \[ F_{wEd} = F_{EdB} / (2 \times \ell_w) = 0.33624 \text{ kN/mm} \]
Fillet weld size (leg length)  \( s = 6 \text{ mm} \)
Design weld resistance  \[ F_{wRd} = 0.7 \times s \times f_{wvd} / 1000 = 0.93571 \text{ kN/mm} \]
Hence, 6 mm FW’s are suitable and will be adopted.

PLATE GIRDER

DESIGN SUMMARY  1500 mm x 450 mm Section
Steel Grade  S 275
External load  1560 kN
Bearing resistance  639.4 kN
Buckling resistance  2050 kN

STIFFENER DETAILS  Plate  315 mm x 16 mm
Welding  2No/6 mm FW’s
Both flanges restrained against rotation in plane of stiffener.
Location: Ex3 - Check load bearing stiffener (End stiffener)

Load bearing stiffener

Calculations are in accordance with BS EN 1993-1-1:2005. References to EC3 Part 1-5 and EC3 Part 1-8 are also made where appropriate.

Force applied through flange \( V_{zEd} = 800 \) kN

Section properties

254 x 254 x 73 UKC

Stiffener design

Assuming initially that the stiffener will be less than or equal to 16 mm thick, two stiffeners are to be used and allowing for a cut-back of 15 mm at the root of the member.

Design strength of stiffener \( f_{ys} = 275 \) N/mm²
Design strength of web \( f_{yw} = 275 \) N/mm²
Bearing resistance \( F_{Rdbr} = (ss+2k)*tw*fyw/(\gamma_M0*10^3) \)
\( = 127.24 \) kN

Assumed stiffener thickness \( ts = 16 \) mm
Assumed stiffener width \( bs = 100 \) mm
Allowable stiffener outstand \( out = 13*ts*e = 192.28 \) mm
As \( bs \leq out \) (100 mm \( \leq 192.28 \) mm) the actual stiffener outstand is less than the allowable, hence OK.

The effective section of the stiffener, is shown.

Check stiffener as a bearing stiffener

Assuming a stiff bearing length \( ss = 0 \) mm
Permissible stress of web \( f_{yw} = 275 \) N/mm²
Bearing resistance of web \( F_{Rdbr} = (ss+n*k)*tw*fyw/(\gamma_M0*10^3) \)
\( = 254.47 \) kN

Force on bearing stiffener \( F_{EdB} = V_{zEd} - F_{Rdbr} = 545.53 \) kN
Bearing resistance of stiffener \( F_{RdB} = f_{ys}*A_{stiff}/(\gamma_M0*10^3) = 748 \) kN
Since \( F_{EdB} \geq F_{RdB} \), stiffener is OK for bearing.

Connection of stiffeners to web

Design strength of fillet weld \( f_{wvd} = fu/(SQR(3) * betw * \gamma_M2) \)
\( = 222.79 \) N/mm²
Design load on weld \( F_{wEd} = F_{EdB}/(4*lw) = 0.74258 \) kN/mm
Fillet weld size (leg length) \( s = 8 \) mm
Design weld resistance \( F_{wRd} = 0.7*s*f_{wvd}/1000 = 1.2476 \) kN/mm

Hence, 8 mm FW's are suitable and will be adopted.
DESIGN SUMMARY

254 x 254 x 73 UC
Steel Grade S 275
External load 800 kN

Location: Cavity wall spanning horizontally adjacent to an opening

Cavity wall spanning horizontally

Wall design to BS5628-1:2005

Wall section between windows will be considered as a cantilever spanning horizontally. The window is assumed to be spanning horizontally transferring wind loading to the end of the cantilever. Between the windows is assumed to be a wall, a column or a wind post secured to floors. The wall sections above and below the windows are beyond the scope of this program.

Length of cantilever \( L = 0.5 \text{ m} \)
Thickness of outer skin \( t_1 = 100 \text{ mm} \)
Thickness of inner skin \( t_2 = 140 \text{ mm} \)
Mortar designation to be used \( \text{mort} = 3 \)
Blockwork compressive strength \( \text{bcs}_1 = 7.3 \text{ N/mm}^2 \)
Outer skin flexural strength \( \text{fkx}_1 = \text{TABLE 3.8 for bcs}_1 = 7.3, \text{mort} = 3 = 0.6 \text{ N/mm}^2 \)

Inner skin is blockwork:
Blockwork compressive strength \( \text{bcs}_2 = 7.3 \text{ N/mm}^2 \)
Inner skin flexural strength \( \text{fkx}_2 = 0.53333 \text{ N/mm}^2 \)
Width of window \( \text{width} = 1.5 \text{ m} \)
Wind loading on wall \( w_2 = 0.4 \text{ kN/m}^2 \)
Outer skin flexural strength \( \text{fkx}_1 = 0.6 \text{ N/mm}^2 \)
Inner skin flexural strength \( \text{fkx}_2 = 0.53333 \text{ N/mm}^2 \)
Partial safety factor of material \( \gamma_m = 3 \)
Wall design moment of resistance \( Mr = mrl + mr2 = 0.91407 \text{ kNm} \)

Cavity wall spanning horizontally

The wall moment of resistance is greater than moment on the wall and therefore the wall is satisfactory for the proposed lateral load of 0.4 kN/m²

Adopt an outer skin of blockwork 100 mm
Adopt an inner skin of blockwork 140 mm
Mortar designation to be used 3
Moment of resistance 0.91407 kNm
Ultimate Moment on wall 0.24 kNm
Factor of safety for wind load 1.2
Location: Cavity wall spanning horizontally adjacent to an opening

Cavity wall spanning horizontally

![Wall elevation diagram]

Wall design to BS5628-1:2005

Wall section between windows will be considered as a cantilever spanning horizontally. The window is assumed to be spanning horizontally transferring wind loading to the end of the cantilever. Between the windows is assumed to be a wall, a column or a wind post secured to floors. The wall sections above and below the windows are beyond the scope of this program.

Length of cantilever
L = 0.75 m

Thickness of outer skin
t1 = 100 mm

Thickness of inner skin
t2 = 140 mm

Mortar designation to be used
mort = 3

Water absorption of bricks
wa = 13

Outer skin flexural strength
fkx1 = TABLE 3.2 for wa = 13, mort = 3 = 0.9 N/mm²

Inner skin is blockwork:
Blockwork compressive strength
bcs2 = 7.3 N/mm²

Inner skin flexural strength
fkx2 = 0.53333 N/mm²

Width of window
width = 1.5 m

Wind loading on wall
w2 = 0.4 kN/m²

Outer skin flexural strength
fkx1 = 0.9 N/mm²

Inner skin flexural strength
fkx2 = 0.53333 N/mm²

Partial safety factor of material
gamma_m = 3

Wall design moment of resistance
Mr = Mr1 + Mr2 = 1.0807 kNm

Cavity wall spanning horizontally

The wall moment of resistance is greater than moment on the wall and therefore the wall is satisfactory for the proposed lateral load of 0.4 kN/m²

Adopt an outer skin of brickwork
100 mm

Water absorption of bricks
13 %

Adopt an inner skin of blockwork
140 mm

Mortar designation to be used
3

Moment of resistance
1.0807 kNm

Ultimate Moment on wall
0.405 kNm

Factor of safety for wind load
1.2
Location: Cavity wall spanning horizontally adjacent to an opening

Cavity wall spanning horizontally

Wall design to EC6 Part 1-1

Wall section between windows will be considered as a cantilever spanning horizontally. The window is assumed to be spanning horizontally transferring wind loading to the cantilever. Between the windows is assumed to be a wall, a column or a wind post secured to floors. The wall sections above and below the windows are beyond the scope of this program.

Length of cantilever  
L=0.5 m

Thickness of outer skin  
t1=100 mm

Thickness of inner skin  
t2=140 mm

Mortar designation to be used  
mort=3

The outer skin is blockwork:
Compressive strength of units  
fb1=7.3 N/mm²

Outer skin flexural strength  
f(xk)2=TABLE 6.8 for fb=7.3, mort=3  
=0.6 N/mm²

Inner skin is blockwork:
Compressive strength of units  
fb2=7.3 N/mm²

Inner skin flexural strength  
f(xk)2'=0.53333 N/mm²

Width of window  
width=1.5 m

Wind loading on wall  
Qkw=0.4 kN/m²

Partial safety factor (material)  
γM=2.4

Wall design moment of resistance  
Mr=mr1+mr2=1.1426 kNm

SUMMARY OF RESULTS

The wall moment of resistance is greater than moment on the wall and therefore the wall is satisfactory for the proposed lateral load of 0.4 kN/m²

Adopt an outer skin of blockwork  
100 mm

Adopt an inner skin of blockwork  
140 mm

Mortar designation to be used  
3

Design moment of resistance  
1.1426 kNm

Design moment on wall  
0.3 kNm

Factor of safety for wind load  
1.5
Location: Cavity wall spanning horizontally adjacent to an opening

Cavity wall spanning horizontally

Wall design to EC6 Part 1-1

Wall section between windows will be considered as a cantilever spanning horizontally. The window is assumed to be spanning horizontally transferring wind loading to the cantilever. Between the windows is assumed to be a wall, a column or a wind post secured to floors. The wall sections above and below the windows are beyond the scope of this program.

Length of cantilever \( L = 0.75 \) m
Thickness of outer skin \( t_1 = 100 \) mm
Thickness of inner skin \( t_2 = 140 \) mm
Mortar designation to be used \( \text{mort} = 3 \)

Outer skin is brickwork:
Water absorption of bricks \( w_a = 13 \% \)
Outer skin flexural strength \( f_{xk2} = \text{TABLE 6.2 for } w_a = 13, \text{mort} = 3 \)
= 0.9 N/mm²

Inner skin is blockwork:
Compressive strength of units \( f_b = 7.3 \) N/mm²
Inner skin flexural strength \( f_{xk2}' = 0.53333 \) N/mm²
Width of window \( w_e = 1.5 \) m
Wind loading on wall \( Q_{kw} = 0.4 \) kN/m²
Partial safety factor (material) \( \gamma_m = 2.4 \)
Wall design moment of resistance \( M_{rd} = m_r1 + m_r2 = 1.3509 \) kNm

SUMMARY OF RESULTS

The wall moment of resistance is greater than moment on the wall and therefore the wall is satisfactory for the proposed lateral load of 0.4 kN/m²

Adopt an outer skin of brickwork 100 mm
Water absorption of bricks 13 %
Adopt an inner skin of blockwork 140 mm
Mortar designation to be used 3
Design moment of resistance 1.3509 kNm
Design moment on wall 0.50625 kNm
Factor of safety for wind load 1.5
Location: Wall on grid line A/1-2

Length of wall panel \( L = 4 \) m
Height of wall panel \( h = 3 \) m
Outer leaf density \( \text{den}(1) = 10 \) kN/m\(^2\)
Thickness of outer leaf \( t(1) = 100 \) mm
Inner leaf density \( \text{den}(2) = 10 \) kN/m\(^2\)
Thickness of inner leaf \( t(2) = 100 \) mm
Mortar designation (Table 1) \( \text{mortar} = 3 \)
Outer leaf (1=clay 2=calc silicate 3=conc brick 4=block) \( \text{typ}(1) = 4 \)
Compressive strength \( \text{po}(1) = 10.4 \) N/mm\(^2\)
Inner leaf (1=clay 2=calc silicate 3=conc brick 4=block) \( \text{typ}(2) = 4 \)
Compressive strength \( \text{po}(2) = 10.4 \) N/mm\(^2\)
Partial safety factor materials \( \gamma_{m} = 3 \)

Characteristic wind load per unit area \( WL = 0.85 \) kN/m\(^2\)
Additional vert DL on panel \( w(1) = 0 \) kN/m
Additional vert DL on panel \( w(2) = 0 \) kN/m

**DESIGN SUMMARY**

| Wall height | 3 m |
| Wall length | 8 m |
| Wall thickness | 150 mm |
| Char comp strength | 18.7 N/mm² |

Horizontal capacity by arching (Clause 32.8)

| Case 1 - normal loading | 2.4267 kN/m² |
| Case 2 - abnormal loading | 2.7603 kN/m² |
Location: Wall on grid line A/1-2

Lateral resistance of vertically loaded single leaf wall by arching

This calculation is in accordance with BS5628-1:2005 being the Code of practice for use of masonry - Part 1: Structural use of unreinforced masonry.

The form of this calculation is in accordance with Clause 32.8 of the code of practice.

Clear height of wall \( h = 0.8 \) m
Thickness of wall \( t = 450 \) mm
Length of wall panel \( l = 1 \) m
Support restraint factor \( rf = 0.75 \)
Mortar designation to Table 1 \( \text{mortar} = 3 \)
Masonry type (1=clay 2=cal silicate 3=conc brick 4=block) \( \text{typ(1)} = 4 \)
Height \( hb = 215 \) mm
Least horiz dimension \( lhd = 100 \) mm
Compressive Strength of Units \( po = 5.2 \) N/mm\(^2\)
Partial Safety Factor Material \( \gamma_{mm} = 3.1 \)
Dead load \( DL(1) = 50 \) kN/m
Imposed load \( LL(1) = 20 \) kN/m
Dead load \( DL(2) = 8 \) kN/m
Imposed load \( LL(2) = 5 \) kN/m
Eccentricity of floor loads \( ecc(2) = 75 \) mm
Number of returns \( nr = 1 \)

DESIGN SUMMARY

Wall height \( 0.8 \) m
Wall length \( 1 \) m
Wall thickness \( 450 \) mm
Char comp strength \( 5 \) N/mm\(^2\)
Horizontal capacity by arching (Clause 32.8)
Case 1 - normal loading \( 228.37 \) kN/m\(^2\)
Case 2 - abnormal loading \( 251.41 \) kN/m\(^2\)
Case 3 - protected member \( 477.68 \) kN/m\(^2\)
Location: Wall on grid line A/1-2

**Lateral resistance of vertically loaded single leaf wall by arching**

This calculation is in accordance with BS5628-1:2005 being the Code of practice for use of masonry - Part 1: Structural use of unreinforced masonry.

The form of this calculation is in accordance with Clause 32.8 of the code of practice.

---

Clear height of wall \( h = 2 \text{ m} \)
Thickness of wall \( t = 100 \text{ mm} \)
Length of wall panel \( l = 3.5 \text{ m} \)
Support restraint factor \( rf = 0.75 \)
Mortar designation to Table 1 \( \text{mortar} = 4 \)
Masonry type (1=clay 2=cal silicate 3=conc brick 4=block) \( \text{typ(1)} = 4 \)
Height \( h_b = 215 \text{ mm} \)
Least horiz dimension \( h_{ld} = 100 \text{ mm} \)
Compressive Strength of Units \( p_0 = 10.4 \text{ N/mm}^2 \)
Partial Safety Factor Material \( \gamma_m = 3.1 \)
Dead load \( DL(1) = 20 \text{ kN/m} \)
Imposed load \( LL(1) = 10 \text{ kN/m} \)
Dead load \( DL(2) = 8 \text{ kN/m} \)
Imposed load \( LL(2) = 5 \text{ kN/m} \)
Eccentricity of floor loads \( \text{ecc}(2) = 16.667 \text{ mm} \)
Number of returns \( nr = 1 \)

Design column in accordance with EC6 - Design of masonry structures Part 1-1: General rules for reinforced and unreinforced masonry.

Column dimensions

- Height of col perp to major axis: $h_{yy} = 2.7$ m
- Height of col perp to minor axis: $h_{zz} = 2.7$ m
- Width of column: $b = 450$ mm
- Thickness of column: $t = 250$ mm
- Effective ht for major axis bend: $h_{ef_{yy}} = 5.4$ m
- Effective ht for minor axis bend: $h_{ef_{zz}} = 2.7$ m

Masonry details

- Mortar designation to Table 1: $\text{mortar}=3$
- Masonry type (1=clay 2=cal silicate 3=conc brick 4=block): $\text{typ}(1)=1$
- Compressive strength of units: $p_0 = 20$ N/mm$^2$
- Constant K from NA Table NA.4: $K(1)=0.5$
- Height of masonry unit: $h_u = 65$ mm
- Least horiz. dimension of units: $l_{hd} = 100$ mm
- Partial safety factor material: $\gamma_{M}=2.3$

Load factors

- Permanent actions: $\gamma_G=1.35$
- Variable actions (vertical load): $\gamma_Q=1.5$

Characteristic loads

- Permanent load at top: $G_k = 25$ kN
- Variable load at top: $Q_k = 60$ kN
- Column self weight: $G_{ksw} = 2.89$ kN
- Eccentricity for major axis bend: $e_{y}' = 20$ mm
- Eccentricity for minor axis bend: $e_{z}' = 25$ mm
**Design load resistance**

Eccentricity at the top or bottom of the column resulting from horizontal loads (e.g. wind load) \( e_{he} = 0 \text{ mm} \)

Design moment at mid-height \( M_{md} = 1.9148 \text{ kNm} \)

Eccentricity at mid-height of the column resulting from horizontal loads (e.g. wind load) \( e_{hm} = 0 \text{ mm} \)

DESIGN
Length of spreader beam: 450 mm
Summary
Width of spreader beam: 50 mm
Eccentricity of load: 0 mm
Char comp strength: 4.1 N/mm²
Local bearing safety factor: 1.25
Design stress capacity: 4.1 N/mm²
Max stress under spreader: 1.9556 N/mm²
**Location:** Bearing under beam B7

- Proposed width of bearing: \( B = 200 \text{ mm} \)
- Proposed length of bearing: \( L = 75 \text{ mm} \)
- Clear edge distance to beam: \( ed = 100 \text{ mm} \)

- Mortar designation to Table 1: mortar = 3
- Masonry type (1=clay 2=cal silicate 3=concrete brick 4=block): typ(1) = 4
- Height: \( h_b = 215 \text{ mm} \)
- Least horiz dimension: \( l_{hd} = 100 \text{ mm} \)
- Compressive strength of units: \( p_o = 10.4 \text{ N/mm}^2 \)
- Material partial safety factor: \( \gamma_{m} = 2.5 \)
- Characteristic dead load: \( D_L = 30 \text{ kN} \)
- Characteristic live load: \( L_L = 20 \text{ kN} \)
- Length of bearing to be used: \( L = 75 \text{ mm} \)

**WARNING:**

Length of bearing should be within range 90.244 mm to 100 mm
Location: Bearing under beam B8

Plan view on wall

Bearing type 2
see Figure 5(b) in BS5628

Proposed width of bearing \( B = 150 \text{ mm} \)
Proposed length of bearing \( L = 50 \text{ mm} \)
Clear edge distance to beam \( ed = 50 \text{ mm} \)
Mortar designation to Table 1 \( \text{mortar} = 3 \)
Masonry type (1=clay 2=cal silicate 3=conc brick 4=block) \( \text{typ(1)} = 4 \)
Height \( h_b = 215 \text{ mm} \)
Least horiz dimension \( l_{hd} = 100 \text{ mm} \)
Compressive strength of units \( p_o = 10.4 \text{ N/mm}^2 \)
Material partial safety factor \( \gamma_m = 2.5 \)
Characteristic dead load \( D_L = 20 \text{ kN} \)
Characteristic live load \( L_L = 10 \text{ kN} \)

Length of spreader beam \( s_l = 450 \text{ mm} \)
Offset load distance \( x_1 = 75 \text{ mm} \)

WARNING:
Max stress under spreader > Max permissible
i.e. \( f_{km} \ (7.8222 \text{ N/mm}^2) > f_{k1} \ (6.56 \text{ N/mm}^2) \)
Location: Bearing under beam B1

Plan on loaded area

Wall thickness \( t = 100 \text{ mm} \)
Load bearing length // to wall \( a_2 = 150 \text{ mm} \)
Load bearing width perp. to wall \( a_3 = 100 \text{ mm} \)
Mortar designation to Table 1 \( \text{mortar} = 3 \)
Masonry type (1=clay 2=cal silicate 3=conc brick 4=block) \( \text{typ}(1) = 4 \)
Compressive strength of units \( p_0 = 10.4 \text{ N/mm}^2 \)
Constant K from NA Table NA.4 \( K(1) = 0.75 \)
Height of masonry unit \( h_u = 215 \text{ mm} \)
Least horiz. dimension of units \( l_{hd} = 100 \text{ mm} \)
Partial safety factor (material) \( \gamma_{M} = 2.3 \)
Characteristic permanent load \( G_k = 20 \text{ kN} \)
Characteristic variable load \( Q_k = 10 \text{ kN} \)

- Slab thickness: t4=200 mm
- Length of member 4: l4=6500 mm
- Modulus of elasticity: E4=36000 N/mm²
- Char permanent load on member 4: Gk4=4.3 kN/m²
- Char variable load on member 4: Qk4=3.5 kN/m²

Eccentricity of roof load
The eccentricity of roof load on masonry wall can be evaluated by dividing the design moment at the top of wall by the design vertical load at the top of the wall.
- Design vert. load @ top of wall: Nid=26.3 kN/m
- Eccentricity of roof load: ecc=ABS(M1)*1000/Nid=67.422 mm

</tbody>
</table>

**Vertical load capacity**

For an external cavity wall it is only necessary to check the inner leaf which carries the majority of load.
At top of Wall:

**Case 1: Max load from above 1.4DL + 1.6LL**

Design vertical load  
\[ g = 1.4 \times (DL(2) + DL(3)) + 1.6 \times (LL(2) + LL(3)) = 43.4 \text{ kN/m} \]

Design vert. load resist of wall  
\[ gd = \beta \times \left( \frac{t(2)}{1000} \times \frac{f_k(2) \times 1000}{\gamma_m} \right) = 115.34 \text{ kN/m} \]

Since \( g \leq gd \) (43.4 kN/m \leq 115.34 kN/m) design vertical load within vertical load resistance of wall, therefore OK.

**Case 2: Min load from above 0.9DL + 1.6LL**

Design vertical load  
\[ g = 0.9 \times DL(2) + 1.4 \times DL(3) + 1.6 \times (LL(2) + LL(3)) = 39.9 \text{ kN/m} \]

Design vert. load resist of wall  
\[ gd = \beta \times \left( \frac{t(2)}{1000} \times \frac{f_k(2) \times 1000}{\gamma_m} \right) = 113.47 \text{ kN/m} \]

Since \( g \leq gd \) (39.9 kN/m \leq 113.47 kN/m) design vertical load within vertical load resistance of wall, therefore OK.

**Lateral load capacity**

Select Case(b) of Clause 18 of the Code: 0.9DL+1.4WL

Design moment (simple supports)  
\[ M = 1.4 \times WL \times h^2 / 8 = 0.63805 \text{ kNm/m} \]

Moment reduction factor  
\[ mrf = 1 \]

Elastic design moment  
\[ M = M / mrf = 0.63805 \text{ kNm/m} \]

Since \( M \leq Mr \) (0.63805 kNm/m \leq 0.97615 kNm/m) elastic design moment within design moment of resistance, therefore OK.

This calculation is based on BS5628-1:2005, the Code of practice for use of masonry, Part 1: Structural use of unreinforced masonry.

External cavity wall

Thickness of outer leaf \( t(1) = 100 \text{ mm} \)
Density of outer leaf \( \text{den}(1) = 12.4 \text{ kN/m}^3 \)
Thickness of inner leaf \( t(2) = 140 \text{ mm} \)
Density of inner leaf \( \text{den}(2) = 12.4 \text{ kN/m}^3 \)
Clear height of wall \( h = 2.425 \text{ m} \)
Support Restraint factor \( \text{rf} = 0.75 \)
Length of wall panel \( L = 4 \text{ m} \)
Mortar designation to Table 1 \( \text{mortar}=3 \)
Partial Safety Factor Material \( \gamma_m = 3.1 \)
Masonry type \( 1=\text{clay} \ 2=\text{cal silicate} \ 3=\text{conc brick} \ 4=\text{block} \) \( \text{typ}(1)=2 \)
Compressive Strength of Units \( \text{po}(1)=60 \text{ N/mm}^2 \)
Masonry type \( 1=\text{clay} \ 2=\text{cal silicate} \ 3=\text{conc brick} \ 4=\text{block} \) \( \text{typ}(2)=3 \)
Compressive Strength of Units \( \text{po}(2)=5.2 \text{ N/mm}^2 \)
Dead load from upper levels \( \text{DL}(1)=4 \text{ kN/m} \)
Dead load from upper levels \( \text{DL}(2)=5 \text{ kN/m} \)
Dead load from upper levels \( \text{DL}(3)=10 \text{ kN/m} \)
Dead load from supported floor \( \text{LL}(2)=5.5 \text{ kN/m} \)
Live load from supported floor \( \text{LL}(3)=5 \text{ kN/m} \)
Ecc of floor load on inner leaf \( \text{ecc}=23.333 \text{ mm} \)
Horizontal wind load \( \text{WL}=0.63 \text{ kN/m}^2 \)

Vertical load capacity

For an external cavity wall it is only necessary to check the inner leaf which carries the majority of load.

At top of Wall:

**Case 1: Max load from above 1.4DL + 1.6LL**

Design vertical load \( g=1.4*(\text{DL}(2)+\text{DL}(3))+1.6*(\text{LL}(2)+\text{LL}(3)) = 37.8 \text{ kN/m} \)
Design vert. load resist of wall \( \text{gd}=\beta \frac{t(2)}{1000} * (f_k(2) * 1000) / \gamma_m = 99.054 \text{ kN/m} \)
Since \( g \leq \text{gd} \) (37.8 kN/m \( \leq 99.054 \text{ kN/m} \)) design vertical load within vertical load resistance of wall, therefore OK.
Case 2: Min load from above  \(0.9DL + 1.6LL\)

Design vertical load
\[ g = 0.9*DL(2) + 1.4*DL(3) + 1.6*(LL(2) + LL(3)) = 35.3 \text{kN/m} \]

Design vert. load resist of wall
\[ gd = \beta*(t(2)/1000)*(fk(2)*1000)/\gamma_m = 97.652 \text{kN/m} \]

Since \(g \leq gd\) (35.3 kN/m \(\leq 97.652 \text{kN/m}\)) design vertical load within vertical load resistance of wall, therefore OK.

Lateral load capacity

Select Case(b) of Clause 18 of the Code: \(0.9DL + 1.4WL\)

Design moment (simple supports)
\[ M = 1.4*WL*h^2/8 = 0.64834 \text{kNm/m} \]

Moment reduction factor
\[ mrf = 1.5 \]

Elastic design moment
\[ M = M/mrf = 0.43223 \text{kNm/m} \]

Since \(M \leq Mr\) (0.43223 kNm/m \(\leq 0.85242 \text{kNm/m}\)) elastic design moment within design moment of resistance, therefore OK.

Load(1) Load(2) Load(3)

External cavity wall

This calculation is based on BS5628-1:2005, the Code of practice for use of masonry, Part 1: Structural use of unreinforced masonry.

WL = wind load

Thickness of outer leaf \( t(1) = 100 \text{ mm} \)
Density of outer leaf \( \text{den}(1) = 12.4 \text{ kN/m}^2 \)
Thickness of inner leaf \( t(2) = 140 \text{ mm} \)
Density of inner leaf \( \text{den}(2) = 12.4 \text{ kN/m}^2 \)
Clear height of wall \( h = 4.25 \text{ m} \)
Support Restraint factor \( rf = 0.75 \)
Length of wall panel \( L = 4 \text{ m} \)
Mortar designation to Table 1 \( \text{mortar} = 3 \)
Partial Safety Factor Material \( \text{gammam} = 3.1 \)
Masonry type (1=clay 2=cal silicate 3=conc brick 4=block) \( \text{typ}(1) = 1 \)
Compressive Strength of Units \( \text{po}(1) = 20 \text{ N/mm}^2 \)
Water absorption %age of leaf \( \text{water} = 9 \)
Masonry type (1=clay 2=cal silicate 3=conc brick 4=block) \( \text{typ}(2) = 4 \)
Compressive Strength of Units \( \text{po}(2) = 22.5 \text{ N/mm}^2 \)
Height \( h_b(2) = 215 \text{ mm} \)
Least horizontal dimension \( lhd(2) = 140 \text{ mm} \)
Dead load from upper levels \( DL(1) = 4 \text{ kN/m} \)
Dead load from upper levels \( DL(2) = 7 \text{ kN/m} \)
Live load from upper levels \( LL(2) = 5.5 \text{ kN/m} \)
Dead load from supported floor \( DL(3) = 12 \text{ kN/m} \)
Live load from supported floor \( LL(3) = 5 \text{ kN/m} \)
Ecc of floor load on inner leaf \( ecc = 23.333 \text{ mm} \)
Horizontal wind load \( WL = 0.25 \text{ kN/m}^2 \)

Vertical load capacity

For an external cavity wall it is only necessary to check the inner leaf which carries the majority of load.
At top of Wall:

**Case 1: Max load from above 1.4DL + 1.6LL**

Design vertical load 
\[ g = 1.4 \times (DL(2)+DL(3)) + 1.6 \times (LL(2) + LL(3)) = 43.4 \text{ kN/m} \]

Design vert. load resist of wall 
\[ gd = \beta \times (t(2)/1000) \times (f_k(2) \times 1000) / \gamma_m = 292.99 \text{ kN/m} \]

Since \( g \geq gd \) (43.4 kN/m \( \geq \) 292.99 kN/m) design vertical load within vertical load resistance of wall, therefore OK.

**Case 2: Min load from above 0.9DL + 1.6LL**

Design vertical load 
\[ g = 0.9 \times DL(2)+1.4 \times DL(3)+1.6 \times (LL(2) + LL(3)) = 39.9 \text{ kN/m} \]

Design vert. load resist of wall 
\[ gd = \beta \times (t(2)/1000) \times (f_k(2) \times 1000) / \gamma_m = 288.28 \text{ kN/m} \]

Since \( g \geq gd \) (39.9 kN/m \( \geq \) 288.28 kN/m) design vertical load within vertical load resistance of wall, therefore OK.

**Lateral load capacity**

Select Case(b) of Clause 18 of the Code: 0.9DL+1.4WL

Design moment (simple supports) 
\[ M = 1.4 \times WL \times h^2 / 8 = 0.79023 \text{ kNm/m} \]

Moment reduction factor 
\[ mrf = 1 \]

Elastic design moment 
\[ M = M / mrf = 0.79023 \text{ kNm/m} \]

Since \( M \geq Mr \) (0.79023 kNm/m \( \geq \) 1.1715 kNm/m) elastic design moment within design moment of resistance, therefore OK.

Load(1) Load(2) 

\[ \text{Load(3)} \]

External cavity wall

This calculation is based on BS5628-1:2005, the Code of practice for use of masonry, Part 1: Structural use of unreinforced masonry.

\[ \text{WL} = \text{wind load} \]

Thickness of outer leaf \( t(1)=102.5 \text{ mm} \)
Density of outer leaf \( \text{den}(1)=20 \text{ kN/m}^3 \)
Thickness of inner leaf \( t(2)=140 \text{ mm} \)
Density of inner leaf \( \text{den}(2)=20 \text{ kN/m}^3 \)
Clear height of wall \( h=3 \text{ m} \)
Support Restraint factor \( \text{rf}=0.75 \)
Length of wall panel \( L=4 \text{ m} \)
Mortar designation to Table 1 \( \text{mortar}=3 \)
Partial Safety Factor Material \( \text{gammam}=3.1 \)
Masonry type \( (1=\text{clay} \ 2=\text{cal silicate} \ 3=\text{conc brick} \ 4=\text{block}) \) \( \text{typ}(1)=1 \)
Compressive Strength of Units \( \text{po}(1)=20 \text{ N/mm}^2 \)
Water absorption %age of leaf \( \text{water}=12 \)
Masonry type \( (1=\text{clay} \ 2=\text{cal silicate} \ 3=\text{conc brick} \ 4=\text{block}) \) \( \text{typ}(2)=4 \)
Compressive Strength of Units \( \text{po}(2)=7.3 \text{ N/mm}^2 \)
Height \( \text{hb}(2)=215 \text{ mm} \)
Least horizontal dimension \( \text{lhd}(2)=140 \text{ mm} \)
Dead load from upper levels \( \text{DL}(1)=10 \text{ kN/m} \)
Dead load from upper levels \( \text{DL}(2)=88.889 \text{ kN/m} \)
Live load from upper levels \( \text{LL}(2)=0 \text{ kN/m} \)
Dead load from supported floor \( \text{DL}(3)=7.4074 \text{ kN/m} \)
Live load from supported floor \( \text{LL}(3)=0 \text{ kN/m} \)
Ecc of floor load on inner leaf \( \text{ecc}=23.333 \text{ mm} \)
Horizontal wind load \( \text{WL}=0.66667 \text{ kN/m}^2 \)

Vertical load capacity

For an external cavity wall it is only necessary to check the inner leaf which carries the majority of load.
At top of Wall:

**Case 1: Max load from above  1.4DL + 1.6LL**

Design vertical load
\[ g = 1.4 \times (DL(2) + DL(3)) + 1.6 \times (LL(2) + LL(3)) = 134.81 \text{ kN/m} \]

Design vert. load resist of wall
\[ gd = \beta \times \left( \frac{t(2)}{1000} \times (fk(2) \times 1000) \right) / \gamma_m = 214.98 \text{ kN/m} \]

Since \( g \leq gd \) (134.81 kN/m ≤ 214.98 kN/m) design vertical load within vertical load resistance of wall, therefore OK.

**Case 2: Min load from above  0.9DL + 1.6LL**

Design vertical load
\[ g = 0.9 \times DL(2) + 1.4 \times DL(3) + 1.6 \times (LL(2) + LL(3)) = 90.37 \text{ kN/m} \]

Design vert. load resist of wall
\[ gd = \beta \times \left( \frac{t(2)}{1000} \times (fk(2) \times 1000) \right) / \gamma_m = 214.98 \text{ kN/m} \]

Since \( g \leq gd \) (90.37 kN/m ≤ 214.98 kN/m) design vertical load within vertical load resistance of wall, therefore OK.

**Lateral load capacity**

Select Case(b) of Clause 18 of the Code: 0.9DL+1.4WL

Design moment (simple supports)
\[ M = 1.4 \times WL \times h^2 / 8 = 1.05 \text{ kNm/m} \]

Moment reduction factor
\[ mrf = 1.5 \]

Elastic design moment
\[ M = M / mrf = 0.7 \text{ kNm/m} \]

Since \( M \leq Mr \) (0.7 kNm/m ≤ 2.7727 kNm/m) elastic design moment within design moment of resistance, therefore OK.

Masonry design to BS5628, MEXE and Eurocode 6

Made by: IFB
Date: 02/12/19

Copyright 1986-2019 Fitzroy Systems Ltd.
Ref No: SC535 BS

**Masonry shear wall**

These calculations are in accordance with BS5628-1:2005 the "Code of practice for the use of masonry".

---

**Elevation on shear wall**

- Length of shear wall: $L = 0.7$ m
- Density of masonry: $dens = 12$ kN/m$^3$
- Thickness of wall: $t = 100$ mm
- Between lateral restraints: $h = 2.6$ m
- Support Restraint factor: $rf = 0.75$
- Mortar designation to Table 1: $mortar = 3$
- Masonry type (1=clay 2=cal silicate 3=conc brick 4=block): $typ(1) = 4$
- Compressive strength of units: $po = 10.4$ N/mm$^2$
- Height: $hb = 215$ mm
- Least horiz dimension: $lhd = 100$ mm
- Partial safety factor material: $gammam = 2.5$
- Characteristic dead load: $DL = 40$ kN
- Characteristic imposed load: $LL = 0$ kN
- Characteristic wind load: $WL = 2.05$ kN

**DESIGN SUMMARY**

- Wall height: $2.6$ m
- Wall length: $0.7$ m
- Wall thickness: $100$ mm
- Char comp strength: $4.7362$ N/mm$^2$
- Char flex strength: $0.25$ N/mm$^2$
- Design shear load: $2.87$ kN
- Design shear strength: $13.312$ kN
- Compression throughout
  - Maximum comp (DL+SL+wind): $1.1147$ N/mm$^2$
  - Allowable compn: $1.8945$ N/mm$^2$
  - Maximum compn (DL+wind): $1.3005$ N/mm$^2$
  - Allowable compn (DL+wind): $1.8945$ N/mm$^2$
Location: Wall on grid line A/1-2

Masonry shear wall

These calculations are in accordance with BS5628-1:2005 the "Code of practice for the use of masonry".

Elevation on shear wall

Shear strength of masonry  
Bond strength

The design of the concrete base is beyond the scope of this proforma. Brick or block Group 1 units could be used for the earth face leaf.

Use masonry units of category I manufacturing.
control and of water absorption ≤ 7%.
Location: Ex2 - Brick retaining wall

Reinforced masonry retaining wall to EC6

Cavity to be filled with concrete or grout and have a minimum width of 100 mm. Infill to be Grade C25/30 or higher. The earth face leaf must not be less than 100 mm thick. Group 1 units to be used. Concrete base design is beyond the scope of this proforma.

Outer leaf thickness t1=102 mm
Earth face leaf thickness t2=102 mm
Wall height H=2.7 m
Cavity width (minimum 100 mm) cw=100 mm
Design moment at top of base Md'=9.5 kNm/m
Design shear at top of base Vd=14.2 kN/m
Mortar designation to Table NA.2 mortar=1
Masonry type (1=clay 2=cal silicate 3=conc brick 4=block) typ(1)=1
Compressive strength of units po(1)=30 N/mm²
Constant K from NA Table NA.4 K(1)=0.5
Height of masonry unit hu=65 mm
Least horiz. dimension of units lhd=100 mm
Partial safety factor (masonry) gamM=2.3
Characteristic tensile strength fy=500 N/mm²
Diameter of reinforcing bars diam=12 mm
Char anchorage bond strength fbok=4.1 N/mm²

DESIGN SUMMARY

Design bending moment 9.5 kNm
Design shear force 14.2 kN
Wall effective depth 152 mm
Wall effective width 1000 mm
Maximum wall height 2.7 m
Tensile strength (reinft) 500 N/mm²
Mortar designation 1
Compressive strength of units 30 N/mm²
Area of steel provided 452.39 mm²/m
Diameter of reinforcing bars 12 mm

Partial safety factors:
Group 1 masonry units 2.3
Reinforcement strength 1.15
Shear strength of masonry 2
Bond strength 1.5

The design of the concrete base is beyond the scope of this proforma. Brick or block Group 1 units could be used for the earth face leaf.
Location: Ex3 - Block retaining wall

Reinforced masonry retaining wall to EC6

Cavity to be filled with concrete or grout and have a minimum width of 100 mm. Infill to be Grade C25/30 or higher. The earth face leaf must not be less than 100 mm thick. Group 1 units to be used. Concrete base design is beyond the scope of this proforma.

Outer leaf thickness \( t_1 = 140 \text{ mm} \)
Earth face leaf thickness \( t_2 = 100 \text{ mm} \)
Wall height \( H = 3.4 \text{ m} \)
Cavity width (minimum 100 mm) \( c_w = 100 \text{ mm} \)
Design moment at top of base \( M_d' = 9.5 \text{ kNm/m} \)
Design shear at top of base \( V_d = 14.2 \text{ kN/m} \)
Mortar designation to Table NA.2 mortar=1
Masonry type (1=clay 2=cal silicate 3=conc brick 4=block) typ(1)=4
Compressive strength of units \( p_o(1) = 30 \text{ N/mm}^2 \)
Constant K from NA Table NA.4 \( K(1) = 0.75 \)
Height of masonry unit \( h_u = 215 \text{ mm} \)
Least horiz. dimension of units \( l_{hd} = 140 \text{ mm} \)
Partial safety factor (masonry) \( \gamma_{M} = 2.3 \)
Characteristic tensile strength \( f_y = 500 \text{ N/mm}^2 \)
Diameter of reinforcing bars \( d_{iam} = 12 \text{ mm} \)
Char anchorage bond strength \( f_{bok} = 4.1 \text{ N/mm}^2 \)

DESIGN SUMMARY

Design bending moment 9.5 kNm
Design shear force 14.2 kN
Wall effective depth 190 mm
Wall effective width 1000 mm
Maximum wall height 3.4 m
Tensile strength (reinft) 500 N/mm²
Mortar designation 1
Compressive strength of units 30 N/mm²
Area of steel provided 452.39 mm²/m
Diameter of reinforcing bars 12 mm

Partial safety factors:
Group 1 masonry units 2.3
Reinforcement strength 1.15
Shear strength of masonry 2
Bond strength 1.5

The design of the concrete base is beyond the scope of this proforma. Brick or block Group 1 units could be used for the earth face leaf.
Location: Ex4 - Outer skin blocks laid flat

Reinforced masonry retaining wall to EC6

Cavity to be filled with concrete or grout and have a minimum width of 100 mm. Infill to be Grade C25/30 or higher. The earth face leaf must not be less than 100 mm thick. Group 1 units to be used. Concrete base design is beyond the scope of this proforma.

Outer leaf thickness  t1=215 mm
Earth face leaf thickness  t2=100 mm
Wall height  H=4.7 m
Cavity width (minimum 100 mm)  cw=100 mm
Design moment at top of base  Md'=9.5 kNm/m
Design shear at top of base  Vd=14.2 kN/m
Mortar designation to Table NA.2 mortar=1
Masonry type (1=clay 2=cal silicate 3=conc brick 4=block) typ(1)=4
Compressive strength of units  po(1)=30 N/mm^2
Constant K from NA Table NA.4  K(1)=0.75
Height of masonry unit  hu=100 mm

Partial safety factor (masonry)  gamM=2.3
Characteristic tensile strength  fy=500 N/mm^2
Diameter of reinforcing bars  diam=12 mm
Char anchorage bond strength  fbok=4.1 N/mm^2

DESIGN SUMMARY

Design bending moment  9.5 kNm
Design shear force  14.2 kN
Wall effective depth  265 mm
Wall effective width  1000 mm
Maximum wall height  4.7 m
Tensile strength (reinft)  500 N/mm^2
Mortar designation  1
Compressive strength of units  30 N/mm^2
Area of steel provided  452.39 mm^2/m
Diameter of reinforcing bars  12 mm

Partial safety factors:
Group 1 masonry units  2.3
Reinforcement strength  1.15
Shear strength of masonry  2
Bond strength  1.5

The design of the concrete base is beyond the scope of this proforma. Brick or block Group 1 units could be used for the earth face leaf.
Location: Ex5 - Pocket-Type ret. wall (Ex R1 by J Roberts w. links)

Reinforced masonry pocket-type retaining wall to EC6

Formed vertical voids (pockets) to be filled with concrete or grout. Infill Grade to be C25/30 or higher. Pockets must be at least 100 mm deep formed in Group 1 units. Concrete base design is beyond the scope of this proforma.

Wall thickness $tw=328$ mm
Wall height $H=3.65$ m
Design moment at top of base $Md'=97.24$ kNm/m
Design shear at top of base $Vd=71.85$ kN/m
Pocket depth $pd=113$ mm
Pocket width along wall length $pw=235$ mm
Pocket spacing $ps=900$ mm
Effective depth to be used $d=271.5$ mm
Mortar designation to Table NA.2 $mortar=1$
Compressive strength of units $po(1)=50$ N/mm$^2$
Constant K from NA Table NA.4 $K(1)=0.5$
Height of masonry unit $hu=65$ mm
Least horiz. dimension of units $lhd=100$ mm
Partial safety factor (masonry) $\gamma_M=2$
Characteristic tensile strength $fy=500$ N/mm$^2$
Diameter of reinforcing bars $diam=25$ mm
Spacing (<0.75d & <300mm) $sv=200$ mm
Char tensile strength of links $fy'=200$ N/mm$^2$
Diameter of shear links $Ds=6$ mm
Number of link legs $nleg=2$
Char anchorage bond strength $fbok=3.4$ N/mm$^2$
**DESIGN SUMMARY**

- **Design bending moment**: 97.24 kNm
- **Design shear force**: 71.85 kN
- **Wall effective depth**: 271.5 mm
- **Wall effective width**: 900 mm
- **Maximum wall height**: 3.65 m
- **Tensile strength (reinft)**: 500 N/mm²
- **Mortar designation**: 1
- **Compressive strength of units**: 50 N/mm²
- **Area of steel provided**: 981.75 mm²/m
- **Diameter of reinforcing bars**: 25 mm

**Partial safety factors:**
- **Group 1 masonry units**: 2
- **Reinforcement strength**: 1.15
- **Shear strength of masonry**: 2
- **Bond strength**: 1.5

Provide closed shear links of 6 mm diameter at pocket positions at 200 mm vertical centres.

The design of the concrete base is beyond the scope of this proforma.

Use masonry units of category I manufacturing control and of water absorption ≤ 7%.
Reinforced masonry pocket-type
retaining wall to EC6

Formed vertical voids (pockets) to be filled with concrete or grout. Infill Grade to be C25/30 or higher. Pockets must be at least 100 mm deep formed in Group 1 units. Concrete base design is beyond the scope of this proforma.

Wall thickness: \( t_w = 440 \text{ mm} \)
Wall height: \( H = 4 \text{ m} \)
Design moment at top of base: \( M_d' = 107.62 \text{ kNm/m} \)
Design shear at top of base: \( V_d = 73.63 \text{ kN/m} \)
Pocket depth: \( p_d = 112.5 \text{ mm} \)
Pocket width along wall length: \( p_w = 235 \text{ mm} \)
Pocket spacing: \( p_s = 900 \text{ mm} \)
Effective depth to be used: \( d = 383.75 \text{ mm} \)
Mortar designation to Table NA.2: mortar = 2
Compressive strength of units: \( p_o(1) = 35 \text{ N/mm}^2 \)
Constant K from NA Table NA.4: \( K(1) = 0.5 \)
Height of masonry unit: \( h_u = 65 \text{ mm} \)
Least horiz. dimension of units: \( l_{hd} = 100 \text{ mm} \)
Partial safety factor (masonry): \( \gamma_M = 2.3 \)
Characteristic tensile strength: \( f_y = 500 \text{ N/mm}^2 \)
Diameter of reinforcing bars: \( d_{iam} = 25 \text{ mm} \)
Char anchorage bond strength: \( f_{bok} = 3.4 \text{ N/mm}^2 \)

**DESIGN SUMMARY**

- Design bending moment: 107.62 kNm
- Design shear force: 73.63 kN
- Wall effective depth: 383.75 mm
- Wall effective width: 900 mm
- Maximum wall height: 4 m
- Tensile strength (reinft): 500 N/mm²
- Mortar designation: 2
- Compressive strength of units: 35 N/mm²
- Area of steel provided: 981.75 mm²/m
- Diameter of reinforcing bars: 25 mm

Partial safety factors:
- Group 1 masonry units: 2.3
- Reinforcement strength: 1.15
- Shear strength of masonry: 2
- Bond strength: 1.5

The design of the concrete base is beyond the scope of this proforma.

Location: Problem 1 in Orton's paper 'Structural Design of Masonry'

**Load distribution to shear walls**

- **Fx**: Resultant wind force in x-direction
- **Fy**: Resultant wind force in y-direction
- **sx**: Shear centre
- **yr**: Distance from origin to centroid of wall in y-dir.

Number of walls resisting movement in x-dirn: \( nx = 4 \)
Number of walls resisting movement in y-dirn: \( ny = 2 \)
Resultant wind force in x-direct. (unfactored) \( F_x = 20.82 \text{ kN} \)
Distance of this force from the origin \( y_m = 3.5 \text{ m} \)
Resultant wind force in y-direct. (unfactored) \( F_y = 0 \text{ kN} \)

**Resistance of walls in x-direction**

**Wall 1**
- Inertia of wall to resist force in x-direction: \( I_{x(i)} = 0.8 \text{ m}^4 \)
- Dist. from origin to centroid of wall in y-dir.: \( y(1) = 7 \text{ m} \)

**Wall 2**
- Inertia of wall to resist force in x-direction: \( I_{x(i)} = 0.3375 \text{ m}^4 \)
- Dist. from origin to centroid of wall in y-dir.: \( y(2) = 0 \text{ m} \)

**Wall 3**
- Inertia of wall to resist force in x-direction: \( I_{x(i)} = 0.0125 \text{ m}^4 \)
- Dist. from origin to centroid of wall in y-dir.: \( y(3) = 4 \text{ m} \)

**Wall 4**
- Inertia of wall to resist force in x-direction: \( I_{x(i)} = 0.0125 \text{ m}^4 \)
- Dist. from origin to centroid of wall in y-dir.: \( y(4) = 4 \text{ m} \)
Resistance of walls in y-direction

Wall 1

Inertia of wall to resist force in y-direction $I_y(i)=0.0125 \, \text{m}^4$
Dist. from origin to centroid of wall in x-dir. $x(i)=0 \, \text{m}$

Wall 2

Inertia of wall to resist force in y-direction $I_y(i)=0.0125 \, \text{m}^4$
Dist. from origin to centroid of wall in x-dir. $x(2)=4 \, \text{m}$

RESULTS

Eccentricity of force $F_x$ from shear centre $e_y= y_m-y_c=-1.4032 \, \text{m}$

Load resistance of individual walls in x-direction

Wall 1:
Load resistance
Proportion of total force resisted by this wall $p_x(1)=f_x(i)/F_x*100$
$=48.788 \%$
Since torsional component reduces calculated load resistance of this wall component, Orton suggests this term be ignored. If this is done, Load resistance $f_x(1)=F_x*I_x(i)/\sigma I_{x_r}=14.328 \, \text{kN}$
Proportion of total force resisted by this wall $p_x(1)=f_x(i)/F_x*100$
$=68.817 \%$

Wall 2:
Load resistance
Proportion of total force resisted by this wall $p_x(2)=f_x(i)/F_x*100$
$=48.792 \%$

Wall 3:
Load resistance
Proportion of total force resisted by this wall $p_x(3)=f_x(i)/F_x*100$
$=1.2101 \%$

Wall 4:
Load resistance
Proportion of total force resisted by this wall $p_x(4)=f_x(i)/F_x*100$
$=1.2101 \%$

Load resistance of individual walls in y-direction

Wall 1:
Load resistance
Wall 2:
Load resistance

NOTE: Negative value indicates force on wall acts in opposite direction to that of applied wind load.
Location: Option 2 with calculation of inertias from wall dimensions

Load distribution to shear walls

\[ F_x = \text{Resultant wind force x-direction} \]
\[ F_y = \text{Resultant wind force y-direction} \]
\[ o = \text{Origin} \]

Number of walls resisting movement in x-dirn \( n_x = 4 \)
Number of walls resisting movement in y-dirn \( n_y = 4 \)

Resultant wind force in x-direct. (unfactored) \( F_x = 50 \text{ kN} \)
Distance of this force from the origin \( y_m = 3 \text{ m} \)
Resultant wind force in y-direct. (unfactored) \( F_y = 30 \text{ kN} \)
Distance of this force from the origin \( x_m = 9 \text{ m} \)

Resistance of walls in x-direction

Wall 1
Inertia of wall to resist force in x-direction \( I_x(i) = 1 \text{ m}^4 \)
Dist. from origin to centroid of wall in y-dir. \( y(1) = 0.5 \text{ m} \)

Wall 2
Inertia of wall to resist force in x-direction \( I_x(i) = 42.667 \text{ m}^4 \)
Dist. from origin to centroid of wall in y-dir. \( y(2) = 6 \text{ m} \)

Wall 3
Inertia of wall to resist force in x-direction \( I_x(i) = 42.667 \text{ m}^4 \)
Dist. from origin to centroid of wall in y-dir. \( y(3) = 11.5 \text{ m} \)

Wall 4
Inertia of wall to resist force in x-direction \( I_x(i) = 1 \text{ m}^4 \)
Dist. from origin to centroid of wall in y-dir. \( y(4) = 11.5 \text{ m} \)
Resistance of walls in y-direction

Wall 1
Inertia of wall to resist force in y-direction $I_y(i)=144 \text{ m}^4$
Dist. from origin to centroid of wall in x-dir. $x(1)=6 \text{ m}$

Wall 2
Inertia of wall to resist force in y-direction $I_y(i)=0.66667 \text{ m}^4$
Dist. from origin to centroid of wall in x-dir. $x(2)=0.5 \text{ m}$

Wall 3
Inertia of wall to resist force in y-direction $I_y(i)=0.66667 \text{ m}^4$
Dist. from origin to centroid of wall in x-dir. $x(3)=11.5 \text{ m}$

Wall 4
Inertia of wall to resist force in y-direction $I_y(i)=144 \text{ m}^4$
Dist. from origin to centroid of wall in x-dir. $x(4)=6 \text{ m}$

RESULTS
Eccentricity of force $F_x$ from shear centre $e_y=y_m-y_c=-5.687 \text{ m}$
Eccentricity of force $F_y$ from shear centre $e_x=x_m-x_c=3 \text{ m}$

Load resistance of individual walls in x-direction

Wall 1 :
Load resistance
Proportion of total force resisted by this wall $p_x(1)=f_x(i)/F_x*100$
=5.3271 %

Wall 2 :
Load resistance
Proportion of total force resisted by this wall $p_x(2)=f_x(i)/F_x*100$
=107.42 %

Wall 3 :
Load resistance
Proportion of total force resisted by this wall $p_x(3)=f_x(i)/F_x*100$
=-12.453 %
Note: Negative value indicates force on wall acts in opposite direction to that of applied wind load.

Wall 4 :
Load resistance
Proportion of total force resisted by this wall $p_x(4)=f_x(i)/F_x*100$
=-0.29187 %
Note: Negative value indicates force on wall acts in opposite direction to that of applied wind load.
Load resistance of individual walls in y-direction

Wall 1:
Load resistance
Proportion of total force resisted by this wall \( py(1) = \frac{f_y(i)}{F_y} \times 100 \)
\[ = 49.77 \% \]

Wall 2:
Load resistance
Proportion of total force resisted by this wall \( py(2) = \frac{f_y(i)}{F_y} \times 100 \)
\[ = 3.3521 \% \]

Wall 3:
Load resistance
Proportion of total force resisted by this wall \( py(3) = \frac{f_y(i)}{F_y} \times 100 \)
\[ = -2.8912 \% \]

NOTE: Negative value indicates force on wall acts in opposite direction to that of applied wind load.

Wall 4:
Load resistance
Proportion of total force resisted by this wall \( py(4) = \frac{f_y(i)}{F_y} \times 100 \)
\[ = 49.77 \% \]
Location: Ex3 - Demonstrates Option 1 input

**Resistance of walls in x-direction**

**Wall 1**

Inertia of wall to resist force in x-direction $I_x(i)=144 \text{ m}^4$
Dist. from origin to centroid of wall in y-dir. $y(i)=0.5 \text{ m}$

**Wall 2**

Inertia of wall to resist force in x-direction $I_x(i)=0.66667 \text{ m}^4$
Dist. from origin to centroid of wall in y-dir. $y(i)=6 \text{ m}$

**Wall 3**

Inertia of wall to resist force in x-direction $I_x(i)=0.66667 \text{ m}^4$
Dist. from origin to centroid of wall in y-dir. $y(i)=6 \text{ m}$

**Wall 4**

Inertia of wall to resist force in x-direction $I_x(i)=144 \text{ m}^4$
Dist. from origin to centroid of wall in y-dir. $y(i)=11.5 \text{ m}$

**Resistance of walls in y-direction**

**Wall 1**

Inertia of wall to resist force in y-direction $I_y(i)=1 \text{ m}^4$
Dist. from origin to centroid of wall in x-dir. $x(i)=6 \text{ m}$

**Wall 2**

Inertia of wall to resist force in y-direction $I_y(i)=42.667 \text{ m}^4$
Dist. from origin to centroid of wall in x-dir. $x(i)=0.5 \text{ m}$

**Wall 3**

Inertia of wall to resist force in y-direction $I_y(i)=42.667 \text{ m}^4$
Dist. from origin to centroid of wall in x-dir. $x(i)=11.5 \text{ m}$

**Wall 4**

Inertia of wall to resist force in y-direction $I_y(i)=1 \text{ m}^4$
Dist. from origin to centroid of wall in x-dir. $x(i)=6 \text{ m}$

**RESULTS**

Eccentricity of force $F_x$ from shear centre $e_y= y_m- y_c = -3 \text{ m}$
Eccentricity of force $F_y$ from shear centre $e_x= x_m- x_c = 3 \text{ m}$
Load resistance of individual walls in x-direction

Wall 1:
Load resistance
Proportion of total force resisted by this wall \( p_x(1) = \frac{f_x(i)}{F_x} \times 100 \)
\[= 58.185 \% \]

Wall 2:
Load resistance
Proportion of total force resisted by this wall \( p_x(2) = \frac{f_x(i)}{F_x} \times 100 \)
\[= 0.23041 \% \]

Wall 3:
Load resistance
Proportion of total force resisted by this wall \( p_x(3) = \frac{f_x(i)}{F_x} \times 100 \)
\[= 0.23041 \% \]

Wall 4:
Load resistance
Proportion of total force resisted by this wall \( p_x(4) = \frac{f_x(i)}{F_x} \times 100 \)
\[= 41.354 \% \]

Since torsional component reduces calculated load resistance of this wall component, Orton suggests this term be ignored. If this is done,
Load resistance
\( f_x(4) = \frac{F_x \times I_x(i)}{\sigma I_{xr}} = 24.885 \text{ kN} \)
Proportion of total force resisted by this wall \( p_x(4) = \frac{f_x(i)}{F_x} \times 100 \)
\[= 49.77 \% \]

Load resistance of individual walls in y-direction

Wall 1:
Load resistance
Proportion of total force resisted by this wall \( p_y(1) = \frac{f_y(i)}{F_y} \times 100 \)
\[= 1.145 \% \]

Wall 2:
Load resistance
Proportion of total force resisted by this wall \( p_y(2) = \frac{f_y(i)}{F_y} \times 100 \)
\[= 53.011 \% \]

Wall 3:
Load resistance
Proportion of total force resisted by this wall \( p_y(3) = \frac{f_y(i)}{F_y} \times 100 \)
\[= 44.699 \% \]

Since torsional component reduces calculated load resistance of this wall component, Orton suggests this term be ignored. If this is done,
Load resistance
\( f_y(3) = \frac{F_y \times I_y(i)}{\sigma I_{yr}} = 14.656 \text{ kN} \)
Proportion of total force resisted by this wall \( p_y(3) = \frac{f_y(i)}{F_y} \times 100 \)
\[= 48.855 \% \]

Wall 4:
Load resistance
Proportion of total force resisted by this wall \( p_y(4) = \frac{f_y(i)}{F_y} \times 100 \)
\[= 1.145 \% \]

SUMMARY

Line of thrust lies above the intrados and below the extrados.

- Moment at left end of arch: 238.54 kNm
- Horizontal reaction at left end: 55 kN
- Moment at right end of arch: -0.23854E-3 kNm
- Horizontal reaction at right end: 55 kN
- Thickness of arch: 1.1992 m

NOTE: All values above are characteristic values.
Location: Ex1 - Masonry dam D1

The following analysis checks the profile of a dam to ensure that the line of thrust comes within the middle third. Stresses at the back and front of the dam are also computed.

Datum \( x(0) \) \( b(0) \) Datum is usually bottom left hand corner of dam cross-section, but need not be. Segments are numbered downwards from top of dam.

\[ p(0) \quad \text{top of dam} \]

Number of segments in dam \( NS=2 \)
Density of masonry \( \gamma=24 \text{ kN/m}^3 \)
Length of dam into paper \( L=1 \text{ m} \)
Horiz.distance from datum at top \( x(0)=0.25 \text{ m} \)
Width of dam at top \( b(0)=2 \text{ m} \)

The following analysis, checks the profile of a dam to ensure that the line of thrust comes within the middle third. Stresses at the back and front of the dam are also computed.

- Datum $x(0)$, $b(0)$: Datum is usually bottom left hand corner of dam cross-section, but need not be.
- Number of segments in dam $N_S = 2$
- Density of masonry $\gamma = 20 \text{ kN/m}^3$
- Length of dam into paper $L = 1 \text{ m}$
- Horiz. distance from datum at top $x(0) = 0.5 \text{ m}$
- Width of dam at top $b(0) = 4 \text{ m}$
- Normal pressure at top of dam $p(0) = 10 \text{ kN/m}^2$

Roof drainage gutters - to BS EN 12056-3:2000 (with Amd. No. 17041)

Width of roof (gutter to ridge) \( Br = 6 \text{ m} \)
Length of roof to be drained \( Lr = 20 \text{ m} \)
Area of wall draining to roof \( A_{wall} = 50 \text{ m}^2 \)
Minimum rainfall intensity rate \( r = 0.021 \text{ l/s/m}^2 \)
Risk factor \( rf = 1 \)
The runoff coefficient \( C = 1 \)

Eaves gutter

\[ W = \text{depth below designed water line} \]
\[ T = \text{width of gutter} \]
\[ S = \text{width of sole} \]
\[ Z = \text{total depth of gutter} \]

Width of gutter \( T = 150 \text{ mm} \)
Depth of water \( W = 150 \text{ mm} \)
Width of sole \( S = 150 \text{ mm} \)
Depth of gutter including freeboard \( Z = 150 \text{ mm} \)
Cross sectional area of gutter \( A_e = 22500 \text{ mm}^2 \)
Length of gutter \( L = 20 \text{ m} \)
Gradient of gutter \( G_{grad} = 1 \text{ mm/m} \)
Width of chute \( L_w = 400 \text{ mm} \)
Width of box \( B_b = 450 \text{ mm} \)
Length of box \( L_b = 500 \text{ mm} \)
Assumed diameter of outlet \( D = 200 \text{ mm} \)
Depth of box below gutter \( h_b = 200 \text{ mm} \)

**DESIGN**

Gutter is trapezoidal

Main chord length                 c=20 m

Balancing percent of radial force per=45 %
Carriageway width                 B=7.6 m
Location: Example 9.6 from Bannister, Raymond & Baker - 7th Edition

Cutting or embankment

Formation width of road \( b = 12.5 \text{ m} \)

X-fall existing ground \( \text{1 in k} \) \( k = 12 \)

Side slopes \( \text{1 in m} \) \( m = 2 \)

Centre line height \( h = 3.1 \text{ m} \)

Side width \( w_1 = (b/2 + m*h)*(k/(k-m)) = 14.94 \text{ m} \)

Side width \( w_2 = (b/2 + m*h)*(k/(k+m)) = 10.671 \text{ m} \)

Area of cutting or embankment \( \text{area} = 1/(2*m)*((b/2+m*h)*(w_1+w_2) - b^2)/2 = 60.184 \text{ m}^2 \)
Location: Example 9.7 from Bannister, Raymond & Baker - 7th Edition

Sections part in cut and part in fill
Formation width of road \( b = 9.5 \text{ m} \)
X-fall existing ground (1 in k) \( k = 5 \)
Side slopes in fill (1 in m) \( m = 3 \)
Side slopes in cut (1 in n) \( n = 1 \)
Centre line height \( h = 0.5 \text{ m} \)
Side width \( w_1 = (k/(k-n)) \times (b/2+n \times h) = 6.5625 \text{ m} \)
Side width \( w_2 = (k/(k-m)) \times (b/2-m \times h) = 8.125 \text{ m} \)
Area of fill \( \text{areaf} = 1/2 \times (b/2-k \times h)^2/(k-m) = 1.2656 \text{ m}^2 \)
Area of cut \( \text{areac} = 1/2 \times (b/2+k \times h)^2/(k-n) = 6.5703 \text{ m}^2 \)
Location: Example 9.7 from Bannister, Raymond & Baker – with -ve 'h'

Sections part in cut and part in fill
Formation width of road \( b = 9.5 \text{ m} \)
X-fall existing ground (1 in k) \( k = 5 \)
Side slopes in fill (1 in m) \( m = 1 \)
Side slopes in cut (1 in n) \( n = 3 \)
Centre line height \( h = -0.5 \text{ m} \)
Side width \( w_1 = (k/(k-n)) \times (b/2+n \times h) = 8.125 \text{ m} \)
Side width \( w_2 = (k/(k-m)) \times (b/2-m \times h) = 6.5625 \text{ m} \)
Area of fill \( \text{areaf} = 1/2 \times (b/2-k \times h)^2/(k-m) = 6.5703 \text{ m}^2 \)
Area of cut \( \text{areac} = 1/2 \times (b/2+k \times h)^2/(k-n) = 1.2656 \text{ m}^2 \)
Location: Example 9.6 from Bannister, Raymond & Baker - 7th Edition

Embankment on three level section

Formation width of road \( b = 12.5 \text{ m} \)

X-fall left of centre (1 in \( k \)) \( k = 12 \)

X-fall right of centre (1 in \( l \)) \( l = 12 \)

Side slopes (1 in \( m \)) \( m = 2 \)

Centre line height \( h = 3.1 \text{ m} \)

Side width \( w_1 = \frac{b}{2} + m \cdot h \cdot \frac{k}{k - m} = 14.94 \text{ m} \)

Side width \( w_2 = \frac{b}{2} + m \cdot h \cdot \frac{l}{l + m} = 10.671 \text{ m} \)

Area of cross section

\[
\text{area} = \frac{1}{2m} \left( (w_1 + w_2) \cdot (m \cdot h + b/2) - b^2 / 2 \right) = 60.184 \text{ m}^2
\]
Volumes by prismoidal formula
The volume of a prismoid is given by  \( V = \frac{D}{6} (A_1 + 4M + A_2) \)
where \( A_1 \) & \( A_2 \) are the areas of the two end faces distance \( D \) apart,  
\( M \) is is the area of the section mid-way between (and not the average of \( A_1 \) & \( A_2 \), see Bannister & Raymond.

Area \( A_1 \) \( \text{m}^2 \)  
Area \( A_2 \) \( \text{m}^2 \)  
Area of sectn midway betwn \( A_1 \& A_2 \) \( \text{m}^2 \)  
Distance between two end faces \( \text{m} \)  
Volume of the prismoid \( \text{m}^3 \)

\[ \begin{align*}
A_1 &= 72 \text{ m}^2 \\
A_2 &= 139.84 \text{ m}^2 \\
M &= 103.36 \text{ m}^2 \\
D &= 40 \text{ m} \\
V &= \frac{D}{6} (A_1 + 4M + A_2) = 4168.5 \text{ m}^3
\end{align*} \]
Location: Volumes from spot levels; example from Bannister & Raymond

</table>

\[ \Sigma hn \times n = 242.61 \]

Therefore volume \[ V = A \times \sigma / 4 = 121305 \text{ m}^3 \]
Location: Simpson's rule for volumes

Simpson's rule for volumes:

\[
V = \frac{D}{3} \left[ A(1) + 4A(2) + 2A(3) + 4A(4) + 2A(n-2) + 4A(n-1) + A(n) \right]
\]

where, \( n \) is number of sections having area \( A(1), A(2) \ldots A(n) \),
(n being odd) equally spaced at uniform distance between them = \( D \).

Number of sections (must be odd) \( n=3 \)
Distance between each section \( D=100 \) m
Section number 1 \( A(1)=416.04 \) m²
Section number 2 \( A(2)=563.7 \) m²
Section number 3 \( A(3)=916.1 \) m²

Accumulate areas

Area coefficient for section 1 \( ac=1 \)
\[
\text{Acum}=\text{Acum}+ac\times A(i)=416.04 \text{ m}^2
\]

Area coefficient for section 2 \( ac=4 \)
\[
\text{Acum}=\text{Acum}+ac\times A(i)=2670.8 \text{ m}^2
\]

Area coefficient for section 3 \( ac=1 \)
\[
\text{Acum}=\text{Acum}+ac\times A(i)=3586.9 \text{ m}^2
\]

Therefore volume \( V=D\times \text{Acum}/3=119565 \text{ m}^3 \)

</table>
Location: Tell-tales located on NE corner of store

Crack movement by tell-tales

Tell-tales are located at positions A, B & C. Tell tales A & B are approximately parallel to the crack denoted thus: \(\|\). The dimensions \(a, b \& c\) are measured by micrometer at various time intervals.

From the initial readings the angle at A is computed by trigonometry.

Let \(s = (a+b+c)/2\) then:

\[
\sin(A) = \frac{2}{bc} \sqrt{s(s-a)(s-b)(s-c)}
\]

then compute: \(x = b \cdot \sin(A)\) & \(y = b \cdot \cos(A)\).

Repeat for final condition and the difference between the two sets gives the movements normal and parallel to the crack.

Initial dimensions

\[
a = 120 \text{ mm} \\
b = 103.92 \text{ mm} \\
c = 60 \text{ mm}
\]

Final dimensions

\[
a' = 119.18 \text{ mm} \\
b' = 108.34 \text{ mm}
\]

Crack movements

Change in dimension normal to AB 4.0073 mm (+ve denotes opening)
parallel to AB -9.4421 mm (+ve in direction of A)
Location: Table for checking beam deflections

Elastic modulus for beam \( E_m = 205 \text{ kN/mm}^2 \)
Smallest span to be considered \( s_{\text{min}} = 6 \text{ m} \)
Largest span to be considered \( s_{\text{max}} = 8 \text{ m} \)
Increment in length of span \( s_{\text{inc}} = 2 \text{ m} \)
Smallest service load considered \( W_{\text{min}} = 50 \text{ kN} \)
Largest service load considered \( W_{\text{max}} = 300 \text{ kN} \)
Increment in service load \( W_{\text{inc}} = 50 \text{ kN} \)
Smallest inertia to be considered \( I_{\text{min}} = 2000 \text{ cm}^4 \)
Largest inertia to be considered \( I_{\text{max}} = 20000 \text{ cm}^4 \)
Increment in inertia \( I_{\text{inc}} = 2000 \text{ cm}^4 \)

Table of maximum deflections for 6 m span (Span/300 = 20 mm)
Table of maximum deflections for 8 m span (Span/300 = 27 mm)
Location: Shears, moments and deflections of beams

Shear, moment and deflection formulas for beams generally taken from 'Formulas for Stress and Strain' by Roark, published by McGraw-Hill with additions from 'Steel Designer's Manual'.

Inertia of beam $I = 0.294 \times 10^{-3}$ m$^4$

Elastic modulus for beam $E = 205$ GPa

--

Length of beam $l = 3$ m

Load $W = 10$ kN

Distance from end C to load $a = 3$ m

Maximum shear $V = -W = -10$ kN (B to C)

Maximum bending moment $M = -W \cdot a = -30$ kNm at C

Maximum deflection $y = -\left(\frac{W}{6Ei}\right) \cdot (3a^2 - a^3) = -0.0014933$ m
Location: Beams under combined axial and transverse loading

Formulas for beams under combined axial & transverse loading, Table VI from 'Formulas for Stress and Strain' by Roark, published McGraw-Hill.

- Young's modulus for beam \( E = 205 \times 10^6 \text{ kN/m}^2 \)
- Inertia of beam \( I = 4.77 \times 10^{-6} \text{ m}^4 \)
- Length of beam \( l = 3 \text{ m} \)
- Axial load \( P = 150 \text{ kN} \)

Moments are positive when clockwise, negative when anti-clockwise.
Deflections in y direction are positive when upwards, negative when downwards. Beam slope with horizontal (theta) positive when upward to the right.

**Cantilever beam under axial compression & transverse end load**

![Cantilever beam diagram]

- PL on cantilever end (+ve down) \( W = 10 \text{ kN} \)
- Maximum moment \( M = -W \times j \times \tan(U) = -61.101 \text{ kNm} \) (at \( x = l \))
- Maximum deflection \( y = -W \times (j \times \tan(U) - l) / P = -0.20734 \text{ m} \) (at \( x = 0 \))
- Maximum slope \( \theta = W \times (1 - \cos(U)) / \cos(U) / P = 0.10624 \text{ radians} \)
Location: Beams under combined axial and transverse loading

Formulas for beams under combined axial & transverse loading, Table VI from 'Formulas for Stress and Strain' by Roark, published McGraw-Hill.

- Young's modulus for beam \( E = 1.6 \times 10^6 \) kN/m²
- Inertia of beam \( I = 13.5 \) m⁴
- Length of beam \( l = 100 \) m
- Axial load \( P = 10000 \) kN

Moments are positive when clockwise, negative when anti-clockwise. Deflections in y direction are positive when upwards, negative when downwards. Beam slope with horizontal (theta) positive when upward to the right.

**Simply supported beam under axial compression & uniform transverse load**

UDL on SS beam (+ve down) \( w = 3 \) kN/m
Cross-sectional area of the strut \( A = 18 \) m²
Dist. from n.a. to outside fibre \( h = 1.5 \) m
Yield stress \( \sigma_y = 5000 \) kN/m²

Maximum moment
\[
M = c_1 (c_2 - 1) = 7162 \text{ kNm} \quad (at \ x = l/2)
\]

Maximum deflection
\[
y = -c_1 (c_2 - 1 - U^2/8)/P = -0.3412 \text{ m} \quad (at \ x = l/2)
\]

Maximum slope \[ \theta = -(w^2/2)(-U/2+c_3)/P \]
\[ = -0.01083 \text{ radians} \quad (at \ x = 0) \]
Location: Beams under combined axial and transverse loading

Formulas for beams under combined axial & transverse loading, Table VI from 'Formulas for Stress and Strain' by Roark, published McGraw-Hill.

Young's modulus for beam \( E = 30.464E^6 \) kN/m²
Inertia of beam \( I = 0.018565 \) m⁴
Length of beam \( l = 60 \) m
Axial load \( P = 500 \) kN

Moments are positive when clockwise, negative when anti-clockwise. Deflections in y direction are positive when upwards, negative when downwards. Beam slope with horizontal (theta) positive when upward to the right.

Simply supported beam under axial compression & uniform transverse load

UDL on SS beam (+ve down) \( w = 0.83 \) kN/m
Cross-sectional area of the strut \( A = 0.16608 \) m²
Dist. from n.a. to outside fibre \( h = 0.5 \) m
Yield stress \( p_y = 17920 \) kN/m²

Maximum moment \( M = c_1(c_2 - 1) = 556.47 \) kNm (at \( x = l/2 \))
Maximum deflection \( y = -c_1(c_2 - 1 - U^2/8)/P \)
\( = -0.36594 \) m (at \( x = l/2 \))
Maximum slope \( \theta = -w*j*(-U/2+c_3)/P \)
\( = -0.01941 \) radians (at \( x = 0 \))

Location: Beam at A/1

Cantilever has 'n' segments with inertias $i_z(1)-i_z(n)$ and spans $s(1)-s(n)$ in order, left to right.

Number of segments in cantilever $n=2$
End point load $p=1$ kN
Young's modulus $e=1E6$ kN/m²
Length of segment 1 $s(i)=1.2$ m (left to right)
Inertia of segment 1 $i_z(i)=0.01$ m⁴ (left to right)
Length of segment 2 $s(i)=1.8$ m (left to right)
Inertia of segment 2 $i_z(i)=0.005$ m⁴ (left to right)
Total length of cantilever $3$ m
Maximum moment $m_m=p\cdot l=3$ kNm
Area of bmd rectangular segment $a_r=p\cdot l\cdot s(i)=2.16$ kNm²
Lever arm of rectangular segment $l_r=l+s(i)/2=2.4$ m
Area of bmd triangular segment $a_t=p\cdot s(i)^2/2=0.72$ kNm²
Lever arm of triangular segment $l_t=l+2\cdot s(i)/3=2.6$ m
Cumulate rotation components $\theta=\theta+(a_r+a_t)/(e\cdot i_z(i))$
$=0.288E-3$ radians
Cumulate deflection components $\delta=\delta+(a_r\cdot l_r+a_t\cdot l_t)/(e\cdot i_z(i))$
$=0.7056E-3$ m
Area of bmd rectangular segment $a_r=p\cdot l\cdot s(i)=-0.39968E-15$ kNm²
Lever arm of rectangular segment $l_r=l+s(i)/2=0.9$ m
Area of bmd triangular segment $a_t=p\cdot s(i)^2/2=1.62$ kNm²
Lever arm of triangular segment $l_t=l+2\cdot s(i)/3=1.2$ m
Cumulate rotation components $\theta=\theta+(a_r+a_t)/(e\cdot i_z(i))$
$=0.612E-3$ radians
Cumulate deflection components $\delta=\delta+(a_r\cdot l_r+a_t\cdot l_t)/(e\cdot i_z(i))$
$=0.0010944$ m
Location: Simply supported beam

![Beam diagram]

Elastic modulus \( E = 205 \times 10^6 \) kN/m²
Beam span \( L = 3 \) m
Inertia about major axis \( I = 4.77 \times 10^{-6} \) m⁴
Dead load factor \( \gamma_{d} = 1.4 \)
Live load factor \( \gamma_{l} = 1.6 \)

All loads are positive downwards, reactions are positive upwards, sagging moments are positive.

Horizontal react at 1 (+ve right) \( H_1 = (V_1 \cdot b + M - w_2 \cdot r \cdot b / 2) / c = 0.28547 \text{ kN} \)
Horizontal react at 3 (+ve left) \( H_3 = 0.28547 \text{ kN} \)
Axial force 1->2 (+ve compressn) \( F_1 = V_1 \cdot \sin(\alpha) + H_1 \cdot \cos(\alpha) = 2.6667 \text{ kN} \)
Shear force 1->2 \( S_1 = V_1 \cdot \cos(\alpha) - H_1 \cdot \sin(\alpha) = 0.20956 \text{ kN} \)

Plan load per unit length \( w_3 = 0.3 \text{ kN/m} \)
Moment at 2
\[
M = (w \cdot r^2 / 8) \cdot (I_{23}/a) / (I_{12}/r + I_{23}/a)
\]
\( = 0.0068483 \text{ kNm} \)
Vertical reaction at 3 (+ve up) \( V_3 = -M/a = -0.0038046 \text{ kN} \)
Vertical reaction at 1 (+ve up) \( V_1 = w_3 \cdot b - V_3 = 0.1838 \text{ kN} \)
Horizontal react at 3 (+ve left) \( H_3 = (w_3 \cdot b^2 / 2 - V_3 \cdot (a+b)) / c = 0.019728 \text{ kN} \)
Horizontal react at 1 (+ve right) \( H_1 = 0.019728 \text{ kN} \)
Axial force 1->2 (+ve compressn) \( F_1 = V_1 \cdot \sin(\alpha) + H_1 \cdot \cos(\alpha) = 0.18429 \text{ kN} \)
Shear force 1->2 \( S_1 = V_1 \cdot \cos(\alpha) - H_1 \cdot \sin(\alpha) = 0.014483 \text{ kN} \)
Suction on rafter (+ve) 

\[ w_4 = 0.75 \text{ kN/m} \]

Moment at 2 

\[ M = \left( \frac{w \times r^2}{8} \right) \left( I_{23}/a \right) / \left( I_{12}/r + I_{23}/a \right) \]

\[ = -0.50411 \text{ kNm} \]

Vertical reaction at 3 (+ve up) 

\[ V_3 = -M/a = 0.28006 \text{ kN} \]

Vertical reaction at 1 (+ve up) 

\[ V_1 = -w_4 \times r \times \cos(\alpha) - V_3 = -0.73006 \text{ kN} \]

Horizontal react at 1 (+ve right) 

\[ H_1 = (V_1 \times b + M + w_4 \times r^2/2)/c = 0.94777 \text{ kN} \]

Horizontal react at 3 (+ve left) 

\[ H_3 = H_1 - w_4 \times r \times \sin(\alpha) = -1.4522 \text{ kN} \]

Axial force 1->2 (+ve compressn) 

\[ F_1 = V_1 \times \sin(\alpha) + H_1 \times \cos(\alpha) = -0.5429 \text{ kN} \]

Shear force 1->2 

\[ S_1 = V_1 \times \cos(\alpha) - H_1 \times \sin(\alpha) = -1.0661 \text{ kN} \]

Vertical load at joint 2 

\[ W_{2v} = 1.7 \text{ kN} \]

Horizontal load at joint 2 

\[ W_{2h} = 0.6 \text{ kN} \]

For small displacements, the horizontal load \( W_{2h} \) causes compression in member 2-3 only; but the vertical force \( W_{2v} \) causes compression in members 1-2 and 2-3. Resolving vertically at joint 2:

Vertical reaction at 3 (+ve up) 

\[ V_3 = 0 \text{ kN} \]

Vertical reaction at 1 (+ve up) 

\[ V_1 = W_{2v} = 1.7 \text{ kN} \]

Axial force 1->2 (+ve compressn) 

\[ F_1 = W_{2v} / \sin(\alpha) = 1.7296 \text{ kN} \]

Shear force 1->2 

\[ S_1 = 0 \text{ kN} \]

Horizontal react at 1 (+ve right) 

\[ H_1 = V_1 \times b / c = 0.31875 \text{ kN} \]

Horizontal react at 3 (+ve left) 

\[ H_3 = H_1 + W_{2h} = 0.91875 \text{ kN} \]

Axial force 2->3 (+ve compressn) 

\[ F_2 = H_3 = 0.91875 \text{ kN} \]

Shear force 2->3 

\[ S_2 = 0 \text{ kN} \]
Location: Influence lines for two span beam

The procedure sets up and reduces a stiffness matrix in which each beam element contributes the submatrices. The matrix is banded 4 elements wide. For each influence line, forces are applied to the appropriate element. The deflected form of the beam is the influence line by the Muller-Breslau principle. Areas in each span are computed by Simpson's rule.

Influence lines for shear are given for all points in the nominated span. The values for shear are those due to a unit load applied just to the right of the position to which the value is referenced. Therefore subtract the value from unity for shears when the unit load is applied just to the left of the reference position.

Number of spans $s_1=2$

Spans in order left to right
(or span ratios):

L₁ = 10 m
L₂ = 10 m

Uniform inertia set in L₁₁ et seq.

Influence lines in order now follow:

Influence line for support number x(1)=1

Influence line for shear in span x(2)=2

Influence line for mmt at point x(3)=2

Location: Influence lines for eight span beam

The procedure sets up and reduces a stiffness matrix in which each beam element contributes the submatrices. The matrix is banded 4 elements wide. For each influence line, forces are applied to the appropriate element. The deflected form of the beam is the influence line by the Muller-Breslau principle. Areas in each span are computed by Simpson's rule.

Influence lines for shear are given for all points in the nominated span. The values for shear are those due to a unit load applied just to the right of the position to which the value is referenced. Therefore subtract the value from unity for shears when the unit load is applied just to the left of the reference position.

Number of spans $s_1=8$

Spans in order left to right (or span ratios):

$$
\begin{align*}
L(1) &= 10 \text{ m} \\
L(2) &= 8 \text{ m} \\
L(3) &= 10 \text{ m} \\
L(4) &= 8 \text{ m} \\
L(5) &= 7 \text{ m} \\
L(6) &= 6 \text{ m} \\
L(7) &= 7 \text{ m} \\
L(8) &= 8 \text{ m}
\end{align*}
$$

Inertias in order left to right (or inertia ratios) stored in $L(11), L(12),...$

$$
\begin{align*}
L(11) &= 1 \text{ m}^4 \\
L(12) &= 1.2 \text{ m}^4 \\
L(13) &= 1 \text{ m}^4 \\
L(14) &= 1.2 \text{ m}^4 \\
L(15) &= 1 \text{ m}^4 \\
L(16) &= 2 \text{ m}^4 \\
L(17) &= 2.1 \text{ m}^4 \\
L(18) &= 2.2 \text{ m}^4
\end{align*}
$$

Influence lines in order now follow:

Influence line for support number $x(1)=5$

Influence line for shear in span $x(2)=7$
Influence lines

Ordinates of influence lines in order — left to right

</table>
Location: Slab with fixed edges supporting central concentrated load

Slab moments due to concentrated loads using Pigeaud's coefficients

Concrete slab with concentrated load symmetrical about both axes

Total load = F kN
All dimensions in metres

Poisson's ratio nu = 0.2
Shorter span lx = 3 m
Longer span ly = 3.75 m

Load details
Load length in lx direction ax = 0.525 m
Load length in ly direction ay = 1.05 m
Individual concentrated load F = 200 kN

Continuity conditions
Two-way slab with all edges continuous.

Calculation of bending moments

Bending moment in x-direction
Mx = F * L * Factor * (alfx1 + nu * alfy1)
= 41.094 kNm/m

Bending moment in y-direction
My = F * L * Factor * (nu * alfx1 + alfy1)
= 31.47 kNm/m

Taking account of suggested allowances for continuity in x-direction:
Bending moment at end support Mx1 = -0.25 * Mx = -10.274 kNm/m
Maximum moment in end span Mx2 = 0.85 * Mx = 34.93 kNm/m
Moment at penultimate support Mx3 = -0.85 * Mx = -34.93 kNm/m
Maximum moment in interior span Mx4 = 0.70 * Mx = 28.766 kNm/m
Moment at interior supports Mx5 = -0.90 * Mx = -36.985 kNm/m

Taking account of suggested allowances for continuity in y-direction:
Bending moment at end support My1 = -0.25 * My = -7.8675 kNm/m
Maximum moment in end span My2 = 0.85 * My = 26.75 kNm/m
Moment at penultimate support My3 = -0.85 * My = -26.75 kNm/m
Maximum moment in interior span My4 = 0.70 * My = 22.029 kNm/m
Moment at interior supports My5 = -0.90 * My = -28.323 kNm/m
Effective width in direction of shorter span \( lx \)

Effective width of slab \( ly_{Eff} = ay + 2lx^2 = 2.85 \) m

Effective width in direction of longer span \( ly \)

Effective width of slab \( lx_{Eff} = ax + 2ly^2 = 2.775 \) m

Approximate shearing forces from each load \( F \)

Shear force at centre of \( ax \) \( V_{ax} = F/(3ay) = 63.492 \) kN/m

Shear force at centre of \( ay \) \( V_{ay} = F/(2ay+ax) = 76.19 \) kN/m
Location: Square fixed-edge slab supporting twin loads

Concrete slab with concentrated loads symmetrical about both axes

Each individual total load = F kN

All dimensions in metres

Poisson's ratio nu=0.2
Shorter span lx=5 m
Longer span ly=5 m

Load details
Load length in lx direction ax=2.5 m
Start of load from nearer support x=0 m
Load length in ly direction ay=1.05 m
Individual concentrated load F=450 kN

Continuity conditions
Two-way slab with all edges continuous.

Calculation of bending moments

Bending moment in x-direction
Mx=F*Factor*(alfx1+nu*alfy1)
=67.302 kNm/m

Bending moment in y-direction
My=F*Factor*(nu*alfx1+alfy1)
=86.814 kNm/m

Taking account of suggested allowances for continuity in x-direction:
Bending moment at end support Mx1=-0.25*Mx=-16.826 kNm/m
Maximum moment in end span Mx2=0.85*Mx=57.207 kNm/m
Moment at penultimate support Mx3=-0.85*Mx=-57.207 kNm/m
Maximum moment in interior span Mx4=0.70*Mx=47.111 kNm/m
Moment at interior supports Mx5=-0.90*Mx=-60.572 kNm/m

Taking account of suggested allowances for continuity in y-direction:
Bending moment at end support My1=-0.25*My=-21.704 kNm/m
Maximum moment in end span My2=0.85*My=73.792 kNm/m
Moment at penultimate support My3=-0.85*My=-73.792 kNm/m
Maximum moment in interior span My4=0.70*My=60.77 kNm/m
Moment at interior supports My5=-0.90*My=-78.133 kNm/m
Effective width in direction of shorter span $lx$

Effective width of slab $ly_{Eff} = ay + 2lx^2 = 3.3 \text{ m}$

Effective width in direction of longer span $ly$

Effective width is equal to total slab width $lx$.

Effective width of slab $5 \text{ m}$

Approximate shearing forces from each load $F$

Shear force at centre of $ax$ $V_{ax} = F / (2ax + ay) = 74.38 \text{ kN/m}$

Shear force at centre of $ay$ $V_{ay} = F / (3ax) = 60 \text{ kN/m}$
Location: Slab w. two adjacent edges continuous & unsymmetrical load

Slab moments due to concentrated loads using Pigeaud's coefficients

Concentrated load is unsymmetrical about both axes

\[
\begin{align*}
\text{Total load} & = F \text{ kN} \\
\text{All dimensions} & \text{ in metres} \\
\end{align*}
\]

Poisson's ratio \( \nu = 0.2 \)
Shorter span \( l_x = 4 \text{ m} \)
Longer span \( l_y = 7 \text{ m} \)

Load details

- Load length in \( l_x \) direction \( a_x = 2 \text{ m} \)
- Start of load from nearer support \( x = 0 \text{ m} \)
- Load length in \( l_y \) direction \( a_y = 3.5 \text{ m} \)
- Start of load from nearer support \( y = 0 \text{ m} \)
- Individual concentrated load \( F = 500 \text{ kN} \)

Continuity conditions

Two-way slab with two adjacent edges continuous.

WARNING:
Specified combination of slab dimensions and fixity conditions falls outside validity of Pigeaud's tables.
Location: To give table failure

Slab moments due to concentrated loads using Pigeaud's coefficients

Concentrated load is unsymmetrical about both axes

Poisson's ratio \( \nu = 0.2 \)
Shorter span \( l_x = 1 \, \text{m} \)
Longer span \( l_y = 20 \, \text{m} \)

Load details
Load length in \( l_x \) direction \( a_x = 0.5 \, \text{m} \)
Start of load from nearer support \( x = 0 \, \text{m} \)
Load length in \( l_y \) direction \( a_y = 10 \, \text{m} \)
Start of load from nearer support \( y = 0 \, \text{m} \)
Individual concentrated load \( F = 0 \, \text{kN} \)

Continuity conditions
Two-way slab with two adjacent edges continuous.

WARNING:
Specified combination of slab dimensions and fixity conditions falls outside validity of Pigeaud's tables.
Location: Slab with fixed edges supporting central concentrated load

Slab moments due to concentrated loads using Pigeaud's coefficients

![Concrete slab with concentrated load symmetrical about both axes]

- Poisson's ratio: $\nu=0.2$
- Shorter span: $l_x=3\,\text{m}$
- Longer span: $l_y=3.75\,\text{m}$

**Load details**

- Load length in $l_x$ direction: $a_x=0.525\,\text{m}$
- Load length in $l_y$ direction: $a_y=1.05\,\text{m}$
- Individual concentrated load: $F=200\,\text{kN}$

**Continuity conditions**

Two-way slab with all edges continuous.

**Calculation of bending moments**

- Bending moment in $x$-direction: $M_x=F\times LF_{\text{Factor}}\times (a_{lfx}+\nu\times a_{lfy})$
  
  \[=41.094\,\text{kNm/m}\]

- Bending moment in $y$-direction: $M_y=F\times LF_{\text{Factor}}\times (\nu\times a_{lfx}+a_{lfy})$
  
  \[=31.47\,\text{kNm/m}\]

Taking account of suggested allowances for continuity in $x$-direction:

- Bending moment at end support: $M_{x1}=-0.25\times M_x=-10.274\,\text{kNm/m}$
- Maximum moment in end span: $M_{x2}=0.85\times M_x=34.93\,\text{kNm/m}$
- Moment at penultimate support: $M_{x3}=-0.85\times M_x=-34.93\,\text{kNm/m}$
- Maximum moment in interior span: $M_{x4}=0.70\times M_x=28.766\,\text{kNm/m}$
- Moment at interior supports: $M_{x5}=-0.90\times M_x=-36.985\,\text{kNm/m}$

Taking account of suggested allowances for continuity in $y$-direction:

- Bending moment at end support: $M_{y1}=-0.25\times M_y=-7.8675\,\text{kNm/m}$
- Maximum moment in end span: $M_{y2}=0.85\times M_y=26.75\,\text{kNm/m}$
- Moment at penultimate support: $M_{y3}=-0.85\times M_y=-26.75\,\text{kNm/m}$
- Maximum moment in interior span: $M_{y4}=0.70\times M_y=22.029\,\text{kNm/m}$
- Moment at interior supports: $M_{y5}=-0.90\times M_y=-28.323\,\text{kNm/m}$
Effective width in direction of shorter span $l_x$

Effective width of slab $l_{yEff} = a_y + 2l_x^2 = 2.85 \text{ m}$

Effective width in direction of longer span $l_y$

Effective width of slab $l_{xEff} = a_x + 2l_y^2 = 2.775 \text{ m}$

Approximate shearing forces from each load $F$

Shear force at centre of $a_x$ $V_{ax} = F/(3a_y) = 63.492 \text{ kN/m}$

Shear force at centre of $a_y$ $V_{ay} = F/(2a_y + a_x) = 76.19 \text{ kN/m}$
Location: Square fixed-edge slab supporting twin loads

Slab moments due to concentrated loads using Pigeaud’s coefficients

Concrete slab with concentrated loads symmetrical about both axes

Each individual total load = F kN
All dimensions in metres

Poisson's ratio nu=0.2
Shorter span lx=5 m
Longer span ly=5 m

Load details

Load length in lx direction ax=2.5 m
Start of load from nearer support x=0 m
Load length in ly direction ay=1.05 m
Individual concentrated load F=450 kN

Continuity conditions

Two-way slab with all edges continuous.

Calculation of bending moments

Bending moment in x-direction

\[ M_x = F \times L \text{Factor} \times (\alpha_f x + \nu \alpha_y l) \]

\[ = 67.302 \text{ kNm/m} \]

Bending moment in y-direction

\[ M_y = F \times L \text{Factor} \times (\nu \alpha_f y + \alpha_y l) \]

\[ = 86.814 \text{ kNm/m} \]

Taking account of suggested allowances for continuity in x-direction:

Bending moment at end support

\[ M_{x1} = -0.25 \times M_x = -16.826 \text{ kNm/m} \]

Maximum moment in end span

\[ M_{x2} = 0.85 \times M_x = 57.207 \text{ kNm/m} \]

Moment at penultimate support

\[ M_{x3} = -0.85 \times M_x = -57.207 \text{ kNm/m} \]

Maximum moment in interior span

\[ M_{x4} = 0.70 \times M_x = 47.111 \text{ kNm/m} \]

Moment at interior supports

\[ M_{x5} = -0.90 \times M_x = -60.572 \text{ kNm/m} \]

Taking account of suggested allowances for continuity in y-direction:

Bending moment at end support

\[ M_{y1} = -0.25 \times M_y = -21.704 \text{ kNm/m} \]

Maximum moment in end span

\[ M_{y2} = 0.85 \times M_y = 73.792 \text{ kNm/m} \]

Moment at penultimate support

\[ M_{y3} = -0.85 \times M_y = -73.792 \text{ kNm/m} \]

Maximum moment in interior span

\[ M_{y4} = 0.70 \times M_y = 60.77 \text{ kNm/m} \]

Moment at interior supports

\[ M_{y5} = -0.90 \times M_y = -78.133 \text{ kNm/m} \]
Effective width in direction of shorter span $l_x$

Effective width of slab $l_y^{\text{eff}} = a_y + 2l_x^2 = 3.3 \text{ m}$

Effective width in direction of longer span $l_y$

Effective width is equal to total slab width $l_x$.

Effective width of slab $5 \text{ m}$

Approximate shearing forces from each load $F$

Shear force at centre of $a_x$ $V_{ax} = F/(2a_x + a_y) = 74.38 \text{ kN/m}$

Shear force at centre of $a_y$ $V_{ay} = F/(3a_x) = 60 \text{ kN/m}$

Design moments and shears in box culverts

The formulae employed and their basis are as given in Table 186 of the 10th Edition of the Reinforced Concrete Designer’s Handbook.

![Diagram of box culvert]

Bending moment and shearing force diagrams are symmetrical about vertical centre-line of section (i.e., MB = MA, MD = MC, etc.).

Values of moment and shear are given at quarter-points along walls, floor and roof of culvert, as shown. h and l are measured between centres of walls and slabs.

Moments and shear in culvert floor are only approximate.

Overall height of culvert \( h_0 = 2.5 \) m
Overall width of culvert \( l_0 = 3.5 \) m
Floor and roof thickness \( h_s = 500 \) mm
Wall thickness \( h_w = 400 \) mm
Degree of compressibility of soil \( \text{comp} = 0.5 \)

Central concentrated (or line) load on culvert roof

Concentrated load \( F(1) = 500 \) kN/m

With non-compressible soil:
- Moment at corner A \( MA_n = -F(1)(l/4)K_2 = -118.86 \) kNm/m
- Moment at corner C \( MC_n = -MA_n/2 = 59.431 \) kNm/m

With highly-compressible soil:
- Moment at corner A \( MA_c = -F(1)K_4/(24K_1K_3) = -94.179 \) kNm/m
- Moment at corner C \( MC_c = MA_c K_6/K_4 = -48.699 \) kNm/m

For soil condition considered:
- Moment at corner A \( MA = MA_c \text{comp} + MA_n (1-\text{comp}) = -106.52 \) kNm/m
- Moment at corner C \( MC = MC_c \text{comp} + MC_n (1-\text{comp}) = 5.366 \) kNm/m

Bending moments at intermediate points:

In roof:
- at midspan \( Mr_m = F(1)/4 + MA = 280.98 \) kNm/m
- at 1/4-point \( Mr_q = (MA + Mr_m)/2 = 87.229 \) kNm/m

In wall:
- at 0.75h above base \( Mw_u = (3*MA + MC)/4 = -78.549 \) kNm/m
- at 0.50h \( Mw_m = (MA + MC)/2 = -50.577 \) kNm/m
- at 0.25h \( Mw_l = (MA + 3*MC)/4 = -22.606 \) kNm/m

In floor:
- at midspan \( Mf_f = (F(1)/8 + MC_c) \text{comp} = 72.525 \) kNm/m
- at 1/4-point \( Mf_q = (3*F(1)/32 + MC_c) \text{comp} = 48.307 \) kNm/m
### Moments and shears due to action of current load

Moments and shears are symmetrical about vertical centreline through section.

### Uniform load on culvert roof

Uniform load

$q(2)=20 \text{ kN/m}^2$

With non-compressible soil:
- Moment at corner A: $M_{An}=-qL^2/(6K^2)=-9.8259 \text{ kNm/m}$
- Moment at corner C: $M_{Cn}=M_{An}/2=4.913 \text{ kNm/m}$

With highly-compressible soil:
- Moment at corner A: $M_{Ac}=-qL^2/(12K^1)=-7.0868 \text{ kNm/m}$
- Moment at corner C: $M_{Cc}=M_{Ac}=-7.0868 \text{ kNm/m}$

For soil condition considered:
- Moment at corner A: $M_{A}=M_{Ac}\text{comp}+M_{An}(1-\text{comp})=-8.4564 \text{ kNm/m}$
- Moment at corner C: $M_{C}=M_{Cc}\text{comp}+M_{Cn}(1-\text{comp})=-1.0869 \text{ kNm/m}$

Bending moments at intermediate points:

**In roof:** at midspan $M_{rm}=qL^2/8+M_{A}=15.569 \text{ kNm/m}$
- at 1/4-point $M_{rq}=3qL^2/32+M_{A}=9.5624 \text{ kNm/m}$

**In wall:** at 0.75h above base $M_{wu}=(3M_{A}+M_{C})/4=6.614 \text{ kNm/m}$
- at 0.50h $M_{wm}=(M_{A}+M_{C})/2=-4.7716 \text{ kNm/m}$
- at 0.25h $M_{wl}=(M_{A}+3M_{C})/4=-2.9293 \text{ kNm/m}$

**In floor:** at midspan $M_{fm}=(qL^2/8+M_{Cc})\text{comp}=8.4691 \text{ kNm/m}$
- at 1/4-point $M_{fq}=(3qL^2/32+M_{Cc})\text{comp}=5.466 \text{ kNm/m}$

Lateral earth pressure on culvert walls

Earth pressure at bottom of wall \( q_{ep}(4) = 20 \text{ kN/m}^2 \)
Let \( q_{ep} = q_{ep}(cycle) = 20 \)

With non-compressible soil:
- Moment at corner A: \( M_{An} = -q_{ep}h^2k/(30K2) = -1.0307 \text{ kNm/m} \)
- Moment at corner C: \( M_{Cn} = M_{An}K8/(2K) = -4.818 \text{ kNm/m} \)

With highly-compressible soil:
- Moment at corner A: \( M_{Ac} = -q_{ep}h^2kK7/(60K1K3) = -1.6613 \text{ kNm/m} \)
- Moment at corner C: \( M_{Cc} = M_{Ac}K8/K7 = -2.0557 \text{ kNm/m} \)

For soil condition considered:
- Moment at corner A: \( M_{A} = M_{Ac} \text{ comp} + M_{An} \text{ (1-comp)} = -1.346 \text{ kNm/m} \)
Moment at corner C  
\[ MC = MC_c \cdot \text{comp} + MC_n \cdot (1 - \text{comp}) = -3.4368 \text{ kNm/m} \]

Bending moments at intermediate points:

- **In roof:**
  - At midspan: \[ Mr_m = MA = -1.346 \text{ kNm/m} \]
  - At 1/4-point: \[ Mr_q = MA = -1.346 \text{ kNm/m} \]

- **In wall:**
  - At 0.75h above base: \[ M_w = q_e \cdot h^2 \cdot 5/128 + (3 \cdot MA + MC)/4 = 1.2563 \text{ kNm/m} \]
  - At 0.50h: \[ M_w = q_e \cdot h^2 / 16 + (MA + MC)/2 = 2.6086 \text{ kNm/m} \]
  - At 0.25h: \[ M_w = q_e \cdot h^2 \cdot 7/128 + (3 \cdot MA + MC)/4 = 1.4609 \text{ kNm/m} \]

- **In floor:**
  - At midspan: \[ M_f = MC_c \cdot \text{comp} = -1.0278 \text{ kNm/m} \]
  - At 1/4-point: \[ M_f = MC_c \cdot \text{comp} = -1.0278 \text{ kNm/m} \]

BENDING MOMENTS
SHEARING FORCES
(in kNm per metre run) (in kN per metre run)

Moments and shears are symmetrical about vertical centreline through section.
**Location:** Deep narrow culvert with earth pressure on walls

**Design moments and shears in box culverts**

The formulae employed and their basis are as given in Table 186 of the 10th Edition of the Reinforced Concrete Designer's Handbook.

![Diagram](image)

Bending moment and shearing force diagrams are symmetrical about vertical centre-line of section (i.e. MB=MA, MD=MC, etc).

Values of moment and shear are given at quarter-points along walls, floor and roof of culvert, as shown.

h and l are measured between centres of walls and slabs. Moments and shear in culvert floor are only approximate.

Overall height of culvert $h_0=3.25$ m

Overall width of culvert $l_0=2$ m

Floor and roof thickness $h_s=500$ mm

Wall thickness $h_w=825$ mm

Degree of compressibility of soil $comp=0.25$

**Lateral earth pressure on culvert walls**

Earth pressure at bottom of wall $q_{ep(1)}=22$ kN/m²

Let $q_{ep}=q_{ep(cycle)}=22$

With non-compressible soil:

- Moment at corner A $MA_n=-q_{ep}h^2k/(30K2)=-1.1461$ kNm/m
- Moment at corner C $MC_n=MA_nK8/(2k)=-10.519$ kNm/m

With highly-compressible soil:

- Moment at corner A $MA_c=-q_{ep}h^2kK7/(60K1K3)$
  $=-2.1694$ kNm/m
- Moment at corner C $MC_c=MA_cK8/K7=-2.5797$ kNm/m

For soil condition considered:

- Moment at corner A $MA=MA_ccomp+MA_n(1-comp)=-1.402$ kNm/m
- Moment at corner C $MC=MC_ccomp+MC_n(1-comp)=-8.5339$ kNm/m

Bending moments at intermediate points:

In roof: at midspan $Mr_m=MA=-1.402$ kNm/m

- at 1/4-point $Mr_q=MA=-1.402$ kNm/m

In wall: at 0.75h above base $Mw_u=q_{ep}h^2/128+(3*MA+MC)/4$

- at 0.50h $Mw_m=q_{ep}h^2/16+(MA+MC)/2=5.4305$ kNm/m
- at 0.25h $Mw_l=q_{ep}h^2/7/128+(MA+3MC)/4$
  $=2.3477$ kNm/m

In floor: at midspan $Mf_m=MC_ccomp=-0.64494$ kNm/m

- at 1/4-point $Mf_q=MC_ccomp=-0.64494$ kNm/m

**BENDING MOMENTS**

(in kNm per metre run)

**SHEARING FORCES**

(in kN per metre run)

Moments and shears are symmetrical about vertical centreline through section.
Location: Central concentrated load on wide shallow culvert

Design moments and shears in box culverts

The formulae employed and their basis are as given in Table 186 of the 10th Edition of the Reinforced Concrete Designer's Handbook.

Bending moment and shearing force diagrams are symmetrical about vertical centre-line of section (i.e. MB=MA, MD=MC, etc).

Values of moment and shear are given at quarter-points along walls, floor and roof of culvert, as shown.

h and l are measured between centres of walls and slabs. Moments and shear in culvert floor are only approximate.

Overall height of culvert $h_0=1.75$ m
Overall width of culvert $l_0=8$ m
Floor and roof thickness $h_s=750$ mm
Wall thickness $h_w=350$ mm
Degree of compressibility of soil $c_{mp}=0.8$

Central concentrated (or line) load on culvert roof

Concentrated load $F(1)=750$ kN/m

With non-compressible soil:
- Moment at corner A $M_{A_{n}}=-F*l/(4*K^2)=-436.48$ kNm/m
- Moment at corner C $M_{C_{n}}=-M_{A_{n}}/2=218.24$ kNm/m

With highly-compressible soil:
- Moment at corner A $M_{A_{c}}=-F*l*K^4/(24*K_{1}*K_{3})=-345.08$ kNm/m
- Moment at corner C $M_{C_{c}}=M_{A_{c}}*K_{6}/K_{4}=-177.75$ kNm/m

For soil condition considered:
- Moment at corner A $M_{A}=M_{A_{c}}*c_{mp}+M_{A_{n}}*(1-c_{mp})=-363.36$ kNm/m
- Moment at corner C $M_{C}=M_{C_{c}}*c_{mp}+M_{C_{n}}*(1-c_{mp})=-98.555$ kNm/m

Bending moments at intermediate points:

In roof: at midspan $M_{r_{m}}=F*l/4+M_{A}=1071$ kNm/m
- at 1/4-point $M_{r_{q}}=(M_{A}+M_{r_{m}})/2=353.83$ kNm/m

In wall: at 0.75h above base $M_{w_{u}}=(3*MA+MC)/4=-297.16$ kNm/m
- at 0.50h $M_{w_{m}}=(MA+MC)/2=-230.96$ kNm/m
- at 0.25h $M_{w_{l}}=(MA+3*MC)/4=-164.76$ kNm/m

In floor: at midspan $M_{f_{m}}=(F*l/8+MC_{c})*c_{mp}=431.55$ kNm/m
- at 1/4-point $M_{f_{q}}=(3*F*l/32+MC_{c})*c_{mp}=288.11$ kNm/m

BENDING MOMENTS  SHEARING FORCES
(in kNm per metre run)  (in kN per metre run)

Moments and shears are symmetrical about vertical centreline through section.
**Location: Deflection at the centre of a circular plate**

### Circular plate with simple support carrying a UDL

- Radius of circular plate: $a = 1 \text{ m}$
- Thickness of circular plate: $t = 0.01 \text{ m}$
- Distance from centre to point: $r = 0 \text{ m}$
- Uniformly distributed load: $w = 5 \text{ kN/m}$
- Modulus of elasticity: $E = 205 \times 10^6 \text{ kN/m}^2$
- Poisson's ratio: $v = 0.3$
- Reciprocal of Poisson's ratio: $m = 1/v = 3.3333$
- Total load on plate: $W = w \pi a^2 = 15.708 \text{ kN}$
- Maximum moment at centre: $M = (3+v)w a^2/16 = 1.0313 \text{ kNm}$
- Radial stress: $sr = -3W((3m+1)(1-r^2/a^2))/(8\pi mt^2) = -61875 \text{ kN/m}^2$
- Tangential stress: $st = -3W((3m+1)-(m+3)r^2/a^2)/(8\pi mt^2) = -61875 \text{ kN/m}^2$
- Deflection constant: $dc = (5m+1)a^2/(2(m+1))+r^4/2a^2-(3m+1)r^2/(m+1) = 2.0385$
- Deflection: $y = -3W(m^2-1)*dc/(8\pi E m^2 t^3) = -0.016966 \text{ m}$
Location: Rectangular plate with simple supports carrying a UDL

Rectangular plate supporting a UDL - this calculation computes deflections and bending moments for a rectangular plate in accordance with "Theory of Plates & Shells" by Timoshenko & Woinowsky-Krieger.

Width of plate \( a = 1 \text{ m} \)
Length of plate \( b = 1.5 \text{ m} \)
Thickness of plate \( t = 0.01 \text{ m} \)
Uniformly distributed load \( q = 5 \text{ kN/m}^2 \)
Modulus of elasticity \( E = 205E6 \text{ kN/m}^2 \)
Max deflection \( w_{max} = \alpha q a^4/D = 0.0020562 \text{ m} \)
Bending moment/unit length \( M_{max} = \beta q a^2 = 0.406 \text{ kNm/m} \)
Shearing force/unit length \( Q_{max} = \gamma q a = 2.12 \text{ kN/m} \)
Support reaction for edge \( x \) \( V_{xmax} = \delta q a = 2.43 \text{ kN/m} \)
Support reaction for edge \( y \) \( V_{ymax} = \delta q a = 2.4 \text{ kN/m} \)
Corner tiedown reactions \( R = \eta q a^2 = 0.425 \text{ kN} \)

From Timoshenko's table 6, \( M_x \) at position \( y=0 \text{ m i.e along x axis.} \)

**Centre span loaded with factored DL + LL, others with DL only**

- **Factored FEM at end of span 1**  
  \[ M_{fa}' = 1.0 \times d_{le}(1) + 0.0 \times d_{le}(1) = 67.5 \text{ kNm} \]
- **Factored FEM at start of span 2**  
  \[ M_{fa} = 1.4 \times d_{ls}(2) + 1.6 \times d_{ls}(2) = 181.69 \text{ kNm} \]
- **Factored FEM at end of span 2**  
  \[ M_{fb} = 1.4 \times d_{le}(2) + 1.6 \times d_{le}(2) = 250.31 \text{ kNm} \]
- **Factored FEM at start of span 3**  
  \[ M_{fb}' = 1.0 \times d_{ls}(3) + 0.0 \times d_{ls}(3) = 0 \text{ kNm} \]
- **Sum of FEM's at A**  
  \[ \text{sig}_{M_{fa}} = M_{fa}' + M_{fa} = -114.19 \text{ kNm} \]
- **Sum of FEM's at B**  
  \[ \text{sig}_{M_{fb}} = M_{fb} + M_{fb}' = 250.31 \text{ kNm} \]
- **Rotation at A (for unit E)**  
  \[ \theta_{A} = k_{1} \times \text{sig}_{M_{fa}} + k_{2} \times \text{sig}_{M_{fb}} = -113205 \text{ kNm} \]
- **Rotation at B (for unit E)**  
  \[ \theta_{B} = k_{3} \times \text{sig}_{M_{fa}} + k_{4} \times \text{sig}_{M_{fb}} = 261961 \text{ kNm} \]
- **Beam (2) moment at A**  
  \[ M_{a} = M_{fa} - \left( \frac{I_{(2)}}{l_{(2)}} \right) \times \left( \theta_{A} + 0.5 \times \theta_{B} \right) = -197.69 \text{ kNm} \]
- **Beam (2) moment at B**  
  \[ M_{b} = M_{fb} - \left( \frac{I_{(2)}}{l_{(2)}} \right) \times \left( \theta_{B} + 0.5 \times \theta_{A} \right) = 65.49 \text{ kNm} \]

Location: Plane truss analysis for triangulated frameworks

Number of known forces (1-4)  \( nkf = 1 \)
Number of unknown forces (1-2)  \( nuf = 2 \)

First known force  \( f_kf = 40 \text{ kN} \)
Angle of first known force  \( \alpha_{kf} = 270^\circ \)
Angle of first unknown force  \( \alpha_{uf} = 0^\circ \)
Angle of second unknown force  \( \alpha_{sf} = 45^\circ \)
First unknown force  -40 \text{ kN tension}
Second unknown force  56.569 \text{ kN compression}
Location: Example from 'Computer Methods in Solid Mechanics'

Plane truss analysis

Elastic modulus for truss members $E=205\times 10^6$ kN/m²
Number of joints $NJ=4$
Number of members $NM=5$
Joint number 1 must always be a pinned support, the highest joint number (4 for this case) must always be a roller. Joints must be numbered consecutively from 1 such that only two unknown member forces occur at each joint. No more than five members may meet at a joint.

X coordinate for joint 1 $X(1)=0$ m
Y coordinate for joint 1 $Y(1)=0$ m
X coordinate for joint 2 $X(2)=2$ m
Y coordinate for joint 2 $Y(2)=1$ m
X coordinate for joint 3 $X(3)=2$ m
Y coordinate for joint 3 $Y(3)=2$ m
X coordinate for joint 4 $X(4)=3$ m
Y coordinate for joint 4 $Y(4)=1$ m

The order of numbering of members is significant. These are numbered consecutively counterclockwise about each joint starting with joint 1 and working through the joints in order.

Horizontal defln at joint 7 -0.0065301 m
Location: Multi-storey & multi-bay frames by moment distribution

The method used follows that given in 'Computer Methods in Solid Mechanics' by Gennaro. The effects of axial and shear deformations are ignored, as is traditional in moment distribution. Loading data comprises: horizontal loads applied at each floor level, vertical point loads and full or partial UDL's applied to beams.

Levels are numbered from top down to ground floor (from 1 to imax).

Column rows are numbered from left to right (from 1 to jmax).

Column bases may be either fixed (jond=1) or pinned (jond=0).

Number of levels                  imax=4
Number of column rows             jmax=5
Fixity of base                    jond=0

Spans in order, left to right, from 1 to 4 spans.

Sp(1)=18.75 m
Sp(2)=22 m
Sp(3)=24 m
Sp(4)=20.25 m

Storey heights in order, top to bottom, from 1 to 3 storeys.

Ht(1)=15 m
Ht(2)=16 m
Ht(3)=18.75 m
Beam inertias in order, left to right & top to bottom, 1 to 12

\[ \begin{align*}
    b_i(1) &= 100 \text{ cm}^4 \\
    b_i(2) &= 100 \text{ cm}^4 \\
    b_i(3) &= 0 \text{ cm}^4 \\
    b_i(4) &= 0 \text{ cm}^4 \\
    b_i(5) &= 200 \text{ cm}^4 \\
    b_i(6) &= 200 \text{ cm}^4 \\

**Beam moments at 20th points**

The sign convention given above is that generally used in the computer analysis of structures. The traditional convention of sagging positive and hogging negative cannot apply to vertical members. Because the traditional convention is still in general use for the design of beams, it is used in the following tables of beam moments at 20th points.

<table>
<thead>
<tr>
<th>Level 1 span 1 BMs at 20th points (+ve sagging) left to right kNm</th>

D denotes distributed moments - 1st line of each pair is column moment
C denotes carry over moments
F denotes final moments
**Location: Example using notation of Arthur Morley**

- **Weight supported by shear legs**: \( W = 5000 \text{ kN} \)
- **Length of each shear leg**: \( L = 8 \text{ m} \)
- **Distance between leg supports**: \( d_c = 5 \text{ m} \)
- **Horizontal distance between A & E**: \( a_e = 10 \text{ m} \)
- **Horizontal distance between E & F**: \( e_f = 3 \text{ m} \)
- **Distance between B & E**: \( b_e = \sqrt{L^2 - (d_c/2)^2} = 7.5993 \text{ m} \)
- **Vertical distance between B & F**: \( b_f = \sqrt{b_e^2 - e_f^2} = 6.9821 \text{ m} \)
- **Length of guy**: \( a_f = a_e + e_f = 13 \text{ m} \)
- **Angle of guy with ground**: \( \alpha = \text{ATN}(b_f/a_f) = 0.49287 \text{ rad} \) \( \alpha' = \text{DEG}(\alpha) = 28.24^\circ \)
- **Angle of BE with ground**: \( \beta = \text{ATN}(b_f/e_f) = 1.165 \text{ rad} \) \( \beta' = \text{DEG}(\beta) = 66.748^\circ \)
- **Tension in guy AB**: \( T = \frac{W}{\sin(\alpha) - \cos(\alpha) \sin(\beta)/\cos(\beta)} = -3170.2 \text{ kN} \)
- **Compression in shear legs**: \( C = -T \cos(\alpha)/\cos(\beta)/(2 \cdot b_e/L) = 3723.8 \text{ kN} \)
Location: Ex1 - Rectangular pinned base portal – after Kleinlogel

Sign conventions:

The direction of the load is considered to be positive.

The moments causing tension on the inside faces of the frame are considered to be positive.

Upward vertical and inward horizontal reactions are positive.

Height of portal $h=4.88$ m
Length of portal $L=9.75$ m
Inertia of columns $I_1=1$ m$^4$
Inertia of beam $I_2=1$ m$^4$
Uniformly distributed load $w=2.05$ kN/m
Moment at B $M_b=(w\cdot h^2/4)\cdot(-k/(2*N)+1)=11.441$ kNm
Moment at C $M_c=(w\cdot h^2/4)\cdot(-k/(2*N)-1)=-12.968$ kNm
Vertical reaction at A $V_a=-w\cdot h^2/(2*L)=-2.5036$ kN
Vertical reaction at D $V_d=-V_a=2.5036$ kN
Horizontal reaction at D $H_d=-M_c/h=2.6574$ kN
Horizontal reaction at A $H_a=-(w\cdot h-H_d)=-7.3466$ kN
**Location:** Ridged pinned base portal – after Kleinlogel

---

*Sign conventions:*

- The direction of the load is considered to be positive.
- The moments causing tension on the inside faces of the frame are considered to be positive.
- Upward vertical and inward horizontal reactions are positive.

**Dimensions:**

- Height to eaves: \( h = 4.88 \) m
- Height eaves to ridge: \( f = 1.6 \) m
- Span of portal: \( L = 9.75 \) m
- Inertia of columns: \( I_1 = 1 \) m\(^4\)
- Inertia of rafters: \( I_2 = 1 \) m\(^4\)

**Uniformly distributed load:** \( w = 2.05 \) kN/m

**Moments:**

- Moment at D: \( M_D = -w h^2/2 + M_D = -11.33 \) kNm
- Moment at B: \( M_B = w h^2/2 + M_D = 13.08 \) kNm
- Moment at C: \( M_C = w h^2/4 + M_D = -2.8396 \) kNm

**Vertical reactions:**

- Vertical reaction at A: \( V_A = -w h^2/(2 L) = -2.5036 \) kN
- Vertical reaction at E: \( V_E = V_A = 2.5036 \) kN

**Horizontal reactions:**

- Horizontal reaction at E: \( H_E = -M_D/h = 2.3217 \) kN
- Horizontal reaction at A: \( H_A = -(w h - H_E) = -7.6823 \) kN
Location: Two bay ridged pinned base portal

Side uniformly distributed load  \( w = 2.05 \text{ kN/m} \)

Moment at A  
\[
M_a = w h^2 \xi (-n_{11} - n) / 4 + w h^2 (y_{11} + y_{13}) / 2 = 8.739 \text{ kNm}
\]

Moment at A'  
\[
M_a' = w h^2 \xi (-n_{11} + n) / 4 + w h^2 (y_{11} - y_{13}) / 2 = -6.6323 \text{ kNm}
\]

Moment at C in L.H. rafter  
\[
M_{c1} = w h^2 \xi (n_{12} - n) / 4 + w h^2 (y_{12} - y_{14}) / 2 = -2.3038 \text{ kNm}
\]

Moment at C in R.H. rafter  
\[
M_{c2} = w h^2 \xi (n_{12} + n) / 4 + w h^2 (y_{12} + y_{14}) / 2 = 6.7347 \text{ kNm}
\]

Moment at B  
\[
M_b = -w h^2 \phi / 2 + \frac{M_a (1 + 2 \phi) + M_{c1}}{2} = -1.9203 \text{ kNm}
\]

Moment at B'  
\[
M_b' = \frac{M_{c2} + M_a (1 + 2 \phi) + M_{c1}}{2} = -2.1233 \text{ kNm}
\]

Moment at C in centre column  
\[
M_{cii} = M_{c1} - M_{c2} = -9.0385 \text{ kNm}
\]

Vertical reaction at D  
\[
V_d = \frac{-M_a + M_{c1}}{L} = -1.1326 \text{ kN}
\]

Vertical reaction at E  
\[
V_e = \frac{M_{cii}}{h} = -1.8521 \text{ kN}
\]

Shear forces in the rafters (numbered from left to right):  
First rafter  
\[
T_1 = V_1 \cos \theta + (H_d - w h) \sin \theta = -2.0775 \text{ kN}
\]

Second rafter  
\[
T_2 = V_2 \cos \theta + (H_d - w h) \sin \theta = -0.8788 \text{ kN}
\]

Third rafter  
\[
T_3 = V_3 \cos \theta + (H_d - w h) \sin \theta = 3.4043 \text{ kN}
\]

Axial thrusts in the rafters (numbered from left to right):  
First rafter  
\[
N_1 = V_1 \sin \theta - (H_d - w h) \cos \theta = 2.6979 \text{ kN}
\]

Second rafter  
\[
N_2 = V_2 \sin \theta - (H_d - w h) \cos \theta = 0.86378 \text{ kN}
\]
Fourth rafter

\[ N'2 = -V2 \sin \theta - H'd \cos \theta = 1.7188 \text{ kN} \]
Location: Couple roof by Kleinlogel

Sign conventions:

The direction of the load is considered to be positive.

The moments causing tension on the inside faces of the frame are considered to be positive.

Upward vertical and inward horizontal reactions are positive.

Height to ridge \( h = 5.6 \) m
Length of couple roof \( L = 9.75 \) m
Horizontal length A to B \( a = 6.75 \) m
Inertia of left rafter \( I_1 = 0.1E^{-3} \) m\(^4\)
Inertia of right rafter \( I_2 = 0.2E^{-3} \) m\(^4\)

Uniformly distributed load \( w = 4 \) kN/m
Moment at B \( M_B = -w \cdot h^2 \cdot 2 \cdot k / (8 \cdot N) = -4.169 \) kNm
Vertical reaction at A \( V_A = w \cdot h^2 / (2 \cdot L) = 6.4328 \) kN
Vertical reaction at C \( V_C = -V_A = -6.4328 \) kN
Horizontal reaction at A \( H_A = w \cdot h \cdot a / 2 - M_B / h = 8.4983 \) kN
Horizontal reaction at C \( H_C = -(w \cdot h - H_A) = -13.902 \) kN
Location: Circular arch — after Roark (Fourth Edition)

O is centre of circle of radius R, of which arch is a segment

th' is angle (degrees) subtended by half arch segment

R = radius of arch segment
i.e. distance between centre O and support points 1 & 2

Forces are positive when as shown in the diagrams.

Elastic modulus of elasticity $E = 9 \times 10^6 \text{kN/m}^2$
Area of X section of arch $A = 1.44 \text{m}^2$
Moment of inertia of arch X sectn $I = 0.1728 \text{m}^4$
Radius of arch $R = 15 \text{m}$
Angle $\theta' = 40^\circ$
Point load $W = 20 \text{kN}$
Angle $\phi' = 15^\circ$
Horizontal force $H = \frac{\mu u}{d e} = 16.748 \text{kN}$
Vertical reaction $V_1 = 0.5 \times W \times (s+n)/s = 14.027 \text{kN}$
Vertical reaction $V_2 = W - V_1 = 5.9735 \text{kN}$
Location: Example on page 386 of Designer's Handbook

Summary of analysis

Breadth of stair: B=1000 mm
Thickness of stair: H=135 mm
Perm load partial safety factor: gamG=1.35
Variable load safety factor: gamQ=1.5

Thickness of stair 'H' is measured at the waist.
In beams of small span/depth ratio, the shear stresses are likely to be high, and the deflection due to shear must be added to the deflection due to bending. Roark gives expressions for computing the deflection due to shear for common cases of loading.

For extremely short beams (span/depth ratios < 3), the assumption of linear stress distribution on which the simple theory of flexure is based is no longer valid. Actual extreme fibre stresses, and horizontal shear stresses are significantly higher than those computed by the simple theory. Roark gives a table of values by which stresses from the simple theory must be multiplied to obtain values found from strain-gauge measurements and photoelastic studies, and these values are used below.

### Beams of relatively great depth

- Uniform load over entire length $w=200 \text{ kN/m}$
- Span taken as length of beam $l=3 \text{ m}$
- Depth of beam $d=1 \text{ m}$
- Thickness of beam $t=0.4 \text{ m}$
- Span of beam $\text{span}=l\times23/24=2.875 \text{ m}$
- Total load on beam $W=w\times l=600 \text{ kN}$
- End shears $V=W/2=300 \text{ kN}$
- Maximum bending moment $M=W\times \text{span}/8=215.63 \text{ kNm}$
- Total deflection $y=y_b+y_s=0.00199 \text{ m}$

Location: Plastic section properties for I section

Plastic section properties of I Section:

\[ \begin{align*}
\text{First moment of I Section about } zz &= DZ \cdot TY \cdot (DY - TY) + \frac{(DY - 2 \cdot TY)^2 \cdot TZ}{4} \\
\text{First moment of I Section about } yy &= \frac{2 \cdot DZ^2 \cdot TY}{4} + \frac{TZ^2 \cdot (DY - 2 \cdot TY)}{4} \\
\text{Plastic torque constant} &= \frac{DZ \cdot TY^2}{2} + \frac{DY \cdot TZ^2}{4} 
\end{align*} \]

Depth of section: \( DY = 200 \text{ mm} \)
Width of section: \( DZ = 100 \text{ mm} \)
Thickness in y direction: \( TY = 12 \text{ mm} \)
Thickness in z direction: \( TZ = 6 \text{ mm} \)
First moment of area about zz: \( S_{zz} = DZ \cdot TY \cdot (DY - TY) + (DY - 2 \cdot TY)^2 \cdot TZ / 4 = 272064 \text{ mm}^3 \)
First moment of area about yy: \( S_{yy} = DZ^2 \cdot TY / 2 + (DY - 2 \cdot TY) \cdot TZ^2 / 4 = 61584 \text{ mm}^3 \)
Plastic torque constant: \( S_{xx} = DZ \cdot TY^2 + DY \cdot TZ^2 / 2 = 18000 \text{ mm}^3 \)
Location: Reduced plastic moment due to shear & thrust

Effect of simultaneous shear force and axial thrust on $M_p$, see Example 3.4. in "Plastic Design of Low-Rise Frames" by MR Horne & LJ Morris, Constrado Monographs, Published: Collins, London.

- **Depth of section**: $D_Y = 257.2$ mm
- **Width of section**: $D_Z = 101.9$ mm
- **Thickness in y direction**: $T_Y = 8.4$ mm
- **Thickness in z direction**: $T_Z = 6$ mm
- **Axial load**: $f_x = 150$ kN
- **Shear force**: $f_y = 180$ kN
- **Design strength of steel**: $p_v = 240$ N/mm²

Let neutral axis position for combined bending and axial thrust be at a distance 'y' from centroidal axis $z_z$, then:

$$y = \frac{f_x \times 1E3}{(2 \times t' \times p_v)} = 84.608 \text{ mm}$$

Reduction in plastic modulus due to thrust $r_p t = 2 \times y^2 \times t' / 4 = 13220$ mm³

Hence reduced plastic modulus $z_{pr} = z_{pr} - r_p t = 248287$ mm³

Reduced plastic moment $M_{pr} = z_{pr} \times p_v / 1E6 = 59.589$ kNm
Interaction formulae for I section subjected to axial load, twisting moment and bending about the Y & Z axes, ref. Prof. Michael R Horne.

Depth of section \( D_Y = 0.921 \text{ m} \)

Width of section \( D_Z = 0.4205 \text{ m} \)

Flange thickness in y direction \( T_Y = 0.0366 \text{ m} \)

Web thickness in z direction \( T_Z = 0.0214 \text{ m} \)

Axial load \( F_x = 2648 \text{ kN} \)

Ultimate axial load \( F_{xp} = 11497 \text{ kN} \)

Twisting moment \( M_x = 0.274 \text{ kNm} \)

Plastic twisting moment \( M_{xp} = 105.04 \text{ kNm} \)

Bending moment about minor axis \( M_y = 745.37 \text{ kNm} \)

Ultimate BM about minor axis \( M_{yp} = 783.23 \text{ kNm} \)

Bending moment about major axis \( M_z = 223.71 \text{ kNm} \)

Ultimate BM about major axis \( M_{zp} = 4151.3 \text{ kNm} \)

For \( n \leq \alpha \) then major axis \( M_{zp} = t \times M_{zp} \times \left(1 - \frac{n^2}{\alpha \times (2-\alpha)}\right) = 3809 \text{ kNm} \)

For \( n \leq \alpha \) then minor axis \( M_{yp} = t \times M_{yp} = 783.23 \text{ kNm} \)

Then with \( M_{zp} \) and \( M_{yp} \) use \( U_{mrh} = (M_z/M_{zp})^2 + M_y/M_{yp} = 0.95511 \)
Location: Properties of typical channel section

Torsional constant for section    IX=2*ix'+ix''=193700 mm⁴
Location: Properties of typical I-beam

Depth of section \( D = 200 \text{ mm} \)
Width of section \( B = 200 \text{ mm} \)
Thickness in Y-direction \( T = 10 \text{ mm} \)
Thickness in Z-direction \( t = 10 \text{ mm} \)

compute \( D_1 = D - 2T = 180 \text{ mm} \)
compute \( D_2 = B - 2t = 180 \text{ mm} \)
Area of section \( A_X = D B - D_1 D_2 = 7600 \text{ mm}^2 \)
Inertia about YY-axis \( I_Y = \frac{D B^3}{12} - \frac{D_1 D_2^3}{12} = 45.853 \times 10^6 \text{ mm}^4 \)
Inertia about ZZ-axis \( I_Z = \frac{B D^3}{12} - \frac{D_2 D_1^3}{12} = 45.853 \times 10^6 \text{ mm}^4 \)
Torsion constant:
\[
I_X = 2T t (D-T)^2 (B-t)^2 / (D+T+B+t-T^2-t^2) = 68.59 \times 10^6 \text{ mm}^4
\]
compute \( D_2 = D/2 = 100 \text{ mm} \)
compute \( D_1 = D_2 - T = 90 \text{ mm} \)
Shape factor:
\[
F = (1+3(D_2^2-D_1^2) * D_1 / (2*D_2^3)(0.5*B/t-1)) * (4*D_2^2*AX)/(10*I_Z) = 2.1935
\]
Shear area in Y-direction \( A_Y = AX/F = 3464.8 \text{ mm}^2 \)
compute \( D_2 = B/2 = 100 \text{ mm} \)
compute \( D_1 = D_2 - t = 90 \text{ mm} \)
Shape factor:
\[
F = (1+3(D_2^2-D_1^2) * D_1 / (2*D_2^3)(0.5*D/T-1)) * (4*D_2^2*AX)/(10*I_Y) = 2.1935
\]
Shear area in Z-direction \( A_Z = AX/F = 3464.8 \text{ mm}^2 \)
Location: Square solid section analysed using general method

Properties of a solid plane section

The section is defined by coordinates of corner points taken in anti-clockwise order round the section. The cross section is kept to the left of the edge running from a previous point to the next point. The section is closed when the original point is specified again.

Coordinates of points in order:
Point 1 : X-coordinate          x(1)=0 mm
        Y-coordinate          y(1)=0 mm
Point 2 : X-coordinate          x(2)=400 mm
        Y-coordinate          y(2)=0 mm
Point 3 : X-coordinate          x(3)=400 mm
        Y-coordinate          y(3)=400 mm
Point 4 : X-coordinate          x(4)=0 mm
        Y-coordinate          y(4)=400 mm
Point 5 : X-coordinate          x(5)=0 mm
        Y-coordinate          y(5)=0 mm

Cross-sectional area              160000 mm²
Second moments of area (inertias) Ixx=2.1333E9 mm⁴
                                           Iyy=2.1333E9 mm⁴
Product of inertia ³dA.xy         Ixy=-1.9073E-6 mm⁴
Distance of centroid from origin  X=200 mm
                                           Y=200 mm
X and Y are principal axes.

Angle of rotation of section      thetaD=45°

Second moments of area (inertia) about redefined axes:
IX'=(Ixx*(COS(thetaR))^2+Iyy*(SIN(thetaR))^2-Ixy*SIN(2*thetaR))
         =2.1333E9 mm⁴
IY'=(Iyy*(COS(thetaR))^2+Ixx*(SIN(thetaR))^2+Ixy*SIN(2*thetaR))
         =2.1333E9 mm⁴
IXy'=(Ixx-Iyy)/2*SIN(2*thetaR)+Ixy*COS(2*thetaR)=-0.11679E-21 mm⁴
Plot of section
Properties of a hollow plane section

The section is defined by coordinates of corner points taken in anti-clockwise order round the section. The cross section is kept to the left of the edge running from a previous point to the next point. The section is closed when the original point is specified again.

Coordinates of points in order:
Point 1 : X-coordinate          x(1)=0 mm

  y(23)=0 mm  

Cross-sectional area  
  18 mm²  

Second moments of area (inertias)  
  Ixx=40.167 mm⁴  
  Iyy=40.167 mm⁴  

Product of inertia  
  Ixy=0 mm⁴  

Distance of centroid from origin  
  X=2.5 mm  
  Y=2.5 mm  

X and Y are principal axes.  

Angle of rotation of section  
  thetaD=45°  

Second moments of area (inertia) about redefined axes:  
  Ix'=(Ixx*(COS(thetaR))^2)+Iyy*(SIN(thetaR))^2-Ixy*SIN(2*thetaR)  
  =40.167 mm⁴  
  Iy'=(Iyy*(COS(thetaR))^2)+Ixx*(SIN(thetaR))^2+Ixy*SIN(2*thetaR)  
  =40.167 mm⁴  
  Ixy'=(Ixx-Iyy)/2*SIN(2*thetaR)+Ixy*COS(2*thetaR)=7.1054E-15 mm⁴
Plot of section
Location: Properties of typical channel section

**Sectional properties of channel**

Depth of section \( h = 200 \text{ mm} \)
Width of section \( b = 200 \text{ mm} \)
Thickness of flanges \( t_f = 10 \text{ mm} \)
Thickness of web \( t_w = 10 \text{ mm} \)

Part area \( a_z = 2 * b * t_f = 4000 \text{ mm}^2 \)
Part area \( a_z' = (h - 2 * t_f) * t_w = 1800 \text{ mm}^2 \)
Area of section \( A_x = a_z + a_z' = 5800 \text{ mm}^2 \)
Shear area in z-direction \( A_z = h * t_w = 2000 \text{ mm}^2 \)
Shear area in y-direction \( A_y = a_z * 5/6 = 3333.3 \text{ mm}^2 \)
Neutral-axis depth \( n = (a_z * b / 2 + a_z' * t_w / 2) / A_x = 70.517 \text{ mm} \)
Inertia about zz-axis \( I_z = (h * n^3 + 2 * t_f * (b - n) * 3 - (n - t_w) * 3 * (h - 2 * t_f)) / 3 = 24.552E6 \text{ mm}^4 \)
Inertia about yy-axis \( I_y = b * h^3 / 12 - (b - t_w) * (h - 2 * t_f) * 3 / 12 = 40.993E6 \text{ mm}^4 \)
Torsional constant for flange \( I_{t1} = b * t_f^3 / (1/3 - 0.21 * t_f / b) = 64567 \text{ mm}^4 \)
Torsional constant for web \( I_{t2} = h * t_w^3 / (1/3 - 0.21 * t_w / h) = 64567 \text{ mm}^4 \)
Torsional constant for section \( I_t = 2 * I_{t1} + I_{t2} = 193700 \text{ mm}^4 \)
Location: Properties of typical I-beam

Depth of section \( h = 200 \text{ mm} \)
Width of section \( b = 200 \text{ mm} \)
Thickness in z-direction \( t_f = 10 \text{ mm} \)
Thickness in y-direction \( t_w = 10 \text{ mm} \)

```
compute \( D_1 = h - 2 \cdot t_f = 180 \text{ mm} \)
compute \( D_2 = b - 2 \cdot t_w = 180 \text{ mm} \)
Area of section \( A_x = h \cdot b \cdot 3/12 - D_1 \cdot D_2 \cdot 3/12 = 45.853E6 \text{ mm}^4 \)
Inertia about zz-axis \( I_z = h \cdot b \cdot 3/12 - D_1 \cdot D_2 \cdot 3/12 = 45.853E6 \text{ mm}^4 \)
Inertia about yy-axis \( I_y = b \cdot h \cdot 3/12 - D_2 \cdot D_1 \cdot 3/12 = 45.853E6 \text{ mm}^4 \)
Torsion constant:
\[
I_t = 2 \cdot t_f \cdot t_w \cdot (h - t_f)^2 \cdot (b - t_w)^2 / (h \cdot t_f + b \cdot t_w - t_f^2 - t_w^2)
\]
\[
= 68.59E6 \text{ mm}^4
\]
compute \( D_2 = h/2 = 100 \text{ mm} \)
compute \( D_1 = D_2 - t_f = 90 \text{ mm} \)
Shape factor:
\[
F = (1 + 3 \cdot (D_2^2 - D_1^2) \cdot D_1 / (2 \cdot D_2^3) \cdot (0.5 \cdot b / t_w - 1)) \cdot (4 \cdot D_2^2 \cdot A_x) / (10 \cdot I_y) = 2.1935
\]
Shear area in z-direction \( A_z = A_x / F = 3464.8 \text{ mm}^2 \)
compute \( D_2 = h/2 = 100 \text{ mm} \)
compute \( D_1 = D_2 - t_w = 90 \text{ mm} \)
Shape factor:
\[
F = (1 + 3 \cdot (D_2^2 - D_1^2) \cdot D_1 / (2 \cdot D_2^3) \cdot (0.5 \cdot h / t_f - 1)) \cdot (4 \cdot D_2^2 \cdot A_x) / (10 \cdot I_z) = 2.1935
\]
Shear area in y-direction \( A_y = A_x / F = 3464.8 \text{ mm}^2 \)
Properties of any plane section

Number of items in section \( n_{item} = 2 \)

**Item Number 1**

Item is defined by co-ordinates of corner points taken in anti-clockwise order around the item. The item is closed when the co-ordinates of the first point input are re-specified.

Item weighting \( i_{w}(1) = 1 \)

Coordinates of points in order:

\[
\begin{align*}
&x(1) = 500 \\
&y(1) = 1000 \\
&x(2) = 1500 \\
&y(2) = 1000 \\
&x(3) = 1500 \\
&y(3) = 1500 \\
&x(4) = 1750 \\
&y(4) = 1500 \\
&x(5) = 1750 \\
&y(5) = 2000 \\
&x(6) = 500 \\
&y(6) = 2000 \\
&x(7) = 500 \\
&y(7) = 1000
\end{align*}
\]

Location of centroid

\[
\begin{align*}
X_c &= 1069.4 \\
Y_c &= 1527.8
\end{align*}
\]

Properties of item are weighted

Area of item \( A_W = 1.125E6 \)

First moment of area about X axis \( M_X = 1.7188E9 \)

First moment of area about Y axis \( M_Y = 1.2031E9 \)

Second moment of area about X axis:

\( I_{XX} = 2.7188E12 \)

Second moment of area about Y axis:

\( I_{YY} = 1.4141E12 \)

Product second moment of area about XY axes:

\( I_{XY} = 1.8555E12 \)
Plot of Item Number 1
Item Number 2

Circle diameter \( cd(2)=600 \)
Location of centroid \( Xc(2)=1000 \)
\( Yc(2)=1500 \)
Weighting of item \( iw(2)=-1 \)
Second moment of area about X axis:
\[
IXX=(\pi*cd(2)^4/64)*iw(2)+AW *Xc(2)^2=-642.53E9
\]
Second moment of area about Y axis:
\[
IYY=(\pi*cd(2)^4/64)*iw(2)+AW *Yc(2)^2=-289.11E9
\]
Product second moment of area about XY axes
\[
IXY=AW*Xc(2)*Yc(2)=-424.12E9
\]

Weighted sectional properties

x,y - centroidal axes
X,Y - global axes
u,v - principal axes

</tr>
</tbody>
</table>

**Conventions:**

- Positive: a/b
- \( \mu \).m: d/c
- m: Length of slab

Steel in bottom of slab produces positive moment. The side key indicates that the ultimate moment/unit length along a positive yield line in the direction ab is \( m \), and the ultimate moment per unit length along a positive yield-line in the direction bc is \( \mu \).m. This implies that the steel to produce the moment \( m \) is at right angles to this direction, that is in direction bc, while the steel to produce the moment \( \mu \).m is in the direction ab.
Location: Ex 5 from 'The analysis of engineering structures'

Suspension bridge with three-pinned stiffening girder

- Span of suspension bridge: \( L = 106.68 \text{ m} \)
- Dip in cable at centre of bridge: \( d = 10.668 \text{ m} \)
- Total DW of bridge as UDL: \( w_0 = 32.69 \text{ kN/m} \)
- Point load on stiffening girders: \( W = 3487.4 \text{ kN} \)
- Distance of \( W \) from left hand end: \( x_1 = 26.67 \text{ m} \)
- Total sectional area of cables: \( A = 0.076129 \text{ m}^2 \)
- Total number of suspension rods: \( N = 22 \)
- Equivalent UDL due to conc.load: \( w = 4 * W * x_1 / L^2 = 32.69 \text{ kN/m} \)
- Horizontal force at supports: \( H = w * L^2 / (8 * d) = 4359.3 \text{ kN} \)

Moment and shears in girders at 20'th points due to concentrated load

Convention: Sagging moment is positive; hogging moment is negative.

</table>
Combining equivalent UDL due to conc load with UDL from dead weight

Total UDL on cables \( wt = w_0 + w = 65.38 \text{ kN/m} \)
Vertical force at each support \( V = \frac{wt \times L}{2} = 3487.4 \text{ kN} \)
Horizontal force at each support \( H = \frac{wt \times L^2}{8 \times d} = 8718.5 \text{ kN} \)
Total tension in cables at centre \( T = H \times \sqrt{1 + \frac{16 \times d^2}{L^2}} = 9390.1 \text{ kN} \)
Force in each suspension rod \( F_{rod} = \frac{wt \times L}{N} = 317.03 \text{ kN} \)
The method of analysis deals with the two dimensional cable problem in which only horizontal and vertical loads are considered, and these act in the plane of the cable. A Newton iteration procedure is used to satisfy 'equilibrium' and 'compatibility'.

Cable data

Unstretched length of cable    UCL=1100

</table>
Natural frequency of multi-storey frames

For frames in which the mass can be assumed to be lumped at floor levels, and where compression of columns and rotation of column heads may be considered negligible in comparison to sway effects, the period of the fundamental mode is given by:

\[ T = \frac{2\pi \sqrt{\sum m_i \cdot x_i^2}}{\sqrt{\sum g \cdot m_i \cdot x_i}} \]

Raleigh's formula

The method:

a) compute the sum of DL + 20% of imposed load for each floor and roof
b) apply these as a set of horizontal forces to the structure
c) substitute computed deflections and masses in Raleigh's formula to find T.

Number of levels \( n=3 \)

\[
\begin{array}{c}
\text{m3} \\
| \quad x_3 \\
\text{m2} \\
| \quad x_2 \\
\text{m1} \\
| \quad x_1 \\
\end{array}
\]

Ex.: if for a three storey frame, \( x_1 \), \( x_2 \) & \( x_3 \) are the displacements corresponding to the set of masses \( m_1 \), \( m_2 \) & \( m_3 \), then period is given by

\[
T = 2\pi \sqrt{\frac{m_1 \cdot x_1^2 + m_2 \cdot x_2^2 + m_3 \cdot x_3^2}{g(m_1 \cdot x_1 + m_2 \cdot x_2 + m_3 \cdot x_3)}}
\]

where \( g \) is 9.8067 m/s²

Lumped mass at this level \( m(1)=24.91 \text{ kN} \)
Corresponding displacement \( x(1)=0.017502 \text{ m} \)
Lumped mass at this level \( m(2)=23.216 \text{ kN} \)
Corresponding displacement \( x(2)=0.079553 \text{ m} \)
Lumped mass at this level \( m(3)=4.1849 \text{ kN} \)
Corresponding displacement \( x(3)=0.11911 \text{ m} \)
Period \( T=2\pi \sqrt{\frac{\text{sigmx}^2}{g \cdot \text{sigmx}}}) =0.55645 \text{ sec} \)
Natural frequency \( f=\frac{1}{T}=1.7971 \text{ hertz} \)
Location: Elastic critical load of column with end load

Formulas taken from 'Formulas for Stress and Strain' by Roark.
Elastic modulus of bar $E=210\, \text{E6 kN/m}^2$
Moment of inertia of bar $I=0.001 \, \text{m}^4$
Length of bar $L=5 \, \text{m}$

Uniform straight bar under end load, one end free, other end fixed.

$P'=\pi^2 E I / (4 \times L^2) = 20726 \, \text{kN}$

Uniform straight bar under end load, both ends pinned.

$P'=\pi^2 E I / L^2 = 82905 \, \text{kN}$

Uniform straight bar under end load, one end fixed, other end hinged and horizontally constrained over fixed end.

$P'=\pi^2 E I / (0.7 \times L)^2 = 169193 \, \text{kN}$

Uniform straight bar under end load, both ends fixed.

$P'=4 \times \pi^2 E I / L^2 = 331619 \, \text{kN}$
Elastic modulus $E = 0.021328 \, \text{kN/m}^2$

Poisson's ratio $\nu = 0.3$

Plate thickness $t = 8 \, \text{m}$

Plate dimension $a = 0.2 \, \text{m}$

$b = 0.2 \, \text{m}$

$c = 0.25 \, \text{m}$

$d = 0.25 \, \text{m}$

Downward deflection at position 1 $w(1) = 0.62072 \, \text{m}$

Downward deflection at position 2 $w(2) = 0.48404 \, \text{m}$

Elastic-plastic analysis of compression members
ÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄÄ
In rigid-frame (non-triangulated) structures, bending moments arise as
'primary moments', whereas in rigid-jointed triangulated frames, loaded
only at the joints, any bending moments arise only as 'secondary
moments'. Results obtained from 'unit shape factor analysis', in which
plastic deformation is assumed to be confined to discrete plastic
'hinges', have been found, both analytically and experimentally, to be
of fully sufficient accuracy for rigid frames. For triangulated
frames, in which the structural action of the members lies essentially
in their resistance to axial forces, unit shape factor analysis may
give results which are not sufficiently reliable. The reasons are as
follows.
a) The presence of initial imperfections and residual stresses has an
appreciable influence on the carrying capacities of members loaded in
axial compression, whereas for members loaded primarily in bending
(even when some compressive axial loading is also present) their effect
explored analytically is small, and certainly overshadowed by the many
variable effects due to other factors which arise in practice and
experimentally.
b) Compression members may, at their maximum capacity load, have
attained a state of only limited plasticity, without the formation
anywhere of a plastic hinge. This is because partially penetrating
plastic zones have so reduced the stiffness of the members of a frame
that a state of critical buckling has been reached.
The following calculation derives the imperfection e to be applied at
the centre of a member using Professor Horne's theory, and computes the
coordinates at quarter points for a member having the imperfection e.
Coordinates of '3' points on a member having imperfection 'e'

For e positive in local y direction as shown above:

Displaced 1/4 point coordinate
\[ x_q = \frac{(x_1 + x_c)}{2} - 0.75 \times e \times \frac{(y_2 - y_1)}{L} \]
\[ = 744.78 \text{ mm} \]

Displaced 1/4 point coordinate
\[ y_q = \frac{(y_1 + y_c)}{2} + 0.75 \times e \times \frac{(x_2 - x_1)}{L} \]
\[ = 755.22 \text{ mm} \]

Displaced mid-point coordinate
\[ x_m = \frac{(x_2 + x_1)}{2} - e \times \frac{(y_2 - y_1)}{L} = 1493 \text{ mm} \]

Displaced mid-point coordinate
\[ y_m = \frac{(y_2 + y_1)}{2} + e \times \frac{(x_2 - x_1)}{L} = 1507 \text{ mm} \]

Displaced 3/4 point coordinate
\[ x_t = \frac{(x_c + x_2)}{2} - 0.75 \times e \times \frac{(y_2 - y_1)}{L} = 2244.8 \text{ mm} \]

Displaced 3/4 point coordinate
\[ y_t = \frac{(y_c + y_2)}{2} + 0.75 \times e \times \frac{(x_2 - x_1)}{L} = 2255.2 \text{ mm} \]

For e negative in local y direction:

Displaced 1/4 point coordinate
\[ x_q = \frac{(x_1 + x_c)}{2} + 0.75 \times e \times \frac{(y_2 - y_1)}{L} = 755.22 \text{ mm} \]

Displaced 1/4 point coordinate
\[ y_q = \frac{(y_1 + y_c)}{2} - 0.75 \times e \times \frac{(x_2 - x_1)}{L} = 744.78 \text{ mm} \]

Displaced mid-point coordinate
\[ x_m = \frac{(x_2 + x_1)}{2} + e \times \frac{(y_2 - y_1)}{L} = 1507 \text{ mm} \]

Displaced mid-point coordinate
\[ y_m = \frac{(y_2 + y_1)}{2} - e \times \frac{(x_2 - x_1)}{L} = 1493 \text{ mm} \]

Displaced 3/4 point coordinate
\[ x_t = \frac{(x_c + x_2)}{2} + 0.75 \times e \times \frac{(y_2 - y_1)}{L} = 2255.2 \text{ mm} \]

Displaced 3/4 point coordinate
\[ y_t = \frac{(y_c + y_2)}{2} - 0.75 \times e \times \frac{(x_2 - x_1)}{L} = 2244.8 \text{ mm} \]

Deflection in local x
\[ \text{xds}=C_x\times X_{ds}+C_y\times Y_{ds}+C_z\times Z_{ds} = -0.0027939167 \]
\[ xde=C_x\times X_{de}+C_y\times Y_{de}+C_z\times Z_{de} = 0 \]

Deflection in local y
\[ \text{yds}=-C_x\times C_y\times X_{ds}/c+C_y\times Y_{ds}+C_z\times Z_{ds}/c = -0.59012373 \]
\[ yde=-C_x\times C_y\times X_{de}/c+C_y\times Y_{de}+C_z\times Z_{de}/c = 0 \]
\[ zds=-C_x\times X_{ds}/c+C_y\times Y_{ds}+C_z\times Z_{ds}/c = -0.65179504 \]
\[ zde=-C_x\times X_{de}/c+C_y\times Y_{de}+C_z\times Z_{de}/c = 0 \]

Rotation about local x
\[ \text{xrs}=C_x\times X_{rs}+C_y\times Y_{rs}+C_z\times Z_{rs} = -0.0077285358 \]
\[ xre=C_x\times X_{re}+C_y\times Y_{re}+C_z\times Z_{re} = 0 \]

Rotation about local y
\[ \text{yrs}=-C_x\times C_y\times X_{rs}/c+C_y\times Y_{rs}+C_z\times Z_{rs}/c = -0.0042004278 \]
\[ yre=-C_x\times C_y\times X_{re}/c+C_y\times Y_{re}+C_z\times Z_{re}/c = 0 \]

Rotation about local z
\[ \text{zrs}=-C_x\times X_{rs}/c+C_y\times Y_{rs}+C_z\times Z_{rs}/c = 0.0026341153 \]
Net length

Net length should be \( L - PL/AE \)
Thus \( \text{netl}=L-fxs*L/(ax*e)=207.84517 \)
Analysis gives
\[
\text{netl}'=\sqrt{(xce+Xde-xcs-Xds)^2+(yce+Yde-ycs-Yds)^2+(zce+Zde-zcs-Zds)^2} = 207.84703
\]
Percentage error \( p=100*(\text{netl}-\text{netl}')/\text{netl} = -0.89478292E-3 \% \)

Net rotation

Net rotation should be \( \text{netr}=T*L/GIx \), where \( T \) is torque and \( Ix \) is torsion constant, length \( L=\text{netl}'=207.84703 \)
Thus \( \text{netr}=mxs*L/(ix*g)=-0.0077247935 \)
Analysis gives \( \text{netr}'=xrs-xre=-0.0077285358 \)
Percentage error \( p=100*(\text{netr}-\text{netr}')/\text{netr}=-0.048445108 \% \)

Equilibrium

Net moment about y axis \( M=mys+mye=99.7285 \)
Should balance end shear x length \( M'=fze*l=99.725006 \)
Percentage error \( p=100*(M-M')/M=0.0035040092 \% \)
Net moment about z axis \( M=mzs+mze=-148.598 \)
Should balance start shear x len \( M'=fys*l=-148.58984 \)
Percentage error \( p=100*(M-M')/M=0.0054896383 \% \)

Flexure about y axis

From buildup of stiffness matrix in NL-STRESS Reference manual, taking into account shear deformation: \( mys=EI/L + 3EI.S/L \) for unit rotation at the start, and \( mye=-EI/L+3EI.S/L \) for unit rotation at the end, where
\[
1 \quad \text{the shear deformation coefficient, } S = \frac{1 + \frac{12EI}{L^2.G.Az}}{1}
\]
For zero shear area take \( s=1 \)
Percentage error \( p=100*(\theta-\theta')/\theta = 0.65529167 \% \)

Flexure about z axis

From buildup of stiffness matrix in NL-STRESS Reference manual, taking into account shear deformation: \( mzs=EI/L + 3EI.S/L \) for unit rotation at the start, and \( mze=-EI/L+3EI.S/L \) for unit rotation at the end, where
\[
1 \quad \text{the shear deformation coefficient, } S = \frac{1 + \frac{12EI}{L^2.G.Ay}}{1}
\]
For zero shear area take \( s=1 \)
Percentage error \( p=100*(\theta-\theta')/\theta = -1.2907055 \% \)
Location: Support displacements to model for guy pretension

Support displacements to model for guy pretension

Guy joins joints i and j with start of guy at joint i.

Projection of guy onto horizontal $H=6$ m
Projection of guy onto vertical $V=5$ m
Cross sectional area of guy $A=18.4E-6$ m$^2$
Elastic modulus of guy $E=210E6$ kN/m$^2$
Tension applied to end i of guy $T_i=1$ kN
Original length of guy $L_o=L-e=7.8083$ m
Impose horizontal displacement $D_h=(L_o-L)\times H/L=-0.0015309$ m
Impose vertical displacement $D_v=(L_o-L)\times V/L=-0.0012757$ m

Therefore to model for average tension 1.0045 kN and vertical load 0.0018 kN/m run on the guy, apply joint displacements of $-0.0015309$ m in the horizontal direction and $-0.0012757$ m in the vertical direction assuming the guy was initially straight between i and j.
Location: Support displacements to model for guy pretension

Analysis of guyed structures using Non Linear STRESS

The analysis of structures such as guyed offshore platforms presents a special problem of modelling flexible members (guys) so that they may be analysed by the stiffness method.

NL-STRESS permits the effects of finite displacements to be taken into account in the analysis when METHOD SWAY is selected; NL-STRESS can therefore be used to analyse structures with attached guys. The stiff part of the structure is modelled in the normal way, but setting the NUMBER OF INCREMENTS to typically 20 (to apply the load in 20 increments) and the NUMBER OF SEGMENTS to 4 also (to divide each member in the structure — cables included — into 4 segments and thereby cater for 'within-member stability' effects).

Because NL-STRESS uses the stiffness method of analysis, each member must have some stiffness. Guys have small diameter in comparison to their length and stiffness is introduced by a guy diameter modelling (or magnification) factor denoted 's', typically having a value of 40. The elastic modulus for the guy is divided by $s^2$ so that the guy behaves in tension just as it would if unmodified.

It will be apparent that the introduction of stiffness to the guys will affect the tensile forces in them. The effects of bending stiffness are nullified by applying a compensating transverse UDL and balancing end point loads to each guy. A further calculation computes these compensating loads — the method was derived by Michael Horne.

The foot of guys are pretensioned to some value when the guy is subject only to its own self weight. The pretension is best modelled by applying JOINT DISPLACEMENTS at the foot of each guy.

Simple guy theory

If a cable is suspended between two points $i$ and $j$, and subjected to a load transverse to the chord $ij$ and evenly distributed along the cable length $iOj$ then when the curve is flat the loading closely approximates to a U.D.L. and the curve to a parabola.

\[
\text{Assuming a parabolic shape, } y = a \cdot x^2
\]
Limitation on s in terms of tension and guy properties

Projection of guy onto horizontal $H=5 \text{ m}$
Projection of guy onto vertical $V=5 \text{ m}$
Cross sectional area of guy $A=18.4E-6 \text{ m}^2$
Elastic modulus of guy $E=210E6 \text{ kN/m}^2$
Percentage error for 1st analysis $p=5\%$
Lowest expected tension in guy $T_{\text{min}}=1 \text{ kN}$

Support displacements to model for guy pretension

Guy joins joints i and j with start of guy at joint i.

Projection of guy onto horizontal $H=5 \text{ m}$
Projection of guy onto vertical $V=5 \text{ m}$
Cross sectional area of guy $A=18.4E-6 \text{ m}^2$
Elastic modulus of guy $E=210E6 \text{ kN/m}^2$
Tension applied to end i of guy $T_i=1 \text{ kN}$
Original length of guy $L_0=L_e=7.0693 \text{ m}$
Impose horizontal displacement $D_h=(L_0-L)\times H/L=-0.0012831 \text{ m}$
Impose vertical displacement $D_v=(L_0-L)\times V/L=-0.0012831 \text{ m}$

Therefore to model for average tension 1.0045 kN and vertical load 0.0018 kN/m run on the guy, apply joint displacements of -0.0012831 m in the horizontal direction and -0.0012831 m in the vertical direction assuming the guy was initially straight between i and j.

Guy projection on X axis (+ or -) $X=3 \text{ m}$
Guy projection on Z axis (+ or -) $Z=4 \text{ m}$
Impose displacement in X directn $D_x=D_h\times X/P=-0.76986E-3 \text{ m}$
Impose displacement in Z directn $D_y=D_h\times Z/P=-0.0010265 \text{ m}$
Location: Guy mark 1-3-5-7

Guy loading to model for artificial guy stiffness

\[ \Delta d_Y = \frac{d_X}{d_X} \Delta d_Y \]
\[ \Delta d_Z = \frac{d_Y}{d_Y} \Delta d_Z \]

Take bottom of guy as origin of XYZ global axes then:

Initial X coord of top of guy \( X = 0 \text{ m} \)
Initial Y coord of top of guy \( Y = 5 \text{ m} \)
Initial Z coord of top of guy \( Z = 6 \text{ m} \)
Displ in X dirn at bottom of guy \( dX_b = 0 \text{ m} \)
Displ in Y dirn at bottom of guy \( dY_b = -0.0012757 \text{ m} \)
Displ in Z dirn at bottom of guy \( dZ_b = -0.0015309 \text{ m} \)
Defln in X dirn at top of guy \( dX_t = 0.0010757 \text{ m} \)
Defln in Y dirn at top of guy \( dY_t = -0.1014 \times 10^{-3} \text{ m} \)
Defln in Z dirn at top of guy \( dZ_t = 0 \text{ m} \)
Defln in X dirn at middle of guy \( dX_m = 0.068287 \text{ m} \)
Defln in Y dirn at middle of guy \( dY_m = -0.0049307 \text{ m} \)
Defln in Z dirn at middle of guy \( dZ_m = 0.002754 \text{ m} \)

Ignoring displacement component in local X direction as we are only interested in transverse displacements.

Defln of middle of guy in local y 
\[ \text{del} y = -\frac{C_x C_y \text{del} X}{H} + \frac{H \text{del} Y - C_y C_z \text{del} Z}{H} = -0.005512 \text{ m} \]

local z 
\[ \text{del} z = \frac{C_z \text{del} X + C_x \text{del} Z}{H} = -0.067749 \text{ m} \]

Elastic modulus for the guy \( E = 210 \times 10^6 \text{ kN/m}^2 \)
True diameter of the guy \( d = 0.0048402 \text{ m} \)
Guy diameter modelling factor \( s = 20 \)
Corrn transv loading in local Y 
\[ w_{fy} = 3.8 \times 10^6 \times (d/L)^4 s^2 \Delta \text{del} y = -0.25952 \times 10^{-3} \text{ kN/m} \]

Compensating end point loads 
\[ W_{fy} = -w_{fy} L/2 = 0.0010134 \text{ kN} \]
Corrn transv loading in local Z 
\[ w_{fz} = 3.8 \times 10^6 \times (d/L)^4 s^2 \Delta \text{del} z = -0.0031898 \text{ kN/m} \]

Compensating end point loads 
\[ W_{fz} = -w_{fz} L/2 = 0.012456 \text{ kN} \]
Location: Roof and snow loading

Snow loading on roof structures to BS6399-3:1988 (Inc amend't 3)

Basic snow load \( S_b = 0.5 \, \text{kN/m}^2 \)
Site altitude is less than 100 m above mean sea level.
Site snow load \( S_o = S_b = 0.5 \, \text{kN/m}^2 \)

Symmetrical pitched Roof

Symmetrical pitched roof where the angle of pitch is > 15°.

For symmetrical roofs with pitches > 15° two load types are to be considered.

CASE 1: Uniform load over whole roof.

CASE 2: Uniform load over one half of roof only.

The value of the snow load shape coefficient \( u_1 \) is dependent upon the angle of pitch of the roof measured from the horizontal. This coefficient \( u_1 \) is considered to be constant across the whole roof in load case 1 and in load case 2 the coefficient \( u_{1a} \) is considered to act on one half of the roof.

Angle of pitch of the roof \( \alpha \) \( \alpha = 16^\circ \)
Snow loading

Location:

NOTE: For roofs of more than two spans b3 is the largest stretch of roof away from the taller ridge.

Snow drift profile extends as a sloping line between the ridges. Height h is the depth of snow at the valley line.

Frame 1 half span length \( b_1 = 10 \text{ m} \)
Frame 2 half span length \( b_2 = 20 \text{ m} \)
Max ridge to outer eaves length \( b_3 = 50 \text{ m} \)
Frame 1 Valley to ridge height \( h_{o1} = 2.5 \text{ m} \)
Frame 2 Valley to ridge height \( h_{o2} = 3.2 \text{ m} \)
Location: Roof and snow loading

Snow loading on roof structures to BS6399-3:1988 (Inc amend't 3)

Basic snow load \( S_b = 0.8 \) kN/m\(^2\)
Site altitude is less than 100 m above mean sea level.
Site snow load \( S_o = S_b = 0.8 \) kN/m\(^2\)

Symmetrical pitched Roof

Symmetrical pitched roof where the angle of pitch is > 15°.

For symmetrical roofs with pitches > 15° two load types are to be considered.

CASE 1: Uniform load over whole roof.

CASE 2: Uniform load over one half of roof only.

The value of the snow load shape coefficient \( u_l \) is dependent upon the angle of pitch of the roof measured from the horizontal. This coefficient \( u_l \) is considered to be constant across the whole roof in load case 1 and in load case 2 the coefficient \( u_{la} \) is considered to act on one half of the roof.

Angle of pitch of the roof \( \alpha \) \( \alpha = 75^\circ \)
Location: Roof and snow loading

Asymmetrical pitched Roof

The value of the snow load shape coefficient $u_1$ is dependent upon the angle of pitch of the roof measured from the horizontal.

Asymmetrical pitched roof.

Roof section

CASE 1: Uniform load - BS6399-3:1988 Clause 7.2.3.2

Left side of roof:
- Angle of left pitch of roof: $\alpha_L=75^\circ$
- Slope of roof is greater than 60° therefore the shape coefficient is zero and the snow loading is zero on this side of the roof.
- Snow load shape coefficient: $u_{1L}=0$
- Snow load on left side of roof: $S_{d1}=u_{1L}*S_0=0$ kN/m²

Right side of roof:
- Angle of right pitch of roof: $\alpha_R=25^\circ$
- Snow load shape coefficient: $u_{1R}=0.8$
- Snow load on right side of roof: $S_{d2}=u_{1R}*S_0=0.64$ kN/m²
Summary of loading

CASE 1: Uniform load

Symmetrical pitched Roof

Symmetrical pitched roof where the angle of pitch is $> 15^\circ$.

For symmetrical roofs with pitches $> 15^\circ$ two load types are to be considered.

**CASE 1:** Uniform load over whole roof.

**CASE 2:** Uniform load over one half of roof only.

The value of the snow load shape coefficient $u_l$ is dependent upon the angle of pitch of the roof measured from the horizontal. This coefficient $u_l$ is considered to be constant across the whole roof in load case 1 and in load case 2 the coefficient $u_{la}$ is considered to act on one half of the roof.

Angle of pitch of the roof $\alpha^\circ$ alpha=$16^\circ$
Location:

Eaves to ridge height
- $h_{ol} = 2.5$ m
- $b_1 = 20$ m
- $b_2 = 10$ m

Slope of roof to building B
- $\alpha = 16^\circ$
- $h = \tan(\text{RAD}(\alpha)) \times \left( \frac{l_{s2}}{l_{s1_2}} \right) = 1.0753$ m
Location: Roof and snow loading

Displacement heights diagram showing:
- Wind direction
- 6Ho
- 2Ho
- Ho
- 0.8Ho
- He
- Hd
- Hr

Ho = Mean height of other buildings
Xo = Upwind spacing of building

Building reference height
Hr = 13.77 m
Upwind of site
Ho = 6.5 m
Upwind spacing of building
Xo = 20 m
Displacement height
Hd = 3.8 m
Building type factor
Kb = 2
Building height
H = 13.77 m

Standard wind loads

Basic wind speed
Vb = 21 m/s
Site altitude above mean sea level
deltaS = 25 m
Direction factor
Sd = 1

Effective height
He = 9.97 m
Altitude factor
Sa = 1.025
Direction factor
Sd = 1
Seasonal factor
Ss = 1
Probability factor
Sp = 1
Dynamic wind pressure
qs = 0.8461 kN/m²
Net pressure coefficients $C_p$ for free-standing monopitch roofs in accordance with BS6399-2:1997 (June 2002)

Tables 13 and 15 of the code will be utilised which take account of the combined effect of the wind on both upper and lower surfaces of the canopy for all wind directions.

Pitch of roof (0° to 30°)  $\alpha_2=25°$

Net downward roof pressure (i.e. normal to the roof)

Local net pressure for zone A  $C_{locA} = qs \times C_{locAp} = 1.692 \text{ kN/m}^2$
Local net pressure for zone B  $C_{locB} = qs \times C_{locBp} = 2.623 \text{ kN/m}^2$
Local net pressure for zone C  $C_{locC} = qs \times C_{locCp} = 1.946 \text{ kN/m}^2$

Net upwind roof pressure (i.e. normal to the roof)

Local net pressure for zone A  $C_{locA} = qs \times C_{locAn} = -1.782 \text{ kN/m}^2$
Local net pressure for zone B  $C_{locB} = qs \times C_{locBn} = -2.193 \text{ kN/m}^2$
Local net pressure for zone C  $C_{locC} = qs \times C_{locCn} = -2.193 \text{ kN/m}^2$

Net pressure on fascias and gables

In addition to pressure normal to the canopy, there will be horizontal loads on the canopy due to the wind pressure on any fascia at the eaves or any gable ends. The pressure for the windward and leeward faces could be taken as follows:

Net pressure (winward face)  $C_{pwin} = qs \times 1.3 = 1.1 \text{ kN/m}^2$
Net pressure (leeward face)  $C_{plee} = qs \times 0.6 = 0.5077 \text{ kN/m}^2$

Direction factor \( S_d = 1 \)

Seasonal factor \( S_s = 1 \)

Probability factor \( S_p = 1 \)

Dynamic wind pressure \( q_s = 0.8461 \text{ kN/m}^2 \)
Net pressure coefficients \( C_p \) for free-standing monopitch roofs in accordance with BS6399-2:1997 (June 2002)

![Diagram of roof sections A, B, C with W/10 and L/10 labels]

Tables 13 and 15 of the code will be utilised which take account of the combined effect of the wind on both upper and lower surfaces of the canopy for all wind directions.

Pitch of roof (0° to 30°) \( \alpha_2 = 30° \)

**Net downward roof pressure (i.e. normal to the roof)**

- Local net pressure for zone A \( C_{locA} = q_s \times C_{locAp} = 1.861 \text{ kN/m}^2 \)
- Local net pressure for zone B \( C_{locB} = q_s \times C_{locBp} = 2.708 \text{ kN/m}^2 \)
- Local net pressure for zone C \( C_{locC} = q_s \times C_{locCp} = 2.031 \text{ kN/m}^2 \)

**Net upwind roof pressure (i.e. normal to the roof)**

- Local net pressure for zone A \( C_{locA} = q_s \times C_{locAn} = -0.9595 \text{ kN/m}^2 \)
- Local net pressure for zone B \( C_{locB} = q_s \times C_{locBn} = -1.371 \text{ kN/m}^2 \)
- Local net pressure for zone C \( C_{locC} = q_s \times C_{locCn} = -1.576 \text{ kN/m}^2 \)

**Net pressure on fascias and gables**

In addition to pressure normal to the canopy, there will be horizontal loads on the canopy due to the wind pressure on any fascia at the eaves or any gable ends. The pressure for the windward and leeward faces could be taken as follows:

- Net pressure (winward face) \( C_{win} = q_s \times 1.3 = 1.1 \text{ kN/m}^2 \)
- Net pressure (leeward face) \( C_{lee} = q_s \times 0.6 = 0.5077 \text{ kN/m}^2 \)

Net pressure coefficients $C_{p_{net}}$ for free-standing monopitch roofs

in accordance with BS EN 1991-1-4:2005+A1:2010 – Table 7.6

Table 7.6 takes account of the combined wind effect on both upper & lower surfaces of the canopy for all wind directions.

Pitch of roof ($0^\circ$ to $30^\circ$) $\alpha_2=25^\circ$

**Net downward roof pressure (i.e. normal to the roof)**

Local net pressure for zone A $C_{p_{locA}}=q_p*C_{locAp}=1.302$ kN/m$^2$
Local net pressure for zone B $C_{p_{locB}}=q_p*C_{locBp}=2.019$ kN/m$^2$
Local net pressure for zone C $C_{p_{locC}}=q_p*C_{locCp}=1.498$ kN/m$^2$

**Net upward roof pressure (i.e. normal to the roof)**

Local net pressure for zone A $C_{p_{locA}}=q_p*C_{locAn}=-1.354$ kN/m$^2$
Local net pressure for zone B $C_{p_{locB}}=q_p*C_{locBn}=-1.667$ kN/m$^2$
Local net pressure for zone C $C_{p_{locC}}=q_p*C_{locCn}=-1.667$ kN/m$^2$

**Net pressure on fascias and gables**

In addition to pressure normal to the canopy, there will be horizontal loads on the canopy due to the wind pressure on any fascia at the eaves or any gable ends. The pressure for the windward and leeward faces could be taken as follows:

Net pressure (windward face) $C_{p_{win}}=q_p*1.3=0.8466$ kN/m$^2$
Net pressure (leeward face) $C_{plee}=q_p*0.6=0.3907$ kN/m$^2$
Location: Default case 8 (free-standing monopitch roof)

**Direction factor** (long face) $C_{di}(0)=0.85$
**Direction factor** (short face) $C_{di}(90)=0.85$
**Seasonal factor** $C_{season}=0.86$
**Probability factor** $C_p=1$
**Long face peak velocity pressure** $q_{p(0)}=0.7266$ kN/m$^2$
**Short face peak velocity pressure** $q_{p(90)}=0.6672$ kN/m$^2$

**Peak velocity pressure & pressure coefficients**

On walls of rectangular buildings

Height of wall including parapet $H_r'=58$ m
Wind acting on long face of building (wind $\theta=0^\circ$):
Peak velocity pressure based on height above ground 58 m.
Peak velocity pressure @ eaves $q_{pe(0)}=0.7266$ kN/m$^2$
Wind acting on short face of building (wind $\theta=90^\circ$):
Peak velocity pressure based on height above ground 58 m.
Peak velocity pressure @ eaves $q_{pe(90)}=0.6672$ kN/m$^2$

**Case 1: Wind on long face of building (i.e. angle $\theta=0^\circ$)**

---

**PLAN VIEW**

- Inwind depth $d=40.5$ m
- Crosswind width $b=150$ m

---

SCALE 5.48 Office 1007 Proforma 702
Case 2: Wind on short face of building (i.e. angle $\theta=90^\circ$)
External pressure coefficients $C_{pe}$ for flat roofs

**PLAN VIEW**

Wind on long face ($\theta=0^\circ$)

- Inwind depth $d=40.5$ m
- Crosswind width $b=150$ m

**PLAN VIEW**

Wind on short face ($\theta=90^\circ$)

- Inwind depth $d=150$ m
- Crosswind width $b=40.5$ m

Assumes a rigid wall and Poisson's ratio = 0.5

dc = distance to centre of load
hs(n) = depth to subdivision n

Line loading  \( ll = 100 \, \text{kN/m} \)
Distance to centre of load  \( dc = 2 \, \text{m} \)
Height of wall  \( hw = 4 \, \text{m} \)
Number of subdivisions  \( ns = 8 \)
Depth to subdivision 1  \( hs(1) = hw/ns = 0.5 \, \text{m} \)
Depth ratio  \( nr(1) = hs(n)/hw = 0.125 \)
\( ma = mr^2 \times nr(n) = 0.03125 \)
\( mb = (mr^2 + (nr(n))^2)^2 = 0.070557 \)

Pressure at depth 0.5  \( qh(1) = 4/\pi \times ll/\text{hw} \times ma/mb = 14.098 \)
Calculations repeated for each depth.

Pressures relate to surcharge load only.
Location: Pressure from retained cohesionless soil

Depth to point considered: \( h = 5 \text{ m} \)

Pressure acting on vertical surface:

- **Surface of soil**
  - Surface of soil at \( \theta = 0^\circ \)
  - Maximum positive surcharge
  - Level fill
  - Maximum -ve surcharge

With maximum positive surcharge:
- Coefficient: \( k_1 = (\cos(\theta))^2 = 0.75 \)
- Horizontal pressure at depth \( h \): \( q_1 = k_1 \cdot D \cdot h = 60 \text{ kN/m}^2 \)

With level fill:
- Coefficient: \( k_2 = \frac{1 - \sin(\theta)}{1 + \sin(\theta)} = 0.33333 \)
- Horizontal pressure at depth \( h \): \( q_2 = k_2 \cdot D \cdot h = 26.667 \text{ kN/m}^2 \)

With maximum negative surcharge:
- Coefficient: \( k_3 = \frac{\cos(\theta)}{1 + \sin(\theta) \cdot \sqrt{2}} \cdot (\cos(\theta))^2 = 0.25736 \)
- Horizontal pressure at depth \( h \): \( q_3 = k_3 \cdot D \cdot h = 20.589 \text{ kN/m}^2 \)
Location: Pressure from contained granular material

Depth to point considered \( h = 5 \text{ m} \)

Pressure acting on inclined surface:

\[
\begin{align*}
q_v &= \text{vertical pressure} \\
q_n &= \text{pressure normal to surface considered} \\
q_h &= \text{horizontal pressure} \\
g_s &= \text{weight of inclined slab per unit area}
\end{align*}
\]

Angle of inclination of surface \( \theta_1 = 45^\circ \)

Weight of inclined slab (if any) \( g_s = 10 \text{ kN/m}^2 \)

Intensities of pressure:

- Vertical \( q_v = D \times h = 80 \text{ kN/m}^2 \)
- Horizontal \( q_h = k_2 \times D \times h = 26.667 \text{ kN/m}^2 \)
- Normal to inclined surface \( q_n = k_4 \times D \times h + g_s \times \cos(\theta_1) = 60.404 \text{ kN/m}^2 \)
Location: Pressure from retained cohesive soil

Cohesion factor \( C = 20 \text{ kN/m}^2 \)
Depth to point considered \( h = 5 \text{ m} \)

/                                                                 \ 
/                                                                 \ 
/                                                          Level fill
```

With level fill:
Coefficient \( k_2 = \frac{1 - \sin(\theta)}{1 + \sin(\theta)} = 0.3333 \)
Depth of tension crack \( z_0 = \frac{2C}{D\sqrt{k_2}} = 4.3301 \text{ m} \)
Assuming tension crack is dry:
Horizontal pressure at depth \( h \) \( q_2 = k_2Dh - 2C\sqrt{k_2} = 3.5727 \text{ kN/m}^2 \)
Assuming tension crack is filled with water:
Horizontal pressure at depth \( h \) \( q_2 = k_2Dh = 26.667 \text{ kN/m}^2 \)
Note that this is less than the horizontal pressure of 42.464 kN/m\(^2\) acting at the bottom of the tension crack.
Location: Pressure from submerged granular material

- Depth to surface of material: $h_o = 2$ m
- Extra depth to point considered: $h = 5$ m
- Proportion of voids ($\beta$): $\beta = 0.3$
- Density of material: $D_m = D = 16$ kN/m$^3$
- Density of water: $D_l = 9.81$ kN/m$^3$
- Factor: $\alpha = 1 + k^2(D_m/D_l - (1 - \beta)) = 1.3103$
- Horizontal pressure at depth $h$: $q_2 = D_l h_o + D_l \alpha h = 83.892$ kN/m$^2$
Location: Typical hopper

Bending moments and shearing forces in hopper bottoms

See Reinforced Concrete Designer's Handbook, 10th edition. All loads and pressures are unfactored.

\[
\begin{align*}
&h1, h2, h3, h4 \quad \text{(dimensions)} \\
&l1, b1, a1, a2 \quad \text{(dimensions)} \\
&\theta_1, \theta_2 \quad \text{(angles)} \\
&t1, t2 \quad \text{(thicknesses)} \\
&q, qn, qh \quad \text{(loads)}
\end{align*}
\]

where, \(X\) = location of mean span and centre of pressure on inclined slab. Since this differs between end and side slabs, dimensions \(l2, b2, h3\) etc. are suffixed 'e' and 's' as appropriate in the following:

Density of contained material \(D=9 \text{ kN/m}^3\)
Angle of int.friction of material \(\theta=25^\circ\)

Total depth of bunker \(ho=h1+h2=6\) m
External dim. of side slabs \(l1=a1+(l-a1)*h2/(ho-h4)=9.3462\) m
External dim. of end slabs \(b1=a2+(b-a2)*h2/(ho-h4)=5.6538\) m
Moments and forces

In sides:

\[ X_s = \text{position of centroid of pressure on side panel} \]

\[ X_s = \frac{q_s \cdot h_s}{E N D} \]

Pressures:

\[ q_s = D \cdot h_s = 38.25 \text{ kN/m}^2 \]

\[ q_{hs} = D \cdot h_s \cdot \frac{1 - \sin(\theta)}{1 + \sin(\theta)} = 15.524 \text{ kN/m}^2 \]

\[ q_{ns} = q_{hs} \cdot (\sin(\theta))^2 + q_s \cdot (\cos(\theta))^2 + 24t2 \cdot \cos(\theta) = 30.198 \text{ kN/m}^2 \]

Horizontal moments and forces:

Bending moments in hopper bottom (per metre length of inclined slab)

At midspan \[ M_{hsm} = q_{ns} \cdot S_{Side}^2 / 32 = 13.787 \text{ kNm} \]

At support \[ M_{hss} = -M_{hsm} = -13.787 \text{ kNm} \]

Direct tension in hopper bottom (per metre length of inclined slab)

\[ V_{hs} = q_{ns} \cdot l_2s \cdot \sin(\theta) / 2 = 72.018 \text{ kN} \]

Moments and direct forces along slope:

Bending moments in inclined hopper bottom (per metre length)

At mid-height \[ M_{vsm} = q_{ns} \cdot S_{Side}^2 / 32 = 13.787 \text{ kNm} \]

At top \[ M_{vss} = -M_{vsm} = -13.787 \text{ kNm} \]

Tension in direction of slope (per metre width of inclined slab)

At mid-height \[ V_{vsm} = F_{xs} / (2 \cdot \sin(\theta) \cdot (l_2s + b_2s)) = 91.157 \text{ kN} \]

At slope top \[ V_{vss} = F / (2 \cdot (l_1 + b_1)) = 119.5 \text{ kN} \]

Vertical hanging-up force \[ V_s = F / (2 \cdot (l_1 + b_1)) = 93.79 \text{ kN} \]

In ends:

\[ X_e = \text{position of centroid of pressure on end panel} \]

\[ X_e = \frac{q_e \cdot h_e}{E N D} \]

Pressures:

\[ q_e = D \cdot h_e = 34.765 \text{ kN/m}^2 \]

\[ q_{he} = D \cdot h_e \cdot \frac{1 - \sin(\theta)}{1 + \sin(\theta)} = 14.11 \text{ kN/m}^2 \]

\[ q_{ne} = q_{he} \cdot (\sin(\theta))^2 + q_e \cdot (\cos(\theta))^2 + 24t2 \cdot \cos(\theta) = 36.331 \text{ kN/m}^2 \]

Horizontal moments and forces:

Bending moments in hopper bottom (per metre length of inclined slab)

At midspan \[ M_{hem} = q_{ne} \cdot S_{End}^2 / 32 = 18.131 \text{ kNm} \]

At support \[ M_{hes} = -M_{hem} = -18.131 \text{ kNm} \]

Direct tension in hopper bottom (per metre length of inclined slab)

\[ V_{he} = q_{ne} \cdot l_2e \cdot \sin(\theta) / 2 = 71.728 \text{ kN} \]
Moments and direct forces along slope:

Bending moments in inclined hopper bottom (per metre length)

At mid-height \( M_{vem} = q_n e \times S_{End}^2 / 32 = 18.131 \text{ kNm} \)

At top \( M_{ves} = -M_{vem} = -18.131 \text{ kNm} \)

Tension in direction of slope (per metre width of inclined slab)

At mid-height \( V_{vem} = F_{xe} / (2 \times \sin(\theta_1) \times (l_{2e} + b_{2e})) = 142.77 \text{ kN} \)

At slope top \( V_{ves} = F / (2 \times \sin(\theta_1) \times (l_{1} + b_{1})) = 168.4 \text{ kN} \)

Vertical hanging-up force \( V_e = F / (2 \times (l_1 + b_1)) = 93.79 \text{ kN} \)
Location: Extremely large hopper

Bending moments and shearing forces in hopper bottoms

See Reinforced Concrete Designer’s Handbook, 10th edition. All loads and pressures are unfactored.

\[ \begin{align*}
\text{Density of contained material} & \quad D = 20 \text{ kN/m}^3 \\
\text{Angle of int. friction of material} & \quad \Theta = 10^\circ
\end{align*} \]

where, \( X \) = location of mean span and centre of pressure on inclined slab

Since this differs between end and side slabs, dimensions \( l_2, b_2, h_3 \) etc. are suffixed ‘e’ and ‘s’ as appropriate in the following:

Total depth of bunker \( ho = h_1 + h_2 = 20 \text{ m} \)

External dim. of side slabs \( l_1 = a_1 + (l - a_1) \times h_2 / (ho - h_4) = 20 \text{ m} \)

External dim. of end slabs \( b_1 = a_2 + (b - a_2) \times h_2 / (ho - h_4) = 20 \text{ m} \)
Moments and forces

In sides:

\[ X_s = \text{position of centroid of pressure on side panel} \]

\[ \frac{q_s}{q_{ns}} \]

\[ \frac{h_s}{\beta} \]

\[ \frac{\beta}{E N D} \]

Pressures:

\[ q_s = D \times h_s = 300 \text{ kN/m}^2 \]

\[ q_{hs} = D \times h_s \times (1 - \sin(\theta)) / (1 + \sin(\theta)) = 211.23 \text{ kN/m}^2 \]

\[ q_{ns} = q_{hs} \times (\sin(\theta))^2 + q_s \times (\cos(\theta))^2 + 24 \times t^2 \times \cos(\theta) = 243.82 \text{ kN/m}^2 \]

Horizontal moments and forces:

Bending moments in hopper bottom (per metre length of inclined slab)

- At midspan: \( M_{hsm} = q_{ns} \times S\text{Side}^2 / 32 = 997.1 \text{ kNm} \)
- At support: \( M_{hss} = -M_{hsm} = -997.1 \text{ kNm} \)

Direct tension in hopper bottom (per metre length of inclined slab)

\( V_{hs} = q_{ns} \times l_2 \times \sin(\theta) / 2 = 1598.5 \text{ kN} \)

Moments and direct forces along slope:

Bending moments in inclined hopper bottom (per metre length)

- At mid-height: \( M_{vsm} = q_{ns} \times S\text{Side}^2 / 32 = 997.1 \text{ kNm} \)
- At top: \( M_{vss} = -M_{vsm} = -997.1 \text{ kNm} \)

Tension in direction of slope (per metre width of inclined slab)

- At mid-height: \( V_{vsm} = F_{xs} / (2 \times \sin(\theta) \times (l_2 + b_2)) = 1741.3 \text{ kN} \)
- At slope top: \( V_{vss} = F / (2 \times (l_1 + b_1)) = 2079.2 \text{ kN} \)

Vertical hanging-up force

\( V_{s} = F / (2 \times (l_1 + b_1)) = 1817.5 \text{ kN} \)

In ends:

\[ X_e = \text{position of centroid of pressure on end panel} \]

\[ \frac{q_e}{q_{ne}} \]

\[ \frac{h_e}{\beta} \]

\[ \frac{\beta}{SIDE} \]

\[ \frac{\beta}{E L E V A T I O N} \]

Pressures:

\[ q_e = D \times h_e = 300 \text{ kN/m}^2 \]

\[ q_{he} = D \times h_e \times (1 - \sin(\theta)) / (1 + \sin(\theta)) = 211.23 \text{ kN/m}^2 \]

\[ q_{ne} = q_{he} \times (\sin(\theta))^2 + q_e \times (\cos(\theta))^2 + 24 \times t^2 \times \cos(\theta) = 243.82 \text{ kN/m}^2 \]

Horizontal moments and forces:

Bending moments in hopper bottom (per metre length of inclined slab)

- At midspan: \( M_{hem} = q_{ne} \times S\text{End}^2 / 32 = 997.1 \text{ kNm} \)
- At support: \( M_{hes} = -M_{hem} = -997.1 \text{ kNm} \)

Direct tension in hopper bottom (per metre length of inclined slab)

\( V_{he} = q_{ne} \times l_2 \times \sin(\theta) / 2 = 1598.5 \text{ kN} \)
Moments and direct forces along slope:

Bending moments in inclined hopper bottom (per metre length)

At mid-height \( M_{vem} = q_{ne} \times S_{End} \times 2/32 = 997.1 \, \text{kNm} \)
At top \( M_{ves} = -M_{vem} = -997.1 \, \text{kNm} \)

Tension in direction of slope (per metre width of inclined slab)

At mid-height \( V_{vem} = F_{xe} / (2 \times \sin(\theta_1) \times (l_{2e} + b_{2e})) = 1741.3 \, \text{kN} \)
At slope top \( V_{ves} = F / (2 \times \sin(\theta_1) \times (l_{1} + b_{1})) = 2079.2 \, \text{kN} \)

Vertical hanging-up force \( V_{e} = F / (2 \times (l_{1} + b_{1})) = 1817.5 \, \text{kN} \)
Location: Extremely small hopper

Bending moments and shearing forces in hopper bottoms

- At slope top: \( V_{ves} = F / \left( 2 \cdot \sin(\theta_1) \cdot (l_1 + b_1) \right) = 8.8375 \text{ kN} \)
- Vertical hanging-up force: \( V_e = F / \left( 2 \cdot (l_1 + b_1) \right) = 6.2491 \text{ kN} \)
Location: Typical tank

Analysis of cylindrical containers with wall monolithic with base

Analyses based on coefficients by
(a) Dr Reissner published in
'Reinforced Concrete Designer's
Handbook' 10th Edition,
Table 184.
(b) Dr J.E.Gibson in 'Thin Shells
Computing and Theory'.

Elastic modulus of wall material \( E = 25 \times 10^6 \text{ kN/m}^2 \)
Diameter of tank \( d = 6 \text{ m} \)
Depth of tank and liquid \( h = 10 \text{ m} \)
Thickness of tank wall at base \( h_A = 0.25 \text{ m} \)
Density of contained liquid \( D_l = 9.807 \text{ kN/m}^3 \)
Poisson's ratio for concrete \( \nu = 0.2 \)
No. of vert. intervals considered \( n = 10 \)

Analysis using Reissner coefficients

Vert. bending moment at wall base \( M_A = K_1 D_l h^3 \frac{d}{2} = 20.23 \text{ kNm/m of circumference.} \)
Height of maximum circum.tension \( h_{max} = K_2 h = 1.739 \text{ m} \)
Maximum circumferential tension \( N_{max} = K_3 D_l h \frac{d}{2} = 251.57 \text{ kN/m of height.} \)
Analysis using Gibson formulae

Basic coefficient

\[
\beta = \left(\frac{3(1-\nu^2)}{4h^2A^2}\right)^{0.25} = 1.5042
\]

Values of deflection, force and moment are then found by solving the equations below at the required heights \(x\) above the base:

- **Radial deflection**:
  \[
  \text{Radial deflection} = -1000Dl(d/2)^2h*(1-x/h-A-B*(1-1/(\beta *h)))/(E*ha) \text{ mm}
  \]

- **Vertical shear**:
  \[
  \text{Vertical shear} = Dl*h*(-2*A+(A+B)/(\beta *h))/(2*\beta) \text{ kN/m}
  \]

- **Ring tension**:
  \[
  \text{Ring tension} = Dl*d/2*h*(1-x/h-A-B*(1-1/(\beta *h))) \text{ kN/m}
  \]

- **Vertical moment**:
  \[
  \text{Vertical moment} = Dl*h*(A*(1-1/(\beta *h))-B)/(2*\beta^2) \text{ kNm/m}
  \]

- **Horizontal moment**:
  \[
  \text{Horizontal moment} = Mx*nu \text{ kNm/m}
  \]

Location: Tall, small diameter tank containing light liquid

Analysis of cylindrical containers with wall monolithic with base

Analyses based on coefficients by
(a) Dr Reissner published in 'Reinforced Concrete Designer's Handbook' 10th Edition, Table 184.
(b) Dr J.E.Gibson in 'Thin Shells Computing and Theory'.

Elastic modulus of wall material $E=40E6$ kN/m$^2$
Diameter of tank $d=3$ m
Depth of tank and liquid $h=20$ m
Thickness of tank wall at base $h_A=1$ m
Density of contained liquid $D_l=8$ kN/m$^3$
Poisson's ratio for concrete $\nu=0.15$
No.of vert.intervals considered $n=20$

Analysis using Reissner coefficients

Vert.bending moment at wall base $MA=K_1*D_l*h^3$
=66.796 kNm/m of circumference.
Height of maximum circum.tension $h_{max}=K_2*h=2.562$ m
Maximum circumferential tension $N_{max}=K_3*D_l*h*d/2$
=217.72 kN/m of height.
Analysis using Gibson formulae

Basic coefficient

\[
\beta = \frac{3(1-\nu^2)}{(d^2/4hA^2)}^{.25} = 1.0685
\]

Values of deflection, force and moment are then found by solving the equations below at the required heights \( x \) above the base:

Radial deflection
\[
= -1000Dl*(d/2)^2*h*(1-x/h-A-B*(1-1/(\beta*h)))/(E*hA) \text{ mm}
\]

Vertical shear
\[
= Dl*h*(-2*A+(A+B)/(\beta*h))/(2*\beta) \text{ kN/m}
\]

Ring tension
\[
= Dl*d/2*h*(1-x/h-A-B*(1-1/(\beta*h))) \text{ kN/m}
\]

Vertical moment
\[
= Dl*h*(A*(1-1/(\beta*h))-B)/(2*\beta^2) \text{ kNm/m}
\]

Horizontal moment
\[
= Mx*\nu \text{ kNm/m}
\]

Location: Inner leaf lintel above front door

Domestic lintel

Calculations in accordance with BS5977-1:1981.

For selection of lintels using published load-span tables, it may be convenient to convert triangular loads and part span loads to equivalent uniformly distributed loads over the whole span. However this may not give correct shear forces and the calculated BM may occur at a point other than mid-span.

NOTE: Load triangle sides are at 45° to the horizontal and Interaction zone triangle sides are at 60° to the horizontal.

Clear span of lintel \( \text{Lc}=1.8 \text{ m} \)

Unfactored masonry load \( \text{Wm}=2.1 \text{ kN/m}^2 \)

Wind loading

Description of wind load: Windward side of roof
Wind Load                     w(1)=-0.5 kN/m²
Wind load (factored by 0.75)   -0.375 kN/m²

Total factored load (on slope)  1.38 kN/m²
Location: Beam ref B1

Steel beam with welded bottom flange plate

Find centroid of loads taking moments about front edge of flange plate. The eccentricity of total load relative to beam centre line will be calculated.

Width of beam section \( B = 166.8 \text{ mm} \)
Total section width \( X = 290 \text{ mm} \)
Flange load position \( L_p = 41.5 \text{ mm} \)
Beam load position \( L_b = 240 \text{ mm} \)

Loadings - unfactored

On flange plate:  
- Dead load \( W_3 = 8 \text{ kN} \)
- Imposed load \( W_4 = 3 \text{ kN} \)

On beam:  
- Dead load \( W_1 = 14.5 \text{ kN} \)
- Imposed load \( W_2 = 11 \text{ kN} \)

Partial load factors

Dead load factor \( \gamma_d = 1.4 \)
Imposed load factor \( \gamma_i = 1.6 \)

Load case - unfactored

Flange moment \( M_p = (W_3 + W_4) \times L_p / 10^3 = 0.4565 \text{ kNm} \)
Beam moment \( M_b = (W_1 + W_2) \times L_b / 10^3 = 6.12 \text{ kNm} \)
Factored loading \( W_f = \gamma_d \times (W_3 + W_1) + \gamma_i \times (W_4 + W_2) = 53.9 \text{ kN} \)
Total moment \( M = M_p + M_b = 6.5765 \text{ kNm} \)
SUMMARY OF DESIGN PARAMETERS FOR TORSION

Factored loading: 53.9 kN
Load Eccentricity: 26.422 mm
Partial safety factor: 1.4767
Location: Beam ref B1

Steel beam with welded bottom flange plate

Width of beam section \( b = 166.8 \text{ mm} \)
Total section width \( X = 290 \text{ mm} \)
Flange load position \( L_p = 41.5 \text{ mm} \)
Beam load position \( L_b = 240 \text{ mm} \)

Loadings - unfactored

On flange plate:
- Permnt load \( W_3 = 8 \text{ kN} \)
- Imposed load \( W_4 = 3 \text{ kN} \)

On beam:
- Permnt load \( W_1 = 14.5 \text{ kN} \)
- Imposed load \( W_2 = 11 \text{ kN} \)

Partial load factors

- Permanent load factor \( \gamma_G = 1.35 \)
- Imposed load factor \( \gamma_Q = 1.5 \)

Load case - unfactored

- Flange moment \( M_p = (W_3 + W_4) \times L_p / 10^3 = 0.4565 \text{ kNm} \)
- Beam moment \( M_b = (W_1 + W_2) \times L_b / 10^3 = 6.12 \text{ kNm} \)
- Factored loading \( W_f = \gamma_G \times (W_3 + W_1) + \gamma_Q \times (W_4 + W_2) = 51.375 \text{ kN} \)
- Total moment \( M_{Ed} = M_p + M_b = 6.5765 \text{ kNm} \)

**ULS Load Combinations to EC0 Expressions 6.10a & 6.10b**

The frame is assumed to be braced (simple construction) and hence pattern loading need not be considered. Second order effects need not be considered provided the frame is sufficiently stiff (i.e. sway deformation under the design loading is relatively small) - this is deemed to be the case for elastic analysis when \( acr > 10 \). The load combinations below assume the dead load is not substantially greater than the imposed load. For storage areas replace the load factor of 1.05 used below with 1.5 as the load combination factor is \( \psi = 1.0 \) and not \( \psi = 0.7 \).

\[
\begin{array}{c}
Wk + EHF \\
\downarrow \\
Wk + EHF \\
\downarrow \\
Wk + EHF \\
\downarrow \\
Wk + EHF \\
\downarrow \\
\end{array}
\]

**Symbols:**
- \( I_k \) = Imposed floor loading (Load combination factor \( \psi = 0.7 \))
- \( I_{kr} \) = Imposed roof loading (Load combination factor \( \psi = 0.7 \))
- \( S_k \) = Snow load applied to roof (Load combination factor \( \psi = 0.5 \))
- \( W_k \) = Horizontal wind load (Load combination factor \( \psi = 0.5 \))
- \( W_{ku} \) = Wind uplift
- \( EHF \) = Frame imperfections & equivalent horizontal forces (i.e. Notional Horizontal Forces)
### Load Combinations Using Equation 6.10b

**Location: Ex17 - Single span steel portal frame**

**Partial safety factors ULS**

Permanent actions (unfavourable) \( \text{gamG}=1.35 \) (Expr. 6.10a)
Permanent actions (unfavourable) \( \text{gamG}=1.25 \) (Expr. 6.10b, governs)
Permanent actions (favourable) \( \text{gamG}=1.0 \) (for STR)
Permanent actions (favourable) \( \text{gamG}=0.9 \) (for EQU)
Variable actions factor \( \text{gamQ}=1.5 \)

**ULS Load Combinations to EC0 Expression 6.10b**

Portal frame designers will generally choose Equations 6.10a & 6.10b over the more onerous Equation 6.10. Furthermore assuming the ratio of permanent to imposed loading is not high which is particularly unlikely for this form of construction, equation 6.10b combinations are more onerous than 6.10a combinations and will be adopted here.

For the single span steel portal frame below the combined permanent and service loads will be treated as one permanent load.

<tr>
<td>Total weight of steel</td>
<td>68.243 kg</td>
</tr>
<tr>
<td>Approx. self-weight of pile cap</td>
<td>49.896 kN</td>
</tr>
<tr>
<td>Approx. total load on each pile</td>
<td>75 kN</td>
</tr>
</tbody>
</table>
Location: Ex1 - Typical pilecap

Total design load on column $N=1500$ kN
Column dimension $cx=500$ mm
Column dimension $cy=500$ mm
Nominal pile diameter $PileD=450$ mm
Partial safety factor for steel $gams=1.15$
Partial safety factor for conc. $gamc=1.5$
Spacing of pile centres $A=1350$ mm
Overhang: pile face to cap edge $olap=150$ mm
Length of pile cap $lx=2100$ mm
Width of pile cap $ly=750$ mm
Char yield strength of reinft. $fyk=500$ N/mm$^2$
Cover to underside of main bars $Cover=150$ mm
Side and top cover to main bars $SCover=75$ mm
Chosen depth of pilecap $h=1000$ mm

Design of main reinforcement

Main steel diameter $dia=16$ mm
Main steel spacing $Space=90$ mm
Distribution steel diameter $LSize=12$ mm
Spacing of bars $LSpac=75$ mm

Check shear resistance

Shear force due to ultimate load $VEd=N/2=750$ kN
Shear resistance $VRdc=\beta'CRdc*ks*Vdc*bw*d/1000 =830.04$ kN
Modified shear resistance $VRdc=VRdm=848.61$ kN

SHEAR SUMMARY

Shear force $750$ kN
Shear resistance $848.61$ kN

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear at column face

Check punching shear at column face:
Eccentricity factor $\beta$ $=1$
Shear stress at column perimeter $vEd=\beta*VEd*1000/(uo*d)=0.89074$ N/mm$^2$
Maximum punching shear resistance $vRdmax=0.5*v*fcd=4.9728$ N/mm$^2$
Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.
Check strength of struts and nodes - Clauses 6.5.2(2) and 6.5.4(4)

Strength of concrete strut:
- Strut compressive stress: $S_{str} = C_{str} \times 1000 / (c_y \times W_{str}) = 4.928 \text{ N/mm}^2$
- Design strength of conc. strut: $S_{Rdmax} = 0.6 \times (1 - f_{ck} / 250) \times f_{cd} = 8.4538 \text{ N/mm}^2$

The strut compressive stress is ≤ the strut design strength, hence OK.

Strength of upper strut node:
- Stress on horizontal plane: $S_{Ed1} = 0.5 \times N \times 1000 / (c_x / 2 \times c_y) = 6 \text{ N/mm}^2$
- Stress on vertical plane: $S_{Ed2} = C_{str} \times 1000 \times A / (2 \times L_{str} \times \text{comp}) = 3.856 \text{ N/mm}^2$

Strength of compression node: $S_{Rdmax} = (1 - f_{ck} / 250) \times f_{cd} = 14.09 \text{ N/mm}^2$
The stress in horizontal and vertical planes is satisfactory.

Strength of lower strut node:
- Stress in strut: $S_{Ed1} = S_{str} = 4.928 \text{ N/mm}^2$
- Stress in pile: $S_{Ed2} = 0.5 \times N \times 1000 / (P_{ileD}^2 \times \pi / 4) = 4.7157 \text{ N/mm}^2$

Strength of compression node: $S_{Rdmax} = 0.85 \times (1 - f_{ck} / 250) \times f_{cd} = 11.976 \text{ N/mm}^2$
The stress in strut and pile is satisfactory.

### QUANTITIES

- Total concrete volume: 1.575 m³
- Total area of formwork: 5.7 m²
Location: Ex2 - Heavily-loaded column

Total design load on column \( N = 2500 \text{ kN} \)
Column dimension \( cx = 500 \text{ mm} \)
Column dimension \( cy = 500 \text{ mm} \)
Nominal pile diameter \( \text{PileD} = 500 \text{ mm} \)
Partial safety factor for steel \( g_{ams} = 1.15 \)
Partial safety factor for conc. \( g_{amc} = 1.5 \)
Spacing of pile centres \( A = 1500 \text{ mm} \)
Overhang: pile face to cap edge \( o_{lap} = 300 \text{ mm} \)
Length of pile cap \( lx = 2600 \text{ mm} \)
Width of pile cap \( ly = 1100 \text{ mm} \)
Char yield strength of reinft. \( f_{yk} = 500 \text{ N/mm}^2 \)
Cover to underside of main bars \( \text{Cover} = 150 \text{ mm} \)
Side and top cover to main bars \( \text{SCover} = 75 \text{ mm} \)
Chosen depth of pilecap \( h = 1200 \text{ mm} \)

Design of main reinforcement

Main steel diameter \( \text{dia} = 12 \text{ mm} \)
Main steel spacing \( \text{Space} = 50 \text{ mm} \)
Distribution steel diameter \( \text{LSize} = 25 \text{ mm} \)
Spacing of bars \( \text{LSpac} = 270 \text{ mm} \)

Check shear resistance

Shear force due to ultimate load \( V_{Ed} = N/2 = 1250 \text{ kN} \)
Shear resistance \( V_{Rdc} = \beta' \times C_{Rdc} \times k_s \times v_{Rdc} \times b \times d / 1000 \)
\( = 1439.1 \text{ kN} \)
Modified shear resistance \( V_{Rdc} = V_{Rdm} = 1567.8 \text{ kN} \)

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Shear force</th>
<th>1250 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>1567.8 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear at column face:

Check punching shear at column face:
Eccentricity factor \( \beta \) \( = 1 \)
Shear stress at column perimeter \( v_{Ed} = \beta \times V_{Ed} \times 1000 / (u_o \times d) = 1.1973 \text{ N/mm}^2 \)
Maximum punching shear resistance \( v_{Rdmax} = 0.5 \times v \times f_{cd} = 5.5808 \text{ N/mm}^2 \)
Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>124.46 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear at column face:

Check punching shear at column face:
Eccentricity factor \( \beta \) \( \text{beta}=1 \)
Shear stress at column perimeter \( v_{Ed}=\beta'VEd*1000/(uo*d)=0.34722 \text{ N/mm}^2 \)
Maximum punching shear resistance \( V_{Rdmax}=0.5*v*f_{cd}=4.9728 \text{ N/mm}^2 \)
Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.
### MAIN REINFORCEMENT SUMMARY
- **Characteristic strength**: 500 N/mm²
- **Diameter of bars**: 12 mm
- **Number of bars**: 7
- **Spacing**: 225 mm
- **Area required**: 742.5 mm²
- **Area provided**: 791.68 mm²

### DISTRIBUTION REINFORCEMENT SUMMARY
- **Characteristic strength**: 500 N/mm²
- **Diameter of bars**: 12 mm
- **Number of bars**: 12
- **Spacing of bars**: 250 mm
- **Area required**: 450 mm²/m
- **Area provided**: 452.39 mm²/m

### TOP BARS SUMMARY
- **Characteristic strength**: 500 N/mm²
- **Diameter of bars**: 12 mm
- **Number of bars**: 7
- **Spacing of bars**: 250 mm

### SIDE BARS SUMMARY
- **Characteristic strength**: 500 N/mm²
- **Diameter of bars**: 12 mm
- **Number of bars/side**: 1
- **Spacing of bars**: 250 mm

### QUANTITIES
- **Total concrete volume**: 1.485 m³
- **Total area of formwork**: 2.79 m²
Location: Ex4 - Typical pilecap

Pilecap for two piles

Ultimate load and moment values to be used.

Total design load on column $N = 1800$ kN
Column dimension $cx = 500$ mm
Column dimension $cy = 500$ mm
Nominal pile diameter $PileD = 450$ mm
Partial safety factor for steel $gams = 1.15$
Partial safety factor for conc. $gamc = 1.5$
Spacing of pile centres $A = 1350$ mm
Overhang: pile face to cap edge $olap = 150$ mm
Length of pile cap $lx = 2100$ mm
Width of pile cap $ly = 750$ mm
Char yield strength of reinft. $fyk = 500$ N/mm²
Cover to underside of main bars $Cover = 150$ mm
Side and top cover to main bars $SCover = 75$ mm
Chosen depth of pilecap $h = 1000$ mm

Design of main reinforcement

Main steel diameter $dia = 16$ mm
Main steel spacing $Space = 65$ mm
Distribution steel diameter $LSize = 12$ mm
Spacing of bars $LSpac = 75$ mm

Check shear resistance

Shear force due to ultimate load $VEd = N/2 = 900$ kN
Shear resistance $VRdc = \beta' \cdot CRdc \cdot k_s \cdot vRdc \cdot bw \cdot d / 1000$

$$= 943.67 \text{ kN}$$

Shear force $900$ kN
Shear resistance $943.67$ kN

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear at column face

Check punching shear at column face:
Eccentricity factor $\beta$ $\beta = 1$
Shear stress at column perimeter $vEd = \beta \cdot VEd \cdot 1000 / (uo \cdot d) = 1.0689$ N/mm²
Maximum punching shear resistance $vRdmax = 0.5 \cdot v \cdot fcd = 5.5808$ N/mm²
Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

---

*SCALE 5.48  Office 1007  Proforma 734*
Location: Ex1 - Typical pilecap

Bottom layer of main steel is assumed to run in the X-direction.

Pilecap for four piles

Designed by truss-analogy to EC2 Part 1-1.

Pile cap assumed square (i.e. lx=ly) with main reinforcement arranged in bands parallel to the principal axes and symmetrical about pile centres.

Ultimate load & moment values to be used.

Total design load on column N=2800 kN
Column dimension cx cx=500 mm
Column dimension cy cy=500 mm
Nominal pile diameter PileD=450 mm
Spc.of pile ctrs in X-direction AX=1350 mm
Overhang: pile face to cap edge olap=150 mm
Length of pile cap lx=2100 mm
Spc.of pile ctrs in Y-direction AY=1350 mm
Breadth of pile cap ly=2100 mm
Char yield strength of reinft. fyk=500 N/mm²
Cover to underside of main bars Cover=150 mm
Side and top cover to main bars Scvr=75 mm
Chosen depth of pilecap h=1000 mm

Design of main steel in X-direction

Main steel diameter diaX=12 mm
Main steel spacing SpcX=70 mm

Design of main steel in Y-direction

Main steel diameter diaY=12 mm
Main steel spacing SpcY=70 mm

Distribution steel

Distribution steel diameter LSize=12 mm
Spacing of bars LSpac=75 mm

Check shear resistance in X-direction

Shear force due to ultimate load VEd=N/2=1400 kN
Shear resistance:  
\[ VR_{dc} = \beta'*CR_{dc}*ks*v_{Rdc}*bw*d/1000 = 2261.8 \, kN \]

Modified shear resistance:  
\[ VR_{dc} = VR_{dm} = 2544.7 \, kN \]

**SHEAR SUMMARY**  
- **Shear force**: 1400 kN  
- **Shear resistance**: 2544.7 kN

Hence section is satisfactory, no shear reinforcement is required.

Check shear resistance in Y-direction:

Shear force due to ultimate load:  
\[ V_{Ed} = N/2 = 1400 \, kN \]

Shear resistance:  
\[ VR_{dc} = \beta'*CR_{dc}*ks*v_{Rdc}*bw*d/1000 = 2245.6 \, kN \]

Modified shear resistance:  
\[ VR_{dc} = VR_{dm} = 2517.4 \, kN \]

**SHEAR SUMMARY**  
- **Shear force**: 1400 kN  
- **Shear resistance**: 2517.4 kN

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear:

Check punching shear at column face:  
- Eccentricity factor $\beta = 1$  
- Shear stress at column perimeter:  
\[ v_{Ed} = \beta*V_{Ed}*1000/(u_0*d) = 1.6827 \, N/mm^2 \]

Maximum punching shear resistance:  
\[ v_{Rd_{max}} = 0.5*v*f_{cd} = 5.5808 \, N/mm^2 \]

Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

Check strength of struts and nodes - Clauses 6.5.2(2) and 6.5.4(4):

Case 1: X-Direction

Strength of concrete strut:  
- Strut compressive stress:  
\[ S_{str} = C_{str}*1000/(c_y*W_{str}) = 4.5907 \, N/mm^2 \]
- Design strength of conc. strut:  
\[ S_{Rd_{max}} = 0.6*(1-f_{ck}/250)*f_{cd} = 9.4874 \, N/mm^2 \]

The strut compressive stress is $\leq$ the strut design strength, hence OK.

Strength of upper strut node:  
- Stress on horizontal plane:  
\[ S_{Ed1} = 0.25*N*1000/(c_x*2*c_y) = 5.6 \, N/mm^2 \]
- Stress on vertical plane:  
\[ S_{Ed2} = C_{str}*1000*A_{X}/(2*L_{str}*comp) = 3.5819 \, N/mm^2 \]

Strength of compression node:  
\[ S_{Rd_{max}} = (1-f_{ck}/250)*f_{cd} = 15.812 \, N/mm^2 \]

The stress in horizontal and vertical planes is satisfactory.

Strength of lower strut node:  
- Stress in strut:  
\[ S_{Ed1} = S_{str} = 4.5907 \, N/mm^2 \]
- Stress in pile:  
\[ S_{Ed2} = 0.25*N*1000/((PileD)^2*\pi/4) = 4.4013 \, N/mm^2 \]
- Strength of compression node:  
\[ S_{Rd_{max}} = 0.85*(1-f_{ck}/250)*f_{cd} = 13.44 \, N/mm^2 \]

The stress in strut and pile is satisfactory.
### MAIN REINFORCEMENT

**IN X-DIRECTION:**
- **Summary**
  - Characteristic strength: 500 N/mm²
  - Diameter of bars: 12 mm
  - Spacing: 70 mm
  - Total number of bars: 28
  - Total area required: 3150 mm²
  - Total area provided: 3166.7 mm²

**IN Y-DIRECTION:**
- **Summary**
  - Characteristic strength: 500 N/mm²
  - Diameter of bars: 12 mm
  - Spacing: 70 mm
  - Total number of bars: 28
  - Total area required: 3150 mm²
  - Total area provided: 3166.7 mm²

### DISTRIBUTION REINFORCEMENT

**Summary**
- Characteristic strength: 500 N/mm²
- Diameter of bars: 12 mm

**IN X-DIRECTION:**
- **In top:**
  - Number of bars: 26
  - Spacing of bars: 75 mm
  - Area required: 1500 mm²/m
  - Area provided: 1508 mm²/m
- **In bottom:**
  - No distribution bars required

**IN Y-DIRECTION:**
- **In top:**
  - Number of bars: 26
  - Spacing of bars: 75 mm
  - Area required: 1500 mm²/m
  - Area provided: 1508 mm²/m
- **In bottom:**
  - No distribution bars required

### SIDE BARS SUMMARY
- Characteristic strength: 500 N/mm²
- Diameter of bars: 12 mm
- Total number of bars: 8
- Spacing of bars: 250 mm

### QUANTITIES
- Total concrete volume: 4.41 m³
- Total area of formwork: 8.4 m²
Location: Ex2 - Large, heavily-loaded pilecap w. mild steel reinf.

Bottom layer of main steel is assumed to run in the X-direction.

**Pilecap for four piles**

Designed by truss-analogy to EC2 Part 1-1.

Pile cap assumed square (i.e. \( lx=ly \)) with main reinforcement arranged in bands parallel to the principal axes and symmetrical about pile centres.

Ultimate load & moment values to be used.

Total design load on column \( N=9000 \text{ kN} \)
Column dimension \( cx=500 \text{ mm} \)
Column dimension \( cy=500 \text{ mm} \)
Nominal pile diameter \( \text{PileD}=450 \text{ mm} \)
Spc.of pile ctrs in X-direction \( AX=1350 \text{ mm} \)
Overhang: pile face to cap edge \( \text{olap}=725 \text{ mm} \)
Length of pile cap \( 1x=3250 \text{ mm} \)
Spc.of pile ctrs in Y-direction \( AY=1350 \text{ mm} \)
Breadth of pile cap \( 1y=3250 \text{ mm} \)
Char yield strength of reinft. \( f_{yk}=500 \text{ N/mm}^2 \)
Cover to underside of main bars \( \text{Cover}=150 \text{ mm} \)
Side and top cover to main bars \( \text{Scvr}=75 \text{ mm} \)
Chosen depth of pilecap \( h=1460 \text{ mm} \)

**Design of main steel in X-direction**

Main steel diameter \( \text{diaX}=16 \text{ mm} \)
Main steel spacing \( \text{SpcX}=90 \text{ mm} \)

**Design of main steel in Y-direction**

Main steel diameter \( \text{diaY}=16 \text{ mm} \)
Main steel spacing \( \text{SpcY}=90 \text{ mm} \)

**Distribution steel**

Distribution steel diameter \( \text{LSize}=25 \text{ mm} \)
Spacing of bars \( \text{LSpac}=220 \text{ mm} \)

**Check shear resistance in X-direction**

Shear force due to ultimate load \( V_{Ed}=N/2=4500 \text{ kN} \)
Shear resistance \[ VR_{dc} = \beta' \cdot CR_{dc} \cdot k_s \cdot v_{Rdc} \cdot b_w \cdot d/1000 \]

= 4588.9 kN

Modified shear resistance \[ VR_{dc} = VR_{dm} = 4864.3 \text{ kN} \]

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Shear force</th>
<th>4500 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>4864.3 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check shear resistance in Y-direction

Shear force due to ultimate load \[ V_{Ed} = N/2 = 4500 \text{ kN} \]

Shear resistance \[ VR_{dc} = \beta' \cdot CR_{dc} \cdot k_s \cdot v_{Rdc} \cdot b_w \cdot d/1000 \]

= 4559.2 kN

Modified shear resistance \[ VR_{dc} = VR_{dm} = 4817.1 \text{ kN} \]

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Shear force</th>
<th>4500 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>4817.1 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear

Check punching shear at column face:

Eccentricity factor \( \beta \) \( \beta = 1 \)

Shear stress at column perimeter \[ v_{Ed} = \beta \cdot V_{Ed} \cdot 1000/(u_0 \cdot d) = 3.4992 \text{ N/mm}^2 \]

Maximum punching shear resistance \[ v_{Rdmax} = 0.5 \cdot v \cdot f_{cd} = 4.5 \text{ N/mm}^2 \]

Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

Location: Ex2 - Heavily-loaded pilecap reinforced with mild steel

Design to BS8110(1997) with partial safety factor for steel gammaS=1.15
Bottom layer of main steel is assumed to run in X-direction.

Pilecap for five piles

- Designed by Truss Analogy
- Calculations are in accordance with BS8110.
- Pile cap assumed square (i.e. lx=ly) with main reinforcement arranged in bands parallel to principal axes and symmetrical about pile centres (i.e. chain lines in diagram).
- For bond calculations, any high-yield bars are assumed Type 2:deformed.

Total ultimate load on column \( N = 12500 \) kN
Column dimension \( cx = 500 \) mm
Column dimension \( cy = 500 \) mm
Nominal pile diameter \( \text{PileD} = 500 \) mm
Spec.min.spacing of pile centres \( \text{spc} = 1350 \) mm
Spec.of pile ctrs in X-direction \( AX = 1910 \) mm
Overhang: pile face to cap edge \( \text{olap} = 700 \) mm
Length of pile cap \( lx = 3810 \) mm
Spec.of pile ctrs in Y-direction \( AY = 1910 \) mm
Breadth of pile cap \( ly = 3810 \) mm
Concrete grade \( f_{cu} = 25 \) N/mm²
Steel strength \( f_y = 250 \) N/mm²
Cover to underside of main bars \( \text{Cover} = 150 \) mm
Side and top cover to main bars \( \text{Scvr} = 75 \) mm
Chosen depth of pilecap \( h = 1720 \) mm

Design of main steel in X-direction

- Main steel diameter \( \text{diaX} = 16 \) mm
- Main steel spacing \( \text{SpcX} = 40 \) mm

Design of main steel in Y-direction

- Main steel diameter \( \text{diaY} = 16 \) mm
- Main steel spacing \( \text{SpcY} = 40 \) mm

Distribution steel

- Diameter of bar \( \text{LSize} = 40 \) mm
- Spacing of bars \( \text{LSpac} = 300 \) mm
### MAIN REINFORCEMENT

**IN X-DIRECTION:**
- **Characteristic strength:** 250 N/mm$^2$

### QUANTITIES

- Total volume of concrete needed: 1.5717 m³
- Total area of formwork: 4.9896 m²
- Total volume of steel: 19098 cm³
- Total weight of steel: 149.92 kg

- Approx. self-weight of pile cap: 52.81 kN
- Approx. total load on each pile: 1411 kN
Location: Ex1 - Typical pilecap

Bottom layer of main steel is assumed to run in X-direction.

Pilecap for five piles

- Designed by truss-analogy to EC2 Part 1-1.

- Pile cap assumed square (i.e. lx=ly) with main reinforcement arranged in bands parallel to the principal axes and symmetrical about pile centres.

Ultimate load & moment values to be used.

Total design load on column  \( N=7000 \) kN
Column dimension \( cx \)  \( cx=500 \) mm
Column dimension \( cy \)  \( cy=500 \) mm
Nominal pile diameter  \( \text{PileD}=450 \) mm
Min spacing of pile centres  \( \text{spc}=1350 \) mm
Partial safety factor for steel  \( gams=1.15 \)
Partial safety factor for conc.  \( \text{gamc}=1.5 \)
Spc.of pile ctrs in X-direction  \( AX=1910 \) mm
Overhang: pile face to cap edge  \( olap=150 \) mm
Length of pile cap  \( lx=2660 \) mm
Spc.of pile ctrs in Y-direction  \( AY=1910 \) mm
Breadth of pile cap  \( ly=2660 \) mm
Char yield strength of reinft.  \( fyk=500 \) N/mm²
Cover to underside of main bars  \( \text{Cover}=150 \) mm
Side and top cover to main bars  \( \text{Scvr}=75 \) mm
Chosen depth of pilecap  \( h=1600 \) mm

Design of main steel in X-direction

Main steel diameter  \( \text{diaX}=16 \) mm
Main steel spacing  \( \text{SpcX}=75 \) mm

Design of main steel in Y-direction

Main steel diameter  \( \text{diaY}=16 \) mm
Main steel spacing  \( \text{SpcY}=75 \) mm
Distribution steel

- Distribution steel diameter: LSize = 20 mm
- Spacing of bars: LSpac = 130 mm

Check shear resistance in X-direction

- Shear force due to ultimate load: VEd = N/2.5 = 2800 kN
- Shear resistance: VRdc = beta'*CRdc*ks*vRdc*bw*d/1000
  = 3372.9 kN
- Modified shear resistance: VRdc = VRdm = 3606.8 kN

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Shear force</th>
<th>2800 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>3606.8 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check shear resistance in Y-direction

- Shear force due to ultimate load: VEd = N/2.5 = 2800 kN
- Shear resistance: VRdc = beta'*CRdc*ks*vRdc*bw*d/1000
  = 3353 kN
- Modified shear resistance: VRdc = VRdm = 3574.9 kN

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Shear force</th>
<th>2800 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>3574.9 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear

- Check punching shear at column face:
  - Eccentricity factor β: beta = 1
  - Shear stress at column perimeter: vEd = beta*VEd*1000/(uo*d) = 1.9635 N/mm²
  - Maximum punching shear resistance: VRdmax = 0.5*v*fcd = 4.9728 N/mm²
  - Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

- Check punching shear at 2d:
  - Shear stress at control perimeter: vRdc = (0.18/gamc)*k*(100*p1 *fck)^0.333 = 0.27925 N/mm²
  - Enhancement factor to be used: senh = 5.0035
  - Enhanced punching shear resist.: VRdc = senh*VRdc = 1.3973 N/mm²
  - Design punching shear resistance: VRdc = senh*0.035*k^1.5*fck^0.5 = 1.4933 N/mm²

Check strength of struts and nodes - Clauses 6.5.2(2) and 6.5.4(4)

- Case 1: X-Direction
  - Strength of concrete strut:
    - Strut compressive stress: Sstr = Cstr*1000/(cy*Wstr) = 8.0565 N/mm²
    - Design strength of conc. strut: SRdmax = 0.6*(1-fck/250)*fcd = 8.4538 N/mm²
  - The strut compressive stress is ≤ the strut design strength, hence OK.
  - Strength of upper strut node:
Stress on horizontal plane: 
\[
\text{SEd1} = 0.20 \times N \times 1000 / (cx/2 \times cy) = 11.2 \text{ N/mm}^2
\]

Stress on vertical plane: 
\[
\text{SEd2} = C_{\text{str}} \times 1000 \times AX / (2 \times L_{\text{str}} \times \text{comp}) = 4.9124 \text{ N/mm}^2
\]

Strength of compression node: 
\[
\text{SRdmax} = (1 - f_{\text{ck}} / 250) \times f_{\text{cd}} = 14.09 \text{ N/mm}^2
\]

The stress in horizontal and vertical planes is satisfactory.

Strength of lower strut node:
\[
\text{SEd1} = S_{\text{str}} = 8.0565 \text{ N/mm}^2
\]

Stress in pile:
\[
\text{SEd2} = 0.20 \times N \times 1000 / (\text{PileD})^2 \times \pi / 4 = 8.8026 \text{ N/mm}^2
\]

Strength of compression node:
\[
\text{SRdmax} = 0.85 \times (1 - f_{\text{ck}} / 250) \times f_{\text{cd}} = 11.976 \text{ N/mm}^2
\]

The stress in strut and pile is satisfactory.

Char yield strength of reinft. \( f_{yk} = 500 \) N/mm²
Cover to underside of main bars \( \text{Cover} = 150 \) mm
Side and top cover to main bars \( \text{Scvr} = 75 \) mm
Chosen depth of pilecap \( h = 1720 \) mm

Design of main steel in X-direction

Main steel diameter \( \text{diaX} = 25 \) mm
Main steel spacing \( \text{SpcX} = 200 \) mm

Design of main steel in Y-direction

Main steel diameter \( \text{diaY} = 25 \) mm
Main steel spacing \( \text{SpcY} = 200 \) mm
Distribution steel

- Distribution steel diameter: \( \text{LSize}=25\text{ mm} \)
- Spacing of bars: \( \text{LSpac}=190\text{ mm} \)

Check shear resistance in X-direction

- Shear force due to ultimate load: \( \text{VEd}=\frac{N}{2.5}=5000\text{ kN} \)
- Shear resistance: \( \text{VRdc}=\beta'\cdot \text{CRdc} \cdot \text{ks} \cdot vRdc \cdot bw \cdot d / 1000 \)
  \[ = 4916.2\text{ kN} \]
- Modified shear resistance: \( \text{VRdc}=\text{VRdm}=5178\text{ kN} \)

**SHEAR SUMMARY**

- Shear force: 5000 kN
- Shear resistance: 5178 kN

Hence section is satisfactory, no shear reinforcement is required.

Check shear resistance in Y-direction

- Shear force due to ultimate load: \( \text{VEd}=\frac{N}{2.5}=5000\text{ kN} \)
- Shear resistance: \( \text{VRdc}=\beta'\cdot \text{CRdc} \cdot \text{ks} \cdot vRdc \cdot bw \cdot d / 1000 \)
  \[ = 4873.9\text{ kN} \]
- Modified shear resistance: \( \text{VRdc}=\text{VRdm}=5111.3\text{ kN} \)

**SHEAR SUMMARY**

- Shear force: 5000 kN
- Shear resistance: 5111.3 kN

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear

- Check punching shear at column face:
  - Eccentricity factor \( \beta \) = 1
  - Shear stress at column perimeter: \( v_{Ed}=\beta \cdot VE_{d} \cdot 1000/(u_{d} \cdot d) = 3.2626 \text{ N/mm}^2 \)
  - Maximum punching shear resistance: \( v_{Rd_{max}}=0.5 \cdot v \cdot f_{cd} = 4.5 \text{ N/mm}^2 \)
  - Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

- Check punching shear at 2d:
  - Shear stress at control perimeter: \( v_{Rd}=(0.18/\gamma_{cm}) \cdot k \cdot (100 \cdot p_{1} \cdot f_{ck})^{0.333}=0.26418 \text{ N/mm}^2 \)
  - Enhancement factor to be used: \( \gamma_{enh}=5.5225 \)
  - Enhanced punching shear resist.: \( v_{Rdc}=\gamma_{enh} \cdot v_{Rdc}=1.459 \text{ N/mm}^2 \)
  - Design punching shear resistance: \( v_{Rdc}=\gamma_{enh} \cdot 0.035 \cdot k \cdot 1.5 \cdot f_{ck}^{0.5} \cdot 1.5349 \text{ N/mm}^2 \)

| Total concrete volume          | 24.968 m³               |
| Total area of formwork         | 26.213 m²               |
Location: Ex3 - Small pilecap with high-grade concrete

Bottom layer of main steel is assumed to run in X-direction.

![Diagram of pilecap for five piles]

- Designed by truss-analogy to EC2 Part 1-1.

Pile cap assumed square (i.e. lx=ly) with main reinforcement arranged in bands parallel to the principal axes and symmetrical about pile centres.

Ultimate load & moment values to be used.

Total design load on column \( N = 7000 \text{ kN} \)
Column dimension \( cx = 350 \text{ mm} \)
Column dimension \( cy = 350 \text{ mm} \)
Nominal pile diameter \( \text{PileD}=250 \text{ mm} \)
Min spacing of pile centres \( \text{spc}=500 \text{ mm} \)
Partial safety factor for steel \( gams=1.15 \)
Partial safety factor for conc. \( gamc=1.5 \)
Spc.of pile ctrs in X-direction \( AX=710 \text{ mm} \)
Overhang: pile face to cap edge \( olap=150 \text{ mm} \)
Length of pile cap \( lx=1260 \text{ mm} \)
Spc.of pile ctrs in Y-direction \( AY=710 \text{ mm} \)
Breadth of pile cap \( ly=1260 \text{ mm} \)
Char yield strength of reinft. \( fyk=500 \text{ N/mm}^2 \)
Cover to underside of main bars \( \text{Cover}=150 \text{ mm} \)
Side and top cover to main bars \( \text{Scvr}=75 \text{ mm} \)
Chosen depth of pilecap \( h=1600 \text{ mm} \)

Design of main steel in X-direction

- Main steel diameter \( \text{diaX}=25 \text{ mm} \)
- Main steel spacing \( \text{SpcX}=175 \text{ mm} \)

Design of main steel in Y-direction

- Main steel diameter \( \text{diaY}=20 \text{ mm} \)
- Main steel spacing \( \text{SpcY}=105 \text{ mm} \)
Distribution steel

Distribution steel diameter \( \text{LSize}=32 \text{ mm} \)
Spacing of bars \( \text{LSpac}=265 \text{ mm} \)

Check shear resistance in X-direction

Shear force due to ultimate load \( V_{E_d}=N/2.5=2800 \text{ kN} \)
Shear resistance \( V_{R_{dc}}=\beta'*C_{R_{dc}}*k_s*V_{R_{dc}}*b_w*d/1000 \)
\( =2641.9 \text{ kN} \)
Modified shear resistance \( V_{R_{dc}}=V_{R_{dm}}=2884.7 \text{ kN} \)

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Shear force</th>
<th>2800 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>2884.7 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check shear resistance in Y-direction

Shear force due to ultimate load \( V_{E_d}=N/2.5=2800 \text{ kN} \)
Shear resistance \( V_{R_{dc}}=\beta'*C_{R_{dc}}*k_s*V_{R_{dc}}*b_w*d/1000 \)
\( =2584.4 \text{ kN} \)
Modified shear resistance \( V_{R_{dc}}=V_{R_{dm}}=2848.7 \text{ kN} \)

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Shear force</th>
<th>2800 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>2848.7 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear

Check punching shear at column face:
Eccentricity factor \( \beta \)
\( \beta=1 \)
Shear stress at column perimeter \( v_{E_d}=\beta*V_{E_d}*1000/(u_o*d)=2.8269 \text{ N/mm}^2 \)
Maximum punching shear resistance \( v_{R_{dmax}}=0.5*v*f_{cd}=8 \text{ N/mm}^2 \)
Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

**MAIN REINFORCEMENT SUMMARY**
- Characteristic strength: 500 N/mm²
- Diameter of bars: 12 mm
- Number of bars: 6
- Spacing: 275 mm
- Area required: 643.5 mm²
- Area provided: 678.58 mm²
- Volume of steel: 1302.9 cm³
- Weight of steel: 10.228 kg

**DISTRIBUTION REINFORCEMENT SUMMARY**
- Characteristic strength: 500 N/mm²
- Diameter of bars: 12 mm
- Number of bars: 11
- Spacing of bars: 285 mm
- Area required: 390 mm²
- Area provided: 396.83 mm²
- Volume of steel: 4486.1 cm³
- Weight of steel: 35.216 kg
### TOP BARS SUMMARY
- **Characteristic strength**: 500 N/mm²
- **Diameter of bars**: 12 mm
- **Number of bars**: 6
- **Spacing of bars**: 285 mm
- **Volume of steel**: 1934 cm³
- **Weight of steel**: 15.182 kg

### SIDE BARS SUMMARY
- **Characteristic strength**: 500 N/mm²
- **Diameter of bars**: 12 mm
- **Number of bars/side**: 1
- **Spacing of bars**: 250 mm
- **Volume of steel**: 644.65 cm³
- **Weight of steel**: 5.0605 kg

### QUANTITIES
- **Total volume of concrete needed**: 1.485 m³
- **Total area of formwork**: 2.79 m²
- **Total volume of steel**: 8367.6 cm³
- **Total weight of steel**: 65.686 kg
- **Approx. self-weight of pile cap**: 49.896 kN
- **Approx. total load on each pile**: 75 kN
Location: Ex1 - Typical pilecap

Pilecap for two piles

Designed using bending theory to EC2 Part 1-1.

Use ultimate values for load and moment.

Total design load on column \( N = 1500 \text{ kN} \)
Column dimension \( c_x = 500 \text{ mm} \)
Column dimension \( c_y = 500 \text{ mm} \)
Nominal pile diameter \( \text{PileD}=450 \text{ mm} \)
Partial safety factor for steel \( g_{ms}=1.15 \)
Partial safety factor for conc. \( g_{mc}=1.5 \)
Spacing of pile centres \( A=1350 \text{ mm} \)
Overhang: pile face to cap edge \( o_{lap}=150 \text{ mm} \)
Length of pile cap \( l_x=2100 \text{ mm} \)
Width of pile cap \( l_y=750 \text{ mm} \)
Char yield strength of reinft. \( f_{yk}=500 \text{ N/mm}^2 \)
Cover to underside of main bars \( \text{Cover}=150 \text{ mm} \)
Side and top cover to main bars \( \text{SCover}=75 \text{ mm} \)
Chosen depth of pilecap \( h=1000 \text{ mm} \)

Design of main reinforcement

Main steel diameter \( \text{dia}=12 \text{ mm} \)
Main steel spacing \( \text{Space}=60 \text{ mm} \)

Distribution steel

Distribution steel diameter \( \text{LSize}=12 \text{ mm} \)
Spacing of bars \( \text{LSpac}=75 \text{ mm} \)
Area of dist.steel provided \( \text{A}^2=\pi L_{\text{Size}}^2 \times 250/L_{\text{Spac}}=1508 \text{ mm}^2/\text{m} \)

Check shear resistance

Shear force due to ultimate load \( V_{Ed}=N/2+M_{x}^\prime \times 1000/A=750 \text{ kN} \)
Shear resistance \( V_{Rdc}=\beta_{1}^\prime C_{Rdc} \times \text{ks} \times v_{Rdc} \times b \times d/1000 \approx 772.6 \text{ kN} \)
Modified shear resistance \( V_{Rdc}=V_{Rdm}=850.1 \text{ kN} \)

**Shear Summary**

<table>
<thead>
<tr>
<th>Shear force</th>
<th>750 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>850.1 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.
Check punching shear at column face

Check punching shear at column face:
Eccentricity factor \( \beta \) \( \beta = 1 \)
Shear stress at column perimeter \( \nu_{Ed} = \beta \nu_{Ed} * 1000 / (u_0*d) \) = 0.8886 N/mm²
Maximum punching shear resistance \( \nu_{Rdmax} = 0.5 \nu * f_{cd} = 4.973 \) N/mm²
Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

**SHEAR SUMMARY**

- **Shear force**  
  2500 kN

---

**Hence section is satisfactory, no shear reinforcement is required.**
Check punching shear at column face

Check punching shear at column face:
Eccentricity factor $\beta$  $\beta = 1$
Shear stress at column perimeter $\sigma_{Ed} = \beta \cdot V_{Ed} \cdot 1000/(u_0 \cdot d) = 1.225 \text{ N/mm}^2$
Maximum punching shear resistance $V_{Rd,max} = 0.5 \cdot v \cdot f_{cd} = 4.973 \text{ N/mm}^2$
Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

Location: Ex3 - Lightly-loaded column

Pilecap for two piles

- Designed using bending theory to EC2 Part 1-1.
- Use ultimate values for load and moment.

Total design load on column \( N = 100 \text{ kN} \)
Column dimension \( cx = 500 \text{ mm} \)
Column dimension \( cy = 500 \text{ mm} \)
Nominal pile diameter \( \text{PileD} = 450 \text{ mm} \)
Partial safety factor for steel \( \gamma_{ms} = 1.15 \)
Partial safety factor for conc. \( \gamma_{mc} = 1.5 \)
Spacing of pile centres \( A = 1350 \text{ mm} \)
Overhang: pile face to cap edge \( \text{olap} = 600 \text{ mm} \)
Length of pile cap \( lx = 3000 \text{ mm} \)
Width of pile cap \( ly = 1650 \text{ mm} \)
Char yield strength of reinft. \( f_{yk} = 500 \text{ N/mm}^2 \)
Cover to underside of main bars \( \text{Cover} = 150 \text{ mm} \)
Side and top cover to main bars \( \text{SCover} = 75 \text{ mm} \)
Chosen depth of pilecap \( h = 300 \text{ mm} \)

Design of main reinforcement

- Main steel diameter \( \text{dia} = 12 \text{ mm} \)
- Main steel spacing \( \text{Space} = 225 \text{ mm} \)

Distribution steel

- Distribution steel diameter \( \text{LSize} = 12 \text{ mm} \)
- Spacing of bars \( \text{LSpac} = 250 \text{ mm} \)
- Area of dist.steel provided \( A2 = \pi \text{LSize}^2 \cdot 250 \cdot \text{LSpac} = 452.4 \text{ mm}^2/m \)

Check shear resistance

- Shear force due to ultimate load \( V_{Ed} = \frac{N}{2} + Mx' \cdot 1000/A = 50 \text{ kN} \)
- Shear resistance \( V_{Rdc} = \beta \cdot C_{Rdc} \cdot k_s \cdot v_{Rdc} \cdot b_w \cdot d/1000 = 120 \text{ kN} \)
- Modified shear resistance \( V_{Rdc} = V_{Rdm} = 124.5 \text{ kN} \)

<table>

Location: Pilecap at G2

Pilecap for 3 piles

Design to EC2 Part 1-1.

Pilecap shaped as shown with main reinforcement parallel to principal axes.

Use ultimate values for load and moment.

Applied moment in the Y-direction only.

Total design load on column \( N = 3000 \text{ kN} \)
Column dimension \( cx = 500 \text{ mm} \)
Column dimension \( cy = 500 \text{ mm} \)
Design BM at bottom of column \( My' = 0 \text{ kNm} \)
Partial safety factor for steel \( gams = 1.15 \)
Partial safety factor for conc. \( gamc = 1.5 \)
Nominal pile diameter \( \text{PileD} = 450 \text{ mm} \)
Spacing of pile ctrs in X-dir. \( AX = 1350 \text{ mm} \)
Dist. from pile face to cap edge \( olap = 150 \text{ mm} \)
Spacing of pile ctrs in Y-dir. \( AY = 1169 \text{ mm} \)
Distance \( AY' \) to centre of column \( AY' = 779 \text{ mm} \)
Max cap length in X-direction \( lx = 2100 \text{ mm} \)
Min cap dimension in X-direction \( BX = 750 \text{ mm} \)
Max cap breadth in Y-direction \( ly = 1919 \text{ mm} \)
Min cap dimension in Y-direction \( BY = 700 \text{ mm} \)
Char yield strength of reinft. \( fyk = 500 \text{ N/mm}^2 \)
Cover to underside of main bars \( Cover = 150 \text{ mm} \)
Side and top cover to main bars \( Scvr = 75 \text{ mm} \)
Chosen depth of pilecap \( h = 1020 \text{ mm} \)

Design of main steel in X-direction

Main steel diameter \( \text{diaX} = 12 \text{ mm} \)
Main steel spacing \( \text{SpcX} = 70 \text{ mm} \)

Design of main steel in Y-direction

Main steel diameter \( \text{diaY} = 16 \text{ mm} \)
Main steel spacing \( \text{SpcY} = 125 \text{ mm} \)
Distribution steel

Distribution steel diameter

Distribution steel diameter (LS): 20 mm
Spacing of bars (LSp): 205 mm
Area of dist steel provided

A2=PI*LS^2*2*250/LSp=1532 mm²/m

Check shear resistance in X-direction

Shear force due to ultimate load

VEd=N2=1000 kN
Shear resistance

VRdc=beta'*CRdc*ks*vRdc*bw*d/1000 =1797 kN
Modified shear resistance

VRdc=VRdm=1870 kN

SHEAR SUMMARY

Shear force 1000 kN
Shear resistance 1870 kN

Hence section is satisfactory, no shear reinforcement is required.

Check shear resistance in Y-direction

Case 1: Check plane passing through single pile on X-X axis
Shear force due to ultimate load

VEd=N1+My'*1000/Ay=1000 kN
Shear resistance

VRdc=beta'*CRdc*ks*vRdc*bw*d/1000 =1597 kN

SHEAR SUMMARY

Shear force 1000 kN
Shear resistance 1597 kN

Hence section is satisfactory, no shear reinforcement is required.

Case 2: Check plane passing through twin-piles
Shear force due to ultimate load

VEd=2*N2+My'*1000/Ay=2000 kN
Shear resistance

VRdc=beta'*CRdc*ks*vRdc*bw*d/1000 =2182 kN
Modified shear resistance

VRdc=VRdm=2393 kN

SHEAR SUMMARY

Shear force 2000 kN
Shear resistance 2393 kN

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear

Check punching shear at column face:
Eccentricity factor β

beta=1
Shear stress at column perimeter

vEd=beta*VEd*1000/(uo*d)=1.765 N/mm²
Maximum punching shear resistance

vRdmax=0.5*v*fcd=4.973 N/mm²
Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

Max cap breadth in Y-direction $ly=2400$ mm
Min cap dimension in Y-direction $BY=1050$ mm
Char yield strength of reinft. $f_{yk}=500$ N/mm$^2$
Cover to underside of main bars $Cover=150$ mm
Side and top cover to main bars $Scvr=75$ mm
Chosen depth of pilecap $h=1080$ mm

Design of main steel in X-direction

Main steel diameter $diaX=25$ mm
Main steel spacing $SpcX=300$ mm

Design of main steel in Y-direction

Main steel diameter $diaY=12$ mm
Main steel spacing $SpcY=65$ mm
Distribution steel

- Distribution steel diameter: LSize=25 mm
- Spacing of bars: LSpac=300 mm
- Area of dist steel provided: A2=PI*LSize^2*250/LSpac=1636 mm²/m

Check shear resistance in X-direction

Shear force due to ultimate load: VEd=N2=1333 kN
Shear resistance: VRdc=beta'*CRdc*ks*vRdc*bw*d/1000 =2701 kN
Modified shear resistance: VRdc=VRdm=2982 kN

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Shear force</th>
<th>1333 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>2982 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check shear resistance in Y-direction

Case 1: Check plane passing through single pile on X-X axis
Shear force due to ultimate load: VEd=N1+My'*1000/AY=1333 kN
Shear resistance: VRdc=beta'*CRdc*ks*vRdc*bw*d/1000 =2315 kN

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Shear force</th>
<th>1333 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>2315 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Case 2: Check plane passing through twin-piles
Shear force due to ultimate load: VEd=2*N2+My'*1000/AY=2667 kN
Shear resistance: VRdc=beta'*CRdc*ks*vRdc*bw*d/1000 =2981 kN
Modified shear resistance: VRdc=VRdm=3305 kN

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Shear force</th>
<th>2667 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>3305 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear

Check punching shear at column face:
- Eccentricity factor β: beta=1
- Shear stress at column perimeter: vEd=beta*VEd*1000/(uo*d)=2.225 N/mm²
- Maximum punching shear resistance: vRdmax=0.5*v*fcd=5.581 N/mm²

Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.
**MAIN REINFORCEMENT**

**IN X-DIRECTION:**
- Characteristic strength: 500 N/mm²
- Diameter of bars: 25 mm
- Spacing: 300 mm
- Total number of bars: 8
- Total area required: 3888 mm²
- Total area provided: 3927 mm²

**SUMMARY**

**MAIN REINFORCEMENT**

**IN Y-DIRECTION:**
- Characteristic strength: 500 N/mm²
- Diameter of bars: 12 mm
- Spacing: 65 mm
- Total number of bars: 38
- Area reqd.@ critical section: 4212 mm²
- Area prov.@ critical section: 4298 mm²

**SUMMARY**

**DISTRIBUTION REINFORCEMENT**

**IN X-DIRECTION:**
- Number of bars: 8
- Spacing of bars: 300 mm
- Area required: 1620 mm²/m
- Area provided: 1636 mm²/m

**IN Y-DIRECTION:**
- Number of bars: 10
- Spacing of bars: 300 mm
- Area required: 1620 mm²/m
- Area provided: 1636 mm²/m

**SIDE BARS SUMMARY**

- Characteristic strength: 500 N/mm²
- Diameter of bars: 12 mm
- Total number of bars: 12
- Spacing of bars: 250 mm

**QUANTITIES**

- Total volume of concrete: 5.646 m³
- Total area of formwork: 9.6 m²
Location: Cap for lightly-loaded column

Pilecap for 3 piles

Design to EC2 Part 1-1.

Pilecap shaped as shown with main reinforcement parallel to principal axes.

Use ultimate values for load and moment.

Applied moment in the Y-direction only.

Total design load on column \( N = 150 \text{ kN} \)
Column dimension \( cx = 400 \text{ mm} \)
Column dimension \( cy = 400 \text{ mm} \)
Design BM at bottom of column \( My' = 0 \text{ kNm} \)
Partial safety factor for steel \( \gamma_{Ms} = 1.15 \)
Partial safety factor for conc. \( \gamma_{Mc} = 1.5 \)
Nominal pile diameter \( \text{PileD} = 250 \text{ mm} \)
Spacing of pile ctrs in X-dir. \( AX = 750 \text{ mm} \)
Dist. from pile face to cap edge \( olap = 150 \text{ mm} \)
Spacing of pile ctrs in Y-dir. \( AY = 650 \text{ mm} \)
Distance \( AY' \) to centre of column \( AY' = 433 \text{ mm} \)
Max cap length in X-direction \( lx = 1300 \text{ mm} \)
Min cap dimension in X-direction \( BX = 550 \text{ mm} \)
Max cap breadth in Y-direction \( ly = 1200 \text{ mm} \)
Min cap dimension in Y-direction \( BY = 500 \text{ mm} \)
Char yield strength of reinft. \( f_{yk} = 500 \text{ N/mm}^2 \)
Cover to underside of main bars \( \text{Cover} = 150 \text{ mm} \)
Side and top cover to main bars \( \text{Scvr} = 75 \text{ mm} \)
Chosen depth of pilecap \( h = 300 \text{ mm} \)

Design of main steel in X-direction

Main steel diameter \( \text{diaX} = 12 \text{ mm} \)
Main steel spacing \( \text{SpcX} = 250 \text{ mm} \)

Design of main steel in Y-direction

Main steel diameter \( \text{diaY} = 12 \text{ mm} \)
Main steel spacing \( \text{SpcY} = 185 \text{ mm} \)
Distribution steel

- Distribution steel diameter: LSize = 12 mm
- Spacing of bars: LSpac = 250 mm
- Area of dist steel provided: A2 = PI*LSize^2*250/LSpac = 452.4 mm²/m

Check shear resistance in X-direction

- Shear force due to ultimate load: VEd = 50 kN
- Shear resistance: VRdc = beta' * CRdc * ks * vRdc * bw * d / 1000
- Modified shear resistance: VRdc = VRdm = 267.9 kN

SHEAR SUMMARY

| Shear force | 50 kN |
| Shear resistance | 267.9 kN |

Hence section is satisfactory, no shear reinforcement is required.

Check shear resistance in Y-direction

Case 1: Check plane passing through single pile on X-X axis
- Shear force due to ultimate load: VEd = 50 kN
- Shear resistance: VRdc = 111.1 kN

SHEAR SUMMARY

| Shear force | 50 kN |
| Shear resistance | 111.1 kN |

Hence section is satisfactory, no shear reinforcement is required.

Case 2: Check plane passing through twin-piles
- Shear force due to ultimate load: VEd = 100 kN
- Shear enhancement: beta' = 4
- Shear resistance: VRdc = 384.4 kN

SHEAR SUMMARY

| Shear force | 100 kN |
| Shear resistance | 384.4 kN |

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear

Check punching shear at column face:
- Eccentricity factor β: beta = 1
- Shear stress at column perimeter: vEd = beta * VEd / (uo * d) = 0.7102 N/mm²
- Maximum punching shear resistance: vRdmax = 0.5 * v * fcd = 5.581 N/mm²
- Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.
Check punching shear at 2d:
Shear stress at control perimeter $v_{Ed}=\beta*V_{Ed}*1000/(u_1*d)=0.4383$ N/mm²
Design punching shear resistance $v_{Rdc}=(0.18/gamc)*k*(100*p_1 *f_{ck})^{0.333}=0.5701$ N/mm²
Enhanced punching shear resist. $v_{Rdc}=\text{senh} \times v_{Rdc}=0.9526$ N/mm²

Use ultimate values for load and moment.

Total design load on column \( N = 3600 \text{ kN} \)
Column dimension \( cx \) \( cx = 500 \text{ mm} \)
Column dimension \( cy \) \( cy = 500 \text{ mm} \)
Nominal pile diameter \( \text{PileD} = 450 \text{ mm} \)
Partial safety factor for steel \( gams = 1.15 \)
Partial safety factor for conc. \( gamc = 1.5 \)
Spacing of pile ctrs in X-dir. \( AX = 1350 \text{ mm} \)
Overhang: pile face to cap edge \( olap = 150 \text{ mm} \)
Length of pile cap \( lx = 2100 \text{ mm} \)
Spacing of pile ctrs in Y-dir. \( AY = 1350 \text{ mm} \)
Breadth of pile cap \( ly = 2100 \text{ mm} \)
Char yield strength of reinf. \( fyk = 500 \text{ N/mm}^2 \)
Cover to underside of main bars \( \text{Cover} = 150 \text{ mm} \)
Side and top cover to main bars \( \text{Scvr} = 75 \text{ mm} \)
Chosen depth of pilecap \( h = 1000 \text{ mm} \)

Design of main steel in X-direction

- Main steel diameter \( \text{diaX} = 12 \text{ mm} \)
- Main steel spacing \( \text{SpcX} = 70 \text{ mm} \)

Design of main steel in Y-direction

- Main steel diameter \( \text{diaY} = 12 \text{ mm} \)
- Main steel spacing \( \text{SpcY} = 70 \text{ mm} \)

Distribution steel

- Distribution steel diameter \( \text{LSize} = 12 \text{ mm} \)
- Spacing of bars \( \text{LSpac} = 75 \text{ mm} \)
- Area of dist.steel provided \( A_2 = \pi \times \text{LSize}^2 \times 250 / \text{LSpac} = 1508 \text{ mm}^2 / \text{m} \)
Check shear resistance in X-direction

Shear force due to ultimate load \( V_{Ed} = \frac{N}{2} + M_x' \times 1000/AX = 1800 \text{ kN} \)
Shear resistance \( V_{Rdc} = \beta' \times C_{Rdc} \times k_s \times v_{Rdc} \times b_w \times d / 1000 \)
\[ = 2262 \text{ kN} \]
Modified shear resistance \( V_{Rd} = V_{Rdm} = 2545 \text{ kN} \)

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Shear force</th>
<th>1800 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>2545 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check shear resistance in Y-direction

Shear force due to ultimate load \( V_{Ed} = \frac{N}{2} + M_y' \times 1000/AY = 1800 \text{ kN} \)
Shear resistance \( V_{Rdc} = \beta' \times C_{Rdc} \times k_s \times v_{Rdc} \times b_w \times d / 1000 \)
\[ = 2246 \text{ kN} \]
Modified shear resistance \( V_{Rd} = V_{Rdm} = 2517 \text{ kN} \)

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Shear force</th>
<th>1800 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>2517 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear

Check punching shear at column face:
Eccentricity factor \( \beta \)
\( \beta = 1 \)
Shear stress at column perimeter \( v_{Ed} = \beta \times V_{Ed} \times 1000/(u_o \times d) = 2.163 \text{ N/mm}^2 \)
Maximum punching shear resistance \( v_{Rdmax} = 0.5 \times v \times f_{cd} = 5.581 \text{ N/mm}^2 \)
Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

## QUANTITIES

| Total concrete volume   | 4.41 m³  |
| Total area of formwork  | 8.4 m²   |
Location: Ex2 - Large, heavily-loaded pilecap with mild steel reinf.

Bottom layer of main steel is assumed to run in X-direction.

Pilecap for four piles

- Designed using bending theory to EC2 Part 1-1.
- Pilecap assumed square (i.e. lx=ly) with main reinforcement arranged in bands parallel to the principal axes and symmetrical about the pile centres.

Use ultimate values for load and moment.

Total design load on column  \( N=5000 \text{ kN} \)
Column dimension \( cx=500 \text{ mm} \)
Column dimension \( cy=500 \text{ mm} \)
Nominal pile diameter \( \text{PileD}=450 \text{ mm} \)
Partial safety factor for steel \( gams=1.15 \)
Partial safety factor for conc. \( gamc=1.5 \)
Spacing of pile ctrs in X-dir. \( AX=2000 \text{ mm} \)
Overhang: pile face to cap edge \( olap=400 \text{ mm} \)
Length of pile cap \( lx=3250 \text{ mm} \)
Spacing of pile ctrs in Y-dir. \( AY=2000 \text{ mm} \)
Breadth of pile cap \( ly=3250 \text{ mm} \)
Char yield strength of reinft. \( fyk=500 \text{ N/mm}^2 \)
Cover to underside of main bars \( \text{Cover}=150 \text{ mm} \)
Side and top cover to main bars \( \text{Scvr}=75 \text{ mm} \)
Chosen depth of pilecap \( h=1440 \text{ mm} \)

Check shear resistance in X-direction

Shear force due to ultimate load \( V_{E,d} = \frac{N}{2} + M_x' \cdot \frac{1000}{A_x} = 2500 \text{ kN} \)

Shear resistance \( V_{R,d,c} = \beta' \cdot C_{R,d,c} \cdot k_s \cdot v_{R,d,c} \cdot b_w \cdot d \cdot 1000 = 4219 \text{ kN} \)

Modified shear resistance \( V_{R,d} = V_{R,d,m} = 4349 \text{ kN} \)

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Shear force (kN)</th>
<th>Shear resistance (kN)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2500</td>
<td>4349</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check shear resistance in Y-direction

Shear force due to ultimate load \( V_{E,d} = \frac{N}{2} + M_y' \cdot \frac{1000}{A_y} = 2500 \text{ kN} \)

Shear resistance \( V_{R,d,c} = \beta' \cdot C_{R,d,c} \cdot k_s \cdot v_{R,d,c} \cdot b_w \cdot d \cdot 1000 = 4191 \text{ kN} \)

Modified shear resistance \( V_{R,d} = V_{R,d,m} = 4306 \text{ kN} \)

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Shear force (kN)</th>
<th>Shear resistance (kN)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2500</td>
<td>4306</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear

Check punching shear at column face:

Eccentricity factor \( \beta \) \( \beta = 1 \)

Shear stress at column perimeter \( \sigma_{Ed} = \beta \cdot V_{E,d} \cdot \frac{1000}{u_o \cdot d} = 1.975 \text{ N/mm}^2 \)

Maximum punching shear resistance \( \sigma_{R,d,max} = 0.5 \cdot \sigma_{f,c} = 5.581 \text{ N/mm}^2 \)

Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

Check punching shear at 2d:

Shear stress at control perimeter \( \sigma_{Ed} = \beta \cdot V_{E,d} \cdot \frac{1000}{u_1 \cdot d} = 0.6735 \text{ N/mm}^2 \)

Design punching shear resistance \( \sigma_{R,d,c} = (0.18 / \gamma_{mc}) \cdot k \cdot (100 \cdot p_1 \cdot f_{ck})^{0.333} = 0.3163 \text{ N/mm}^2 \)

Enhancement factor to be used \( \gamma_{enh} = 4.117 \)

Enhanced punching shear resist. \( \sigma_{R,d} = \gamma_{enh} \cdot \sigma_{R,d,c} = 1.302 \text{ N/mm}^2 \)

Design punching shear resistance \( \sigma_{R,d} = \gamma_{enh} \cdot 0.035 \cdot k^1.5 \cdot f_{ck}^0.5 \)

### QUANTITIES

- Total concrete volume: 15.21 m³
- Total area of formwork: 18.72 m²
Location: Ex3 - Small cap with closely-spaced piles.

Bottom layer of main steel is assumed to run in X-direction.

Pilecap for four piles

- Designed using bending theory to EC2 Part 1-1.
- Pilecap assumed square (i.e. lx=ly) with main reinforcement arranged in bands parallel to the principal axes and symmetrical about the pile centres.

Use ultimate values for load and moment.

Total design load on column N=3000 kN
Column dimension cx cx=350 mm
Column dimension cy cy=350 mm
Nominal pile diameter PileD=250 mm
Partial safety factor for steel gams=1.15
Partial safety factor for conc. gamc=1.5
Spacing of pile ctrs in X-dir. AX=500 mm
Overhang: pile face to cap edge olap=150 mm
Length of pile cap lx=1050 mm
Spacing of pile ctrs in Y-dir. AY=500 mm
Breadth of pile cap ly=1050 mm
Char yield strength of reinft. fyk=500 N/mm²
Cover to underside of main bars Cover=150 mm
Side and top cover to main bars Scvr=75 mm
Chosen depth of pilecap h=990 mm

Design of main steel in X-direction

Main steel diameter diaX=20 mm
Main steel spacing SpcX=175 mm

Design of main steel in Y-direction

Main steel diameter diaY=16 mm
Main steel spacing SpcY=110 mm

Distribution steel

Distribution steel diameter LSize=20 mm
Spacing of bars LSpac=180 mm
Area of dist.steel provided A2=\(\pi \times \text{LSize}^2 \times \frac{250}{\text{LSpac}} = 1745 \text{ mm}^2/\text{m}\)
Check shear resistance in X-direction

Shear force due to ultimate load \( V_{Ed} = \frac{N}{2} + M_x' \times \frac{1000}{A_X} = 1500 \text{ kN} \)

Shear enhancement \( \beta' = 4 \)

Shear resistance
\[
V_{Rdc} = \beta' \times C_{Rdc} \times k_s \times v_{Rdc} \times b_w \times d / 1000 \\
= 1379 \text{ kN}
\]

Modified shear resistance
\( V_{Rdc} = V_{Rdm} = 1571 \text{ kN} \)

**SHEAR SUMMARY**

- Shear force: 1500 kN
- Shear resistance: 1571 kN

Hence section is satisfactory, no shear reinforcement is required.

Check shear resistance in Y-direction

Shear force due to ultimate load \( V_{Ed} = \frac{N}{2} + M_y' \times \frac{1000}{A_Y} = 1500 \text{ kN} \)

Shear enhancement \( \beta' = 4 \)

Shear resistance
\[
V_{Rdc} = \beta' \times C_{Rdc} \times k_s \times v_{Rdc} \times b_w \times d / 1000 \\
= 1346 \text{ kN}
\]

Modified shear resistance
\( V_{Rdc} = V_{Rdm} = 1545 \text{ kN} \)

**SHEAR SUMMARY**

- Shear force: 1500 kN
- Shear resistance: 1545 kN

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear

Check punching shear at column face:

- Eccentricity factor \( \beta \) \( \beta = 1 \)

Shear stress at column perimeter
\[
v_{Ed} = \beta \times V_{Ed} \times 1000 / (u_0 \times d) = 2.639 \text{ N/mm}^2
\]

Maximum punching shear resistance
\( v_{Rdmax} = 0.5 \times v \times f_{cd} = 8 \text{ N/mm}^2 \)

Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

**MAIN REINFORCEMENT**

**IN X-DIRECTION:**

- Characteristic strength: 500 N/mm²
- Diameter of bars: 20 mm
- Spacing: 175 mm
- Total number of bars: 6
- Total area required: 1823 mm²
- Total area provided: 1885 mm²

**IN Y-DIRECTION:**

- Characteristic strength: 500 N/mm²
- Diameter of bars: 16 mm
- Spacing: 110 mm
- Total number of bars: 9
- Total area required: 1778 mm²
- Total area provided: 1810 mm²
### DISTRIBUTION REINFORCEMENT

**SUMMARY**
- Characteristic strength: 500 N/mm²
- Diameter of bars: 20 mm

**IN X-DIRECTION:**
- **In top:**
  - Number of bars: 5
  - Spacing of bars: 180 mm
  - Area required: 1736 mm²/m
  - Area provided: 1745 mm²/m

**IN Y-DIRECTION:**
- **In top:**
  - Number of bars: 5
  - Spacing of bars: 180 mm
  - Area required: 1736 mm²/m
  - Area provided: 1745 mm²/m

### SIDE BARS SUMMARY

- Characteristic strength: 500 N/mm²
- Diameter of bars: 12 mm
- Total number of bars: 8
- Spacing of bars: 250 mm

### QUANTITIES

- Total concrete volume: 1.091 m³
- Total area of formwork: 4.158 m²
Location: Typical pilecap

### MAIN REINFORCEMENT

**IN X-DIRECTION:**

**SUMMARY**

- Characteristic strength: 250 N/mm²
- Diameter of bars: 32 mm
- Spacing: 190 mm
- Total number of bars: 20
- Total area required: 15911 mm²
- Total area provided: 16085 mm²
- Volume of steel: 70806 cm³
- Weight of steel: 555.83 kg

### MAIN REINFORCEMENT

**IN Y-DIRECTION:**

**SUMMARY**

- Characteristic strength: 250 N/mm²
- Diameter of bars: 32 mm
- Spacing: 190 mm
- Total number of bars: 20
- Total area required: 15911 mm²
- Total area provided: 16085 mm²
- Volume of steel: 70806 cm³
- Weight of steel: 555.83 kg

### DISTRIBUTION REINFORCEMENT

**SUMMARY**

- Characteristic strength: 250 N/mm²
- Diameter of bars: 40 mm

**IN X-DIRECTION:**

- In top:
  - Number of bars: 13
  - Spacing of bars: 300 mm
  - Area required: 4176 mm²/m
  - Area provided: 4188.8 mm²/m
  - Volume of steel: 59791 cm³
  - Weight of steel: 469.36 kg

**IN Y-DIRECTION:**

- In top:
  - Number of bars: 13
  - Spacing of bars: 300 mm
  - Area required: 4176 mm²/m
  - Area provided: 4188.8 mm²/m
  - Volume of steel: 59791 cm³
  - Weight of steel: 469.36 kg

### SIDE BARS SUMMARY

- Characteristic strength: 250 N/mm²
- Diameter of bars: 12 mm
- Total number of bars: 14
- Spacing of bars: 250 mm
- Volume of steel: 12421 cm³
- Weight of steel: 97.509 kg

### QUANTITIES

- Total concrete volume: 25.258 m³
- Total area of formwork: 26.518 m²
- Total volume of steel: 273615 cm³
- Total weight of steel: 2147.9 kg

- Approx. self-weight of pile cap: 848.67 kN
- Approx. total load on each pile: 2670 kN
Location: Small pilecap with high-grade concrete

Design to BS8110(1997) with partial safety factor for steel \( \gamma_S = 1.15 \). Bottom layer of main steel is assumed to run in X-direction.

![Diagram of pilecap for five piles]

**Pilecap for five piles**

Designed using bending theory in accordance with BS8110.

Pile cap assumed square (i.e. \( lx=ly \)) with main reinforcement arranged in bands parallel to the principal axes and symmetrical about pile centres (i.e. chain lines in adjoining diagram).

**Total ultimate load on column**  \( N=7000 \text{ kN} \)

**Column dimension** \( cx=350 \text{ mm} \)

**Column dimension** \( cy=350 \text{ mm} \)

**Nominal pile diameter**  \( \text{PileD}=250 \text{ mm} \)

**Spec.min.spacing of pile centres**  \( \text{spc}=500 \text{ mm} \)

**Spec.of pile ctrs in X-direction**  \( AX=710 \text{ mm} \)

**Overhang: pile face to cap edge**  \( \text{olap}=170 \text{ mm} \)

**Length of pile cap**  \( lx=1300 \text{ mm} \)

**Spec.of pile ctrs in Y-direction**  \( AY=710 \text{ mm} \)

**Breadth of pile cap**  \( ly=1300 \text{ mm} \)

**Concrete grade**  \( f_{cu}=60 \text{ N/mm}^2 \)

**Steel strength**  \( f_y=500 \text{ N/mm}^2 \)

**Cover to underside of main bars**  \( \text{Cover}=150 \text{ mm} \)

**Side and top cover to main bars**  \( \text{Scvr}=75 \text{ mm} \)

**Chosen depth of pilecap**  \( h=990 \text{ mm} \)

**Design of main steel in X-direction**

**Main steel diameter**  \( \text{diaX}=12 \text{ mm} \)

Location: Ex1 - Typical pilecap

Bottom layer of main steel is assumed to run in X-direction.

Pilecap for five piles

- Designed using bending theory to EC2 Part 1-1.
- Pilecap assumed square (i.e. lx=ly) with main reinforcement arranged in bands parallel to the principal axes and symmetrical about pile centres.
- Use ultimate values for load and moment.

Total design load on column: N=7000 kN
Column dimension cx: cx=500 mm
Column dimension cy: cy=500 mm
Partial safety factor for steel: gams=1.15
Partial safety factor for conc.: gamc=1.5
Nominal pile diameter: PileD=450 mm
Spec.min spacing of pile centres: spc=1350 mm
Spacing of pile ctrs in X-dir: AX=1910 mm
Dist. from pile face to cap edge: olap=150 mm
Length of pile cap: lx=2660 mm
Spacing of pile ctrs in Y-dir: AY=1910 mm
Breadth of pile cap: ly=2660 mm
Char yield strength of reinft.: fyk=500 N/mm²
Cover to underside of main bars: Cover=150 mm
Side and top cover to main bars: Scvr=75 mm
Chosen depth of pilecap: h=1420 mm

Design of main steel in X-direction

Main steel diameter: diaX=25 mm
Main steel spacing: SpcX=225 mm

Design of main steel in Y-direction

Main steel diameter: diaY=25 mm
Main steel spacing: SpcY=225 mm

Distribution steel

Distribution steel diameter: LSize=25 mm
Spacing of bars: LSpac=230 mm
Area of dist. steel provided: A2=Π*LSize²*250/LSpac=2134 mm²/m
Check shear resistance in X-direction

Shear force due to ultimate load \( V_{Ed} = N/2.5 + Mx'*1000/AX = 2800 \; \text{kN} \)
Shear resistance \( V_{Rdc} = \beta'*C_{Rdc}*k_s*v_{Rdc}*b*w*d/1000 = 3265 \; \text{kN} \)

<table>
<thead>
<tr>
<th>SHEAR SUMMARY</th>
<th>Shear force</th>
<th>2800 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Shear resistance</td>
<td>3265 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check shear resistance in Y-direction

Shear force due to ultimate load \( V_{Ed} = N/2.5 + My'*1000/AY = 2800 \; \text{kN} \)
Shear resistance \( V_{Rdc} = \beta'*C_{Rdc}*k_s*v_{Rdc}*b*w*d/1000 = 3231 \; \text{kN} \)

<table>
<thead>
<tr>
<th>SHEAR SUMMARY</th>
<th>Shear force</th>
<th>2800 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Shear resistance</td>
<td>3231 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear

Check punching shear at column face:
Eccentricity factor \( \beta \) \( \beta = 1 \)
Shear stress at column perimeter \( v_{Ed} = \beta*V_{Ed}*1000/(u_o*d) = 2.272 \; \text{N/mm}^2 \)
Maximum punching shear resistance \( v_{Rdmax} = 0.5*v*f_{cd} = 4.973 \; \text{N/mm}^2 \)
Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

Check punching shear at 2d:
Shear stress at control perimeter \( v_{Ed} = \beta*V_{Ed}*1000/(u_1*d) = 0.8141 \; \text{N/mm}^2 \)
Design punching shear resistance \( v_{Rdc} = (0.18/gamc)*k*(100*p_1*f_{ck})^{0.333} = 0.3084 \; \text{N/mm}^2 \)
Enhancement factor to be used \( senh = 4.325 \)
Enhanced punching shear resist. \( v_{Rdc} = senh*v_{Rdc} = 1.334 \; \text{N/mm}^2 \)

## QUANTITIES

| Total concrete volume     | 10.05 m³ |
| Total area of formwork    | 15.11 m² |
Location: Ex2 - Heavily-loaded pilecap reinforced with mild steel

Bottom layer of main steel is assumed to run in X-direction.

Pilecap for five piles
- Designed using bending theory to EC2 Part 1-1.
- Pilecap assumed square (i.e. lx=ly) with main reinforcement arranged in bands parallel to the principal axes and symmetrical about pile centres.
- Use ultimate values for load and moment.

Total design load on column $N=12500$ kN
Column dimension $cx = 500$ mm
Column dimension $cy = 500$ mm
Partial safety factor for steel $\gamma_{ms} = 1.15$
Partial safety factor for conc. $\gamma_{mc} = 1.5$
Nominal pile diameter $PileD = 450$ mm
Spec.min spacing of pile centres $spc = 1350$ mm
Spacing of pile ctrs in X-dir $AX = 1910$ mm
Dist. from pile face to cap edge $olap = 725$ mm
Length of pile cap $lx = 3810$ mm
Spacing of pile ctrs in Y-dir $AY = 1910$ mm
Breadth of pile cap $ly = 3810$ mm
Char yield strength of reinft. $f_yk = 500$ N/mm$^2$
Cover to underside of main bars $Cover = 150$ mm
Side and top cover to main bars $Scvr = 75$ mm
Chosen depth of pilecap $h = 1740$ mm

Design of main steel in X-direction
- Main steel diameter $diaX = 20$ mm
- Main steel spacing $SpcX = 115$ mm

Design of main steel in Y-direction
- Main steel diameter $diaY = 20$ mm
- Main steel spacing $SpcY = 115$ mm

Distribution steel
- Distribution steel diameter $LSize = 20$ mm
- Spacing of bars $LSpac = 120$ mm
- Area of dist. steel provided $A2 = \pi \times LSize^2 \times 250 / LSpac = 2618$ mm$^2$/m
Check shear resistance in X-direction

Shear force due to ultimate load \( V_{Ed} = \frac{N}{2.5} + \frac{M_x}{1000AX} = 5000 \text{ kN} \)

Shear resistance \( V_{Rdc} = \beta' * CRdc * ks * v_{Rdc} * bw * d / 1000 = 5444 \text{ kN} \)

<table>
<thead>
<tr>
<th>SHEAR SUMMARY</th>
<th>Shear force</th>
<th>5000 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Shear resistance</td>
<td>5444 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check shear resistance in Y-direction

Shear force due to ultimate load \( V_{Ed} = \frac{N}{2.5} + \frac{M_y}{1000AY} = 5000 \text{ kN} \)

Shear resistance \( V_{Rdc} = \beta' * CRdc * ks * v_{Rdc} * bw * d / 1000 = 5407 \text{ kN} \)

<table>
<thead>
<tr>
<th>SHEAR SUMMARY</th>
<th>Shear force</th>
<th>5000 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Shear resistance</td>
<td>5407 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear

Check punching shear at column face:
Eccentricity factor \( \beta \) \( \beta = 1 \)
Shear stress at column perimeter \( v_{Ed} = \beta * V_{Ed} * 1000 / (u_0 * d) = 3.205 \text{ N/mm}^2 \)
Maximum punching shear resistance \( v_{Rdmax} = 0.5 * v_fcd = 5.581 \text{ N/mm}^2 \)
Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

Check punching shear at 2d:
Shear stress at control perimeter \( v_{Ed} = \beta * V_{Ed} * 1000 / (u_1 * d) = 1.149 \text{ N/mm}^2 \)
Design punching shear resistance \( v_{Rdc} = (0.18 / \gamma_{mc}) * k * (100 * p1 * fck)^{0.333} = 0.3213 \text{ N/mm}^2 \)
Enhancement factor to be used \( senh = 5.474 \)
Enhanced punching shear resist. \( v_{Rdc} = senh * v_{Rdc} = 1.759 \text{ N/mm}^2 \)

Location: Pilecap at G3

Design to BS8110(1997) with partial safety factor for steel gammaS=1.15
Bottom layer of main steel is assumed to run in X-direction.

Pilecap for six piles

Designed by Bending Theory
Calculations are in accordance with BS8110.
Main reinforcement is arranged in bands parallel to principal axes and is symmetrical about pile centres.
For bond calculations, any high-yield bars are assumed Type 2: deformed.

Total ultimate load on column N=8400 kN
Column dimension cx cx=500 mm
Column dimension cy cy=500 mm
Nominal pile diameter PileD=450 mm
Spc.of pile ctrs in X-direction AX=1350 mm
Overhang: pile face to cap edge olap=150 mm
Length of pile cap lx=3450 mm
Spc.of pile ctrs in Y-direction AY=1350 mm
Breadth of pile cap ly=2100 mm
Concrete grade fcu=35 N/mm²
Steel strength fy=500 N/mm²
Cover to underside of main bars Cover=150 mm
Side and top cover to main bars Scvr=75 mm
Chosen depth of pilecap h=1730 mm

Design of main steel in X-direction
Main steel diameter diaX=32 mm
Main steel spacing SpcX=375 mm

Design of main steel in Y-direction
Main steel diameter diaY=16 mm
Main steel spacing SpcY=85 mm

Distribution steel
Diameter of bar LSize=25 mm
Spacing of bars LSpac=215 mm
### MAIN REINFORCEMENT

**IN X-DIRECTION:**
- Characteristic strength: 500 N/mm²
- Diameter of bars: 32 mm
- Spacing: 375 mm
- Total number of bars: 6
- Total area required: 4780 mm²
- Total area provided: 4825.5 mm²
- Volume of steel: 23891 cm³
- Weight of steel: 187.54 kg

**IN Y-DIRECTION:**
- Characteristic strength: 500 N/mm²
- Diameter of bars: 16 mm
- Spacing: 85 mm
- Total number of bars: 39
- Total area required: 7759.1 mm²
- Total area provided: 7841.4 mm²
- Volume of steel: 31350 cm³
- Weight of steel: 246.1 kg

### DISTRIBUTION REINFORCEMENT

**SUMMARY**
- Characteristic strength: 500 N/mm²
- Diameter of bars: 25 mm

**IN X-DIRECTION:**
- In top:
  - Number of bars: 9
  - Spacing of bars: 215 mm
  - Area required: 2249 mm²/m
  - Area provided: 2283.1 mm²/m
  - Volume of steel: 14579 cm³
  - Weight of steel: 114.44 kg

**IN Y-DIRECTION:**
- In top:
  - Number of bars: 16
  - Spacing of bars: 215 mm
  - Area required: 2249 mm²/m
  - Area provided: 2283.1 mm²/m
  - Volume of steel: 15315 cm³
  - Weight of steel: 120.22 kg

### SIDE BARS SUMMARY

- Characteristic strength: 500 N/mm²
- Diameter of bars: 12 mm
- Total number of bars: 28
- Spacing of bars: 250 mm
- Volume of steel: 9880.2 cm³
- Weight of steel: 77.559 kg

### QUANTITIES

- Total concrete volume: 12.534 m³
- Total area of formwork: 19.203 m²
- Total volume of steel: 95015 cm³
- Total weight of steel: 745.87 kg

Approx. self-weight of pile cap: 421.14 kN
Approx. total load on each pile: 1471 kN
Location: Cap for heavily-loaded column using mild steel reinf.

Design to BS8110(1997) with partial safety factor for steel gammaS=1.15

### QUANTITIES
- **Total concrete volume**: 1.712 m³
- **Total area of formwork**: 2.914 m²
- **Total volume of steel**: 10972 cm³
- **Total weight of steel**: 86.129 kg

- **Approx. self-weight of pile cap**: 57.522 kN
- **Approx. total load on each pile**: 93 kN
Location: Ex1 - Pilecap at G3

Bottom layer of main steel is assumed to run in X-direction.

Pilecap for six piles

Designed using bending theory to EC2 Part 1-1.

Main reinforcement is arranged in bands // to the principal axes and symmetrical about pile centres.

Use ultimate values for load and moment.

Total design load on column N=8400 kN
Column dimension cx cx=500 mm
Column dimension cy cy=500 mm
Nominal pile diameter PileD=450 mm
Partial safety factor for steel gams=1.15
Partial safety factor for conc. gamc=1.5
Spacing of pile ctrs in X-dir AX=1350 mm
Overhang: pile face to cap edge olap=150 mm
Length of pile cap lx=3450 mm
Spacing of pile ctrs in Y-dir AY=1350 mm
Breadth of pile cap ly=2100 mm
Char yield strength of reinf. fyk=500 N/mm²
Cover to underside of main bars Cover=150 mm
Side and top cover to main bars Scvr=75 mm
Chosen depth of pilecap h=1730 mm

Design of main steel in X-direction

Main steel diameter diaX=12 mm
Main steel spacing SpcX=40 mm

Design of main steel in Y-direction

Main steel diameter diaY=20 mm
Main steel spacing SpcY=115 mm

Distribution steel

Distribution steel diameter LSize=20 mm
Spacing of bars LSpac=120 mm
Area of dist. steel provided A2=π*LSize^2*250/LSpac=2618 mm²/m

Check shear resistance in X-direction

Shear force due to ultimate load VEd=N/3+Mx'*1000/AX=2800 kN
Shear resistance: \[ VR_{dc} = \beta \cdot CR_{dc} \cdot ks \cdot vR_{dc} \cdot bw \cdot d / 1000 \]
\[ = 2939 \text{ kN} \]
Modified shear resistance: \[ VR_{dc} = VR_{dm} = 3155 \text{ kN} \]

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear force</td>
<td>2800 kN</td>
</tr>
<tr>
<td>Shear resistance</td>
<td>3155 kN</td>
</tr>
</tbody>
</table>

**Hence section is satisfactory, no shear reinforcement is required.**

Check shear resistance in Y-direction:

Shear force due to ultimate load: \[ V_{Ed} = \frac{N}{2} + \frac{My^*1000}{AY} = 4200 \text{ kN} \]
Shear resistance: \[ VR_{dc} = \beta \cdot CR_{dc} \cdot ks \cdot vR_{dc} \cdot bw \cdot d / 1000 \]
\[ = 5889 \text{ kN} \]
Modified shear resistance: \[ VR_{dc} = VR_{dm} = 6303 \text{ kN} \]

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Description</th>
<th>Value</th>
</tr>

<tbody>
<tr>
<td>Shear force</td>
<td>4200 kN</td>
</tr>
<tr>
<td>Shear resistance</td>
<td>6303 kN</td>
</tr>
</tbody>
</table>

**Hence section is satisfactory, no shear reinforcement is required.**

Check punching shear at column face:

Eccentricity factor: \[ \beta = 1 \]
Shear stress at column perimeter: \[ v_{Ed} = \beta \cdot V_{Ed} \cdot 1000 / (uo \cdot d) = 2.696 \text{ N/mm}^2 \]
Maximum punching shear resistance: \[ v_{Rdmax} = 0.5 \cdot v \cdot f_{cd} = 4.973 \text{ N/mm}^2 \]
Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

### QUANTITIES

| Total concrete volume   | 12.53 m³  |
| Total area of formwork  | 19.2 m²    |
Location: Ex2 - Cap for heavily-loaded column w. mild steel reinf.

Bottom layer of main steel is assumed to run in X-direction.

Pilecap for six piles

Designed using bending theory to EC2 Part 1-1.

Main reinforcement is arranged in bands // to the principal axes and symmetrical about pile centres.

Use ultimate values for load and moment.

Total design load on column \( N = 20000 \) kN
Column dimension \( cx = 500 \) mm
Column dimension \( cy = 500 \) mm
Nominal pile diameter \( \text{PileD} = 500 \) mm
Partial safety factor for steel \( g_{\text{ams}} = 1.15 \)
Partial safety factor for conc. \( g_{\text{amc}} = 1.5 \)
Spacing of pile ctrs in X-dir \( AX = 1500 \) mm
Overhang: pile face to cap edge \( \text{olap} = 300 \) mm
Length of pile cap \( 1x = 4100 \) mm
Spacing of pile ctrs in Y-dir \( AY = 1500 \) mm
Breadth of pile cap \( 1y = 4100 \) mm
Char yield strength of reinf. \( f_{yk} = 500 \) N/mm²
Cover to underside of main bars \( \text{Cover} = 150 \) mm
Side and top cover to main bars \( \text{Scvr} = 75 \) mm
Chosen depth of pilecap \( h = 2840 \) mm

Design of main steel in X-direction

Main steel diameter \( \text{diaX} = 40 \) mm
Main steel spacing \( \text{SpcX} = 300 \) mm

Design of main steel in Y-direction

Main steel diameter \( \text{diaY} = 40 \) mm
Main steel spacing \( \text{SpcY} = 300 \) mm

Distribution steel

Distribution steel diameter \( \text{LSize} = 25 \) mm
Spacing of bars \( \text{LSpac} = 115 \) mm
Area of dist. steel provided \( A2 = \pi \times \text{LSize}^2 \times 250 / \text{LSpac} = 4268 \) mm²/m

Check shear resistance in X-direction

Shear force due to ultimate load \( V_{Ed} = N / 3 + Mx' \times 1000 / AX = 6667 \) kN
Shear resistance  \[ VRdc = \beta' \cdot CRdc \cdot ks \cdot Vrdc \cdot bw \cdot d / 1000 \]
= 11049 kN

Modified shear resistance  \[ VRdc = VRdm = 11657 \text{ kN} \]

Design of main steel in Y-direction

Main steel diameter \( diaY = 12 \text{ mm} \)
Main steel spacing \( SpcY = 180 \text{ mm} \)

Distribution steel

Distribution steel diameter \( LSize = 12 \text{ mm} \)
Spacing of bars \( LSpac = 185 \text{ mm} \)
Area of dist. steel provided \( A2 = \pi \times LSize^2 \times 250 / LSpac = 611.3 \text{ mm}^2 / \text{m} \)

Check shear resistance in X-direction

Shear force due to ultimate load \( V_{Ed} = N / 3 + Mx' \times 1000 / AX = 166.7 \text{ kN} \)
Shear resistance \[ VR_{dc} = \beta' \cdot C_{Rdc} \cdot k_s \cdot v_{Rdc} \cdot b_w \cdot d / 1000 \] = 264.4 kN

Modified shear resistance \[ VR_{dc} = VR_{dm} = 298.6 \text{ kN} \]

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th></th>
<th>Shear force</th>

<td>298.6 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check shear resistance in Y-direction

Shear force due to ultimate load \[ V_{Ed} = N/2 + M_y ' \cdot 1000 / A_Y = 250 \text{ kN} \]

Shear resistance \[ VR_{dc} = \beta' \cdot C_{Rdc} \cdot k_s \cdot v_{Rdc} \cdot b_w \cdot d / 1000 \] = 800.5 kN

Modified shear resistance \[ VR_{dc} = VR_{dm} = 894.2 \text{ kN} \]

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th></th>
<th>Shear force</th>
<th>Shear resistance</th>

</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear at column face

Check punching shear at column face:

- Eccentricity factor \( \beta \): \( \beta = 1 \)
- Shear stress at column perimeter \( v_{Ed} = \beta \cdot V_{Ed} \cdot 1000 / (u_o \cdot d) = 1.796 \text{ N/mm}^2 \)
- Maximum punching shear resistance \( v_{Rd_{max}} = 0.5 \times v \times f_{cd} = 5.581 \text{ N/mm}^2 \)

Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

**MAIN REINFORCEMENT**

**IN X-DIRECTION:**

- Characteristic strength: 500 N/mm²
- Diameter of bars: 12 mm
- Spacing: 180 mm

Location: Pilecap at G3

Design to BS8110(1997) with partial safety factor for steel gammaS=1.15
Bottom layer of main steel is assumed to run in X-direction.

Pilecap for seven piles

Designed by Bending Theory.
7th pile located directly beneath column.
Calculations are in accordance with BS8110.
Main reinforcement is arranged in bands parallel to principal axes and is symmetrical about pile centres.
For bond calculations, any high-yield bars are assumed Type2:deformed.

Total ultimate load on column N=9800 kN
Column dimension cx cx=500 mm
Column dimension cy cy=500 mm
Nominal pile diameter PileD=450 mm
Spc.of pile ctrs in X-direction AX=1350 mm
Overhang: pile face to cap edge olap=150 mm
Spc.of pile ctrs in Y-direction AY=1169 mm
Breadth of pile cap ly=3088 mm
Maximum length of pile cap lx=3566 mm
Minimum length of pile cap lx'=1783 mm
Concrete grade fcu=35 N/mm²
Steel strength fy=500 N/mm²
Cover to underside of main bars Cover=150 mm
Side and top cover to main bars Scvr=75 mm
Chosen depth of pilecap h=1500 mm

Design of main steel in X-direction

Main steel diameter diaX=16 mm
Main steel spacing SpcX=95 mm

Design of main steel in Y-direction

Main steel diameter diaY=16 mm
Main steel spacing SpcY=95 mm

Distribution steel

Diameter of bar LSize=20 mm
Spacing of bars LSpac=160 mm
MAIN REINFORCEMENT

IN X-DIRECTION:

Summary

- Characteristic strength: 500 N/mm²
- Diameter of bars: 16 mm
- Spacing: 95 mm
- Total number of bars: 30
- Total area required: 6021.6 mm²
- Total area provided: 6031.9 mm²
- Volume of steel: 24359 cm³
- Weight of steel: 191.22 kg

IN Y-DIRECTION:

Summary

- Characteristic strength: 500 N/mm²
- Diameter of bars: 16 mm
- Spacing: 95 mm
- Total number of bars: 32
- Total area required: 6390.7 mm²
- Total area provided: 6434 mm²
- Volume of steel: 26023 cm³
- Weight of steel: 204.28 kg

DISTRIBUTION REINFORCEMENT

Summary

- Characteristic strength: 500 N/mm²
- Diameter of bars: 20 mm

IN X-DIRECTION:

In top:

- Number of bars: 18
- Spacing of bars: 160 mm
- Area required: 1950 mm²/m
- Area provided: 1963.5 mm²/m
- Volume of steel: 14599 cm³
- Weight of steel: 114.6 kg

IN Y-DIRECTION:

### QUANTITIES

- Total concrete volume: 36.5 m³
- Total area of formwork: 47.28 m²
Location: Ex3 - Cap for lightly-loaded column

Bottom layer of main steel is assumed to run in X-direction.

Pilecap for seven piles

Designed using bending theory to EC2 Part 1-1. Seventh pile is located directly beneath column. Main reinforcement is arranged in bands // to principal axes and is symmetrical about pile centres. Ultimate values for load & moment to be used.

Total design load on column N=500 kN
Column dimension cx cx=300 mm
Column dimension cy cy=300 mm
Nominal pile diameter PileD=250 mm
Partial safety factor for steel gams=1.15
Partial safety factor for conc. gamc=1.5
Spacing of pile ctrs in X-dir AX=750 mm
Overhang: pile face to cap edge olap=150 mm
Spacing of pile ctrs in Y-dir AY=650 mm
Breadth of pile cap ly=1850 mm
Maximum length of pile cap lx=2135 mm
Minimum length of pile cap lx'=1067.6 mm
Char yield strength of reinft. fyk=500 N/mm²
Cover to underside of main bars Cover=150 mm
Side and top cover to main bars Scvr=75 mm
Chosen depth of pilecap h=400 mm

Design of main steel in X-direction

Main steel diameter diaX=12 mm
Main steel spacing SpcX=165 mm

Design of main steel in Y-direction

Main steel diameter diaY=12 mm
Main steel spacing SpcY=160 mm

Distribution steel

Distribution steel diameter LSize=12 mm
Spacing of bars LSpac=185 mm
Area of dist steel provided A2=PI*LSize^2*250/LSpac=611.3 mm²/m
Check shear resistance in X-direction

Shear force due to ultimate load  \( V_{Ed} = 3 \times N/7 + M_{x}' \times 1000/AX = 214.3 \text{ kN} \)

Shear resistance  \( VR_{dc} = \beta' \times CR_{dc} \times ks \times v_{Rdc} \times bw \times d/1000 = 642.8 \text{ kN} \)

Modified shear resistance  \( VR_{dc} = VR_{dm} = 715.3 \text{ kN} \)

SHEAR SUMMARY

<table>
<thead>
<tr>
<th>shear force</th>
<th>214.3 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>shear resistance</td>
<td>715.3 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check shear resistance in Y-direction

Shear force due to ultimate load  \( V_{Ed} = N/7 + M_{y}' \times 1000/AY = 142.9 \text{ kN} \)

Shear resistance  \( VR_{dc} = \beta' \times CR_{dc} \times ks \times v_{Rdc} \times bw \times d/1000 = 192.6 \text{ kN} \)

SHEAR SUMMARY

<table>
<thead>
<tr>
<th>shear force</th>
<th>142.9 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>shear resistance</td>
<td>192.6 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear

Check punching shear at column face:
Eccentricity factor \( \beta \)  \( \beta = 1 \)
Shear stress at column perimeter  \( v_{Ed} = \beta \times V_{Ed} \times 1000/(uo \times d) = 1.796 \text{ N/mm}^2 \)

Maximum punching shear resistance  \( v_{Rd}_{max} = 0.5 \times v \times f_{cd} = 4.973 \text{ N/mm}^2 \)

Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

- Spacing of bars: 250 mm

## QUANTITIES

- Total concrete volume: 1.185 m³
- Total area of formwork: 2.563 m²
Location: Pilecap at G3

Design to BS8110(1997) with partial safety factor for steel $\gamma_S=1.15$.
Bottom layer of main steel is assumed to run in X-direction.

### Pilecap for eight piles

Designed by Bending Theory. Calculations are in accordance with BS8110.
Main reinforcement is arranged in bands parallel to principal axes and is symmetrical about pile centres.

For bond calculations, any high-yield bars are assumed Type 2: deformed.

---

**Total ultimate load on column** $N=11200$ kN  
**Nominal pile diameter** $PileD=450$ mm  
**Column dimension cx** $cx=500$ mm  
**Column dimension cy** $cy=500$ mm  
**Spc.of pile ctrs in X-direction** $AX=1350$ mm  
**Overhang: pile face to cap edge** $olap=150$ mm  
**Length of pile cap** $lx=3450$ mm

### Design of main steel in X-direction

Main steel diameter $diaX=20$ mm  
Main steel spacing $SpcX=135$ mm

### Design of main steel in Y-direction

Main steel diameter $diaY=20$ mm  
Main steel spacing $SpcY=145$ mm

### Distribution steel

Diameter of bar $LSize=20$ mm  
Spacing of bars $LSpac=160$ mm  
Area of dist.steel provided $A2=\pi\times LSize^2\times 250/LSpac=1963.5$ mm$^2$/m
Check shear resistance in X-direction (Cl.3.11.4.4)

Total shear resistance provided: \( V_{\text{Prov}} = \frac{(V_{\text{Mod}} \times CP1Xs + vc \times CP2Xs) \times \text{EffDX}}{1E3} = 11006 \text{ kN} \)

Total shear resistance required: \( = 4200 \text{ kN} \)

Shear resistance in X-direction is satisfactory.

Check shear resistance in Y-direction - Clause 3.11.4.4

Total shear resistance provided: \( V_{\text{Prov}} = \frac{(V_{\text{Mod}} \times CP1Ys + vc \times CP2Ys) \times \text{EffDY}}{1E3} = 4354.9 \text{ kN} \)

Total shear resistance required: \( = 4200 \text{ kN} \)

Shear resistance in Y-direction is satisfactory.

Check punching shear at column face - Clause 3.11.4.5

Punching-shear resistance provided: \( V_{\text{pR1}} = V_{\text{max}} \times 2 \times (cx \times \text{EffDY} + cy \times \text{EffDX}) / 1E3 = 12589 \text{ kN} \)

Punching-shear resistance required: \( = 11200 \text{ kN} \)

Punching-shear stress on column perimeter is satisfactory.

  - Weight of steel: 17.579 kg

### SIDE BARS SUMMARY
- Characteristic strength: 500 N/mm²
- Diameter of bars: 12 mm
- Total number of bars: 4
- Spacing of bars: 250 mm
- Volume of steel: 1207.9 cm³
- Weight of steel: 9.4819 kg

### QUANTITIES
- Total concrete volume: 1.8777 m³
- Total area of formwork: 3.196 m²
- Total volume of steel: 11615 cm³
- Total weight of steel: 91.179 kg

- Approx. self-weight of pile cap: 63.089 kN
- Approx. total load on each pile: 71 kN
Location: Ex1 - Pilecap at G3

Bottom layer of main steel is assumed to run in X-direction.

Total design load on column \( N = 12000 \) kN
Nominal pile diameter \( PileD = 450 \) mm
Column dimension \( cx = 500 \) mm
Column dimension \( cy = 500 \) mm
Partial safety factor for steel \( \gamma_{ms} = 1.15 \)
Partial safety factor for conc. \( \gamma_{mc} = 1.5 \)
Spacing of pile ctrs in X-dir \( AX = 1350 \) mm
Overhang: pile face to cap edge \( olap = 150 \) mm
Length of pile cap \( lx = 3450 \) mm
Spacing of pile ctrs in Y-dir \( AY = 1169 \) mm
Breadth of pile cap \( ly = 3088 \) mm
Char yield strength of reinf. \( f_{yk} = 500 \) N/mm²
Cover to underside of main bars \( Cover = 150 \) mm
Side and top cover to main bars \( Scvr = 75 \) mm
Chosen depth of pilecap \( h = 1500 \) mm

Design of main steel in X-direction
Main steel diameter \( diaX = 16 \) mm
Main steel spacing \( SpcX = 85 \) mm

Design of main steel in Y-direction
Main steel diameter \( diaY = 16 \) mm
Main steel spacing \( SpcY = 85 \) mm

Distribution steel
Distribution steel diameter \( LSize = 25 \) mm
Spacing of bars \( LSpac = 215 \) mm
Area of dist. steel provided \( \frac{2 \pi \cdot LSize^2 \cdot 250}{LSpac} = 2283 \) mm²/m
Check shear resistance in X-direction

At Critical Plane 1:
Shear force due to ultimate load \( V_{Ed} = \frac{3N}{8} + Mx' * 1000 / AX = 4200 \text{ kN} \)
Shear resistance \( \frac{\beta'^*CR_{dc}*ks*v_{Rdc}*bw*d}{1000} = 4847 \text{ kN} \)
Modified shear resistance \( \frac{VR_{dc} = VR_{dm} = 5355 \text{ kN}}{1000} \)

</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear at column face

Check punching shear at column face:
Eccentricity factor \( \beta = 1 \)
Shear stress at column perimeter \( \frac{v_{Ed} = \beta*V_{Ed}*1000}{(uo*d)} = 4.223 \text{ N/mm}^2 \)
Maximum punching shear resistance \( v_{Rdmax} = 0.5*v*f_{cd} = 5.581 \text{ N/mm}^2 \)
Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

| Total concrete volume   | 84.05 m³ |
| Total area of formwork  | 82 m²    |
Location: Ex3 - Cap for lightly-loaded column

Bottom layer of main steel is assumed to run in X-direction.

---

Pilecap for eight piles

 Designed using bending theory to EC2 Part 1-1. Main reinforcement is arranged in bands // to principal axes and is symmetrical about pile centres. Ultimate load & moment values to be used.

---

Total design load on column $N = 500$ kN
Nominal pile diameter $PileD = 250$ mm
Column dimension $cx = 300$ mm
Column dimension $cy = 300$ mm
Partial safety factor for steel $\gamma_m = 1.15$
Partial safety factor for conc. $\gamma_c = 1.5$
Spacing of pile ctrs in X-dir $AX = 750$ mm
Overhang: pile face to cap edge $olap = 300$ mm
Length of pile cap $lx = 2350$ mm
Spacing of pile ctrs in Y-dir $AY = 650$ mm
Breadth of pile cap $ly = 2350$ mm
Char yield strength of reinft. $f_{yk} = 500$ N/mm$^2$
Cover to underside of main bars $Cover = 150$ mm
Side and top cover to main bars $Scvr = 75$ mm
Chosen depth of pilecap $h = 400$ mm

---

**Design of main steel in X-direction**

Main steel diameter $diaX = 12$ mm
Main steel spacing $SpcX = 180$ mm

**Design of main steel in Y-direction**

Main steel diameter $diaY = 12$ mm
Main steel spacing $SpcY = 180$ mm

**Distribution steel**

Distribution steel diameter $LSize = 12$ mm
Spacing of bars $LSpac = 185$ mm
Area of dist. steel provided $A2 = \pi * LSize^2 * 250 / LSpac = 611.3$ mm$^2$/m
Check shear resistance in X-direction

At Critical Plane 1:
Shear force due to ultimate load \( V_{Ed} = \frac{3}{8}N + M_x' \times 1000/AX = 187.5 \text{ kN} \)
Shear resistance \( V_{Rd\text{c}} = \beta' \times C_{Rd} \times k_s \times v_{Rd} \times bw \times d/1000 = 751.2 \text{ kN} \)
Modified shear resistance \( V_{Rd} = V_{Rd\text{m}} = 792.7 \text{ kN} \)

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Shear force</th>
<th>187.5 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>792.7 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

At Critical Plane 2:
Shear force due to ultimate load \( V_{Ed} = N/4 + M_x' \times 1000/AX = 125 \text{ kN} \)
Shear resistance \( V_{Rd\text{c}} = \beta' \times C_{Rd} \times k_s \times v_{Rd} \times bw \times d/1000 = 230.9 \text{ kN} \)
Modified shear resistance \( V_{Rd} = V_{Rd\text{m}} = 243.6 \text{ kN} \)

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Shear force</th>
<th>125 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>243.6 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check shear resistance in Y-direction

Shear force due to ultimate load \( V_{Ed} = \frac{3}{8}N + M_y' \times 1000/AY = 187.5 \text{ kN} \)
Shear resistance \( V_{Rd\text{c}} = \beta' \times C_{Rd} \times k_s \times v_{Rd} \times bw \times d/1000 = 262.5 \text{ kN} \)
Modified shear resistance \( V_{Rd} = V_{Rd\text{m}} = 282.7 \text{ kN} \)

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Shear force</th>
<th>187.5 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>282.7 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear at column face

Check punching shear at column face:
Eccentricity factor \( \beta \) \( \beta = 1 \)
Shear stress at column perimeter \( v_{Ed} = \beta \times V_{Ed} \times 1000/(uo \times d) = 1.796 \text{ N/mm}^2 \)
Maximum punching shear resistance \( v_{Rd\text{max}} = 0.5 \times v \times f_{cd} = 4.973 \text{ N/mm}^2 \)
Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

Check punching shear at 2d:
Shear stress at control perimeter \( v_{Ed} = \beta \times V_{Ed} \times 1000/(u_1 \times d) = 1.006 \text{ N/mm}^2 \)
Design punching shear resistance \( v_{Rd} = (0.18/g_{amc}) \times k \times (100*p_1 f_{ck})^{0.33} = 0.333 = 0.4594 \text{ N/mm}^2 \)
Enhanced punching shear resistance \( v_{Rd} = senh \times v_{Rd} = 1.421 \text{ N/mm}^2 \)
Design punching shear resistance \( v_{Rd} = senh \times 0.035 \times k \times 1.5 \times f_{ck}^{0.5} = 1.534 \text{ N/mm}^2 \)

Check punching shear at 2d:
Shear stress at control perimeter \( v_{Ed} = \beta \times V_{Ed} \times 1000/(u_1 \times d) = 0.4176 \text{ N/mm}^2 \)
Design punching shear resistance \( v_{Rd} = (0.18/g_{amc}) \times k \times (100*p_1 f_{ck})^{0.33} = 0.333 = 0.4594 \text{ N/mm}^2 \)
Enhanced punching shear resist. \( v_{\text{Rdc}} = s e n h \cdot v_{\text{Rdc}} = 0.5016 \, \text{N/mm}^2 \)

Design punching shear resistance \( v_{\text{Rdc}} = s e n h \cdot 0.035 \cdot k^1.5 \cdot f_{\text{ck}}^0.5 \) = 0.5415 \( \text{N/mm}^2 \)

- Characteristic strength: 250 N/mm²
- Diameter of bars: 50 mm

**IN X-DIRECTION:**
- In top:
  - Number of bars: 14
  - Spacing of bars: 285 mm
  - Area required: 6816 mm²/m
  - Area provided: 6889.5 mm²/m
  - Volume of steel: 108581 cm³
  - Weight of steel: 852.36 kg

**IN Y-DIRECTION:**
- In top:
  - Number of bars: 14
  - Spacing of bars: 285 mm
  - Area required: 6816 mm²/m
  - Area provided: 6889.5 mm²/m
  - Volume of steel: 108581 cm³
  - Weight of steel: 852.36 kg

### SIDE BARS SUMMARY

- Characteristic strength: 250 N/mm²
- Diameter of bars: 12 mm
- Total number of bars: 44
- Spacing of bars: 250 mm
- Volume of steel: 21896 cm³
- Weight of steel: 171.88 kg

### QUANTITIES

- Total volume of concrete needed: 47.74 m³
- Total area of formwork: 46.576 m²
- Total volume of steel: 673585 cm³
- Total weight of steel: 5287.6 kg
- Approx. self-weight of pile cap: 1604.1 kN
- Approx. total load on each pile: 3512 kN
Location: Cap for lightly-loaded column

Design to BS8110(1997) with partial safety factor for steel \( \gamma_S = 1.15 \). Bottom layer of main steel is assumed to run in X-direction.

**Pilecap for nine piles**

Based on Bending Theory. Calculations are in accordance with BS8110. Main reinforcement is arranged in bands parallel to principal axes and is symmetrical about pile centres.

For bond calculations, any high-yield bars are assumed Type 2: deformed.

Total ultimate load on column \( N = 500 \text{ kN} \)
Nominal pile diameter \( P = 250 \text{ mm} \)
Column dimension \( cx = 300 \text{ mm} \)
Column dimension \( cy = 300 \text{ mm} \)
Spc.of pile ctrs in X-direction \( AX = 750 \text{ mm} \)
Overhang: pile face to cap edge \( olap = 300 \text{ mm} \)
Length of pile cap \( lx = 2350 \text{ mm} \)
Spc.of pile ctrs in Y-direction \( AY = 750 \text{ mm} \)
Breadth of pile cap \( ly = 2350 \text{ mm} \)
Concrete grade \( f_{cu} = 35 \text{ N/mm}^2 \)
Steel strength \( f_y = 500 \text{ N/mm}^2 \)
Cover to underside of main bars \( Cover = 150 \text{ mm} \)
Side and top cover to main bars \( Scvr = 75 \text{ mm} \)
Chosen depth of pilecap \( h = 300 \text{ mm} \)

**Design of main steel in X-direction**

Main steel diameter \( \text{diaX} = 16 \text{ mm} \)
Main steel spacing \( \text{SpcX} = 225 \text{ mm} \)

**Design of main steel in Y-direction**

Main steel diameter \( \text{diaY} = 12 \text{ mm} \)
Main steel spacing \( \text{SpcY} = 105 \text{ mm} \)

**Distribution steel**

Diameter of bar \( \text{LSize} = 12 \text{ mm} \)
Spacing of bars \( \text{LSpac} = 285 \text{ mm} \)

Location: Ex1 - Pilecap at G3

Bottom layer of main steel is assumed to run in X-direction.

Pilecap for nine piles

Designed using bending theory to EC2 Part 1-1. Main reinforcement is arranged in bands // to principal axes and is symmetrical about pile centres. Ultimate load and moment values to be used. Ninth pile is located under column.

Total design load on column N=10600 kN
Nominal pile diameter PileD=450 mm
Column dimension cx cx=500 mm
Column dimension cy cy=500 mm
Partial safety factor for steel gamS=1.15
Partial safety factor for conc. gamC=1.5
Spacing of pile ctrs in X-dir AX=1350 mm
Overhang: pile face to cap edge olap=150 mm
Length of pile cap lx=3450 mm
Spacing of pile ctrs in Y-dir AY=1350 mm
Breadth of pile cap ly=3450 mm
Char yield strength of reinft. fyk=500 N/mm²
Cover to underside of main bars Cover=150 mm
Side and top cover to main bars Scvr=75 mm
Chosen depth of pilecap h=1690 mm

Design of main steel in X-direction

Main steel diameter diaX=20 mm
Main steel spacing SpcX=120 mm

Design of main steel in Y-direction

Main steel diameter diaY=20 mm
Main steel spacing SpcY=120 mm

Distribution steel

Distribution steel diameter LSize=25 mm
Spacing of bars LSpac=190 mm
Area of dist.steel provided A2=PI*LSize^2*250/LSpac=2584 mm²/m
Check shear resistance in X-direction

At Critical Plane 1:
Shear force due to ultimate load \( V_{Ed} = \frac{N}{3} + M_x' \times 1000 / A_X = 3533 \text{ kN} \)
Shear resistance \( V_{Rdc} = \beta' \times C_{Rdc} \times k_s \times v_{Rdc} \times b_w \times d / 1000 = 4778 \text{ kN} \)
Modified shear resistance \( V_{Rdc} = V_{Rdm} = 5265 \text{ kN} \)

<table>
<thead>
<tr>
<th>SHEAR SUMMARY</th>
<th>Shear force</th>
<th>3533 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Shear resistance</td>
<td>5265 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check shear resistance in Y-direction

Shear force due to ultimate load \( V_{Ed} = \frac{N}{3} + M_y' \times 1000 / A_Y = 3533 \text{ kN} \)
Shear resistance \( V_{Rdc} = \beta' \times C_{Rdc} \times k_s \times v_{Rdc} \times b_w \times d / 1000 = 4682 \text{ kN} \)
Modified shear resistance \( V_{Rdc} = V_{Rdm} = 5142 \text{ kN} \)

<table>
<thead>
<tr>
<th>SHEAR SUMMARY</th>
<th>Shear force</th>
<th>3533 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Shear resistance</td>
<td>5142 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

Check punching shear

Check punching shear at column face:
Eccentricity factor \( \beta \) \( \beta = 1 \)
Shear stress at column perimeter \( v_{Ed} = \beta \times V_{Ed} \times 1000 / (u_0 \times d) = 3.51 \text{ N/mm}^2 \)
Maximum punching shear resistance \( v_{Rdmax} = 0.5 \times v \times f_{cd} = 5.581 \text{ N/mm}^2 \)
Shear stress at column perimeter is within the maximum punching shear resistance, hence satisfactory.

RC retaining wall to BS8002

Using either Rankine or Coulomb theory, the following assumptions are made:

- surface of rupture is a plane
- point of resultant pressure P on back of wall is at one third of the distance up from the base of the wall.

Weight/unit vol. of retained soil \( w = 18.8 \text{ kN/m}^3 \)
Height of wall \( h = 4.38 \text{ m} \)
Load above wall supported on stem \( v_o = 0 \text{ kN/m} \)
Angle of slope of soil (if any) \( \theta = 0^\circ \)
Internal friction angle of soil \( \phi = 30^\circ \)
Angle of wall-to-soil friction \( \delta = 20^\circ \)
Friction factor on underside base \( f_b = 0.4 \)
Thickness of wall \( t = 0.22 \text{ m} \)
Density of wall (stem) \( d_t = 24 \text{ kN/m}^3 \)

**Forces and moments on wall**

Maximum B.M. at base of stem \( M = Ph/h/3 + Psh/h/2 = 87.762 \text{ kNm/m} \)
Maximum S.F. at base of stem \( S = Ph + Psh = 60.111 \text{ kN/m} \)

**Base**

Thickness of base \( d = 0.19 \text{ m} \)
Length of base \( L = 3.124 \text{ m} \)
Distance from A to centre of stem \( x = 1.86 \text{ m} \)
Depth of soil over base at toe \( d_b = 0 \text{ m} \)
Depth of soil for passive resist. \( d_p = 1.5 \text{ m} \)
Allowable ground pressure \( p = 75 \text{ kN/m}^2 \)
Centroid of load lies within middle third. Pressure varies from pa at A to pb at B.

\[ \text{Max pressure is at B \quad p_{\text{max}} = pb = 62.75 \, \text{kN/m}^2} \]

As p\textsubscript{max} does not exceed \( p \) (62.75 kN/m\(^2\) \leq 75 kN/m\(^2\)), pressure beneath base is within specified limit.

**Shear forces and bending moments on base**

- Total S.F. on toe (plus is up) \( \text{Sw}_{b} = \frac{(p_{wb}+pb)}{2-dt\cdot d} \cdot (xl-t/2)-wf \)
  \[= 65.165 \, \text{kN/m} \]
- Total S.F. on heel (plus is up) \( \text{Sw}_{a} = \text{Sau} - \text{Sad} = -54.011 \, \text{kN/m} \)
- Total B.M. on toe (plus is up) \( \text{M}_{wb} = \frac{(2\cdot pb+p_{wb})\cdot (xl-t/2)^2}{6-M_{bd}} \)
  \[= 37.982 \, \text{kNm/m} \]
- Total B.M. on heel (plus is up) \( \text{M}_{wa} = \frac{(2\cdot pa+p_{wa})\cdot (x-t/2)^2}{6-M_{ad}} \)
  \[= -48.592 \, \text{kNm/m} \]

**Resistance to sliding**

- FoS sliding (frict.resist.only) \( \text{FOS}_{f} = \frac{F}{St} = 1.1093 \)
- FoS sliding (friction/cohesion + passive) \( \text{FOS}_{f2} = \frac{(F+R)}{St} = 2.0789 \)

**Resistance to overturning**

Rotation assumed to occur about lowest forward edge of base (i.e. toe).
Safety factors against overturning:
- Including vert.comp.of pressure \( \text{FOS}_{O} = \frac{Mr_{1}}{Mot} = 3.7675 \)
- Ignoring vert.comp.of pressure \( \text{FOS}_{O2} = \frac{Mr_{2}}{Mot} = 3.7675 \)
**Design Summary**

- Moment at base of stem: 87.762 kNm
- Shear at base of stem: 60.111 kN
- Moment at c-c (toe): 37.982 kNm
- Shear at c-c (toe): 65.165 kN
- Moment at c-c (heel): -48.592 kNm
- Shear at c-c (heel): -54.011 kN

FoS for Overturning:
1. With vertical component of earth pressure considered: 3.7675
2. Ignoring vertical component of earth pressure: 3.7675

FoS for Sliding:
1. Friction only: 1.1093
2. Friction+passive: 2.0789

Pressure at A: 53.43 kN/m²
Pressure at B: 62.75 kN/m²
Allowable GBP: 75 kN/m²

NOTE: The sliding resistance calculation check assumes that a heel beam/key will be provided to the underside of base.
Location: Massive, heavily-loaded wall with cohesionless soil

RC retaining wall to BS8002

Using either Rankine or Coulomb theory, the following assumptions are made:

- surface of rupture is a plane
- point of resultant pressure P on back back of wall is at one third of the distance up from the base of the wall.

Weight/unit vol.of retained soil \( w = 25 \) kN/m\(^3\)
Height of wall \( h = 20 \) m
Depth of soil surcharge \( ds = 5 \) m
Load above wall supported on stem \( vo = 1000 \) kN/m
Angle of slope of soil (if any) \( \theta = 15^\circ \)
Internal friction angle of soil \( \phi = 35^\circ \)
Angle of wall-to-soil friction \( \delta = 23.333^\circ \)
Friction factor on underside base \( f_b = 0.4 \)
Thickness of wall \( t = 1.5 \) m
Density of wall (stem) \( d_t = 24 \) kN/m\(^3\)

Forces and moments on wall

Maximum B.M. at base of stem \( M = Ph^h/3 + Psh^h/2 = 16100 \) kNm/m
Maximum S.F. at base of stem \( S = Ph + Psh = 2087.8 \) kN/m

Base

Thickness of base \( d = 2 \) m
Length of base \( L = 20 \) m
Distance from A to centre of stem \( x = 15 \) m
Depth of soil over base at toe \( db = 0 \) m
Depth of soil for passive resist. \( dp = 2 \) m
Allowable ground pressure \( p = 700 \text{ kN/m}^2 \)

Centroid of load lies within middle third. Pressure varies from \( p_a \) at A to \( p_b \) at B.

\[
\begin{array}{c}
\text{A} \\
\text{pa} \\
\text{B} \\
\text{pb}
\end{array}
\]

Maximum pressure is at B \( p_{\text{max}} = p_b = 680.73 \text{ kN/m}^2 \)

As \( p_{\text{max}} \) does not exceed \( p \) (\( 680.73 \text{ kN/m}^2 \leq 700 \text{ kN/m}^2 \)), pressure beneath base is within specified limit.

**Shear forces and bending moments on base**

Total S.F. on toe (plus is up) \( S_{\text{wb}} = \frac{(p_{\text{wb}} + p_b)}{2} - d_t \cdot d \cdot (x_1 - t/2) - w_f \)
\[= 2657.2 \text{ kN/m} \]

Total S.F. on heel (plus is up) \( S_{\text{wa}} = S_{\text{au}} - S_{\text{a}} = -1218 \text{ kN/m} \)

Total B.M. on toe (plus is up) \( M_{\text{wb}} = \frac{(2 \cdot p_b + p_{\text{wb}}) \cdot (x_1 - t/2)^2}{6} - M_{\text{bd}} \)
\[= 5669.2 \text{ kNm/m} \]

Total B.M. on heel (plus is up) \( M_{\text{wa}} = \frac{(2 \cdot p_a + p_{\text{wa}}) \cdot (x - t/2)^2}{6} - M_{\text{a}} \)
\[= -11146 \text{ kNm/m} \]

**Resistance to sliding**

FoS sliding (friction resistance only) \( F_{\text{OSF}} = \frac{F}{S_t} = 2.1557 \)

FoS sliding (friction/cohesion + passive) \( F_{\text{OSF2}} = \frac{(F + R)}{S_t} = 2.2328 \)

**Resistance to overturning**

Rotation assumed to occur about lowest forward edge of base (i.e. toe).

Safety factors against overturning:

Including vert. comp. of pressure \( F_{\text{OSOT1}} = \frac{M_r}{M_{\text{ot}}} = 7.2725 \)

Ignoring vert. comp. of pressure \( F_{\text{OSOT2}} = \frac{M_r}{M_{\text{ot}}} = 7.0898 \)
Design Summary

- Moment at base of stem: 16100 kNm
- Shear at base of stem: 2087.8 kN
- Moment at c-c (toe): 5669.2 kNm
- Shear at c-c (toe): 2657.2 kN
- Moment at c-c (heel): -11146 kNm
- Shear at c-c (heel): -1218 kN

For Overturning:
1. With vertical component of earth pressure considered: 7.2725
2. Ignoring vertical component of earth pressure: 7.0898

For Sliding:
1. Friction only: 2.1557
2. Friction+passive: 2.2328

Pressure at A: 610.08 kN/m²
Pressure at B: 680.73 kN/m²
Allowable GBP: 700 kN/m²
Location: Cohesive soil, triangular soil pressure dist.

RC retaining wall to BS8002

Using either Rankine or Coulomb theory, the following assumptions are made:

- surface of rupture is a plane
- point of resultant pressure P on back back of wall is at one third of the distance up from the base of the wall.

Weights

- Weight/unit vol. of retained soil: $w=20\text{ kN/m}^3$
- Height of wall: $h=6\text{ m}$
- Pressure due to surcharge: $press=100\text{ kN/m}^2$
- Load above wall supported on stem: $vo=0\text{ kN/m}$
- Angle of slope of soil (if any): $\theta=-10^\circ$
- Internal friction angle of soil: $\phi=35^\circ$
- Angle of wall-to-soil friction: $\delta=23.333^\circ$
- Cohesion of clay under base: $fc=100\text{ kN/m}^2$
- Thickness of wall: $t=0.22\text{ m}$
- Density of wall (stem): $dt=24\text{ kN/m}^3$

Forces and moments on wall

- Maximum B.M. at base of stem: $M=Ph^3/3+Psh^3/2=594.42\text{ kNm/m}$
- Maximum S.F. at base of stem: $S=Ph+Psh=222.56\text{ kN/m}$

Base

- Thickness of base: $d=0.4\text{ m}$
- Length of base: $L=5.25\text{ m}$
- Distance from A to centre of stem: $x=0.11\text{ m}$
- Depth of soil over base at toe: $db=2\text{ m}$
- Depth of soil for passive resist: $dp=4\text{ m}$
Allowable ground pressure \( p = 500 \text{ kN/m}^2 \)

Centroid of load outside middle third giving triangular distribution of pressure.
Pressure varies from 0 at distance \( dp \) from A to a maximum of \( pb \) at B.

\[
\begin{align*}
A & \quad \text{dp} \quad \text{lb} \quad \text{B} \\
\text{\textbackslash} \text{\textbackslash} \text{\textbackslash} \text{\textbackslash} \text{\textbackslash} \text{\textbackslash} \\
\text{pb}
\end{align*}
\]

Maximum pressure is at B \( p_{\text{max}} = pb = 150.9 \text{ kN/m}^2 \)
As \( p_{\text{max}} \) does not exceed \( p \) (\( 150.9 \text{ kN/m}^2 \leq 500 \text{ kN/m}^2 \)), pressure beneath base is within specified limit.

**Shear forces and bending moments on base**

Total S.F. on toe (plus is up) \( S_{wb} = \frac{(p_{wb} + pb)}{2} \cdot d \cdot (x_1 - t/2) - w_f = 137.74 \text{ kN/m} \)

Total S.F. on heel (plus is up) \( S_{wa} = -dt \cdot d \cdot (x - t/2) - w_{be} - w_{bs} = 0 \text{ kN/m} \)

Total B.M. on toe (plus is up) \( M_{wb} = \frac{2 \cdot pb + p_{wb}}{6} \cdot (x_1 - t/2)^2 - M_{bd} = 658.12 \text{ kNm/m} \)

Total B.M. on heel (plus is up)

**Resistance to sliding**

FoS sliding (cohes. resist. only) \( F_{OSF} = \frac{F}{St} = 1.0637 \)

FoS sliding (friction/cohesion + passive) \( F_{OSF2} = \frac{F + R}{St} = 3.5101 \)

**Resistance to overturning**

Rotation assumed to occur about lowest forward edge of base (i.e. toe).
Safety factors against overturning:

Including vert. comp. of pressure \( F_{OSOT1} = \frac{Mr1}{Mot} = 1.9682 \)

Ignoring vert. comp. of pressure \( F_{OSOT2} = \frac{Mr2}{Mot} = 1.17 \)
**Design Summary**

- Moment at stem base: 594.42 kNm
- Shear at stem base: 222.56 kN
- Moment on toe: 658.12 kNm
- Shear on toe: 137.74 kN

**FoS for Overturning**

1. With vertical component of earth pressure considered: 1.9682
2. Ignoring vertical component of earth pressure: 1.17

**FoS for Sliding**

1. Friction only: 1.0637
2. Friction + passive: 3.5101

Maximum pressure at B: 150.9 kN/m²
Allowable GBP: 500 kN/m²

NOTE: The sliding resistance calculation check assumes that a heel beam/key will be provided to the underside of base.
Location: Ex1 - RC retaining wall

Reinforced concrete retaining wall to EC7

Using either Rankine or Coulomb theory, the following assumptions are made:

- the surface of rupture is assumed to be plane
- point of resultant pressure P on back of wall is at one third of the distance up from the base of the wall.

Weight/unit vol. of retained soil \( w = 18.8 \text{ kN/m}^3 \)
Wall height \( h = 4 \text{ m} \)
Load above wall supported on stem \( v_0 = 0 \text{ kN/m} \)
Angle of slope of soil (if any) \( \theta = 0^\circ \)
Angle of wall-to-soil friction \( \delta = 0^\circ \)
Friction factor @ underside base \( f_b = 0.5 \)
Thickness of wall \( t = 0.3 \text{ m} \)
Base thickness \( d = 0.3 \text{ m} \)
Density of wall (stem) \( \text{den} = 25 \text{ kN/m}^3 \)

Forces and moments on wall - SLS

compute \( M_1 = Ph^*(d/2+h/3) = 74.364 \text{ kNm/m} \)
compute \( M_2 = Psh^*(d/2+h/2) = 0 \text{ kNm/m} \)
Maximum stem bending moment \( M = M_1 + M_2 = 74.364 \text{ kNm/m} \)
Horizontal shear at base of stem \( V = Ph + Psh = 50.133 \text{ kNm/m} \)

Check bearing pressures - SLS

Length of base \( L = 3.124 \text{ m} \)
Distance from A to centre of stem \( x = 1.86 \text{ m} \)
Depth of soil over base at toe \( d_b = 0 \text{ m} \)
Depth of soil for passive resist. \( d_p = 1.2 \text{ m} \)
Allowable ground pressure \( p = 75 \text{ kN/m}^2 \)
Centroid of load lies within middle third. Pressure varies from pa at A to pb at B.

\[
\begin{array}{c}
A \quad \text{pa} \quad \_ \quad \_ \quad \_ \quad B
\end{array}
\]

Maximum pressure is at B  \( p_{\text{max}} = pb = 58.921 \text{ kN/m}^2 \)

As \( p_{\text{max}} \leq p \) (58.921 kN/m\(^2\) \leq 75 \text{ kN/m}^2), the pressure beneath base is within the specified limit.

**Partial factors - ULS load combination 1**

Partial load factor (backfill)  \( g_1 = 1 \)
Partial load factor (v.surcharge)  \( g_2 = 0 \)

**Forces and moments on wall - ULS load combination 1**

Stem design moment  \( M_{Ed1} = g_4 * M_1 + g_5 * M_2 = 100.39 \text{ kNm/m} \)
Horizontal shear at base of stem  \( V_{Ed1} = g_4 * P_h + g_5 * P_{sh} = 67.679 \text{ kN/m} \)

**Bearing pressures - ULS load combination 1**

Centroid of load lies within middle third. Pressure varies from pal at A to pbl at B.

\[
\begin{array}{c}
A \quad \text{pal} \quad \_ \quad \_ \quad \_ \quad B
\end{array}
\]

Maximum pressure is at B  \( p_{\text{max}} = pb = 84.699 \text{ kN/m}^2 \)

**Shear forces and bending moments on base - ULS load combination 1**

Total S.F. on toe (plus is up)  \( Sw_b = ((p_{wb} + p_{b1})/2 - \text{den}*d) \times (x_1-t/2) - w_f 1 = 77.877 \text{ kN/m} \)
Total S.F. on heel (plus is up)  \( Sw_a = S_{au} - S_{ad} = -47.372 \text{ kN/m} \)
Total B.M. on toe (plus is up)  \( M_{wb} = (2*p_{b1} + p_{wb}) \times (x_1-t/2)^2/6 - M_{bd} = 44.885 \text{ kNm/m} \)
Total B.M. on heel (plus is up)  \( M_{wa} = (2*p_{b1} + p_{a1}) \times (x-t/2)^2/6 - M_{ad} = -45.958 \text{ kNm/m} \)
Resistance to sliding - ULS (load combinations 1 & 2)

Combination 1:
Sliding force \( S_{For} = S_{t1}' = 114.38 \text{ kN} \)
Friction plus passive resistance \( S_{Res} = F + R = 131.62 \text{ kN} \)
Thus the criterion for sliding is satisfied.

Combination 2:
Coefficient of passive pressure \( K_{p}' = 2.4442 \)
Sliding force \( S_{For} = K_{a2}/K_{a}*(g_{7}P_{1}+g_{8}P_{2}) = 103.99 \text{ kN} \)
Friction plus passive resistance \( S_{Res} = F + R = 124.09 \text{ kN} \)
Thus the criterion for sliding is satisfied.

Resistance to overturning - ULS (load combinations 1 & 2)

Combination 1:
Total restraining mt. (with Mrv) \( Mr_{1} = g_{9}*(M_{re}+M_{rw}+M_{rv}) = 329.66 \text{ kNm/m} \)
ditto (without Mrv) \( Mr_{2} = g_{9}*(M_{re}+M_{rw}) = 329.66 \text{ kNm/m} \)
Total overturning moment \( M_{ot} = Mt_{1} + Mt_{2} = 91.344 \text{ kNm/m} \)

Combination 2:
Total restraining mt. (with Mrv) \( Mr_{1} = g_{9}'*(M_{re}+M_{rw}+M_{rv}) = 329.66 \text{ kNm/m} \)
ditto (without Mrv) \( Mr_{2} = g_{9}'*(M_{re}+M_{rw}) = 329.66 \text{ kNm/m} \)
Total overturning moment \( M_{ot} = Mt_{1} + Mt_{2} = 101.92 \text{ kNm/m} \)

Partial factors - ULS load combination 2

Forces and moments on wall - ULS load combination 2

Stem design moment \( M_{Ed2} = g_{4}M_{1} + g_{5}M_{2} = 74.364 \text{ kNm/m} \)
Horizontal shear at base of stem \( V_{Ed2} = g_{4}Ph + g_{5}P_{sh} = 50.133 \text{ kN/m} \)

Bearing pressures - ULS load combination 2

\[
Ka_{2} = \frac{1-\sin(\text{rad}(\phi'd_{1}'))}{1+\sin(\text{rad}(\phi'd_{1}'))}
\]
Centroid of load lies within middle third. Pressure varies from $\overline{pa_2}$ at A to $\overline{pb_2}$ at B.

$$\overline{pa_2} \quad \overline{-}\quad \overline{-}\quad \overline{pb_2}$$

Maximum pressure is at B $\quad p_{max_2}=\overline{pb_2}=70.53 \text{ kN/m}^2$

**Shear forces and bending moments on base - ULS load combination 2**

Total S.F. on toe (plus is up) $\quad S_{wb_2}=\left(\frac{(pwb+pb_2)/2-den*d}{2}\right)*(x_1-t/2) - w_{f_2}=65.343 \text{ kN/m}$

Total S.F. on heel (plus is up) $\quad S_{wa_2}=S_{a_u}-S_{a_d}=-51.275 \text{ kN/m}$

Total B.M. on toe (plus is up) $\quad M_{wb_2}=\left(2*pb_2+pwb\right)*(x_1-t/2)^2/6-M_{b_d} = 37.301 \text{ kNm/m}$

Total B.M. on heel (plus is up) $\quad M_{wa_2}=\left(2*pa_2+pwa\right)*(x-t/2)^2/6-M_{a_d} = -47.112 \text{ kNm/m}$

**Design Summary - ULS load combinations 1 & 2 to EC7**

- Moment at base of stem: 100.39 kNm
- Shear at base of stem: 67.679 kN
- Moment at b-b (toe): 44.885 kNm
- Shear at b-b (toe): 77.877 kN
- Moment at a-a (heel): -47.112 kNm
- Shear at a-a (heel): -51.275 kN

**Pressures under base - SLS**

- Pressure @ A: 57.611 kN/m²
- Pressure @ B: 58.921 kN/m²
- Allowable GBP: 75 kN/m²

NOTE: The sliding resistance calculation check assumes that a heel beam/key will be provided to the underside of base.
Location: Ex2 - Massive, heavily-loaded wall with cohesionless soil

Reinforced concrete retaining wall to EC7

Using either Rankine or Coulomb theory, the following assumptions are made:

- the surface of rupture is assumed to be plane
- point of resultant pressure $P$ on back of wall is at one third of the distance up from the base of the wall.

Weight/unit vol. of retained soil $w=25$ kN/m$^3$
Wall height $h=20$ m
Depth of soil surcharge $ds=5$ m
Load above wall supported on stem $vo=1000$ kN/m
Angle of slope of soil (if any) $\theta=15^\circ$
Angle of wall-to-soil friction $\delta=0^\circ$
Friction factor @ underside base $fb=0.4$
Thickness of wall $t=1.5$ m
Base thickness $d=2$ m
Density of wall (stem) $den=25$ kN/m$^3$

Forces and moments on wall - SLS

$M1=Ph*(d/2+h/3)=10989$ kNm/m
$M2=Psh*(d/2+h/2)=7198.3$ kNm/m
Maximum stem bending moment $M=M1+M2=18188$ kNm/m
Horizontal shear at base of stem $V=Ph+Fsh=2087.8$ kN/m

Check bearing pressures - SLS

Length of base $L=20$ m
Distance from A to centre of stem $x=15$ m
Depth of soil over base at toe $db=0$ m
Depth of soil for passive resist. $dp=3$ m
Allowable ground pressure \( p = 700 \text{ kN/m}^2 \)

Centroid of load lies within middle third. Pressure varies from \( p_a \) at A to \( p_b \) at B.

\[
\begin{array}{c}
A \\
p_a & - & - & - \\
\hline \\
& & & & B \\
\end{array} \quad \begin{array}{c}
p_b \\
\end{array}
\]

Maximum pressure is at B \( \text{p}_{\text{max}} = 686.48 \text{ kN/m}^2 \)

As \( \text{p}_{\text{max}} \leq p \ (686.48 \text{ kN/m}^2 \leq 700 \text{ kN/m}^2) \), the pressure beneath base is within the specified limit.

**Partial factors - ULS load combination 1**

Partial load factor (backfill) \( g_1 = 1 \)
Partial load factor (v.surcharge) \( g_2 = 0 \)

**Forces and moments on wall - ULS load combination 1**

Stem design moment \( \text{M}_{\text{Ed}1} = g_4 \cdot M_1 + g_5 \cdot M_2 = 25633 \text{ kNm/m} \)

Horizontal shear at base of stem \( \text{V}_{\text{Ed}1} = g_4 \cdot P_h + g_5 \cdot P_{sh} = 2916.7 \text{ kN/m} \)

**Bearing pressures - ULS load combination 1**

Centroid of load lies within middle third. Pressure varies from \( p_{a1} \) at A to \( p_{b1} \) at B.

\[
\begin{array}{c}
A \\
p_{a1} & - & - & - \\
\hline \\
& & & & B \\
\end{array} \quad \begin{array}{c}
p_{b1} \\
\end{array}
\]

Maximum pressure is at B \( \text{p}_{\text{max}1} = 921.03 \text{ kN/m}^2 \)
Shear forces and bending moments on base - ULS load combination 1

Total S.F. on toe (plus is up) \[ S_{wb} = \frac{(p_{wb}+p_{b1})}{2} - d \times (x_1 - t/2) - w_{f1} \]
= 3430.6 kN/m

Total S.F. on heel (plus is up) \[ S_{wa} = S_{a1} - S_{a2} = -904.01 \text{ kN/m} \]

Total B.M. on toe (plus is up) \[ M_{wb} = \frac{(2*p_{b1} + p_{wb})}{2} \times (x_1 - t/2)^2/6 - M_{bd} \]
= 7482.1 kNm/m

Total B.M. on heel (plus is up) \[ M_{wa} = \frac{(2*p_{a1} + p_{wa})}{2} \times (x - t/2)^2/6 - M_{ad} \]
= -15300 kNm/m

Resistance to sliding - ULS (load combinations 1 & 2)

Combination 1:
Sliding force \[ S_{For} = S_{t1}' = 3818.1 \text{ kN} \]
Friction plus passive resistance \[ S_{Res} = F + R = 4816.8 \text{ kN} \]
Thus the criterion for sliding is satisfied.

Combination 2:
Coefficient of passive pressure \[ K_p' = 2.9117 \]
Sliding force \[ S_{For} = K_a2/K_a \times (g7 * P1 + g8 * P2) = 3443 \text{ kN} \]
Friction plus passive resistance \[ S_{Res} = F + R = 4729.2 \text{ kN} \]
Thus the criterion for sliding is satisfied.

Resistance to overturning - ULS (load combinations 1 & 2)

Combination 1:
Total restraining mt. (with Mrv) \[ M_{r1} = g9 \times (M_{re} + M_{rw} + M_{rv}) = 111094 \text{ kNm/m} \]
Total overturning moment \[ M_{ot} = M_{t1} + M_{t2} = 25391 \text{ kNm/m} \]

Combination 2:
Total restraining mt. (with Mrv) \[ M_{r1} = g9' \times (M_{re} + M_{rw} + M_{rv}) = 111094 \text{ kNm/m} \]
Total overturning moment \[ M_{ot} = M_{t1} + M_{t2} = 26128 \text{ kNm/m} \]

Partial factors - ULS load combination 2

Forces and moments on wall - ULS load combination 2

Stem design moment \[ M_{Ed2} = g4 \times M1 + g5 \times M2 = 20347 \text{ kNm/m} \]
Horizontal shear at base of stem \[ V_{Ed2} = g4 \times Ph + g5 \times Psh = 2284.1 \text{ kN/m} \]
**Bearing pressures - ULS load combination 2**

Centroid of load lies within middle third. Pressure varies from $p_a2$ at $A$ to $p_b2$ at $B$.

Maximum pressure is at $B$  \[ p_{max2} = p_b2 = 802.35 \, \text{kN/m}^2 \]

**Shear forces and bending moments on base - ULS load combination 2**

| Total S.F. on toe (plus is up) | $S_{wb2} = \left( \frac{p_{wb2} + p_b2}{2} - d \cdot d \right) \cdot \left( x_1 - \frac{t}{2} \right)$  | $w_f2 = 2987.3 \, \text{kN/m}$ |
| Total S.F. on heel (plus is up) | $S_{wa2} = S_{au} - S_{ad} = -1354 \, \text{kN/m}$ |
| Total B.M. on toe (plus is up)  | $M_{wb2} = \left( 2 \cdot p_b2 + p_{wb} \right) \cdot \left( x_1 - \frac{t}{2} \right)^2 - M_{bd}$  | $6496.9 \, \text{kNm/m}$ |
| Total B.M. on heel (plus is up) | $M_{wa2} = \left( 2 \cdot p_a2 + p_{wa} \right) \cdot \left( x - \frac{t}{2} \right)^2 - M_{ad}$  | $-16875 \, \text{kNm/m}$ |
Design Summary - ULS load

combinations 1 & 2 to EC7

- Moment at base of stem: 25633 kNm
- Shear at base of stem: 2916.7 kN
- Moment at b-b (toe): 7482.1 kNm
- Shear at b-b (toe): 3430.6 kN
- Moment at a-a (heel): -16875 kNm
- Shear at a-a (heel): -1354 kN

Pressures under base - SLS

- Pressure @ A: 611.33 kN/m²
- Pressure @ B: 686.48 kN/m²
- Allowable GBP: 700 kN/m²

NOTE: The sliding resistance calculation check assumes that a heel beam/key will be provided to the underside of base.
Reinforced concrete retaining wall to EC7

Using either Rankine or Coulomb theory, the following assumptions are made:

- the surface of rupture is assumed to be plane
- point of resultant pressure P on back of wall is at one third of the distance up from the base of the wall.

**Location:** Ex3 - Cohesive soil, triangular soil pressure dist.

- Weight/unit vol. of retained soil: \( w = 20 \text{ kN/m}^3 \)
- Wall height: \( h = 6 \text{ m} \)
- Pressure due to surcharge: \( \text{press} = 50 \text{ kN/m}^2 \)
- Load above wall supported on stem: \( \text{vo} = 0 \text{ kN/m} \)
- Angle of slope of soil (if any): \( \theta = -10^\circ \)
- Angle of wall-to-soil friction \( \delta = 23.33^\circ \)
- Undrained shear strength: \( C_u = 50 \text{ kN/m}^2 \)
- Thickness of wall: \( t = 0.4 \text{ m} \)
- Base thickness: \( d = 0.4 \text{ m} \)
- Density of wall (stem): \( \text{den} = 25 \text{ kN/m}^3 \)

**Forces and moments on wall - SLS**

\[
M_1 = P_h \left( \frac{d}{2} + \frac{h}{3} \right) = 161.18 \text{ kNm/m}
\]

\[
M_2 = P_{sh} \left( \frac{d}{2} + \frac{h}{2} \right) = 238.87 \text{ kNm/m}
\]

Maximum stem bending moment: \( M = M_1 + M_2 = 400.06 \text{ kNm/m} \)

Horizontal shear at base of stem: \( V = P_h + P_{sh} = 147.91 \text{ kN/m} \)

**Check bearing pressures - SLS**

- Length of base: \( L = 5.25 \text{ m} \)
- Distance from A to centre of stem: \( x = 0.2 \text{ m} \)
- Depth of soil over base at toe: \( d_b = 2 \text{ m} \)
- Depth of soil for passive resist.: \( d_p = 4 \text{ m} \)
Allowable ground pressure $p = 500 \text{kN/m}^2$

Centroid of load lies within middle third. Pressure varies from $p_a$ at $A$ to $p_b$ at $B$.

Maximum pressure is at $B$ $p_{max} = p_b = 102.17 \text{kN/m}^2$

As $p_{max} \leq p$ ($102.17 \text{kN/m}^2 \leq 500 \text{kN/m}^2$), the pressure beneath base is within the specified limit.

**Partial factors - ULS load combination 1**

Partial load factor (backfill) $g_1 = 1$
Partial load factor (v.surcharge) $g_2 = 0$

**Forces and moments on wall - ULS load combination 1**

Stem design moment $M_{Ed1} = g_4 M_1 + g_5 M_2 = 575.91 \text{kNm/m}$
Horizontal shear at base of stem $V_{Ed1} = g_4 P_h + g_5 P_{sh} = 210.88 \text{kN/m}$

**Bearing pressures - ULS load combination 1**

Centroid of load lies within middle third. Pressure varies from $p_{a1}$ at $A$ to $p_{b1}$ at $B$.

Maximum pressure is at $B$ $p_{max1} = p_{b1} = 128.4 \text{kN/m}^2$
Shear forces and bending moments on base - ULS load combination 1

Total S.F. on toe (plus is up) \[ S_{wb} = \frac{(p_{wb}+p_{b1})}{2} - \text{den} \cdot d \cdot (x_1-t/2) - w_f \]
= 184.89 kN/m

Total S.F. on heel (plus is up) \[ S_{wa} = S_{a}-S_{d} = 0 \text{ kN/m} \]

Total B.M. on toe (plus is up) \[ M_{wb} = \frac{(2 \cdot p_{b1}+p_{wb})}{2} \cdot (x_1-t/2)^2/6 - M_{bd} \]
= 606.26 kNm/m

Total B.M. on heel (plus is up) \[ M_{wa} = \frac{(2 \cdot p_{a1}+p_{wa})}{2} \cdot (x-t/2)^2/6 - M_{ad} \]
= 0 kNm/m

Resistance to sliding - ULS (load combinations 1 & 2)

Combination 1:
Sliding force \[ S_{For} = S_{t1}' = 502.46 \text{ kN} \]
Cohesion plus passive resistance \[ S_{Res} = F + R = 829.84 \text{ kN} \]
Thus the criterion for sliding is satisfied.

Combination 2:
Coefficient of passive pressure \[ K_p' = 2.9117 \]
Sliding force \[ S_{For} = K_a \cdot g_7 \cdot P_1 + g_8 \cdot P_2 = 616.38 \text{ kN} \]
Cohesion plus passive resistance \[ S_{Res} = F + R = 653.37 \text{ kN} \]
Thus the criterion for sliding is satisfied.

Resistance to overturning - ULS (load combinations 1 & 2)

Combination 1:
Total restraining mt. (with Mrv) \[ M_{r1} = g_9 \cdot (M_{re}+M_{rw}+M_{rv}) = 987.45 \text{ kNm/m} \]
ditto (without Mrv) \[ M_{r2} = g_9 \cdot (M_{re}+M_{rw}) = 820.14 \text{ kNm/m} \]
Total overturning moment \[ M_{ot} = M_{t1} + M_{t2} = 574.84 \text{ kNm/m} \]

Combination 2:
Total restraining mt. (with Mrv) \[ M_{r1} = g_9' \cdot (M_{re}+M_{rw}+M_{rv}) = 987.45 \text{ kNm/m} \]
ditto (without Mrv) \[ M_{r2} = g_9' \cdot (M_{re}+M_{rw}) = 820.14 \text{ kNm/m} \]
Total overturning moment \[ M_{ot} = M_{t1} + M_{t2} = 704.64 \text{ kNm/m} \]

Partial factors - ULS load combination 2

Forces and moments on wall - ULS load combination 2

Stem design moment \[ M_{Ed2} = g_4 \cdot M_1 + g_5 \cdot M_2 = 471.72 \text{ kNm/m} \]
Horizontal shear at base of stem \[ V_{Ed2} = g_4 \cdot P_h + g_5 \cdot P_{sh} = 170.31 \text{ kN/m} \]
Bearing pressures - ULS load combination 2

Centroid of load lies within middle third. Pressure varies from $p_{a2}$ at A to $p_{b2}$ at B.

$$\begin{align*}
\text{Maximum pressure is at B} & \quad p_{\text{max}2} = p_{b2} = 143.15 \text{ kN/m}^2 \\
\end{align*}$$

Shear forces and bending moments on base - ULS load combination 2

$$\begin{align*}
\text{Total S.F. on toe (plus is up)} & \quad Sw_{b2} = \left(\frac{p_{wb} + p_{b2}}{2} - \text{den} \cdot d\right) \cdot (x_1 - t/2) \\
\text{Total S.F. on heel (plus is up)} & \quad Sw_{a2} = Sw_{a1} - Sw_{d1} = 0 \text{ kN/m} \\
\text{Total B.M. on toe (plus is up)} & \quad M_{wb2} = \left(2 \cdot p_{b2} + p_{wb}\right) \cdot (x_1 - t/2)^2 / 6 - M_{bd} \\
\text{Total B.M. on heel (plus is up)} & \quad M_{wa2} = \left(2 \cdot p_{a2} + p_{wa}\right) \cdot (x - t/2)^2 / 6 - M_{ad} = 0 \text{ kNm/m} \\
\end{align*}$$
Design Summary - ULS load

combinations 1 & 2 to EC7

- Moment at stem base: 575.91 kNm
- Shear at stem base: 210.88 kN
- Moment on toe: 635.33 kNm
- Shear on toe: 184.89 kN

Pressures under base - SLS

- Pressure @ A: 41.166 kN/m²
- Pressure @ B: 102.17 kN/m²
- Allowable GBP: 500 kN/m²

Reinforced concrete retaining wall to EC7

Using either Rankine or Coulomb theory, the following assumptions are made:

- the surface of rupture is assumed to be plane
- point of resultant pressure \( P \) on back of wall is at one third of the distance up from the base of the wall.

Weight/unit vol. of retained soil \( w = 17 \) kN/m³
Wall height \( h = 4.5 \) m
Pressure due to surcharge \( \text{press} = 5 \) kN/m²
Load above wall supported on stem \( \text{vo} = 0 \) kN/m
Angle of slope of soil (if any) \( \theta = 0^\circ \)
Angle of wall-to-soil friction \( \delta = 0^\circ \)
Friction factor \( f_b \) at underside base \( f_b = 0.5 \)
Thickness of wall \( t = 0.315 \) m
Base thickness \( d = 0.4 \) m
Density of wall (stem) \( \text{den} = 25 \) kN/m³

Forces and moments on wall - SLS

\[
M_1 = P_h \left( \frac{d}{2} + h/3 \right) = 97.537 \text{ kNm/m}
\]
\[
M_2 = P_{sh} \left( \frac{d}{2} + h/2 \right) = 18.375 \text{ kNm/m}
\]
Maximum stem bending moment \( M = M_1 + M_2 = 115.91 \) kNm/m
Horizontal shear at base of stem \( V = P_h + P_{sh} = 64.874 \) kN/m

Check bearing pressures - SLS

Length of base \( L = 3.4 \) m
Distance from A to centre of stem \( x = 2.4 \) m
Depth of soil over base at toe \( d_b = 0 \) m
Depth of soil for passive resist. \( d_p = 0.6 \) m
Allowable ground pressure \( p = 500 \text{ kN/m}^2 \)
Centroid of load lies within middle third. Pressure varies from \( p_a \) at A to \( p_b \) at B.

\[
\begin{array}{c}
\text{A} \\
\text{p}_a \\
\text{---} \quad \text{---} \quad \text{---} \\
\text{---} \quad \text{---} \quad \text{---} \\
\text{B} \\
\text{pb}
\end{array}
\]

Maximum pressure is at B \( p_{\text{max}} = 100.21 \text{ kN/m}^2 \)
As \( p_{\text{max}} \leq p \ (100.21 \text{ kN/m}^2 \leq 500 \text{ kN/m}^2) \), the pressure beneath base is within the specified limit.

**Partial factors - ULS load combination 1**

Partial load factor (backfill) \( g_1 = 1 \)
Partial load factor (v.surcharge) \( g_2 = 0 \)

**Forces and moments on wall - ULS load combination 1**

Stem design moment \( M_{E1} = g_4*M_1 + g_5*M_2 = 159.24 \text{ kNm/m} \)
Horizontal shear at base of stem \( V_{E1} = g_4*P_h + g_5*P_{sh} = 88.705 \text{ kN/m} \)

**Bearing pressures - ULS load combination 1**

\[
\begin{array}{c}
\text{Soil side} \\
\text{W} \\
\text{x} \\
\text{x}_1 \\
M_{E1}
\end{array}
\]

Centroid of load lies within middle third. Pressure varies from \( p_{a1} \) at A to \( p_{b1} \) at B.

\[
\begin{array}{c}
\text{A} \\
\text{p}_{a1} \\
\text{---} \quad \text{---} \quad \text{---} \\
\text{---} \quad \text{---} \quad \text{---} \\
\text{B} \\
\text{p}_{b1}
\end{array}
\]

Maximum pressure is at B \( p_{\text{max}1} = 137.31 \text{ kN/m}^2 \)
Shear forces and bending moments on base - ULS load combination 1

Total S.F. on toe (plus is up)  \( Swb=((pwb+pb1)/2-den\cdot d)\cdot(x1-t/2)-wf1 \)
\[ =94.882 \text{ kN/m} \]
Total S.F. on heel (plus is up)  \( Swa=Sau-Sad=-64.259 \text{ kN/m} \)
Total B.M. on toe (plus is up)  \( Mwb=(2\cdot pb1+pwb)\cdot(x1-t/2)^2/6-Mbd \)
\[ =41.707 \text{ kNm/m} \]
Total B.M. on heel (plus is up)  \( Mwa=(2\cdot pa1+pwa)\cdot(x-t/2)^2/6-Mad \)
\[ =-104.82 \text{ kNm/m} \]

Resistance to sliding - ULS (load combinations 1 & 2)

Combination 1:
Sliding force  \( SFor=Stl'=112.24 \text{ kN} \)
Friction plus passive resistance  \( SRes=F+R=129.67 \text{ kN} \)
Thus the criterion for sliding is satisfied.

Combination 2:
Coefficient of passive pressure  \( Kp'=2.4442 \)
Sliding force  \( SFor=Ka2/Ka\cdot(g7\cdot P1+g8\cdot P2)=104.02 \text{ kN} \)
Friction plus passive resistance  \( SRes=F+R=127.97 \text{ kN} \)
Thus the criterion for sliding is satisfied.

Resistance to overturning - ULS (load combinations 1 & 2)

Combination 1:
Total restraining mt. (with Mrv)  \( Mr1=g9\cdot (Mre+Mrw+Mrv)=435.74 \text{ kNm/m} \)
ditto (without Mrv)  \( Mr2=g9\cdot (Mre+Mrw)=435.74 \text{ kNm/m} \)
Total overturning moment  \( Mot=Mt1+Mt2=152.24 \text{ kNm/m} \)

Combination 2:
Total restraining mt. (with Mrv)  \( Mr1=g9'\cdot (Mre+Mrw+Mrv)=435.74 \text{ kNm/m} \)
ditto (without Mrv)  \( Mr2=g9'\cdot (Mre+Mrw)=435.74 \text{ kNm/m} \)
Total overturning moment  \( Mot=Mt1+Mt2=168.3 \text{ kNm/m} \)

Partial factors - ULS load combination 2

- Shear at a-a (heel): -42.257 kN

Pressures under base - SLS

- Pressure @ A: 66.409 kN/m²
- Pressure @ B: 66.925 kN/m²
- Allowable GBP: 150 kN/m²

NOTE: The sliding resistance calculation check assumes that a heel beam/key will be provided to the underside of base.
Location: Ex6 - Ex from 'The Structural Engineer' Jan 2014 Vol.92

Reinforced concrete retaining wall to EC7

Using either Rankine or Coulomb theory, the following assumptions are made:

- the surface of rupture is assumed to be plane
- point of resultant pressure $P$ on back of wall is at one third of the distance up from the base of the wall.

- Weight/unit vol. of retained soil $w=18$ kN/m$^3$
- Wall height $h=5$ m
- Pressure due to surcharge $\text{press}=10$ kN/m$^2$
- Load above wall supported on stem $\text{vo}=0$ kN/m
- Angle of slope of soil (if any) $\theta=0^\circ$
- Angle of wall-to-soil friction $\delta=0^\circ$
- Friction factor @ underside base $f_b=0.455$
- Thickness of wall $t=0.45$ m
- Base thickness $d=0.45$ m
- Density of wall (stem) $\text{den}=25$ kN/m$^3$

Forces and moments on wall - SLS

$$M_1=Ph*(d/2+h/3)=141.87 \text{ kNm/m}$$
$$M_2=Psh*(d/2+h/2)=45.417 \text{ kNm/m}$$
$$M=M_1+M_2=187.29 \text{ kNm/m}$$
$$V=Ph+Psh=91.666 \text{ kN/m}$$

Check bearing pressures - SLS

$$L=4 \text{ m}$$
$$x=3.225 \text{ m}$$
$$\text{db}=0 \text{ m}$$
$$\text{dp}=0.55 \text{ m}$$
Allowable ground pressure \( p = 250 \text{ kN/m}^2 \)

Centroid of load lies within middle third. Pressure varies from \( p_a \) at A to \( p_b \) at B.

\[
\begin{array}{c}
\text{A} \quad \text{B} \\
p_a & \text{---} \quad \text{---} \quad \text{---} & p_b
\end{array}
\]

Maximum pressure is at B \( p_{\text{max}} = p_b = 149.17 \text{ kN/m}^2 \)

As \( p_{\text{max}} \leq p \ (149.17 \text{ kN/m}^2 \leq 250 \text{ kN/m}^2) \), the pressure beneath base is within the specified limit.

**Partial factors - ULS load combination 1**

Partial load factor (backfill) \( g_1 = 1 \)

Partial load factor (v.surcharge) \( g_2 = 0 \)

**Forces and moments on wall - ULS load combination 1**

Stem design moment \( M_{\text{Ed1}} = g_4 M_1 + g_5 M_2 = 259.65 \text{ kNm/m} \)

Horizontal shear at base of stem \( V_{\text{Ed1}} = g_4 P_h + g_5 P_{sh} = 126.25 \text{ kN/m} \)

**Bearing pressures - ULS load combination 1**

Centroid of load lies within middle third. Pressure varies from \( p_{a1} \) at A to \( p_{b1} \) at B.

\[
\begin{array}{c}
\text{A} \quad \text{B} \\
p_{a1} & \text{---} \quad \text{---} \quad \text{---} & p_{b1}
\end{array}
\]

Maximum pressure is at B \( p_{\text{max1}} = p_{b1} = 195.73 \text{ kN/m}^2 \)
Shear forces and bending moments on base - ULS load combination 1

Total S.F. on toe (plus is up)  
Swb=((pwb+pb1)/2-den\*d)*(x1-t/2)-wf1  
=94.349 kN/m

Total S.F. on heel (plus is up)  
Swa=Sau-Sad=-69.276 kN/m

Total B.M. on toe (plus is up)  
Mwb=(2*pb1+pwb)*(x1-t/2)^2/6-Mbd  
=26.598 kNm/m

Total B.M. on heel (plus is up)  
Mwa=(2*pa1+pwa)*(x-t/2)^2/6-Mad  
=-209.73 kNm/m

Resistance to sliding - ULS (load combinations 1 & 2)

Combination 1:  
Sliding force  
SFor=St1'=152.5 kN  
Friction plus passive resistance  
SRes=F+R=177.09 kN  
Thus the criterion for sliding is satisfied.

Combination 2:  
Coefficient of passive pressure  
Kp'=2.4442  
Sliding force  
SFor=Ka2/Ka*(g7*P1+g8*P2)=142.94 kN  
Friction plus passive resistance  
SRes=F+R=175.57 kN  
Thus the criterion for sliding is satisfied.

Resistance to overturning - ULS (load combinations 1 & 2)

Combination 1:  
Total restraining mt.(with Mrv)  
Mr1=g9*(Mre+Mrw+Mrv)=727.73 kNm/m  
ditto (without Mrv)  
Mr2=g9*(Mre+Mrw)=727.73 kNm/m  
Total overturning moment  
Mot=Mr1+Mr2=252.32 kNm/m

Combination 2:  
Total restraining mt.(with Mrv)  
Mr1=g9''*(Mre+Mrw+Mrv)=727.73 kNm/m  
ditto (without Mrv)  
Mr2=g9''*(Mre+Mrw)=727.73 kNm/m  
Total overturning moment  
Mot=Mr1+Mr2=277.68 kNm/m

Partial factors - ULS load combination 2

Forces and moments on wall - ULS load combination 2

Stem design moment  
MEd2=g4*M1+g5*M2=200.92 kNm/m  
Horizontal shear at base of stem  
VEd2=g4*Ph+g5*Psh=96.666 kN/m
Bearing pressures - ULS load combination 2

\text{Maximum stem bending moment} & \quad M = M_1 + M_2 = 1.0444 \text{ kNm/m} \\
\text{Horizontal shear at base of stem} & \quad V = P_h + P_{sh} = 3.1333 \text{ kN/m}
\end{align*}
\]

Bearing pressures - SLS

Soil depth for passive resistance  \( \text{dp} = 0 \) m
Allowable ground pressure  \( p = 100 \) kN/m²
Centroid of load outside middle third giving triangular distribution of pressure.
Pressure varies from 0 at distance \( x \) from A to a maximum of \( p_b \) at B.

\[
\begin{align*}
\text{Maximum pressure is at B} & \quad p_{\text{max}} = p_b = 50.067 \text{ kN/m}² \\
\text{As } p_{\text{max}} \leq p \text{ (50.067 kN/m}² \leq 100 \text{ kN/m}²), \text{ the pressure beneath base is within the specified limit.}
\end{align*}
\]
Partial factors - ULS load combination 1

Partial load factor (backfill) \( g_1 = 1 \)
Partial load factor (v. surcharge) \( g_2 = 0 \)

Forces and moments on wall - ULS load combination 1

Stem design moment \( M_{E1} = g_4 M_1 + g_5 M_2 = 1.41 \text{ kNm/m} \)
Horizontal shear at base of stem \( V_{E1} = g_4 P_h + g_5 P_{sh} = 4.23 \text{ kN/m} \)

Bearing pressures - ULS load combination 1

Centroid of load outside middle third giving triangular distribution of pressure.
Pressure varies from 0 at distance \( x \) from A to a maximum of \( p_{b1} \) at B.

\[
\begin{array}{c}
A \\
\downarrow \\
\downarrow \\
\downarrow \\
\downarrow \\
\downarrow \\
\downarrow \\
B
\end{array}
\]

Maximum pressure is at B \( p_{max1} = p_{b1} = 67.59 \text{ kN/m}^2 \)

Resistance to sliding - ULS (load combinations 1 & 2)

Combination 1:
Sliding force \( S_{For} = S_{t1} = 4.23 \text{ kN} \)
Frictional resistance \( S_{Res} = F = 5 \text{ kN} \)
Thus the criterion for sliding is satisfied.

Combination 2:
Sliding force \( S_{For} = K_2 / K_1 (g_7 P_{abh1} / g_4 + g_8 P_{sbh1} / g_5) = 3.8458 \text{ kN} \)
Frictional resistance \( S_{Res} = F = 5 \text{ kN} \)
Thus the criterion for sliding is satisfied.

Resistance to overturning - ULS (load combinations 1 & 2)

Combination 1:
Total restraining mt. (with Mrv) \( Mr_1 = g_9 (M_{re} + M_{rw} + M_{rv}) = 2.8125 \text{ kNm/m} \)
 ditto (without Mrv) \( Mr_2 = g_9 (M_{re} + M_{rw}) = 2.8125 \text{ kNm/m} \)
Total overturning moment \( M_{ot} = M_{t1} + M_{t2} = 1.1489 \text{ kNm/m} \)

Combination 2:
Total restraining mt. (with Mrv) \( Mr_1 = g_9' (M_{re} + M_{rw} + M_{rv}) = 2.8125 \text{ kNm/m} \)
 ditto (without Mrv) \( Mr_2 = g_9' (M_{re} + M_{rw}) = 2.8125 \text{ kNm/m} \)
Total overturning moment \( M_{ot} = M_{t1} + M_{t2} = 1.2819 \text{ kNm/m} \)
Design Summary - ULS load

Diagram shows forces on wall due to active pressure
Active Pressure on a Retaining Wall to BS8002:1994 using Coulomb's "Wedge Theory" for cohesive and cohesionless soils

The angle of friction between wall and soil "delta" will be taken as zero as the soil at the top of the wall is assumed to be horizontal.

Soil 1

- Surcharge pressure: \( q = 0 \text{ kN/m}^2 \)
- Depth of soil (1): \( d_1 = 2 \text{ m} \)
- Cohesive strength of soil (1): \( c'_1 = 0 \text{ kN/m}^2 \)
- Coefficient of wall cohesion: \( c_{w1} = 0 \text{ kN/m}^2 \)
- Friction angle of soil (1): \( \phi'_1 = 35^\circ \)
- Dry unit weight of soil (1): \( \gamma_1 = 17 \text{ kN/m}^3 \)

Soil 2

- Depth of soil (2): \( d_2 = 3 \text{ m} \)
- Cohesive strength of soil (2): \( c'_2 = 0 \text{ kN/m}^2 \)
- Coefficient of wall cohesion: \( c_{w2} = 0 \text{ kN/m}^2 \)
- Friction angle of soil (2): \( \phi'_2 = 35^\circ \)
- Saturated unit weight soil (2): \( \gamma_2 = 20 \text{ kN/m}^3 \)

For soil 1

\[
K_1 = \frac{(1 - \sin(\text{RAD}(\phi'_1)))}{(1 + \sin(\text{RAD}(\phi'_1)))} = 0.27099
\]

For soil 2

\[
K_2 = \frac{(1 - \sin(\text{RAD}(\phi'_2)))}{(1 + \sin(\text{RAD}(\phi'_2)))} = 0.27099
\]

Horiz. force from water in tension crack: \( P_w = 0 \text{ kN} \)

No tension crack will develop: \( Z_0 = 0 \text{ m} \)

Active forces on wall (soil 1)

\[
P_1 = p_{at1} \cdot d_1 = 0 \text{ kN}
\]
\[
P_2 = 0.5 \cdot (p_{at1} - p_{at1}) \cdot d_1 = 9.2137 \text{ kN}
\]

Active forces on wall (soil 2)

\[
P_3 = p_{at2} \cdot d_2 = 27.641 \text{ kN}
\]
\[
P_4 = 0.5 \cdot (p_{at2} - p_{at2}) \cdot d_2 = 56.571 \text{ kN}
\]
Active force from water in crack \( P_5 = P_{w} = 0 \) kN

Point of application of total active pressure will be at a distance "L3" from the bottom of the wall.

\[
L_3 = \frac{(P_1L_1 + P_2L_2 + P_3L_3 + P_4L_4 + P_5L_5)}{\text{Pa}} = 1.4109 \text{ m}
\]

**Summary of results**

Diagram shows forces on wall and point of application

Horizontal component of active force \( h_{Pa} = \text{Pa} = 93.426 \) kN
Vertical component of active force \( R_v = 0 \) kN
Point of application of active force \( L_3 = L_3 = 1.4109 \) m
Active Pressure on a Retaining Wall to BS8002:1994 using Coulomb's "Wedge Theory" for cohesive and cohesionless soils

Water level is assumed to be below the base of the wall.
Angle of earth surface to horizontal \( \theta = 0^\circ \)
Height of wall under consideration \( H = 5.4 \text{ m} \)

**Forces on soil wedge**

\[
\begin{align*}
\text{Surcharge load} & \quad q_s = 0 \text{ kN/m}^2 \\

Diagram shows forces on wall due to active pressure
Active Pressure on a Retaining Wall to BS8002:1994 using Coulomb's "Wedge Theory" for cohesive and cohesionless soils

Water level is assumed to be below the base of the wall. The active pressure of cohesive soils could be evaluated using Coulomb's wedge theory. Bell's solution will be used for evaluating the depth of tension cracks (i.e. depth Zo).

Coulomb's theory assumes that there is a neutral or ineffective zone of depth (Zo) within which there is no adhesion or friction along the back of the wall or along the plane of rupture. This theory also assumes that the surface of rupture is plane. For cohesionless soils Zo will be taken as zero.

Coulomb's wedge theory takes into account two further forces acting on the wedge which have not previously been considered by "Rankine" or "Bell". These are as follows:

a) Cohesion along the failure plane;
b) Cohesion along the plane of the wall.

For cohesionless soils the above forces will be taken as zero.

It is worth pointing out that the "wedge theory" is much simpler to use for evaluating the active pressure when the soil surface is not horizontal. The back of the retaining wall will be assumed to be vertical in this program. Both cohesive and cohesionless soils can be considered using this theory.

Angle of earth surface to horizontal $\theta = 0^\circ$
Height of wall under consideration $H = 8\ m$
Bell's solution

Bell gives the formula for the active clay pressure at failure on the back of the wall as follows:

\[ p_a = K_a \cdot D_s \cdot Z - 2 \cdot c \cdot K_a^{0.5} \]

where \( K_a \) is the coefficient of active clay pressure which relates to the angle "phi" and is given by the following expression:

\[ K_a = \left( \tan \left( 45 - \frac{\phi}{2} \right) \right)^2 \]

By comparing two soils, one cohesive (say clay) and the other cohesionless, both having the same bulk density and angle of shearing resistance, the cohesive soil, being more self-supporting, exerts a smaller pressure on the retaining wall than does the cohesionless soil, the difference being the second component in "Bell's equation given above.

Forces on soil wedge

\[ \text{Surcharge load} \quad q_s = 75 \text{ kN/m}^2 \]
By resolving the forces shown in the figure above in two directions the following equations can be derived:

A) \[ P_a \cos(d) + C_s \sin(a) = R \cos(a + \phi) + P_w \]

B) \[ P_a \sin(d) + C_w - W - P_s + C_s \cos(a) + R \sin(a + \phi) = 0 \]

Substituting equation (A) into (B) the expression becomes

where,

- \( P_a \) = total active force on the retaining wall in kN
- \( W \) = weight of soil wedge in kN
- \( P_w \) = horizontal force from water in tension cracks in kN
- \( C_w \) = cohesion force at the back of wall \( (C_w = c_w \times \text{length KB}) \)
- \( c_w \) = coefficient of wall cohesion or adhesion at back of wall in kN/m²
- \( C_s \) = cohesion force acting along failure plane \( (C_s = c \times \text{length BD}) \)
- \( c \) = cohesion of the soil or shear strength of soil in kN/m²
- \( \phi \) = angle of internal friction (or angle of shearing resistance)
- \( \delta \) = angle of friction between wall and soil in degrees
- \( \alpha \) = angle between failure plane and the vertical in degrees
- \( \theta \) = angle between earth surface and horizontal in degrees
- \( P_s \) = surcharge force \( (P_s = q_s \times \text{length AE}) \)
- \( q_s \) = surcharge per unit area in kN/m²

As the plane of rupture (or failure) is not known a series of trial wedges will be considered by varying angle "alpha" and the maximum value active force on the wall \( (P_a) \).

**Consider the pressure distribution on a vertical wall**

\[ 2C(Ka-Ka.cw/c)^{0.5} \]

Theoretically, down to depth \( Z_o \) the active pressure is negative (i.e. tensile)

Angle of internal friction \( \phi = 0^\circ \)

Angle of friction between wall and soil \( \delta = 0^\circ \)
Wedge theory will be adopted

Saturated density of soil \( D_s = 18.5 \text{ kN/m}^3 \)
Cohesion of soil \( c = 30 \text{ kN/m}^2 \)
Coefficient of wall cohesion \( c_w = 0 \text{ kN/m}^2 \)
Angle of shearing resistance \( \phi = 0^\circ \)
Coefficient of active soil pressure \( K_a = (\tan(\text{RAD}(45-\phi/2)))^2 = 1 \)
\( K_1 = K_a = 1 \)
Depth of tension cracks \( Z_0 = \frac{(2cK_1^{0.5} - q_sK_a)}{D_sK_a} \)
\( = -0.81081 \text{ m} \)
As \( Z_0 \) is negative this will be ignored \( Z_0 = 0 \text{ m} \)
Density of water \( D_w = 9.81 \text{ kN/m}^3 \)
Horiz. force from water in tension crack \( P_w = 0 \text{ kN} \)

\[
\text{num}=W+P_s+P_w\tan(\text{RAD}(ap))-C_w-C_s\cos(\text{RAD}(a))-C_s\sin(\text{RAD}(a))
\]
\[
\text{den}=\sin(\text{RAD}(d))+\cos(\text{RAD}(d))\tan(\text{RAD}(ap))=712
\]
Total active force \( P_a = \frac{\text{num}}{\text{den}} = 712 \text{ kN} \)

Summary of results derived from wedge theory

Horizontal component of active force \( h_Pa = P_a\cos(\text{RAD}(\delta)) = 712 \text{ kN} \)
Vertical component of active force \( v_Pa = P_a\sin(\text{RAD}(\delta)) = 0 \text{ kN} \)

Distance \( L_1 = H - 2Z_0/3 = 8 \text{ m} \)
Distance \( L_2 = (H+q_s/D_s-Z_0)/3 = 4.018 \text{ m} \)
Distance \( L_3 = (P_wL_1+(h_Pa-P_w)L_2)/h_Pa = 4.018 \text{ m} \)
Diagram shows forces on wall due to active pressure.

Active Pressure on a Retaining Wall to BS8002:1994 using Coulomb's "Wedge Theory" for cohesive and cohesionless soils

Water level is assumed to be below the base of the wall. The active pressure of cohesive soils could be evaluated using Coulomb's wedge theory. Bell's solution will be used for evaluating the depth of tension cracks (i.e. depth Zo).

Coulomb's theory assumes that there is a neutral or ineffective zone of depth (Zo) within which there is no adhesion or friction along the back of the wall or along the plane of rupture. This theory also assumes that the surface of rupture is plane. For cohesionless soils Zo will be taken as zero.

Coulomb's wedge theory takes into account two further forces acting on the wedge which have not previously been considered by "Rankine" or "Bell". These are as follows:

a) Cohesion along the failure plane;
b) Cohesion along the plane of the wall.

For cohesionless soils the above forces will be taken as zero.

It is worth pointing out that the "wedge theory" is much simpler to use for evaluating the active pressure when the soil surface is not horizontal. The back of the retaining wall will be assumed to be vertical in this program. Both cohesive and cohesionless soils can be considered using this theory.

Angle of earth surface to horizontal $\theta = 23.2^\circ$
Height of wall under consideration $H = 8$ m
Bell's solution

Bell gives the formula for the active clay pressure at failure on the back of the wall as follows:

\[ p_a = K_a . D_s . Z - 2 . c . K_a^{0.5} \]

where \( K_a \) is the coefficient of active clay pressure which relates to the angle "phi" and is given by the following expression:

\[ K_a = (\tan(45 - \frac{\phi}{2}))^2 \]

By comparing two soils, one cohesive (say clay) and the other cohesionless, both having the same bulk density and angle of shearing resistance, the cohesive soil, being more self-supporting, exerts a smaller pressure on the retaining wall than does the cohesionless soil, the difference being the second component in "Bell's equation given above.

Forces on soil wedge

Surcharge load \( q_s = 0 \text{ kN/m}^2 \)
By resolving the forces shown in the figure above in two directions
the following equations can be derived:

A) \[ P_a \cos(d) + C_s \sin(a) = R \cos(a + \phi) + P_w \]
B) \[ P_a \sin(d) + C_w - W - P_s + C_s \cos(a) + R \sin(a + \phi) = 0 \]

substituting equation ( A ) into ( B ) the expression becomes

where,

- \( P_a \) = total active force on the retaining wall in kN
- \( W \) = weight of soil wedge in kN
- \( P_w \) = horizontal force from water in tension cracks in kN
- \( C_w \) = cohesion force at the back of wall \(( C_w = c_w \cdot \text{length } KB )\)
- \( c_w \) = coefficient of wall cohesion or adhesion at back of wall in kN/m²
- \( C_s \) = cohesion force acting along failure plane \(( C_s = c \cdot \text{length } BD )\)
- \( c \) = cohesion of the soil or shear strength of soil in kN/m²
- \( \phi \) = angle of internal friction (or angle of shearing resistance)
- \( \delta \) = angle of friction between wall and soil in degrees
- \( \alpha \) = angle between failure plane and the vertical in degrees
- \( \theta \) = angle between earth surface and horizontal in degrees
- \( P_s \) = surcharge force \(( P_s = q_s \cdot \text{length } AE )\)
- \( q_s \) = surcharge per unit area in kN/m²

As the plane of rupture (or failure) is not known a series of trial wedges will be considered by varying angle "alpha" and the maximum value active force on the wall (\( P_a \)).

Consider the pressure distribution on a vertical wall

\[ 2.C.(K_a-K_a.c_c/c)^{0.5} \]

Theoretically, down to depth \( Z_0 \) the active pressure is negative (i.e. tensile)

Angle of internal friction \( \phi \) \( \phi = 30° \)
Angle of friction between wall and soil \( \delta = 20° \)
Wedge theory will be adopted

Dry density of soil \( D_s = 17.17 \text{ kN/m}^3 \)
Cohesion of soil \( c = 0 \text{ kN/m}^2 \)
Coefficient of wall cohesion \( c_w = 0 \text{ kN/m}^2 \)
Angle of shearing resistance \( \phi = 30^\circ \)
Coefficient of active soil pressure \( K_a = (\tan(\text{RAD}(45 - \phi/2)))^2 = 0.3333 \)
K_1 = K_a = 0.3333
Depth of tension cracks \( Z_o = \frac{2cK_1^{0.5} - q_sK_a}{DsK_a} = 0 \text{ m} \)
Horiz. force from water in tension cracks \( P_w = 0 \text{ kN} \)

\[
\text{num} = W + P_s + P_w \cdot \tan(\text{RAD}(\alpha)) - C_w - C_s \cdot \cos(\text{RAD}(\alpha)) - C_s \cdot \sin(\text{RAD}(\alpha)) \\
\text{den} = \sin(\text{RAD}(d)) + \cos(\text{RAD}(d)) \cdot \tan(\text{RAD}(\alpha)) = 3.6191
\]

Total active force \( P_a = \frac{\text{num}}{\text{den}} = 250.14 \text{ kN} \)

Summary of results derived from wedge theory

Horizontal component of active force \( h_{Pa} = P_a \cdot \cos(\text{RAD}(\delta)) = 235.05 \text{ kN} \)
Vertical component of active force \( v_{Pa} = P_a \cdot \sin(\text{RAD}(\delta)) = 85.552 \text{ kN} \)

Distance \( L_1 = H - 2Z_o/3 = 8 \text{ m} \)
Distance \( L_2 = (H + q_s/D_s - Z_o)/3 = 2.6667 \text{ m} \)
Distance \( L_3 = (P_wL_1 + (h_{Pa} - P_w)L_2)/h_{Pa} = 2.6667 \text{ m} \)
Active pressure on a retaining wall to BS8002:1994

**Active Pressure on a Retaining Wall to BS8002:1994 using Coulomb's "Wedge Theory" for cohesive and cohesionless soils**

The angle of friction between wall and soil "delta" will be taken as zero as the soil at the top of the wall is assumed to be horizontal.

**Soil 1**

- Surcharge pressure $q=0$ kN/m²
- Depth of soil (1) $d_1=4$ m
- Cohesive strength of soil (1) $c_1'=8$ kN/m²
- Coefficient of wall cohesion $c_{w1}=4$ kN/m²
- Friction angle of soil (1) $\phi_1'=27^\circ$
- Dry unit weight of soil (1) $\gamma_{1}=20$ kN/m³

**Soil 2**

- Depth of soil (2) $d_2=4$ m
- Cohesive strength of soil (2) $c_2'=8$ kN/m²
- Coefficient of wall cohesion $c_{w2}=4$ kN/m²
- Friction angle of soil (2) $\phi_2'=27^\circ$
- Saturated unit weight soil (2) $\gamma_{2}=20$ kN/m³

For soil 1
$$K_a1 = \frac{1 - \sin(\text{RAD}(\phi_1'))}{1 + \sin(\text{RAD}(\phi_1'))} = 0.37552$$

For soil 2
$$K_a2 = \frac{1 - \sin(\text{RAD}(\phi_2'))}{1 + \sin(\text{RAD}(\phi_2'))} = 0.37552$$

Depth of tension cracks
$$Z_0 = \frac{2c_1'SQR(K_{ac})-q*K_{a1}}{(\gamma_{1}*K_{a1})} = 1.5989$$ m

Active forces on wall (soil 1)
$$P_1 = p_{at1}*d_1 = -39.219$$ kN
$$P_2 = 0.5*(p_{ab1}-p_{at1})*d_1 = 60.084$$ kN

Active forces on wall (soil 2)
$$P_3 = p_{at2}*d_2 = 80.949$$ kN
$$P_4 = 0.5*(p_{ab2}-p_{at2})*d_2 = 109.09$$ kN
Active force from water in crack $P_5 = P_{w} = 12.539 \text{ kN}$

Point of application of total active pressure will be at a distance "$L_3$" from the bottom of the wall.

$$L_3 = \frac{(P_1L_1 + P_2L_2 + P_3L_3 + P_4L_4 + P_5L_5)}{P_a} = 2.1456 \text{ m}$$

**Summary of results**

Total active force  
$$Pa = \frac{num}{den} = \frac{183.6}{kN}$$

**Summary of results derived from wedge theory**

Horizontal component of active force  
$$h_{Pa} = Pa \times \cos(\text{RAD}(\delta)) = 183.6 \text{ kN}$$

Vertical component of active force  
$$v_{Pa} = Pa \times \sin(\text{RAD}(\delta)) = 0 \text{ kN}$$

Distance  
$$L_1 = H - 2 \times Zo / 3 = 5.4 \text{ m}$$

Distance  
$$L_2 = (H + qs / Ds - Zo) / 3 = 2.6 \text{ m}$$

Distance  
$$L_3 = (Pw \times L_1 + (h_{Pa} - Pw) \times L_2) / h_{Pa} = 2.6 \text{ m}$$
Active pressure on a retaining wall to BS EN 1997-1:2004 using Coulomb's "Wedge Theory" for cohesive and cohesionless soils

Water level is assumed to be below the base of the wall.
Angle of earth surface to horizontal \( \theta = 0^\circ \)
Height of wall under consideration \( H = 8 \text{ m} \)

Forces on soil wedge

\[
\text{Surcharge load} \quad q_{s} = 0 \text{ kN/m}^2
\]

Angle of shearing resistance \( \varphi \) \( \phi' = 0^\circ \)
Angle of friction between wall and soil \( \delta = 0^\circ \)

Wedge theory will be adopted

Saturated density of soil \( D_s = 18 \text{ kN/m}^3 \)
Cohesion of soil \( c = 32 \text{ kN/m}^2 \)
Coefficient of wall cohesion \( c_w = 0 \text{ kN/m}^2 \)
Angle of shearing resistance \( \varphi \) \( \phi' = \phi' = 0^\circ \)
Coefficient of active soil pressure \( K_a = (\tan(\text{RAD}(45 - \phi')/2))^2 = 1 \)
\( K_1 = K_a = 1 \)
Depth of tension cracks \( Z_o = (2cK_1^{0.5} - q_{s}K_a)/(D_sK_a) = 3.5556 \text{ m} \)
Rain water in tension cracks will be ignored.
Horiz.force from water in tension crack \( P_w = 0 \text{ kN} \)
num = W + Ps + Pw * TAN(RAD(ap)) - Cw - Cs * COS(RAD(a)) - Cs * SIN(RAD(a)) * TAN(RAD(ap)) = 177.78

Total active force

\[ Pa = \frac{num}{den} = 177.78 \text{ kN} \]

**Summary of results derived from wedge theory**

Horizontal component of active force

\[ hPa = Pa \times \text{COS(RAD(delta))} = 177.78 \text{ kN} \]

Vertical component of active force

\[ vPa = Pa \times \text{SIN(RAD(delta))} = 0 \text{ kN} \]

Distance

\[ L1 = H - 2 \times ZO / 3 = 5.6296 \text{ m} \]

\[ L2 = (H + qS / Ds - ZO) / 3 = 1.4815 \text{ m} \]

\[ L3 = (Pw \times L1 + (hPa - Pw) \times L2) / hPa = 1.4815 \text{ m} \]
Active pressure on a retaining wall to BS EN 1997-1:2004 using Coulomb's "Wedge Theory" for cohesive and cohesionless soils

Water level is assumed to be below the base of the wall. The active pressure of cohesive soils could be evaluated using Coulomb's wedge theory. Bell's solution will be used for evaluating the depth of tension cracks (i.e. depth Zo).

Coulomb's theory assumes that there is a neutral or ineffective zone of depth (Zo) within which there is no adhesion or friction along the back of the wall or along the plane of rupture. This theory also assumes that the surface of rupture is plane. For cohesionless soils Zo will be taken as zero.

Coulomb's wedge theory takes into account two further forces acting on the wedge which have not previously been considered by "Rankine" or "Bell". These are as follows:

a) Cohesion along the failure plane;
b) Cohesion along the plane of the wall.

For cohesionless soils the above forces will be taken as zero.

It is worth pointing out that the "wedge theory" is much simpler to use for evaluating the active pressure when the soil surface is not horizontal. The back of the retaining wall will be assumed to be vertical in this program. Both cohesive and cohesionless soils can be considered using this theory.

Angle of earth surface to horizontal  \( \theta = 0^\circ \)
Height of wall under consideration  \( H = 8 \text{ m} \)
Bell's solution

Bell gives the formula for the active clay pressure at failure on the back of the wall as follows:

$$pa = Ka .Ds .Z - 2 .c .Ka^{0.5}$$

where Ka is the coefficient of active clay pressure which relates to the angle "phi'" and is given by the following expression:

$$Ka = ( \tan (45 - \phi'/2) )^2$$

By comparing two soils, one cohesive (say clay) and the other cohesionless, both having the same bulk density and angle of shearing resistance, the cohesive soil, being more self-supporting, exerts a smaller pressure on the retaining wall than does the cohesionless soil, the difference being the second component in "Bell's equation given above.

Forces on soil wedge

Surcharge load $qs=75$ kN/m²
By resolving the forces shown in the figure above in two directions
the following equations can be derived:

A) \( P_a \cos(d) + C_s \sin(a) = R \cos(a + \phi') + P_w \)
B) \( P_a \sin(d) + C_w - W - P_s + C_s \cos(a) + R \sin(a + \phi') = 0 \)

substituting equation (A) into (B) the expression becomes

where,

\( P_a \) = total active force on the retaining wall in kN
\( W \) = weight of soil wedge in kN
\( P_w \) = horizontal force from water in tension cracks in kN
\( C_w \) = cohesion force at the back of wall (\( C_w = c_w . \) length KB)
\( C_s \) = cohesion force acting along failure plane (\( C_s = c . \) length BD)
\( c \) = cohesion of the soil or shear strength of soil in kN/m²
\( \phi' \) = angle of internal friction (or angle of shearing resistance)
\( \delta \) = angle of friction between wall and soil in degrees
\( \alpha \) = angle between failure plane and the vertical in degrees
\( \theta \) = angle between earth surface and horizontal in degrees
\( P_s \) = surcharge force (\( P_s = q_s . \) length AE)
\( q_s \) = surcharge per unit area in kN/m²

As the plane of rupture (or failure) is not known a series of trial
wedges will be considered by varying angle "\( \alpha \)" and the maximum
value active force on the wall (\( P_a \)).

**Consider the pressure distribution on a vertical wall**

\[ 2.C.(K_a-K_c.cw/c)^{0.5} \]

Theoretically, down to
depth \( Z_0 \) the active
pressure is negative
(i.e. tensile)

Angle of shearing resistance \( \phi \) = \( 0^\circ \)
Angle of friction between wall and soil \( \delta = 0^\circ \)
Wedge theory will be adopted

Saturated density of soil \( D_s = 18.5 \text{ kN/m}^3 \)

Cohesion of soil \( c = 30 \text{ kN/m}^2 \)

Coefficient of wall cohesion \( c_w = 0 \text{ kN/m}^2 \)

Angle of shearing resistance \( \phi' = 0^\circ \)

Coefficient of active soil pressure \( K_a = (\tan(\text{RAD}(45-\phi'/2)))^2 = 1 \)

\( K_1 = K_a = 1 \)

Depth of tension cracks \( Z_o = (2cK_1^{0.5} - q_sK_a)/(D_sK_a) \approx -0.81081 \text{ m} \)

As \( Z_o \) is negative this will be ignored \( Z_o = 0 \text{ m} \)

Density of water \( D_w = 9.81 \text{ kN/m}^3 \)

Horiz. force from water in tension crack \( P_w = 0 \text{ kN} \)

\[
\text{num} = W + P_s + P_w \tan(\text{RAD}(\alpha)) - C_w \cos(\text{RAD}(\alpha)) - C_s \sin(\text{RAD}(\alpha)) * \tan(\text{RAD}(\alpha)) = 712
\]

\[
\text{den} = \sin(\text{RAD}(\delta)) + \cos(\text{RAD}(\delta)) * \tan(\text{RAD}(\alpha)) = 1
\]

Total active force \( P_a = \frac{\text{num}}{\text{den}} = 712 \text{ kN} \)

Summary of results derived from wedge theory

Horizontal component of active force \( hP_a = P_a \cos(\text{RAD}(\delta)) = 712 \text{ kN} \)

Vertical component of active force \( vP_a = P_a \sin(\text{RAD}(\delta)) = 0 \text{ kN} \)

Distance \( L_1 = H - 2Z_o/3 = 8 \text{ m} \)

Distance \( L_2 = (H + q_s/D_s - Z_o)/3 = 4.018 \text{ m} \)

Distance \( L_3 = (P_wL_1 + (hP_a - P_w)L_2)/hP_a = 4.018 \text{ m} \)
Diagram shows forces on wall due to active pressure.
Active pressure on a retaining wall to BS EN 1997-1:2004 using Coulomb's "Wedge Theory" for cohesive and cohesionless soils

Water level is assumed to be below the base of the wall.
The active pressure of cohesive soils could be evaluated using Coulomb's wedge theory. Bell's solution will be used for evaluating the depth of tension cracks (i.e. depth Zo).

Coulomb's theory assumes that there is a neutral or ineffective zone of depth (Zo) within which there is no adhesion or friction along the back of the wall or along the plane of rupture. This theory also assumes that the surface of rupture is plane. For cohesionless soils Zo will be taken as zero.

Coulomb's wedge theory takes into account two further forces acting on the wedge which have not previously been considered by "Rankine" or "Bell". These are as follows:

a) Cohesion along the failure plane;
b) Cohesion along the plane of the wall.

For cohesionless soils the above forces will be taken as zero.

It is worth pointing out that the "wedge theory" is much simpler to use for evaluating the active pressure when the soil surface is not horizontal. The back of the retaining wall will be assumed to be vertical in this program. Both cohesive and cohesionless soils can be considered using this theory.

Angle of earth surface to horizontal \( \theta = 23.2^\circ \)
Height of wall under consideration \( H = 8 \text{ m} \)
**Bell's solution**

Bell gives the formula for the active clay pressure at failure on the back of the wall as follows:

\[ p_a = K_a \cdot D_s \cdot Z - 2 \cdot c \cdot K_a^{0.5} \]

where \( K_a \) is the coefficient of active clay pressure which relates to the angle "phi'" and is given by the following expression:

\[ K_a = (\tan(45 - \phi'/2))^2 \]

By comparing two soils, one cohesive (say clay) and the other cohesionless, both having the same bulk density and angle of shearing resistance, the cohesive soil, being more self-supporting, exerts a smaller pressure on the retaining wall than does the cohesionless soil, the difference being the second component in "Bell's equation given above.

**Forces on soil wedge**

\[
\begin{align*}
\text{surcharge} & \uparrow \\
\text{Ps} & \\
\text{Vo} & \\
\text{Vo} & \\
\text{Pa} & \\
\text{B} & \\
\text{t} & = \text{angle} \ "\thetaeta" \\
\text{phi'} & = \text{angle} \ "\phi'" \\
\text{Zo} & = \text{depth of cracks} \\
a & = \text{angle} \ "\alphaalpha" \\
d & = \text{angle} \ "\deltaelt" \\
qs & = 0 \text{ kN/m}^2
\end{align*}
\]
By resolving the forces shown in the figure above in two directions the following equations can be derived:

A) \[ Pa \cos(d) + Cs \sin(a) = R \cos(a + \phi') + Pw \]
B) \[ Pa \sin(d) + Cw - W - Ps + Cs \cos(a) + R \sin(a + \phi') = 0 \]

substituting equation (A) into (B) the expression becomes

where,

\[
\begin{align*}
Pa &= \text{total active force on the retaining wall in kN} \\
W &= \text{weight of soil wedge in kN} \\
Pw &= \text{horizontal force from water in tension cracks in kN} \\
Cw &= \text{cohesion force at the back of wall (Cw = cw. length KB)} \\
Cs &= \text{cohesion force acting along failure plane (Cs = c . length BD)} \\
c &= \text{cohesion of the soil or shear strength of soil in kN/m}^2 \\
\phi' &= \text{angle of internal friction (or angle of shearing resistance)} \\
delta &= \text{angle of friction between wall and soil in degrees} \\
alpha &= \text{angle between failure plane and the vertical in degrees} \\
theta &= \text{angle between earth surface and horizontal in degrees} \\
Ps &= \text{surcharge force (Ps = qs. length AE)} \\
qs &= \text{surcharge per unit area in kN/m}^2
\end{align*}
\]

As the plane of rupture (or failure) is not known a series of trial wedges will be considered by varying angle "alpha" and the maximum value active force on the wall (Pa).

**Consider the pressure distribution on a vertical wall**

\[ 2.0 \cdot (K_a - K_a \cdot cw/c)^{0.5} \]

![Pressure distribution diagram](image)

Theoretically, down to depth Zo the active pressure is negative (i.e. tensile)

Angle of shearing resistance \( \phi' = 30^\circ \)
Angle of friction between wall and soil \( \delta = 20^\circ \)
Wedge theory will be adopted

Dry density of soil \( D_s = 17.17 \text{ kN/m}^3 \)
Cohesion of soil \( c = 0 \text{ kN/m}^2 \)
Coefficient of wall cohesion \( c_w = 0 \text{ kN/m}^2 \)
Angle of shearing resistance \( \phi' = \phi' = 30^\circ \)
Coefficient of active soil pressure \( K_a = (\tan(\text{RAD}(45-\phi'/2)))^2 = 0.33333 \)
\( K_1 = K_a = 0.33333 \)
Depth of tension cracks \( Z_o = (2cK_1^{0.5} - q_s K_a)/(D_s K_a) = 0 \text{ m} \)
Horiz. force from water in tension cracks \( P_w = 0 \text{ kN} \)

\[
\text{num} = W + P_s + P_w \tan(\text{RAD}(\delta)) - C_w - C_s \cos(\text{RAD}(\alpha)) - C_s \sin(\text{RAD}(\alpha)) \\
\text{den} = \sin(\text{RAD}(d)) + \cos(\text{RAD}(d)) \tan(\text{RAD}(\alpha)) = 3.6191
\]

Total active force \( P_a = \text{num}/\text{den} = 250.14 \text{ kN} \)

Summary of results derived from wedge theory

Horizontal component of active force \( h_P = P_a \cos(\text{RAD}(\delta)) = 235.05 \text{ kN} \)
Vertical component of active force \( v_P = P_a \sin(\text{RAD}(\delta)) = 85.552 \text{ kN} \)

Distance \( L_1 = H - 2Z_o/3 = 8 \text{ m} \)
Distance \( L_2 = (H + q_s/D_s - Z_o)/3 = 2.6667 \text{ m} \)
Distance \( L_3 = (P_wL_1 + (h_P - P_w)L_2)/h_P = 2.6667 \text{ m} \)
Diagram shows forces on wall due to active pressure.

Active pressure on a retaining wall to BS EN 1997-1:2004 using Coulomb's "Wedge Theory" for cohesive and cohesionless soils

The angle of friction between wall and soil "delta" will be taken as zero as the soil at the top of the wall is assumed to be horizontal.

Surcharge pressure \( q = 0 \) kN/m²

**Design data for soil 1**

- Depth of soil \( d_1 = 4 \) m
- Cohesive strength of soil \( c_1' = 8 \) kN/m²
- Coefficient of wall cohesion \( c_{w1} = 4 \) kN/m²
- Angle of shearing resistance \( \phi_{1'} = 27° \)
- Dry unit weight of soil \( \gamma_1 = 20 \) kN/m³

**Design data for soil 2**

- Depth of soil \( d_2 = 4 \) m
- Cohesive strength of soil \( c_2' = 8 \) kN/m²
- Coefficient of wall cohesion \( c_{w2} = 4 \) kN/m²
- Angle of shearing resistance \( \phi_{2'} = 27° \)
- Saturated unit weight soil \( \gamma_2 = 20 \) kN/m³

Depth of tension cracks \( Z_o = \frac{2 \cdot c_1' \cdot \sqrt{K_{ac}} - q \cdot K_{a1}}{\gamma_1 \cdot K_{a1}} = 1.5989 \) m

Active forces on wall (soil 1)

- \( P_1 = p_{a1} \cdot d_1 = -39.219 \) kN
- \( P_2 = 0.5 \cdot (p_{a1} - p_{a1}) \cdot d_1 = 60.084 \) kN

Active forces on wall (soil 2)

- \( P_3 = p_{a2} \cdot d_2 = 80.949 \) kN
- \( P_4 = 0.5 \cdot (p_{a2} - p_{a2}) \cdot d_2 = 109.09 \) kN

Active force from water in crack \( P_5 = P_{w} = 12.539 \) kN
Point of application of total active pressure will be at a distance "L3" from the bottom of the wall.

\[
L3 = \frac{(P1 \cdot L1 + P2 \cdot L2 + P3 \cdot L3 + P4 \cdot L4 + P5 \cdot L5)}{Pa} = 2.1456 \text{ m}
\]

---

**Summary of results**

- **Horizontal component of active force**: \(hPa = Pa = 223.45 \text{ kN}\)
- **Vertical component of active force**: \(Rv = 0 \text{ kN}\)
- **Point of application of active force**: \(L3 = 2.1456 \text{ m}\)
Location: Example 8.10 of 'Basic soil mechanics' by Roy Whitlow

Retaining wall base to BS8002

vo = axial load on wall
d = depth of base
h = height of stem
L3 = lever arm from u/s of base
Pabh = horizontal component of active force
Pabv = vertical component of active force
theta = angle of slope of soil

Horiz.component of active force Pabh=138.9 kN/m
Distance (as above) L3=2.667 m
Vertical component active force Pabv=0 kN/m
Weight/unit vol.of retained soil w=20 kN/m³
Height of wall h=7.25 m
Load above wall supported on stem vo=0 kN/m
Angle of shearing resistance phi'=40°
Friction factor @ underside base fb=0.67
Thickness of wall t=0.3 m
Density of wall (stem) dt=24 kN/m³
Tickness of base d=0.75 m
Angle of slope of soil (if any) theta=0°

Forces and moments on wall

Maximum B.M. at base of stem M=Pabh*(L3-d)=266.27 kNm/m
Maximum S.F. at base of stem S=Pabh=138.9 kN/m

Check bearing pressure

Length of base L=5.2 m
Distance from A to centre of stem x=3.35 m
Depth of soil over base at toe db=0 m
Depth of soil for passive resist. \( dp = 0 \) m
Allowable ground pressure \( p = 150 \) kN/m²

**WARNING:**

*Eccentricity is negative, i.e. pressure at heel (A) is greater than pressure at toe (B).*

Centroid of load lies within middle third. Pressure varies from \( p_a \) at A to \( p_b \) at B.

\[
\begin{array}{c}
A \\
p_a \\
\_ \\
- \\
- \\
\_ \\
p_b \\
B
\end{array}
\]

Maximum pressure is at A \( p_{max} = p_a = 129.34 \) kN/m²
As \( p_{max} \leq p \) (129.34 kN/m² \( \leq 150 \) kN/m²), the pressure beneath the base is within specified limit.

**Shear forces and bending moments on base**

- Total S.F. on toe (plus is up) \( S_{wb} = \left( \frac{p_w + p_b}{2} - d_t d \right) \times \left( x_1 - \frac{t}{2} \right) - w_f \)
  \[ = 154.94 \] kN/m

- Total S.F. on heel (plus is up) \( S_{wa} = S_{au} - S_{ad} = -131.48 \) kN/m

- Total B.M. on toe (plus is up) \( M_{wb} = (2 \times p_b + p_w) \times \left( x_1 - \frac{t}{2} \right)^2 / 6 - M_{bd} \)
  \[ = 129.8 \] kNm/m

- Total B.M. on heel (plus is up) \( M_{wa} = (2 \times p_a + p_w) \times \left( x - \frac{t}{2} \right)^2 / 6 - M_{ad} \)
  \[ = -197.69 \] kNm/m

**Resistance to sliding**

- FoS sliding (frict.resist.only) \( F_{OSF} = F / St = 2.9414 \)

**Resistance to overturning**

Rotation assumed to occur about lowest forward edge of base (i.e. toe). Safety factors against overturning:

- Including vert.comp.of pressure \( F_{OST1} = M_{r1} / M_{ot} = 5.4268 \)
- Ignoring vert.comp.of pressure \( F_{OST2} = M_{r2} / M_{ot} = 5.4268 \)

Check bearing pressure

Length of base  \( L=3 \text{ m} \)
Distance from A to centre of stem  \( x=1.9 \text{ m} \)
Depth of soil over base at toe \( db = 0 \text{ m} \)
Depth of soil for passive resist. \( dp = 0 \text{ m} \)
Allowable ground pressure \( p = 150 \text{ kN/m}^2 \)

Centroid of load lies within middle third. Pressure varies from \( pa \) at A to \( pb \) at B.

\[
\begin{array}{c}
A \\
\text{pa} \\
B \\
\text{pb}
\end{array}
\]

Maximum pressure is at B \( \text{pmax} = pb = 119.24 \text{ kN/m}^2 \)
As \( \text{pmax} \leq p \) (119.24 kN/m\(^2\) \leq 150 kN/m\(^2\)), the pressure beneath the base is within specified limit.

**Shear forces and bending moments on base**

- Total S.F. on toe (plus is up) \( Swb = \frac{(pwb+pb)/2-dt*d}{2}*(x1-t/2)-wf \)  
  \[= 91.512 \text{ kN/m} \]
- Total S.F. on heel (plus is up) \( Swa = Sau - Sad = -79.827 \text{ kN/m} \)
- Total B.M. on toe (plus is up) \( Mwb = \frac{2*pb+pwb}{x1-t/2}^2/6-Mbd \)  
  \[= 45.501 \text{ kNm/m} \]
- Total B.M. on heel (plus is up) \( Mwa = \frac{2*pa+pwa}{x-t/2}^2/6-Mad \)  
  \[= -82.555 \text{ kNm/m} \]

**Resistance to sliding**

- FoS sliding (frict.resist.only) \( FOSF = F/St = 1.4913 \)

**WARNING:**

*Factor of safety against sliding (considering frictional resistance only) is less than 1.5.*

**Resistance to overturning**

Rotation assumed to occur about lowest forward edge of base (i.e. toe).
Safety factors against overturning:
- Including vert.comp.of pressure \( \text{FOSOT1} = Mr1/Mot = 2.8238 \)
- Ignoring vert.comp.of pressure \( \text{FOSOT2} = Mr2/Mot = 2.8238 \)
Retaining wall base to BS8002

vo = axial load on wall

\( \theta \)

\( d = \) depth of base
\( h = \) height of stem

\( L_3 = \) lever arm from u/s of base

\( P_{abv} = \) horizontal component of active force

\( P_{abh} = \) vertical component of active force

\( \theta = \) angle of slope of soil

Horiz. component of active force \( P_{abh} = 65.439 \text{ kN/m} \)
Distance (as above) \( L_3 = 1.5233 \text{ m} \)
Vertical component active force \( P_{abv} = 0 \text{ kN/m} \)
Weight/unit vol. of retained soil \( w = 18.8 \text{ kN/m}^3 \)
Height of wall \( h = 4.38 \text{ m} \)
Load above wall supported on stem \( v_o = 0 \text{ kN/m} \)
Angle of shearing resistance \( \phi' = 30^\circ \)
Friction factor \( f_b = 0.4 \)
Thickness of wall \( t = 0.22 \text{ m} \)
Density of wall (stem) \( d_t = 24 \text{ kN/m}^3 \)
Thickness of base \( d = 0.19 \text{ m} \)
Angle of slope of soil (if any) \( \theta = 0^\circ \)

Forces and moments on wall

Maximum B.M. at base of stem \( M = P_{abh}(L_3 - d) = 87.25 \text{ kNm/m} \)
Maximum S.F. at base of stem \( S = P_{abh} = 65.439 \text{ kN/m} \)

Check bearing pressure

Length of base \( L = 3.124 \text{ m} \)
Distance from A to centre of stem \( x = 1.86 \text{ m} \)
Depth of soil over base at toe \( d_b = 0 \text{ m} \)
Depth of soil for passive resist. \( dp = 1.5 \text{ m} \)
Allowable ground pressure \( p = 75 \text{ kN/m}^2 \)

Centroid of load lies within middle third. Pressure varies from \( p_a \) at A to \( p_b \) at B.

\[
\begin{array}{c}
A \\
- \\
p_a \\
- \\
B \\
\end{array}
\]

Maximum pressure is at B \( p_{\text{max}} = p_b = 62.748 \text{ kN/m}^2 \)
As \( p_{\text{max}} \leq p \) (62.748 kN/m² ≤ 75 kN/m²), the pressure beneath the base is within specified limit.

**Shear forces and bending moments on base**

Total S.F. on toe (plus is up) \( S_{wb} = \frac{(p_{wb} + p_b)}{2 - d_t d} * (x_1 - t/2) - w_f \)
= 65.164 kN/m

Total S.F. on heel (plus is up) \( S_{wa} = S_{au} - S_{ad} = -54.009 \text{ kN/m} \)

Total B.M. on toe (plus is up) \( M_{wb} = \frac{(2p_b + p_{wb})}{6} * (x_1 - t/2)^2 - M_{bd} \)
= 37.981 kNm/m

Total B.M. on heel (plus is up) \( M_{wa} = \frac{(2p_a + p_{wa})}{6} * (x - t/2)^2 - M_{ad} \)
= -48.59 kNm/m

**Resistance to sliding**

\( \text{FoS sliding (frict. resist. only)} \) \( \frac{F_{OSF}}{F/st} = 1.1093 \)

**WARNING:**

Factor of safety against sliding (considering frictional resistance only) is less than 1.5.

\( \text{FoS sliding (friction/cohesion + passive)} \) \( \frac{F_{OSS}}{(F+R)/st} = 2.0789 \)

**Resistance to overturning**

Rotation assumed to occur about lowest forward edge of base (i.e. toe).
Safety factors against overturning:

Including vert. comp. of pressure \( \frac{F_{OS1}}{M_{r1}/M_{ot}} = 3.7676 \)

Ignoring vert. comp. of pressure \( \frac{F_{OS2}}{M_{r2}/M_{ot}} = 3.7676 \)
Location: Ex1 - 'Soil mechanics' by R.F.Craig (Ex. 6.5)

Retaining wall base to EC7

\[ \text{vo} = \text{axial load on wall} \]
\[ d = \text{depth of base} \]
\[ h = \text{height of stem} \]
\[ L_3 = \text{lever arm from u/s of base} \]

Pabh and Pabv are the unfactored horizontal & vertical components of the total active force. Angle \( \theta \) is the soil slope.

**Lever arm (as per diagram)**

\[ L_3 = 1.962 \text{ m} \]

**Weight/unit vol. of retained soil**

\[ w = 17 \text{ kN/m}^3 \]

**Height of stem**

\[ h = 5 \text{ m} \]

**Pressure due to surcharge**

\[ \text{press} = 0 \text{ kN/m}^2 \]

**Load above wall supported on stem**

\[ \text{vo} = 0 \text{ kN/m} \]

**Friction factor @ underside base**

\[ f_b = 0.509 \]

**Thickness of wall**

\[ t = 0.3 \text{ m} \]

**Thickness of base**

\[ d = 0.4 \text{ m} \]

**Density of wall (stem)**

\[ \text{den} = 25 \text{ kN/m}^3 \]

**Angle of slope of soil (if any)**

\[ \theta = 0^\circ \]

**Forces and moments on wall - SLS**

\[ M = \text{Pabh}(L_3-d) = 122.46 \text{ kNm/m} \]

\[ V = \text{Pabh} = 78.4 \text{ kN/m} \]

**Check bearing pressures - SLS**

\[ L = 3 \text{ m} \]
\[ x = 1.9 \text{ m} \]
\[ db = 0 \text{ m} \]
\[ dp = 0 \text{ m} \]
\[ p = 150 \text{ kN/m}^2 \]
Centroid of load lies within middle third. Pressure varies from pa at A to pb at B.

\[ \text{Maximum pressure is at B } \quad p_{\text{max}} = pb = 122.65 \text{ kN/m}^2 \]

As \( p_{\text{max}} \leq p \) (122.65 kN/m\(^2\) ≤ 150 kN/m\(^2\)), the pressure beneath base is within specified limit.

**Partial factors - ULS load combinations 1**

- Partial load factor (backfill) \( g_1 = 1 \)
- Partial load factor (v. surcharge) \( g_2 = 0 \)
- Partial load factor (wall & base) \( g_3 = 1.35 \)
- Partial load factor (earth press) \( g_4 = 1.35 \) (horiz. pressure)
- Partial load factor (surcharge) \( g_5 = 1.5 \) (horiz. pressure)

**Forces and moments on wall - ULS load combination 1**

- Stem design moment \( M_{Ed1} = (g_4 \times Pe + g_5 \times Ps) \times (L_3 - d/2) = 186.49 \text{ kNm/m} \)
- Horizontal shear at base of stem \( V_{Ed1} = g_4 \times Pe + g_5 \times Ps = 105.84 \text{ kN/m} \)

**Bearing pressures - ULS load combination 1**

Centroid of load outside middle third giving triangular distribution of pressure.

Pressure varies from 0 at distance x from A to a maximum of pb1 at B.
Maximum pressure is at B  \( p_{\text{max1}} = p_{b1} = 170.59 \text{ kN/m}^2 \)

**Shear forces and bending moments on base - ULS load combination 1**

- Total S.F. on toe (plus is up)  \( S_{wb} = \frac{(p_{wb} + p_{b1})}{2} - \text{den} \cdot d \cdot (x_1 - t/2) - w_{f1} = 125.19 \text{ kN/m} \)
- Total S.F. on heel (plus is up)  \( S_{wa} = S_{au} - S_{ad} = -92.22 \text{ kN/m} \)
- Total B.M. on toe (plus is up)  \( M_{wb} = \frac{(2 \cdot p_{b1} + p_{wb})}{6} \cdot (x_1 - t/2)^2 = 63.797 \text{ kNm/m} \)
- Total B.M. on heel (plus is up)  \( M_{wa} = S_{au} \cdot \left( \frac{lb - (x_1 + t/2)}{3} \right) = -106.91 \text{ kNm/m} \)

**Resistance to sliding - ULS (load combinations 1 & 2)**

- **Combination 1:**
  - Sliding force  \( S_{For} = S_{t1} = 105.84 \text{ kN} \)
  - Frictional resistance  \( S_{Res} = F = 110.07 \text{ kN} \)
  - Thus the criterion for sliding is satisfied.

- **Combination 2:**
  - Sliding force  \( S_{For} = \frac{K_a \cdot (g_7 \cdot P_e + g_8 \cdot P_s)}{K_a} = 99.987 \text{ kN} \)
  - Frictional resistance  \( S_{Res} = F = 110.07 \text{ kN} \)
  - Thus the criterion for sliding is satisfied.

**Resistance to overturning - ULS (load combination 1 & 2)**

- **Combination 1:**
  - Total restraining mt. (with Mrv)  \( M_{r1} = g_9 \cdot (M_{re} + M_{rw} + M_{rv}) = 362.11 \text{ kNm/m} \)
  - ditto (without Mrv)  \( M_{r2} = g_9 \cdot (M_{re} + M_{rw}) = 362.11 \text{ kNm/m} \)
  - Total overturning moment  \( M_{ot} = M_{t1} + M_{t2} = 169.2 \text{ kNm/m} \)

- **Combination 2:**
  - Total restraining mt. (with Mrv)  \( M_{r1} = g_9' \cdot (M_{re} + M_{rw} + M_{rv}) = 362.11 \text{ kNm/m} \)
  - ditto (without Mrv)  \( M_{r2} = g_9' \cdot (M_{re} + M_{rw}) = 362.11 \text{ kNm/m} \)
  - Total overturning moment  \( M_{ot} = M_{t1} + M_{t2} = 196.17 \text{ kNm/m} \)

**Partial factors - ULS load combinations 2**

- Partial load factor (backfill)  \( g_1 = 1.0 \)
- Partial load factor (v.surcharge)  \( g_2' = 0 \)
- Partial load factor (wall & base)  \( g_3 = 1.0 \)
- Partial load factor (earth press)  \( g_4 = 1.0 \) (horiz.pressure)
- Partial load factor (surcharge)  \( g_5 = 1.3 \) (horiz.pressure)

**Forces and moments on wall - ULS load combination 2**

- Stem design moment  \( M_{Ed2} = (g_4 \cdot P_e + g_5 \cdot P_s) \cdot (L_3 - d/2) = 138.14 \text{ kNm/m} \)
- Horizontal shear at base of stem  \( V_{Ed2} = g_4 \cdot P_e + g_5 \cdot P_s = 78.4 \text{ kN/m} \)
Bearing pressures - ULS load combination 2

Centroid of load lies within middle third. Pressure varies from \( p_a^2 \) at A to \( p_b^2 \) at B.

Maximum pressure is at B \( p_{\text{max}}^2 = p_b^2 = 122.65 \text{ kN/m}^2 \)

Shear forces and bending moments on base - ULS load combination 2

Total S.F. on toe (plus is up):
\[
S_{wb}^2 = (\frac{p_wb + p_b^2}{2} - \text{den} * d) * (x_1 - t/2) - w_f^2 = 91.806 \text{ kN/m}
\]

Total S.F. on heel (plus is up):
\[
S_{wa}^2 = S_{a2} - S_{a1} = -76.977 \text{ kN/m}
\]

Total B.M. on toe (plus is up):
\[
M_{wb}^2 = (2*p_b^2 + p_wb) * (x_1 - t/2)^2/6 - M_{b1} = 46.017 \text{ kNm/m}
\]

Total B.M. on heel (plus is up):
\[
M_{wa}^2 = (2*p_a^2 + p_wa) * (x - t/2)^2/6 - M_{a1} = -82.411 \text{ kNm/m}
\]
Design Summary - ULS load

combination 1 & 2 to EC7

- Moment at base of stem: 186.49 kNm
- Shear at base of stem: 105.84 kN
- Moment at b-b (toe): 63.797 kNm
- Shear at b-b (toe): 125.19 kN
- Moment at a-a (heel): -106.91 kNm
- Shear at a-a (heel): -92.22 kN

Pressures under base - SLS

- Pressure @ A: 21.515 kN/m²
- Pressure @ B: 122.65 kN/m²
- Allowable GBP: 150 kN/m²
Location: Ex2 - 'Basic soil mechanics' by Roy Whitlow (Ex. 8.10)

Retaining wall base to EC7

\[ \text{vo} = \text{axial load on wall} \]
\[ d = \text{depth of base} \]
\[ h = \text{height of stem} \]
\[ L_3 = \text{lever arm from u/s of base} \]

Pabh and Pabv are the unfactored horizontal & vertical components of the total active force. Angle \( \theta \) is the soil slope.

Lever arm (as per diagram) \( L_3 = 2.667 \) m
Weight/unit vol. of retained soil \( w = 20 \) kN/m\(^3\)
Height of stem \( h = 7.25 \) m
Load above wall supported on stem \( \text{vo} = 0 \) kN/m
Friction factor @ underside base \( \text{fb} = 0.67 \)
Thickness of wall \( t = 0.3 \) m
Thickness of base \( d = 0.75 \) m
Density of wall (stem) \( \text{den} = 25 \) kN/m\(^3\)
Angle of slope of soil (if any) \( \theta = 0^\circ \)

Forces and moments on wall - SLS

Maximum B.M. at base of stem \( M = \text{Pabh} \times (L_3 - d) = 266.27 \) kNm/m
Maximum S.F. at base of stem \( V = \text{Pabh} = 138.9 \) kN/m

Check bearing pressures - SLS

Length of base \( L = 5.2 \) m
Distance from A to centre of stem \( x = 3.35 \) m
Depth of soil over base at toe \( db = 0 \) m
Depth of soil for passive resist. \( dp = 0 \) m
Allowable ground pressure \( p = 150 \) kN/m\(^2\)
WARNING:

Eccentricity is negative, i.e. pressure at heel (A) is greater than pressure at toe (B).

Centroid of load lies within middle third. Pressure varies from pa at A to pb at B.

\[
\begin{array}{c|c|c}
A & \_ & B \\
\_ & \_ & \_ \\
\hline
pa & \_ & pb
\end{array}
\]

Maximum pressure is at A \( p_{\text{max}} = p_a = 130.15 \text{ kN/m}^2 \)

As \( p_{\text{max}} \leq p \) \((130.15 \text{ kN/m}^2 \leq 150 \text{ kN/m}^2)\), the pressure beneath base is within specified limit.

**Partial factors - ULS load combinations 1**

- Partial load factor (backfill) \( g_1 = 1 \)
- Partial load factor (v.surcharge) \( g_2 = 0 \)
- Partial load factor (wall & base) \( g_3 = 1.35 \)
- Partial load factor (earth press) \( g_4 = 1.35 \) (horiz. pressure)
- Partial load factor (surcharge) \( g_5 = 1.5 \) (horiz. pressure)

**Forces and moments on wall - ULS load combination 1**

- Stem design moment \( M_{\text{Ed1}} = (g_4 \cdot P_e + g_5 \cdot P_s) \cdot (L_3 - d/2) \)
  \[ = 429.78 \text{ kNm/m} \]

- Horizontal shear at base of stem \( V_{\text{Ed1}} = g_4 \cdot P_e + g_5 \cdot P_s = 187.52 \text{ kN/m} \)

**Bearing pressures - ULS load combination 1**
Centroid of load lies within middle third. Pressure varies from pal at A to pbl at B.

\[
A \quad \text{pal} \quad \text{B} \quad \text{pbl}
\]

Maximum pressure is at B \( p_{max1}=p_{b1}=148.89 \text{ kN/m}^2 \)

**Shear forces and bending moments on base - ULS load combination 1**

- Total S.F. on toe (plus is up) \( S_{wb}=(p_{wb}+p_{b1})/(2-den*d)*(x_1-t/2)-w_{f1} \)
  \(=209.99 \text{ kN/m} \)
- Total S.F. on heel (plus is up) \( S_{wa}=S_{uw}-S_{ad}=-137.18 \text{ kN/m} \)
- Total B.M. on toe (plus is up) \( M_{wb}=(2*p_{b1}+p_{wb})*(x_1-t/2)^2/6-M_{bd} \)
  \(=181.68 \text{ kNm/m} \)
- Total B.M. on heel (plus is up) \( M_{wa}=(2*p_{a1}+p_{wa})*(x-t/2)^2/6-M_{ad} \)
  \(=-240.74 \text{ kNm/m} \)

**Resistance to sliding - ULS (load combinations 1 & 2)**

Combination 1:
- Sliding force \( S_{For}=S_{t1}=187.52 \text{ kN} \)
- Frictional resistance \( S_{Res}=F=412.64 \text{ kN} \)
  Thus the criterion for sliding is satisfied.

Combination 2:
- Sliding force \( S_{For}=K_a^2/K_a*(g_7*P_e+g_8*P_s)=181.56 \text{ kN} \)
- Frictional resistance \( S_{Res}=F=412.64 \text{ kN} \)
  Thus the criterion for sliding is satisfied.

**Resistance to overturning - ULS (load combination 1 & 2)**

Combination 1:
- Total restraining mt. (with Mrv) \( M_{r1}=g_9*(M_{re}+M_{rw}+M_{rv})=1822 \text{ kNm/m} \)
  ditto \( M_{r2}=g_9*(M_{re}+M_{rw})=1822 \text{ kNm/m} \)
- Total overturning moment \( M_{ot}=M_{t1}+M_{t2}=407.49 \text{ kNm/m} \)

Combination 2:
- Total restraining mt. (with Mrv) \( M_{r1}=g_9''*(M_{re}+M_{rw}+M_{rv})=1822 \text{ kNm/m} \)
  ditto \( M_{r2}=g_9''*(M_{re}+M_{rw})=1822 \text{ kNm/m} \)
- Total overturning moment \( M_{ot}=M_{t1}+M_{t2}=484.23 \text{ kNm/m} \)

**Partial factors - ULS load combinations 2**

- Partial load factor (backfill) \( g_1=1.0 \)
- Partial load factor (v.surcharge) \( g_2'=0 \)
- Partial load factor (wall & base) \( g_3=1.0 \)
- Partial load factor (earth press) \( g_4=1.0 \text{ (horiz.pressure)} \)
- Partial load factor (surcharge) \( g_5=1.3 \text{ (horiz.pressure)} \)
Forces and moments on wall - ULS load combination 2

Stem design moment \[ M_{Ed2} = (g4 \cdot P_e + g5 \cdot P_s) \cdot (L3 - d/2) \] \[ = 318.36 \text{ kNm/m} \]

Horizontal shear at base of stem \[ V_{Ed2} = g4 \cdot P_e + g5 \cdot P_s = 138.9 \text{ kN/m} \]

Bearing pressures - ULS load combination 2

WARNING:
Eccentricity is negative, i.e. pressure at heel (A) is greater than pressure at toe (B).

Centroid of load lies within middle third. Pressure varies from \( P_{a2} \) at A to \( P_{b2} \) at B.

\[ A \quad \frac{-}{-} \quad \frac{-}{-} \quad \frac{-}{-} \quad B \]

\[ P_{a2} \quad P_{b2} \]

Maximum pressure is at A \( P_{max2} = P_{a2} = 130.15 \text{ kN/m}^2 \)

Shear forces and bending moments on base - ULS load combination 2

Total S.F. on toe (plus is up):
\[ S_{wb2} = ((p_{wb} + p_{b2})/2 - \text{den} \cdot d) \cdot (x1 - t/2) \]
\[ -w_{f2} = 156.07 \text{ kN/m} \]

Total S.F. on heel (plus is up):
\[ S_{wa2} = S_{\text{a2}} - S_{\text{d}} = -130.59 \text{ kN/m} \]

Total B.M. on toe (plus is up):
\[ M_{wb2} = (2 \cdot p_{b2} + p_{wb}) \cdot (x1 - t/2)^2/6 - M_{bd} \]
\[ = 130.82 \text{ kNm/m} \]

Total B.M. on heel (plus is up):
\[ M_{wa2} = (2 \cdot p_{a2} + p_{wa}) \cdot (x - t/2)^2/6 - M_{ad} \]
\[ = -196.64 \text{ kNm/m} \]
Design Summary - ULS load

combination 1 & 2 to EC7

- Moment at base of stem: 429.78 kNm

**Forces and moments on wall - ULS load combination 1**

- Stem design moment  \( M_{\text{Ed1}} = (g_4 \times P_e + g_5 \times P_s) \times (L_3 - d/2) = 126.18 \text{ kNm/m} \)
- Horizontal shear at base of stem  \( V_{\text{Ed1}} = g_4 \times P_e + g_5 \times P_s = 88.343 \text{ kN/m} \)

**Bearing pressures - ULS load combination 1**

Centroid of load lies within middle third. Pressure varies from pal at A to pbl at B.

\[ \text{A} \quad \text{pal} \quad - \quad - \quad - \quad \text{pbl} \quad \text{B} \]

Maximum pressure is at B  \( p_{\text{max1}} = \text{pbl} = 90.779 \text{ kN/m}^2 \)
Shear forces and bending moments on base - ULS load combination 1

Total S.F. on toe (plus is up) \[ Swb=((pwb+pb1)/2-den*d)*(x1-t/2)-wf1 \] = 87.415 kN/m
Total S.F. on heel (plus is up) \[ Swa=Sau-Sad=-63.671 \text{ kN/m} \]
Total B.M. on toe (plus is up) \[ Mwb=(2*pb1+pwb)*(x1-t/2)^2/6-Mbd \] = 52.72 kNm/m
Total B.M. on heel (plus is up) \[ Mwa=(2*pa1+pwa)*(x-t/2)^2/6-Mad \] = -63.67 kNm/m

Resistance to sliding - ULS (load combinations 1 & 2)

Combination 1:
Sliding force \[ SFor=St1'=88.343 \text{ kN} \]
Friction plus passive resistance \[ SRes=F+R=136.66 \text{ kN} \]
Thus the criterion for sliding is satisfied.

Combination 2:
Coefficient of passive pressure \[ Kp'=2.4442 \]
Sliding force \[ SFor=Ka2/Ka*(g7*P1+g8*P2)=80.321 \text{ kN} \]
Friction plus passive resistance \[ SRes=F+R=124.91 \text{ kN} \]
Thus the criterion for sliding is satisfied.

Resistance to overturning - ULS (load combination 1 & 2)

Combination 1:
Total restraining mt. (with Mrv) \[ Mr1=g9*(Mre+Mrw+Mrv)=339.94 \text{ kNm/m} \]
ditto (without Mrv) \[ Mr2=g9*(Mre+Mrw)=339.94 \text{ kNm/m} \]
Total overturning moment \[ Mot=Mt1+Mt2=109.65 \text{ kNm/m} \]

Combination 2:
Total restraining mt. (with Mrv) \[ Mr1=g9'**(Mre+Mrw+Mrv)=339.94 \text{ kNm/m} \]
ditto (without Mrv) \[ Mr2=g9'**(Mre+Mrw)=339.94 \text{ kNm/m} \]
Total overturning moment \[ Mot=Mt1+Mt2=122.35 \text{ kNm/m} \]

Partial factors - ULS load combinations 2

Partial load factor (backfill) \[ g1=1.0 \]
Partial load factor (v.surcharge) \[ g2'=0 \]
Partial load factor (wall & base) \[ g3=1.0 \]
Partial load factor (earth press) \[ g4=1.0 \text{ (horiz.pressure)} \]
Partial load factor (surcharge) \[ g5=1.3 \text{ (horiz.pressure)} \]

Forces and moments on wall - ULS load combination 2

Stem design moment \[ MEd2=(g4*Pe+g5*Ps)*(L3-d/2) = 93.467 \text{ kNm/m} \]
Horizontal shear at base of stem \[ VEd2=g4*Pe+g5*Ps=65.439 \text{ kN/m} \]
Bearing pressures - ULS load combination 2

Centroid of load lies within middle third. Pressure varies from $p_{a2}$ at A to $p_{b2}$ at B.

Maximum pressure is at B \[ p_{\text{max}2}=p_{b2}=63.423 \text{ kN/m}^2 \]

Shear forces and bending moments on base - ULS load combination 2

Total S.F. on toe (plus is up):
\[ S_{\text{wb}2}=\frac{(p_{\text{wb}}+p_{b2})}{2}\text{den}d\times(x_{1}-t/2) \]
\[ -w_{f2}=65.648 \text{ kN/m} \]

Total S.F. on heel (plus is up):
\[ S_{\text{wa}2}=S_{\text{au}}-S_{\text{ad}}=-53.606 \text{ kN/m} \]

Total B.M. on toe (plus is up):
\[ M_{\text{wb}2}=\frac{(2p_{b2}+p_{\text{wb}})}{6}\times(x_{1}-t/2)^2-M_{\text{bd}} \]
\[ =38.275 \text{ kNm/m} \]

Total B.M. on heel (plus is up):
\[ M_{\text{wa}2}=\frac{(2p_{a2}+p_{\text{wa}})}{6}\times(x-t/2)^2-M_{\text{ad}} \]
\[ =-48.287 \text{ kNm/m} \]
Design Summary - ULS load

combination 1 & 2 to EC7

- Moment at base of stem: 126.18 kNm
- Shear at base of stem: 88.343 kN
- Moment at b-b (toe): 52.72 kNm
- Shear at b-b (toe): 87.415 kN
- Moment at a-a (heel): -63.67 kNm
- Shear at a-a (heel): -63.671 kN

Pressures under base - SLS

- Pressure @ A: 53.754 kN/m²
- Pressure @ B: 63.423 kN/m²
- Allowable GBP: 75 kN/m²
Location: Biaxial moments on pad base

Pressures due to biaxial bending on rectangular base

3               Corner 1
N   Mx
o    My
Ly

4      Lx

Base length in X-direction Lx=6 m
Base length in Y-direction Ly=3 m
Bending moment in X-direction Mx=150 kNm
Bending moment in Y-direction My=300 kNm
Axial load N=1000 kN

\[ P_3 = 80.556 \text{ kN/m}^2 \]
\[ P_{\text{max}} = 97.222 \text{ kN/m}^2 \]
\[ P_2 = 30.556 \text{ kN/m}^2 \]
\[ P_4 = 13.889 \text{ kN/m}^2 \]

Moments Mx & My are shown in directions X & Y (rather than the more usual way of showing them acting about the axes) to accord with the references.
Location: Bases on grids A2-A6, K2-K6

Pad base with vertical and horizontal loads (V & H) and overturning moment (M)

Characteristic bending moment \( M = 150 \text{ kNm} \)
Characteristic vertical force \( V = 250 \text{ kN} \)
Characteristic horizontal shear \( H = 50 \text{ kN} \)
Width of base (into figure) \( b = 2.4 \text{ m} \)
Depth of base \( d = 0.6 \text{ m} \)
Length of base \( L = 3 \text{ m} \)
Distance to load position \( x = 1.5 \text{ m} \)
Allowable ground pressure \( p = 100 \text{ kN/m}^2 \)

Overturning

Overturning moment \( \text{Mot}=M+H*d = 180 \text{ kNm} \)
Restraining moment \( \text{Mre}=Sw*L/2+V*(L-x) = 530.52 \text{ kNm} \)
F.O.S. against overturning \( \text{FOSOT} = \text{Mre}/\text{Mot} = 2.9473 \)
Location: Bases on grids A2-A6, K2-K6

Characteristic bending moment   \( M = 150 \text{ kNm} \)
Characteristic vertical load    \( V = 250 \text{ kN} \)
Characteristic horizontal load  \( H = 50 \text{ kN} \)
Width of base (into figure)     \( b = 2.4 \text{ m} \)
Depth of base                   \( d = 0.6 \text{ m} \)
Length of base                  \( L = 3 \text{ m} \)
Distance to load position       \( x = 1.5 \text{ m} \)
Allowable ground pressure       \( p = 100 \text{ kN/m}^2 \)

Resistance to overturning - ULS (load combination 1 & 2)

Combination 1:
Partial load factor (vert.load)  \( g_1 = 1 \)
Partial load factor (bend.moment) \( g_2 = 1.5 \)
Partial load factor (horiz.shear) \( g_3 = 1.5 \)
Restraining moment              \( M_{re} = g_1 \left( \frac{S_w L}{2} + V(L-x) \right) = 530.52 \text{ kNm} \)
Total overturning moment        \( M_{ot1} = M_{t1} + M_{t2} = 270 \text{ kNm/m} \)

Combination 2:
Partial load factor (vert.load)  \( g_4 = 1 \)
Partial load factor (bend.moment) \( g_5 = 1.3 \)
Partial load factor (horiz.shear) \( g_6 = 1.3 \)
Restraining moment              \( M_{re} = g_4 \left( \frac{S_w L}{2} + V(L-x) \right) = 530.52 \text{ kNm} \)
Total overturning moment        \( M_{ot2} = M_{t1} + M_{t2} = 234 \text{ kNm/m} \)
Location: Automatic sizing of trapezoidal base for typical loads.

Preliminary calculations for trapezoidal combined base

Distance between columns  dist=7.5 m
Thickness of base         h=1 m
Left column: vertical load FVleft=580 kN
horizontal shear         FHleft=150 kN
moment (clockwise)       Mleft=0 kNm
Right column: vertical load FVrt=400 kN
horizontal shear         FHrt=50 kN
moment (clockwise)       Mrt=0 kNm

No reversal of moments so moment-reversal multiplier revm=1 throughout.
Shear-reversal multiplier revs is set to 1 when shear forces act from
left to right, and to -1 when shear forces act from right to left.
Allowable bearing pressure press=80 kN/m²
Concrete density         den=24 kN/m³

Value of dimension x0    x0=0.82 m
Value of dimension x1    x1=0.82 m
Value of dimension x2    x2=1.38 m
Value of dimension x3    x3=1.38 m
Length of base           L=x1+dist+x3=9.7 m
Smaller width of base    bmin=2*x0=1.64 m
Greater width of base    bmax=2*x2=2.76 m
Area of base             areaP=L*(bmax+bmin)/2=21.34 m²
Self-weight of base      Swt=areaP*den=512.16 kN
Total vertical load on base V=FVleft+FVrt+Swt=1492.2 kN
Position of centroid of base xbarP=L/3*(2*x0+x2)/(x0+x2)=4.4385 m from left end.
x'=xbarP-x3=3.0585 m from left-hand column.
Moment of inertia of base Ixx=(x0^2+4*x0*x2+x2^2)/(x0+x2)*L^3/18=163.71 m⁴

With clockwise moments and left to right shears

Taking moments about position of left column:
clock=FVrt*dist+revs*(FHleft+FHrt)*h+revm*(Mleft+Mrt)+Swt*x'
   =4766.4 kNm
Centroid of load from left col. xbar=clock/V=3.1943 m
Eccentricity of upward pressure e=x'-xbar=-0.13583 m
Trapezoidal distribution of pressure beneath base

Pressure at left end of base
\[ \text{Plt} = V \left( \frac{1}{\text{areaP}} + e \frac{x_{barP}}{I_{xx}} \right) \]
\[ = 64.428 \text{ kN/m}^2 \]

Pressure at right end of base
\[ \text{Prt} = V \left( \frac{1}{\text{areaP}} - e \frac{(l-x_{barP})}{I_{xx}} \right) \]
\[ = 76.437 \text{ kN/m}^2 \]

Bending moments and shears at a specific point

Dist. of point considered from left end of base \( x = 4.75 \) m

Final shearing forces:
- To left: \( \text{SL} = \text{SL-FVleft} = -40.789 \text{ kN} \)
- To right: \( \text{SR} = \text{SR-FVrt} = 40.789 \text{ kN} \)

Final bending moments:
- To left: \( \text{ML} = \text{ML-FVleft*(x-x3)+revm*Mleft+revs*(FHleft*h)} = -1210.1 \text{ kNm} \)
- To right: \( \text{MR} = \text{MR-FVrt*(1-x-x1)-revm*Mrt-revs*(FHrt*h)} = -1210.1 \text{ kNm} \)

With clockwise moments and right to left shears

Taking moments about position of left column:
- \( \text{clock} = \text{FVrt*dist+revs*(FHleft+FHrt)*h+revm*(Mleft+Mrt)+Swt*x'} = 4504 \text{ kNm} \)
- Centroid of load from left col. \( \bar{x} = \text{clock/V} = 1.743 \) m
- Eccentricity of upward pressure \( e = x'-\bar{x} = 1.4792 \) m

Triangular distribution of pressure beneath base.

**WARNING: Uplift occurs**

Point of zero upward pressure \( xz = 9.0918 \) m from left end of base.

Pressure at left end of base \[ \text{Plt} = \frac{V}{(xz*(wz+4*x2)/6)} = 169.07 \text{ kN/m}^2 \]

Bending moments and shears at a specific point

Dist.of point considered from left end of base x=4.75 m

Final shearing forces:
- To left \( SL = SL - FV_{left} = 212.56 \) kN
- To right \( SR = SR - FV_{rt} = -212.56 \) kN

Final bending moments:
- To left \( ML = ML - FV_{left} \times (x - x_3) + \text{revm} \times M_{left} + \text{revs} \times FH_{left} \times h = -1136.6 \) kNm
- To right \( MR = MR - FV_{rt} \times (l - x - x_1) - \text{revm} \times M_{rt} - \text{revs} \times FH_{rt} \times h = -1136.6 \) kNm
Location: Manual check of trapezoidal base w. uplift on right column

Preliminary calculations for trapezoidal combined base

Distance between columns \( \text{dist}=7.5 \text{ m} \)
Thicknes of base \( h=1 \text{ m} \)
Left column: vertical load \( F_{Vleft}=1000 \text{ kN} \)
  horizontal shear \( F_{Hleft}=0 \text{ kN} \)
  moment (clockwise) \( M_{left}=0 \text{ kNm} \)
Right column: vertical load \( F_{Vrt}=-200 \text{ kN} \)
  horizontal shear \( F_{Hrt}=0 \text{ kN} \)
  moment (clockwise) \( M_{rt}=0 \text{ kNm} \)

No reversal of moments so moment-reversal multiplier \( \text{revm}=1 \) throughout.
No reversal of shears, so shear-reversal multiplier \( \text{revs}=1 \) throughout.
Allowable bearing pressure \( \text{press}=200 \text{ kN/m}^2 \)
Concrete density \( \text{den}=24 \text{ kN/m}^3 \)

Value of dimension \( x_0 \) \( x_0=1 \text{ m} \)
Value of dimension \( x_1 \) \( x_1=1 \text{ m} \)
Value of dimension \( x_2 \) \( x_2=2 \text{ m} \)
Value of dimension \( x_3 \) \( x_3=1 \text{ m} \)
Length of base \( l=x_1+\text{dist}+x_3=9.5 \text{ m} \)
Smaller width of base \( b_{\text{min}}=2\times x_0=2 \text{ m} \)
Greater width of base \( b_{\text{max}}=2\times x_2=4 \text{ m} \)
Area of base \( \text{area}_{P}=l\times (b_{\text{max}}+b_{\text{min}})/2=28.5 \text{ m}^2 \)
Self-weight of base \( \text{Swt} = \text{area}_{P}\times \text{den} = 684 \text{ kN} \)
Total vertical load on base \( V=F_{Vleft}+F_{Vrt}+\text{Swt}=1484 \text{ kN} \)
Position of centroid of base \( x_{\text{bar}_{P}}=l/3\times(2\times x_0+x_2)/(x_0+x_2) = 4.2222 \text{ m from left end.} \)
\( x'=x_{\text{bar}_{P}}-x_3 = 3.2222 \text{ m from left-hand column.} \)
Moment of inertia of base \( I_{xx} = (x_0^2+4\times x_0\times x_2+x_2^2)/(x_0+x_2)\times l^3/18 = 206.41 \text{ m}^4 \)
Taking moments about position of left column:
  clock\(=F_{Vrt}\times \text{dist}+\text{revs}\times (F_{Hleft}+F_{Hrt})\times h+\text{revm}\times (M_{left}+M_{rt})+\text{Swt}\times x'=704 \text{ kNm} \)
Centroid of load from left col. \( x_{\text{bar}} = \text{clock}/V = 0.47439 \text{ m} \)
Eccentricity of upward pressure \( e = x'-x_{\text{bar}} = 2.7478 \text{ m} \)
Triangular distribution of pressure beneath base.

WARNING: Uplift occurs

Point of zero upward pressure \( x_z = 4.6276 \) m from left end of base.
Pressure at left end of base \( P_{lt} = \frac{V}{(x_z^* (w_z + 4*x^2))} = 174.51 \) kN/m²

Bending moments and shears at a specific point

Dist of point considered from left end of base \( x = 4.75 \) m

Final shearing forces:
To left \( SL = SL - F_{V left} = 85 \) kN
To right \( SR = SR - F_{V right} = -85 \) kN

Final bending moments:
To left \( ML = ML - F_{V left} (x - x_3) + revm^* M_{left} + revs \) \* \( FH_{left}^* h = 118.25 \) kNm
To right \( MR = MR - F_{V right} (l - x - x_1) - revm^* M_{right} - revs \) \* \( FH_{right}^* h = 118.25 \) kNm
Location: Typical calculation for optimum missing dimension.

Preliminary calculations for trapezoidal combined base

Distance between columns \( \text{dist} = 7.5 \text{ m} \)
Thickness of base \( h = 1 \text{ m} \)
Left column: vertical load \( F_{Vleft} = 1450 \text{ kN} \)
horizontal shear \( F_{Hleft} = 200 \text{ kN} \)
moment (clockwise) \( M_{left} = 0 \text{ kNm} \)
Right column: vertical load \( F_{Vrt} = 800 \text{ kN} \)
horizontal shear \( F_{Hrt} = 200 \text{ kN} \)
moment (clockwise) \( M_{rt} = 0 \text{ kNm} \)

No reversal of moments so moment-reversal multiplier \( \text{revm} = 1 \) throughout.
No reversal of shears, so shear-reversal multiplier \( \text{revs} = 1 \) throughout.
Allowable bearing pressure \( \text{press} = 200 \text{ kN/m}^2 \)
Concrete density \( \text{den} = 24 \text{ kN/m}^3 \)

Value of dimension \( x_0 = 0.5 \text{ m} \)
Value of dimension \( x_1 = 0.5 \text{ m} \)
Value of dimension \( x_2 = 0 \text{ m} \)
Value of dimension \( x_3 = 1.2 \text{ m} \)
Length of base \( l = x_1 + \text{dist} + x_3 = 9.2 \text{ m} \)
Smaller width of base \( b_{min} = 2x_0 = 1 \text{ m} \)
Greater width of base \( b_{max} = 2x_2 = 1.94 \text{ m} \)
Area of base \( \text{area}_P = l(x_{max} + b_{min})/2 = 13.524 \text{ m}^2 \)
Self-weight of base \( \text{Swt} = \text{area}_P \times \text{den} = 324.58 \text{ kN} \)
Total vertical load on base \( V = F_{Vleft} + F_{Vrt} + \text{Swt} = 2574.6 \text{ kN} \)
Position of centroid of base \( x_{bar} = \text{clock} / V = 2.8527 \text{ m} \)
Eccentricity of upward pressure \( e = x' - x_{bar} = 0.057073 \text{ m} \)

Taking moments about position of left column:

\[
\text{clock} = F_{Vrt} \times \text{dist} + \text{revs} \times (F_{Hleft} + F_{Hrt}) \times h + \text{revm} \times (M_{left} + M_{rt}) + \text{Swt} \times x' \\
= 7344.4 \text{ kNm}
\]

Position of centroid from left col. \( x_{bar} = \text{clock} / V = 2.8527 \text{ m} \)

Eccentricity of upward pressure \( e = x' - x_{bar} = 0.057073 \text{ m} \)
Trapezoidal distribution of pressure beneath base

Pressure at left end of base
\[ P_{lt} = V \times \left( \frac{1}{A_1} + e \times \bar{x}_{P} / I_{xx} \right) \]
\[ = 196.92 \text{ kN/m}^2 \]

Pressure at right end of base
\[ P_{rt} = V \times \left( \frac{1}{A_1} - e \times (l - \bar{x}_{P}) / I_{xx} \right) \]
\[ = 182.25 \text{ kN/m}^2 \]

Bending moments and shears at a specific point

Dist of point considered from left end of base x=4.6 m

Final shearing forces:
To left \( SL = SL - FV_{left} = -121.2 \text{ kN} \)
To right \( SR = SR - FV_{rt} = 121.2 \text{ kN} \)

Final bending moments:
To left \( ML = ML - FV_{left} \times (x-x_3) + revm \times M_{left} + revs \times FH_{left} \times h = -1511.4 \text{ kNm} \)
To right \( MR = MR - FV_{rt} \times (l-x-x_1) - revm \times M_{rt} - revs \times FH_{rt} \times h = -1511.4 \text{ kNm} \)
Preliminary calculations for T-shaped combined base

Distance between columns \( \text{dist}=7.5 \text{ m} \)
Thickness of base \( h=1 \text{ m} \)
Left column: vertical load \( \text{FV}_{\text{left}}=580 \text{ kN} \)
  \( \text{horizontal shear (->)} \) \( \text{FH}_{\text{left}}=150 \text{ kN} \)
  \( \text{moment (clockwise)} \) \( \text{M}_{\text{left}}=0 \text{ kNm} \)
Right column: vertical load \( \text{FV}_{\text{rt}}=400 \text{ kN} \)
  \( \text{horizontal shear (->)} \) \( \text{FH}_{\text{rt}}=150 \text{ kN} \)
  \( \text{moment (clockwise)} \) \( \text{M}_{\text{rt}}=0 \text{ kNm} \)

No reversal of moments so moment-reversal multiplier \( \text{revm}=1 \) throughout.
Shear-reversal multiplier \( \text{revs} \) is set to 1 when shear forces act from left to right, and to -1 when shear forces act from right to left.
Allowable bearing pressure \( \text{press}=80 \text{ kN/m}^2 \)
Concrete density \( \text{den}=24 \text{ kN/m}^3 \)

Location: Automatic sizing of T-shaped base with typical loads.

Value of dimension \( x_0 \) \( x_0=0.88 \text{ m} \)
Value of dimension \( x_1 \) \( x_1=0.88 \text{ m} \)
Value of dimension \( x_2 \) \( x_2=1.32 \text{ m} \)
Value of dimension \( x_3 \) \( x_3=1.32 \text{ m} \)
Length of base \( l=x_1+\text{dist}+x_3=9.7 \text{ m} \)
Smaller width of base \( b_{\text{min}}=2x_0=1.76 \text{ m} \)
Greater width of base \( b_{\text{max}}=2x_2=2.64 \text{ m} \)
Area of base \( \text{area}_P= l*b_{\text{min}}+(b_{\text{max}}-b_{\text{min}})*(x_3+\text{dist}/2) = 21.534 \text{ m}^2 \)
Self-weight of base \( \text{Swt}=\text{area}_P*h*\text{den}=516.81 \text{ kN} \)
Total vertical load on base \( \text{V}=\text{FV}_{\text{left}}+\text{FV}_{\text{rt}}+\text{Swt}=1496.8 \text{ kN} \)
\( x_{\text{bar}}P=((x_2-x_0)*(x_3+\text{dist}/2)^2+x_0*l^2)/(2*((x_2-x_0)*(x_3+\text{dist}/2)+x_0*l)) = 4.3703 \)
Position of centroid of base \( x_{\text{bar}}P=4.3703 \text{ m} \) from left end.
\( x'=x_{\text{bar}}P-x_3 = 3.0503 \text{ m} \) from left-hand column.
\( I_{xx}=2*(x_2*x_{\text{bar}}P^3+3+x_0*(1-x_{\text{bar}}P)^3-(x_{\text{bar}}P-x_3-\text{dist}/2)^3*(x_2-x_0))/3=162.37 \text{ m}^4 \)
Moment of inertia of base \( I_{xx}=162.37 \text{ m}^4 \)
Dist. from left end of base to change in width \( x_4=x_3+\text{dist}/2=5.07 \text{ m} \)
With clockwise moments and left to right shears

Taking moments about position of left column:
\[
\text{clock} = FV_{rt} \cdot \text{dist} + \text{revs} \cdot (F_{Hleft} + F_{Hrt}) \cdot h + \text{revm} \cdot (M_{left} + M_{rt}) + Swt' \cdot x' \]
\[
= 4776.4 \text{ kNm}
\]
Centroid of load from left col. \(x_{bar} = \text{clock} / V = 3.1911 \text{ m}\)
Eccentricity of upward pressure \(e = x' - x_{bar} = -0.14074 \text{ m}\)

Trapezoidal distribution of pressure beneath base

Pressure at left end of base
\[
\text{Pl}_l = V \cdot (1 / \text{area}_P + e' \cdot x_{bar} / I_{xx})
\]
\[
= 63.84 \text{ kN/m}
\]
Pressure at right end of base
\[
\text{Pr}_r = V \cdot (1 / \text{area}_P - e \cdot (l - x_{bar}) / I_{xx})
\]
\[
= 76.425 \text{ kN/m}
\]

Bending moments and shears at a specific point

Dist. of point considered from left end of base \( x = 4.85 \) m

Final shearing forces:
- To left: \( SL = SL - F_{V_{left}} = 31.759 \) kN
- To right: \( SR = SR - F_{V_{right}} = -31.759 \) kN

Final bending moments:
- To left: \( ML = ML - F_{V_{left}} \times (x - x_3) + rev_{M_{left}} + rev_{F_{H_{left}}} \times h = -684.62 \) kNm
- To right: \( MR = MR - F_{V_{right}} \times (l - x - x_1) - rev_{M_{right}} - rev_{F_{H_{right}}} \times h = -684.62 \) kNm
**Location:** Manual check of T-shaped base with typical loading.

**Preliminary calculations for T-shaped combined base**

- **Distance between columns:** $\text{dist}=7.5 \text{ m}$
- **Thickness of base:** $h=1 \text{ m}$
- **Left column:**
  - Vertical load: $F_{V_{\text{left}}}=1500 \text{ kN}$
  - Horizontal shear: $F_{H_{\text{left}}}=400 \text{ kN}$
  - Moment (clockwise): $M_{\text{left}}=50 \text{ kNm}$
- **Right column:**
  - Vertical load: $F_{V_{\text{rt}}}=400 \text{ kN}$
  - Horizontal shear: $F_{H_{\text{rt}}}=400 \text{ kN}$
  - Moment (clockwise): $M_{\text{rt}}=50 \text{ kNm}$

No reversal of moments so moment-reversal multiplier $revm=1$ throughout.

Shear-reversal multiplier $revs$ is set to 1 when shear forces act from left to right, and to -1 when shear forces act from right to left.

- **Allowable bearing pressure:** $\text{press}=300 \text{ kN/m}^2$
- **Concrete density:** $\text{den}=24 \text{ kN/m}^3$

```

  \node at (0,2) {x0};
  \node at (0,-2) {x0};
  \node at (-2,-1) {$x_2$};
  \node at (2,-1) {$x_2$};
  \node at (-1,-3) {$x_3$};
  \node at (1,-3) {$x_3$};
\end{tikzpicture}
```

- **Value of dimension $x_0$:** $x_0=1 \text{ m}$
- **Value of dimension $x_1$:** $x_1=1 \text{ m}$
- **Value of dimension $x_2$:** $x_2=2 \text{ m}$
- **Value of dimension $x_3$:** $x_3=1 \text{ m}$
- **Length of base:** $l=x_1+\text{dist}+x_3=9.5 \text{ m}$
- **Smaller width of base:** $b_{\text{min}}=2x_0=2 \text{ m}$
- **Greater width of base:** $b_{\text{max}}=2x_2=4 \text{ m}$
- **Area of base:** $\text{area}_P=l\cdot b_{\text{min}}+(b_{\text{max}}-b_{\text{min}})\cdot (x_3+\text{dist}/2)=28.5 \text{ m}^2$
- **Self-weight of base:** $\text{Swt}=\text{area}_P\cdot h\cdot \text{den}=684 \text{ kN}$
- **Total vertical load on base:** $V=F_{V_{\text{left}}}+F_{V_{\text{rt}}}+\text{Swt}=2584 \text{ kN}$
- **Position of centroid of base:** $x_{\text{bar}}=3.9583 \text{ m}$ from left end.
  - $x'=x_{\text{bar}}-x_3=2.9583 \text{ m}$ from left-hand column.
- **Moment of inertia of base:** $I_{xx}=196.48 \text{ m}^4$
- **Dist. from left end of base to change in width:** $x_4=x_3+\text{dist}/2=4.75 \text{ m}$
With clockwise moments and left to right shears

Taking moments about position of left column:
\[
\text{clock} = FV_{rt} \times \text{dist} + \text{revs} \times (FH_{left} + FH_{rt}) \times h + \text{revm} \times (M_{left} + M_{rt}) + Swt \times x'
\]
\[= 5923.5 \text{ kNm} \]

Centroid of load from left col.
\[x_{bar} = \frac{\text{clock}}{V} = 2.2924 \text{ m} \]

Eccentricity of upward pressure
\[e = x' - x_{bar} = 0.66596 \text{ m} \]

Trapezoidal distribution of pressure beneath base

Pressure at left end of base
\[P_{lt} = V \times \left( \frac{1}{\text{areaP}} + e \times x_{barP} / I_{xx} \right) \]
\[= 125.33 \text{ kN/m}^2 \]

Pressure at right end of base
\[P_{rt} = V \times \left( \frac{1}{\text{areaP}} - e \times (l - x_{barP}) / I_{xx} \right) \]
\[= 42.131 \text{ kN/m}^2 \]

- To right \( SR = SR - FV_{\text{rt}} = 50.949 \text{ kN} \)

Final bending moments:
- To left \( ML = ML - FV_{\text{left}} \times (x - x_3) + \text{revm} \times M_{\text{left}} + \text{revs} \times FH_{\text{left}} \times h = -1606.1 \text{ kNm} \)
- To right \( MR = MR - FV_{\text{rt}} \times (l - x - x_1) - \text{revm} \times M_{\text{rt}} - \text{revs} \times FH_{\text{rt}} \times h = -1606.1 \text{ kNm} \)

---

**SCALE 5.48**

**Office 1007**

**Proforma 757**
Preliminary calculations for combined rectangular base

Distance between columns \( \text{dist}=7.5 \text{ m} \)
Thickmess of base \( h=1 \text{ m} \)
Left column: vertical load \( F_{V\text{left}}=580 \text{ kN} \)
  horizontal shear \( F_{H\text{left}}=150 \text{ kN} \)
  moment (clockwise) \( M_{\text{left}}=0 \text{ kNm} \)
Right column: vertical load \( F_{V\text{rt}}=400 \text{ kN} \)
  horizontal shear \( F_{H\text{rt}}=50 \text{ kN} \)
  moment (clockwise) \( M_{\text{rt}}=0 \text{ kNm} \)

No reversal of moments so moment-reversal multiplier \( \text{revm}=1 \) throughout.
Shear-reversal multiplier \( \text{revs} \) is set to 1 when shear forces act from left to right, and to -1 when shear forces act from right to left.
Allowable bearing pressure \( \text{press}=80 \text{ kN/m}^2 \)
Concrete density \( \text{den}=24 \text{ kN/m}^3 \)

Value of dimension \( x_0 \) \( x_0=1.11 \text{ m} \)
Value of dimension \( x_1 \) \( x_1=0.4 \text{ m} \)
Value of dimension \( x_2 \) \( x_2=1.78 \text{ m} \)
Length of base \( l=x_1+\text{dist}+x_2=9.68 \text{ m} \)
Width of base \( b=2\times x_0=2.22 \text{ m} \)
Area of base \( \text{area}=l\times b=21.49 \text{ m}^2 \)
Self-weight of base \( \text{Swt}=l\times b\times h\times \text{den}=515.75 \text{ kN} \)
Total vertical load on base \( V=F_{V\text{left}}+F_{V\text{rt}}+\text{Swt}=1495.8 \text{ kN} \)
Base centroid from left column \( x'=l/2-x_2=3.06 \text{ m} \)

With clockwise moments and left->right shears:

Taking moments about position of left column:
\[ \text{clock}=F_{V\text{rt}}\times \text{dist}+(\text{revs})\times (F_{H\text{left}}+F_{H\text{rt}})\times h+(\text{revm})\times (M_{\text{left}}+M_{\text{rt}})+\text{Swt}\times x' \]
\[ =4778.2 \text{ kNm} \]

Centroid of load from left col. \( x_{\text{bar}}=\text{clock}/V=3.1945 \text{ m} \)
Eccentricity of upward pressure \( e=x'-x_{\text{bar}}=-0.13451 \text{ m} \)

As \( e<1/6 \), distribution of pressure beneath base is trapezoidal

Pressure at left end of base \( P_{\text{lt}}=V\times(1+6\times e/l)/(b\times l)=63.8 \text{ kN/m}^2 \)
Pressure at right end of base \( P_{\text{rt}}=V\times(1-6\times e/l)/(b\times l)=75.407 \text{ kN/m}^2 \)
Dist. (m) | Shearing force (kN) | Bending moment (kNm)

</table>

Dist. of point considered from left end of base x=6.925 m

**Final shearing forces:**

- To left: \( SL = SL - FV_{left} = -550.81 \) kN
- To right: \( SR = SR - FV_{rt} = 550.81 \) kN

**Final bending moments:**

- To left: \( ML = ML - FV_{left} \times (x-x^2) + revm \times M_{left} + revs \times FH_{left} \times h = 923.13 \) kNm
- To right: \( MR = MR - FV_{rt} \times (l-x-x_1) - revm \times M_{rt} - revs \times FH_{rt} \times h = 923.13 \) kNm
Location: Heavy load on left base: no moment or shear reversal

If pairs of bases supporting a trestle, gantry or similar structure are subjected to moments and horizontal shearing forces acting in the same sense on each base simultaneously, by linking the pairs of bases by tie beams the bases are relieved of the effects resulting from eccentricity and may be then designed as concentrically loaded. In such a case the size, flexibility and arrangement of the tie beam must be such that it does not provide load support itself nor does it transmit load from one base to the other. To reduce the risk of differential settlement, the bases must also be so dimensioned that the bearing pressure beneath each is similar under all possible loading conditions. If the applied moments and/or the horizontal shearing forces can reverse in direction, remember to check these situations also.

Distance between column centres: dist=5.5 m
Concrete density: den=24 kN/m³
Width: bleft=4 m
Length: lleft=2 m
Depth: hleft=0.8 m
Vertical applied load: FVleft=4500 kN
Horizontal load (left to right): FHleft=100 kN
Applied moment (clockwise): Mleft=50 kNm
Width: bright=4 m
Length: lright=2 m
Depth: hright=0.8 m
Vertical applied load: FVright=1000 kN
Horizontal load (left to right): FHright=100 kN
Applied moment (clockwise): Mright=50 kNm

No reversal of moments or shearing forces

Moment at centreline of left base: BMleft=-(Mleft+FHleft*hleft)=-130 kNm
Moment at centreline of right base: BMright=Mright+FHright*hright=130 kNm
BM at left end of connecting beam: Mlend=BMleft-(BMleft-BMright)*lleft/(2*dist) =-82.727 kNm
BM at right end of connecting beam: Mrend=BMright+(BMleft-BMright)*lright/(2*dist) =82.727 kNm
Shear force on connecting beam: Sbeam=(-BMleft+BMright)/dist =47.273 kN
**Location:** Same as Example No.1 but with moment and shear reversal

If pairs of bases supporting a trestle, gantry or similar structure are subjected to moments and horizontal shearing forces acting in the same sense on each base simultaneously, by linking the pairs of bases by tie beams the bases are relieved of the effects resulting from eccentricity and may be then designed as concentrically loaded. In such a case the size, flexibility and arrangement of the tie beam must be such that it does not provide load support itself nor does it transmit load from one base to the other. To reduce the risk of differential settlement, the bases must also be so dimensioned that the bearing pressure beneath each is similar under all possible loading conditions. If the applied moments and/or the horizontal shearing forces can reverse in direction, remember to check these situations also.

Distance between column centres \( \text{dist}=5.5 \text{ m} \)
Concrete density \( \text{den}=24 \text{ kN/m}^3 \)
Width \( b_{\text{left}}=4 \text{ m} \)
Length \( l_{\text{left}}=2 \text{ m} \)
Depth \( h_{\text{left}}=0.8 \text{ m} \)
Vertical applied load \( F_{V_{\text{left}}}=4500 \text{ kN} \)
Horizontal load (left to right) \( F_{H_{\text{left}}}=100 \text{ kN} \)
Applied moment (clockwise) \( M_{\text{left}}=50 \text{ kNm} \)
Width \( b_{\text{right}}=4 \text{ m} \)
Length \( l_{\text{right}}=2 \text{ m} \)
Depth \( h_{\text{right}}=0.8 \text{ m} \)
Vertical applied load \( F_{V_{\text{right}}}=1000 \text{ kN} \)
Horizontal load (left to right) \( F_{H_{\text{right}}}=100 \text{ kN} \)
Applied moment (clockwise) \( M_{\text{right}}=50 \text{ kNm} \)

**No reversal of moments or shearing forces**

Moment at centreline of left base \( B_{M_{\text{left}}}=-\left(M_{\text{left}}+F_{H_{\text{left}}}h_{\text{left}}\right)=-130 \text{ kNm} \)
Moment at centreline of right base \( B_{M_{\text{right}}}=M_{\text{right}}+F_{H_{\text{right}}}h_{\text{right}}=130 \text{ kNm} \)
BM at left end of connecting beam:
\[
M_{\text{left}} = B_{M_{\text{left}}} - (B_{M_{\text{left}}}-B_{M_{\text{right}}})l_{\text{left}}/(2\text{*dist})
\]
\[
= -82.727 \text{ kNm}
\]
BM at right end of connecting beam:
\[
M_{\text{right}} = B_{M_{\text{right}}} + (B_{M_{\text{left}}}-B_{M_{\text{right}}})l_{\text{right}}/(2\text{*dist})
\]
\[
= 82.727 \text{ kNm}
\]
Shear force on connecting beam \( S_{\text{beam}}=(B_{M_{\text{left}}}+B_{M_{\text{right}}})/\text{dist} \)
\[
= 47.273 \text{ kN}
\]
Location: Uplift on right base: moment reversal only

If pairs of bases supporting a trestle, gantry or similar structure are subjected to moments and horizontal shearing forces acting in the same sense on each base simultaneously, by linking the pairs of bases by tie beams the bases are relieved of the effects resulting from eccentricity and may be then designed as concentrically loaded. In such a case the size, flexibility and arrangement of the tie beam must be such that it does not provide load support itself nor does it transmit load from one base to the other. To reduce the risk of differential settlement, the bases must also be so dimensioned that the bearing pressure beneath each is similar under all possible loading conditions. If the applied moments and/or the horizontal shearing forces can reverse in direction, remember to check these situations also.

Distance between column centres \( \text{dist} = 5.5 \text{ m} \)
Concrete density \( \text{den}=24 \text{ kN/m}^3 \)
Width \( b_{\text{left}}=4 \text{ m} \)
Length \( l_{\text{left}}=2 \text{ m} \)
Depth \( h_{\text{left}}=0.8 \text{ m} \)
Vertical applied load \( F_{V_{\text{left}}}=4500 \text{ kN} \)
Horizontal load (left to right) \( F_{H_{\text{left}}}=100 \text{ kN} \)
Applied moment (clockwise) \( M_{\text{left}}=50 \text{ kNm} \)
Width \( b_{\text{right}}=4 \text{ m} \)
Length \( l_{\text{right}}=2 \text{ m} \)
Depth \( h_{\text{right}}=0.8 \text{ m} \)
Vertical applied load \( F_{V_{\text{right}}}=-100 \text{ kN} \)
Horizontal load (left to right) \( F_{H_{\text{right}}}=100 \text{ kN} \)
Applied moment (clockwise) \( M_{\text{right}}=50 \text{ kNm} \)

**No reversal of moments or shearing forces**

Moment at centreline of left base \( B_{M_{\text{left}}} = -(M_{\text{left}} + F_{H_{\text{left}}} \times h_{\text{left}}) = -130 \text{ kNm} \)
Moment at centreline of right base \( B_{M_{\text{right}}} = M_{\text{right}} + F_{H_{\text{right}}} \times h_{\text{right}} = 130 \text{ kNm} \)
BM at left end of connecting beam:
\[
M_{\text{lend}} = B_{M_{\text{left}}} - (B_{M_{\text{left}}} - B_{M_{\text{right}}}) \times l_{\text{left}} / (2 \times \text{dist})
\]
\[
= -82.727 \text{ kNm}
\]
BM at right end of connecting beam:
\[
M_{\text{rend}} = B_{M_{\text{right}}} + (B_{M_{\text{left}}} - B_{M_{\text{right}}}) \times l_{\text{right}} / (2 \times \text{dist})
\]
\[
= 82.727 \text{ kNm}
\]
Shear force on connecting beam \( S_{\text{beam}} = (-B_{M_{\text{left}}} + B_{M_{\text{right}}}) / \text{dist} \)
\[
= 47.273 \text{ kN}
\]
Analysis of combined footing

Tapered base of constant thickness supporting two point loads L1 and L2.

The point loads are on the centre-line of base.

Distance to load 1: a = 0.457 m
Distance to load 2: b = 4.72 m
Length of base: c = 5.13 m
Width of base at left end: d = 2.688 m
Width of base at right end: e = 1.295 m
Thickness of base: f = 0.9 m
Load L1: L1 = 1690 kN
Load L2: L2 = 1245 kN

Ground pressures

Average pressure: AP = TL/ta = 308.88 kN/m²
Eccentric pressure left end: PL = TL*(eb-EL)/zl = 0.20115 kN/m²
Eccentric pressure right end: PR = TL*(EL-eb)/zr = -0.25423 kN/m²
Maximum pressure at left end: SL = AP + PL = 309.08 kN/m²
Maximum pressure at right end: SR = AP + PR = 308.63 kN/m²
Maximum pressure (excluding self-weight) at left end: LS = SL - f*24 = 287.48 kN/m²
Maximum pressure (excluding self-weight) at right end: RS = SR - f*24 = 287.03 kN/m²
Distance right end to zero shear: x = SX = 2.65 m

Bending moments

For moment at load L1, with and
D = b - a = 4.263 m
B1 = e*RS*l^2/2 = 4058.4 kNm
B2 = (e*(LS-RS) + RS*(d-e)) * l^3 / (6*c)
   = 1327.5 kNm
B3 = (d-e) * (LS-RS) * l^4 / (12*c^2) - L2*D
   = -5306.5 kNm
Then bending moment at Load L1: BM = B1 + B2 + B3 = 79.449 kNm

For moment at load L2, with and
D = 0
B1 = e*RS*l^2/2 = 31.242 kNm
B2 = (e*(LS-RS) + RS*(d-e)) * l^3 / (6*c)
   = 0.8966 kNm

SCALE 5.48 Office 1007 Proforma 760
Then bending moment at Load L2

\[ B3 = (d-e)(LS-RS) \frac{l^4}{(12c^2)} - L2D \]

\[ = 56.76 \times 10^{-6} \text{ kNm} \]

Then maximum moment in span

\[ BM = B1 + B2 + B3 = 32.138 \text{ kNm} \]

For maximum moment in span, with

\[ l = x = 2.65 \text{ m} \]

\[ D = x + b - c = 2.24 \text{ m} \]

\[ B1 = eRS \frac{l^2}{2} = 1305.1 \text{ kNm} \]

\[ B2 = e(LS-RS) + RS(d-e) \frac{l^3}{6c} = 242.1 \text{ kNm} \]

\[ B3 = (d-e)(LS-RS) \frac{l^4}{(12c^2)} - L2D = -2788.7 \text{ kNm} \]

Then maximum moment in span

\[ BM = B1 + B2 + B3 = -1241.5 \text{ kNm} \]

**Base widths**

Width of base at load L1

\[ D1 = e + (c-a)(d-e) / c = 2.5639 \text{ m} \]

Width of base at load L2

\[ D2 = e + (c-b)(d-e) / c = 1.4063 \text{ m} \]

Width of base at max. span moment

\[ D3 = e + x(d-e) / c = 2.0146 \text{ m} \]
**Location:** Large, heavily-loaded trapezoidal base

**Analysis of combined footing**

Tapered base of constant thickness supporting two point loads $L_1$ and $L_2$.

The point loads are on the centre-line of base.

Distance to load 1 $a=0.3$ m  
Distance to load 2 $b=9.8$ m  
Length of base $c=10$ m  
Width of base at left end $d=5$ m  
Width of base at right end $e=2$ m  
Thickness of base $f=1.5$ m  
Load $L_1$ $L_1=3000$ kN  
Load $L_2$ $L_2=1500$ kN

**Ground pressures**

Average pressure $AP=TL/ta=164.57$ kN/m²  
Eccentric pressure left end $PL=TL)*(eb-EL)/z1=57.689$ kN/m²  
Eccentric pressure right end $PR=TL*(EL-eb)/zr=-76.919$ kN/m²  
Maximum pressure at left end $SL=AP+PL=222.26$ kN/m²  
Maximum pressure at right end $SR=AP+PR=87.652$ kN/m²  
Maximum pressure (excluding self-weight) at left end $LS=SL-f*24=186.26$ kN/m²  
Maximum pressure (excluding self-weight) at right end $RS=SR-f*24=51.652$ kN/m²  
Distance right end to zero shear $x=SX=5.65$ m

**Bending moments**

For moment at load $L_1$, with $l=c-a=9.7$ m and $D=b-a=9.5$ m  
$B_1=e*RS*1^2/2=4860$ kNm  
$B_2=(e*(LS-RS)+RS*(d-e))*1^3/(6*c)$  
$=6452.2$ kNm  
$B_3=(d-e)*(LS-RS)*1^4/(12*c^2)-L_2*D$  
$=-11271$ kNm  
Then bending moment at Load $L_1$ $BM=B_1+B_2+B_3=41.357$ kNm

For moment at load $L_2$, with $l=c-b=0.2$ m and $D=0$  
$B_1=e*RS*1^2/2=2.0661$ kNm  
$B_2=(e*(LS-RS)+RS*(d-e))*1^3/(6*c)$  
$=0.056557$ kNm
B3 = (d-e) * (LS-RS) * l^4 / (12 * c^2) - L2 * D
= 0.53843E-3 kNm

Then bending moment at Load L2
BM = B1 + B2 + B3 = 2.1232 kNm

For maximum moment in span, with
l = x = 5.65 m
D = x + b - c = 5.45 m
B1 = e * RS * l^2 / 2 = 1648.9 kNm
B2 = (e * (LS-RS) + RS * (d-e)) * l^3 / (6 * c)
= 1275.1 kNm
B3 = (d-e) * (LS-RS) * l^4 / (12 * c^2) - L2 * D
= -7832.1 kNm

Then maximum moment in span
BM = B1 + B2 + B3 = -4908.1 kNm

**Base widths**

Width of base at load L1
D1 = e + (c-a) * (d-e) / c = 4.91 m

Width of base at load L2
D2 = e + (c-b) * (d-e) / c = 2.06 m

Width of base at max. span moment
D3 = e + x * (d-e) / c = 3.695 m
Location: Small, rectangular base

Analysis of combined footing

Tapered base of constant thickness supporting two Point loads L1 and L2. The point loads are on the centre-line of base.

Distance to load 1: a = 0.5 m
Distance to load 2: b = 2.5 m
Length of base: c = 3 m
Width of base at left end: d = 1.5 m
Width of base at right end: e = 1.5 m
Thickness of base: f = 0.5 m
Load L1: L1 = 1500 kN
Load L2: L2 = 1000 kN

Ground pressures

Average pressure: \( AP = \frac{TL}{ta} = 567.56 \text{ kN/m}^2 \)
Eccentric pressure left end: \( PL = \frac{TL*(eb-EL)}{zl} = 222.22 \text{ kN/m}^2 \)
Eccentric pressure right end: \( PR = \frac{TL*(EL-eb)}{zr} = -222.22 \text{ kN/m}^2 \)
Maximum pressure at left end: \( SL = AP + PL = 789.78 \text{ kN/m}^2 \)
Maximum pressure at right end: \( SR = AP + PR = 345.33 \text{ kN/m}^2 \)
Maximum pressure (excluding self-weight) at left end: \( LS = SL - f*24 = 777.78 \text{ kN/m}^2 \)
Maximum pressure (excluding self-weight) at right end: \( RS = SR - f*24 = 333.33 \text{ kN/m}^2 \)
Distance right end to zero shear: \( x = SX = 1.5 \text{ m} \)

Bending moments

For moment at load L1, with l = c-a=2.5 m and
\[
D = b-a = 2 \text{ m}
\]
\[
B1 = e*RS*1^2/2 = 1562.5 \text{ kNm}
\]
\[
B2 = (e*(LS-RS)+RS*(d-e))*1^3/(6*c)
\]
\[
= 578.7 \text{ kNm}
\]
\[
B3 = (d-e)*(LS-RS)*1^4/(12*c^2)-L2*D
\]
\[
= -2000 \text{ kNm}
\]
Then bending moment at Load L1: \( BM = B1 + B2 + B3 = 141.2 \text{ kNm} \)

For moment at load L2, with l = c-b=0.5 m and
\[
D = 0
\]
\[
B1 = e*RS*1^2/2 = 62.5 \text{ kNm}
\]
\[
B2 = (e*(LS-RS)+RS*(d-e))*1^3/(6*c)
\]
\[
= 4.6296 \text{ kNm}
\]

SCALE 5.48 Office 1007 Proforma 760
B3 = (d-e) * (LS-RS) * l^4 / (12 * c^2) - L2 * D
= 0 kNm

Then bending moment at Load L2
BM = B1 + B2 + B3 = 67.13 kNm

For maximum moment in span, with
l = x = 1.5 m
D = x + b - c = 1 m
B1 = e * RS * l^2 / 2 = 562.5 kNm
B2 = (e * (LS-RS) + RS * (d-e)) * l^3 / (6 * c) = 125 kNm
B3 = (d-e) * (LS-RS) * l^4 / (12 * c^2) - L2 * D
= -1000 kNm

Then maximum moment in span
BM = B1 + B2 + B3 = -312.5 kNm

**Base widths**

Width of base at load L1
D1 = e + (c-a) * (d-e) / c = 1.5 m

Width of base at load L2
D2 = e + (c-b) * (d-e) / c = 1.5 m

Width of base at max. span moment
D3 = e + x * (d-e) / c = 1.5 m
Location: Example 17.5 from Design of Reinforced Concrete Buildings

Length of base \( L = 20 \text{ m} \)
Width of base \( B = 2 \text{ m} \)
Number of point loads \( n = 5 \)
Point load 1 \( W_1 = 500 \text{ kN} \)
Distance from left end of found \( x_1 = 2 \text{ m} \)
Point load 2 \( W_2 = 450 \text{ kN} \)
Distance from left end of found \( x_2 = 5 \text{ m} \)
Point load 3 \( W_3 = 400 \text{ kN} \)
Distance from left end of found \( x_3 = 8.5 \text{ m} \)
Point load 4 \( W_4 = 350 \text{ kN} \)
Distance from left end of found \( x_4 = 12.5 \text{ m} \)
Point load 5 \( W_5 = 300 \text{ kN} \)
Distance from left end of found \( x_5 = 18 \text{ m} \)

Location: Example 1

Active thrust on wall - cohesionless soil with horizontal surface

Height of wall $h=5\text{ m}$
Depth to water table $d=2\text{ m}$
Surcharge $q=0\text{ kN/m}^2$
Shearing resist. angle (degrees) $\phi'=35^\circ$
Dry unit weight $\gamma_d=17\text{ kN/m}^3$
Saturated unit weight $\gamma_{sm}=20\text{ kN/m}^3$
Unit weight of water $\gamma_w=9.8\text{ kN/m}^3$
Location: Example 2

Active thrust on wall - cohesionless soil with horizontal surface

![Diagram of wall and surcharge with labels for height h, surcharge, active thrust, and surcharge area.](image)

Height of wall \( h = 5 \text{ m} \)
Surcharge \( q = 0 \text{ kN/m}^2 \)
Unit weight \( \gamma = 18 \text{ kN/m}^3 \)
Shearing resist. angle (degrees) \( \phi' = 35^\circ \)
Location: Example 1

Active and passive pressures on sheet pile wall - with two soils

Unsupported height of wall \( h = 4.5 \) m
Surcharge pressure \( q = 50 \) kN/m²

Design data for soil 1
- Depth of soil \( d_1 = 6 \) m
- Cohesive strength \( c_1' = 0 \) kN/m²
- Dry unit weight \( \gamma_1 = 18 \) kN/m³
- Shearing resist. angle (degrees) \( \phi_1' = 38° \)

Design data for soil 2
- Depth of soil \( d_2 = 3 \) m
- Cohesive strength of soil \( c_2' = 10 \) kN/m²
- Saturated unit weight soil \( \gamma_2 = 20 \) kN/m³
- Shearing resist. angle (degrees) \( \phi_2' = 28° \)
- Unit weight of water \( \gamma_w = 9.8 \) kN/m³

Active and passive pressures
- Active pressure top of soil 1 \( p_{at1} = K_{a1} q - 2 c_1' \sqrt{K_{a1}} = 11.894 \) kN/m²
- Active pressure bot of soil 1 \( p_{ab1} = p_{at1} + K_{a1} \gamma_1 d_1 = 37.586 \) kN/m²
- Active pressure top of soil 2 \( p_{at2} = K_{a2} (q + \gamma_1 d_1) - 2 c_2' \sqrt{K_{a2}} = 45.026 \) kN/m²
- Active pressure bot of soil 2 \( p_{ab2} = p_{at2} + K_{a2} (\gamma_2 - \gamma_w) d_2 = 56.074 \) kN/m²
- Passive pressure top of soil 1 \( p_{pt1} = 0 \) kN/m²
- Passive pressure bot of soil 1 \( p_{pb1} = K_{p1} \gamma_1 (d_1 - h) = 113.5 \) kN/m²
- Passive pressure top of soil 2 \( p_{pt2} = K_{p2} \gamma_1 (d_1 - h) + 2 c_2' \sqrt{K_{p2}} = 108.07 \) kN/m²
- Passive pressure bot of soil 2 \( p_{pb2} = p_{pt2} + K_{p2} (\gamma_2 - \gamma_w) d_2 = 192.83 \) kN/m²
Location: Grid B

Active/passive wall pressures (Rankine) retaining soil slope

Design assumptions:
- water table below wall
- Cohesion $c'=0$

Height of wall $H=6$ m
Unit weight of soil $\gamma=18$ kN/m$^3$
Soil slope in degrees $\beta=20^\circ$
Soil friction angle in degrees $\phi=40^\circ$
Total active thrust on wall $P_a=0.5*\gamma H^2 \cos(\beta')$

$=81.135$ kN/m
Location: Example from Capper & Cassie

Slope Stability

Factor of safety of soil slope using Taylor's stability numbers method.

Height of bank: H=12 m
Slope of soil (degrees): i=45°
Unit weight of soil: \( \gamma = 20.4 \, \text{kN/m}^3 \)
Soil cohesion: \( c = 28.5 \, \text{kN/m}^2 \)
Soil angle of friction: \( \phi = 20° \)
Factor of Safety (cohesion): \( F_c = c/(N \cdot \gamma \cdot H) = 1.8191 \)

The true factor of safety will be somewhat less than this as cohesion alone was considered.
Selected reduced F.O.S.: \( F_s = 1.5 \)
The actual F.O.S. must lie between these values (1.5 and 1.313).
Further iteration gives:
Factor of Safety will be around 1.37
Location: Capper & Cassie Example in Fig 90

Coefficient of volume compressibility and compression index

Specific gravity - soil particles \( G_s = 2.73 \)
Initial thickness of specimen \( t_i = 19 \text{ mm} \)
Water content at end of test \( w_1 = 19.8 \% \)

Final thickness \( t_f = t_i - (d(1) - d(i)) = 15.48 \text{ mm} \)
Void ratio at end of test \( e_1 = w_1 \times G_s / 100 = 0.54054 \)
Change in thickness \( \delta H = t_i - t_f = 3.52 \text{ mm} \)
Change in void ratio \( \delta e' = (1 + e_1) \times \delta H / (t_i - \delta H) = 0.3503 \)

Void ratio at start of test \( e_0 = e_1 + \delta e' = 0.89084 \)

\[
\delta e' = \frac{1.8908}{19} \quad \text{i.e.} \quad \delta e' = 0.099518 \times \delta H \quad \text{and can be used}
\]

to obtain the void ratio at the end of each increment as below:

Preconsolidation pressure

RF Craig in 'Soil Mechanics' states "Whenever possible the preconsolidation pressure for an overconsolidated clay should not be exceeded in construction. Compression will not usually be great if the effective vertical stress remains below \( \sigma'c \): only if \( \sigma'c \) is exceeded will compression be large."

Casagrande has suggested an empirical method to estimate the preconsolidation pressure from the curve of void ratio plotted against the effective pressure plotted to a LOG10 scale. A numerical procedure will be used to avoid having to plot void ratio against the LOG of pressure. Firstly 'curve fit' to fill out 5 intermediate values between each of the above values for void ratio and pressure.

Preconsolidation pressure \( \text{sig}'p_c = \exp(x/0.4342945) = 318.39 \)
Coefficient of volume compressibility and compression index

Void ratio for higher stress  \( e_1 = 0.57814 \)

Coeff. of volume compressibility  \( m_v = (e_0 - e_1) / (1 + e_0) / (\sigma_{'1} - \sigma_{'0}) \)

\[ = 66.574 \times 10^{-6} \text{ m}^3/\text{kN} \]

Compression index is as follows:

\[ C_c = \frac{(e_0 - e_1)}{(0.43429 \times \log(\frac{\sigma_{'1}}{\sigma_{'0}}))} = 0.30859 \]
Location: Example 7.2

Length of foundation \( X = 45 \, \text{m} \)
Breadth of foundation \( Y = 30 \, \text{m} \)
Thickness of clay layer \( H = 4 \, \text{m} \)
Depth to centre of clay layer \( z = 23.5 \, \text{m} \)
Coefficient of volume compress. - clay \( m_v = 0.35 \, \text{m}^2/\text{MN} \)
Pressure beneath foundation \( q = 125 \, \text{kN/m}^2 \)
Location: Safe bearing pressures by bearing capacity factors

Determination of soil safe bearing capacity

Determination of soil Safe Bearing Capacity assuming the removal of overburden pressure when calculating the net ultimate bearing capacity.

Soil type is assumed to be constant.

Foundation formation depth $D_f = 1.8$ m
Foundation breadth $B = 1.4$ m
Foundation length $L = 15$ m
Drained shear strength parameter $c' = 0$ kN/m$^2$
Soil angle of friction $\phi = 28^\circ$
Saturated unit weight of soil $\gamma_{sat} = 18.8$ kN/m$^3$
Dry unit weight of soil $\gamma_{dry} = 14.6$ kN/m$^3$
Depth to ground water table $GWT = 1.8$ m
Gross ultimate bearing capacity $q_{ult} = nc + nq + ng = 443.22$ kN/m$^2$
Factor of safety against failure $F_s = 3$
Gross safe bearing capacity $q_{max} = q_{ult}/F_s + q = 174.02$ kN/m$^2$
Foundation type under consideration is a strip foundation.
Location: Ex1 - Leisure centre car park

The structural design of bituminous roads

The TRRL Report 1132 published by the Department of Transport will be adopted for pavement design. This document recommends that any material within 450 mm of the road surface including the Subbase itself, must be frost resistant. The weight of vehicles on circulatory roads or service roads in a commercial car park is assumed to be greater than 1500 kg and less than this weight on car parking areas.

(A) Parking areas for cars only

The TRRL Report is not relevant for parking areas as vehicle weights are less than 1500 kg. Dense bitumen macadam to be in accordance with BS EN 13108 and/or PD 6691:2010 Guidance on the use of BS EN 13108 Bituminous mixtures - Materials Specifications.

For CBR values over 3% the following minimum layer thicknesses are recommended:

Wearing course (Surface course): 25 mm thick (6 mm size) Dense Bitumen Macadam (DBM)

Basecourse (Binder course) : 60 mm Dense Bitumen Macadam (DBM)

Roadbase (Base) : 225 mm thick layer of DOT type 1 granular fill

<table>

(B) Circulatory roads

Vehicles of weight greater than 1500 kg are assumed.
Design life of flexible pavement life=20 years
CBR value from site tests cbr=2 %

The total thickness of the bound layer entails the Wearing course, Basecourse and Roadbase.

Design life n=life=20 years
Initial daily flow of vehicles Fo=10
Growth rate r=r'/100=0.02
Below P’ represents the commercial vehicles using the slow lane.
Percentage of commercial vehicles P’=100 %
Proportion of commercial vehicles P=P’/100=1
The expression below is by Addis and Robinson (1983) and will be used to calculate the total number of commercial vehicles (Tn) using the slow lane over the design life of 20 years.

Total number of vehicles

\[ T_n = \frac{365 \times F_0 \times ((1+r)^{n-1}) \times P}{(r \times 1000000)} \]

= 0.088685 million

Year car park will be completed

Year = 2017

Mid-term year with a base of 1945

\[ t = \text{Year} + \frac{n}{2} - 1945 = 82 \]

Mid-term daily flow

\[ F = F_0 \times (1+r)^{\frac{n}{2}} = 12.19 \]

Expression

\[ C_1 = 0.082 + 0.93^{\frac{t}{2}} \times 0.93^{\frac{t}{2}} = 0.084604 \]

Expression

\[ C_2 = 0.082 + 0.92^{\frac{t}{2}} \times 0.92^{\frac{t}{2}} = 0.083073 \]

Expression

\[ C_3 = 3.9^{\left(\frac{F}{1550}\right)} = 1.0108 \]

Vehicle damage factor

\[ D = \frac{0.35}{C_1 - \left(\frac{0.26}{C_2}\right) \times (1.0/C_3)} = 1.0405 \]

Number of standard axles

\[ N_{sa} = T_n \times D = 0.092275 \text{ msa} \]

The following minimum thickness is from Fig D2 of TRRL Report 1132.

Minimum thickness of bound layer

\[ \text{tbl} = \text{TABLE 1 for } N_{sa} = 0.092275, \text{ cbr}=2 \]

= 150.68 mm

= 155 mm (rounded up)

Bound layer thickness

Hot rolled asphalt and dense bitumen macadam to be in accordance with BS EN 13108 and/or PD 6691:2010 Guidance on the use of BS EN 13108 Bituminous mixtures - Materials Specifications.

Wearing course (Surface course): 35 mm Hot Rolled Asphalt (HRA)
Basecourse (Binder course) : 55 mm Dense Bitumen Macadam (DBM)
Roadbase (Base) : 85 mm Dense Bitumen Macadam (DBM)

Subbase thickness

The thickness of the Subbase can be obtained from Figure C3 or Figure C5 of the TRRL Report 1132. The former utilises DOT type 1 granular material only and the latter a combination of DOT type 1 granular fill and a Capping layer.

Option 1 - DOT type 1 only

When a Capping layer is not employed for weak Subgrades of less than 5% CBR, the thickness of Subbase will exceed 225 mm and must be laid in two layers. The lower layer should be as thick as practically possible and preferably 225 mm, in order to avoid the danger of damaging the Subbase or Subgrade during compaction. The upper layer should have a minimum thickness of 50 mm. Fig C3 of the TRRL Report 1132 will be utilised to evaluate the Subbase thickness.

Length of road under construction L_{road} = 150 m

Subbase thickness (DOT type 1) Sub = 300 mm
Option 2 - (DOT type 1 + Capping layer)

From Figure C5 for CBR values of 2%, 3%, 4% and 5% use 150 mm Subbase of DOT type 1 over 350 mm of Capping layer. In order to reduce the possibility of failure within the Capping layer the latter should have a minimum CBR value of 15%. A suitable material for a Capping layer is 6F2 as defined in the specification for Highway Works: Volume 1: Tables 6/1 and 6/2.
The structural design of bituminous roads

The TRRL Report 1132 published by the Department of Transport will be adopted for pavement design. This document recommends that any material within 450 mm of the road surface including the Subbase itself, must be frost resistant. The weight of vehicles on circulatory roads or service roads in a commercial car park is assumed to be greater than 1500 kg and less than this weight on car parking areas.

\[ tbl = \text{TABLE 1 for } N_{sa} = 4.9666, \text{ cbr} = 5 \]
= 249.67 mm
= 250 mm (rounded up)

Bound layer thickness

Bound layer thickness

The thickness of the Subbase can be obtained from Figure C3 or Figure C5 of the TRRL Report 1132. The former utilises DOT type 1 granular material only and the latter a combination of DOT type 1 granular fill and a Capping layer.

Option 1 - DOT type 1 only

When a Capping layer is not employed for weak Subgrades of less than 5% CBR, the thickness of Subbase will exceed 225 mm and must be laid in two layers. The lower layer should be as thick as practically possible and preferably 225 mm, in order to avoid the danger of damaging the Subbase or Subgrade during compaction. The upper layer should have a minimum thickness of 50 mm. Fig C3 of the TRRL Report 1132 will be utilised to evaluate the Subbase thickness.

Length of road under construction \( L_{\text{road}} = 150 \text{ m} \)
Subbase thickness (DOT type 1) \( \text{Sub} = 225 \text{ mm} \)
Option 2 - (DOT type 1 + Capping layer)

From Figure C5 for CBR values of 2%, 3%, 4% and 5% use 150 mm Subbase of DOT type 1 over 350 mm of Capping layer.
In order to reduce the possibility of failure within the Capping layer the latter should have a minimum CBR value of 15%. A suitable material for a Capping layer is 6F2 as defined in the specification for Highway Works: Volume 1: Tables 6/1 and 6/2.
Location: Ex1 - Leisure centre car park (Foundation Class 1)

The structural design of bituminous roads

The Highways Agency Design Manual for Roads and Bridges HD26/06 will be adopted for the upper pavement design. This standard provides details of permitted materials and thickness for the construction of pavements for new trunk roads. The total thickness of the combined bituminous layer will be determined from Fig 2.1 - Design Thickness for Flexible Pavements. The upper pavement thickness entails the surface course, binder course and base. The pavement foundation entails the Subbase and Capping over the Subgrade (Soil). The overall thickness of the pavement foundation will be determined in accordance with HD25 assuming either Restricted Foundation Design (Classes 1, 2 & 3) or Performance Foundation Design (Classes 1, 2, 3 & 4). Interim Advice Note IAN 73/06 Rev 1 (2009), will be utilised by this proforma as currently HD25 is in DRAFT form. Standard HD26/06 (Chapter 3 under Materials section) states that all materials within 450mm of the road surface, where the mean annual frost index (MAFI) of the site is ≥ 50 must be frost susceptible in the long-term. Where the MAFI is <50 the thickness of non-frost susceptible material may be 350mm.

Design Criteria

The designs are based on the design manual for roads and bridges, which in turn is based on the work of the Transport Research Laboratory. This design manual is only applicable to roads to be built in the UK and only for trunk roads, motorways and other multi-laned roads.

When comparing the relative benefits of the types of road, it is necessary to compare both over a similar time period. This is normally the design life, which is typically 20 years for flexible pavements. As such, it is necessary to take into consideration all maintenance costs.

Upper pavement overall design thickness

Design life (flexible pavement) life=20 years
Design traffic in msa units dtr=20 msa
Upper pavement design thickness dt=TABLE 3 for dtr=20
=320 mm
=325 mm (rounded up)

Upper pavement design options

(A) The following three options use HDM50 for binder & base courses

Option 1:
Surfacing (wearing course) 45 mm Hot Rolled Asphalt (HRA)
Binder course 55 mm High Density Macadam (HDM50)
Base 225 mm High Density Macadam (HDM50)
Option 2:
Surfacing (wearing course) 45 mm Hot Rolled Asphalt (HRA)
Base 280 mm High Density Macadam (HDM50)

Option 3:
Surfacing (wearing course) 50 mm Porous Asphalt (PA)
Binder course 60 mm High Density Macadam (HDM50)
Base 245 mm High Density Macadam (HDM50)

Choosing a PA surfacing with a standard 50mm thickness, the contribution to design thickness from PA will be taken to be 20mm only.

(B) The following three options use DBM50 for binder & base courses

Option 4:
Surfacing (wearing course) 45 mm Hot Rolled Asphalt (HRA)
Binder course 55 mm Dense Bitumen Macadam (DBM50)
Base 225 mm Dense Bitumen Macadam (DBM50)

Option 5:
Surfacing (wearing course) 45 mm Hot Rolled Asphalt (HRA)
Base 280 mm Dense Bitumen Macadam (DBM50)

Option 6:
Surfacing (wearing course) 50 mm Porous Asphalt (PA)
Binder course 60 mm Dense Bitumen Macadam (DBM50)
Base 245 mm Dense Bitumen Macadam (DBM50)

Choosing a PA surfacing with a standard 50mm thickness, the contribution to design thickness from PA will be taken to be 20mm only.

Foundation design

Restricted Foundation Design with Capping only will be adopted i.e. no Subbase layer will be provided. The design traffic is ≤ 20 million standard axles (msa). Capping Specification (MCHW1) Series 600 (see Foundation materials section).

Subgrade CBR (%) CBR=5 %
Subgrade Stiffness Modulus E=17.6*(CBR)^0.64=49.301 MPa

The structural design of bituminous roads

The Highways Agency Design Manual for Roads and Bridges HD26/06 will be adopted for the upper pavement design. This standard provides details of permitted materials and thickness for the construction of pavements for new trunk roads. The total thickness of the combined bituminous layer will be determined from Fig 2.1 - Design Thickness for Flexible Pavements. The upper pavement thickness entails the surface course, binder course and base. The pavement foundation entails the Subbase and Capping over the Subgrade (Soil). The overall thickness of the pavement foundation will be determined in accordance with HD25 assuming either Restricted Foundation Design (Classes 1, 2 & 3) or Performance Foundation Design (Classes 1, 2, 3 & 4). Interim Advice Note IAN 73/06 Rev 1 (2009), will be utilised by this proforma as currently HD25 is in DRAFT form. Standard HD26/06 (Chapter 3 under Materials section) states that all materials within 450mm of the road surface, where the mean annual frost index (MAFI) of the site is $\geq 50$ must be frost susceptible in the long-term. Where the MAFI is $<50$ the thickness of non-frost susceptible material may be 350mm.

Design Criteria

The designs are based on the design manual for roads and bridges, which in turn is based on the work of the Transport Research Laboratory. This design manual is only applicable to roads to be built in the UK and only for trunk roads, motorways and other multi-laned roads.

When comparing the relative benefits of the types of road, it is necessary to compare both over a similar time period. This is normally the design life, which is typically 20 years for flexible pavements. As such, it is necessary to take into consideration all maintenance costs

Upper pavement overall design thickness

| Design life (flexible pavement) | life=20 years |
| Design traffic in msa units | dtr=75 msa |
| Upper pavement design thickness | dt=TABLE 5 for dtr=75 |
| | $=320$ mm |
| | $=325$ mm (rounded up) |

Upper pavement design options

(A) The following three options use HDM50 for binder & base courses

Option 1:
Surfacing (wearing course) 45 mm Hot Rolled Asphalt (HRA)
Binder course 55 mm High Density Macadam (HDM50)
Base 225 mm High Density Macadam (HDM50)
Option 2:
Surfacing (wearing course) 45 mm Hot Rolled Asphalt (HRA)
Base 280 mm High Density Macadam (HDM50)

Option 3:
Surfacing (wearing course) 50 mm Porous Asphalt (PA)
Binder course 60 mm High Density Macadam (HDM50)
Base 245 mm High Density Macadam (HDM50)

Choosing a PA surfacing with a standard 50mm thickness, the contribution to design thickness from PA will be taken to be 20mm only.

(B) The following three options use DBM50 for binder & base courses

Option 4:
Surfacing (wearing course) 45 mm Hot Rolled Asphalt (HRA)
Binder course 55 mm Dense Bitumen Macadam (DBM50)
Base 225 mm Dense Bitumen Macadam (DBM50)

Option 5:
Surfacing (wearing course) 45 mm Hot Rolled Asphalt (HRA)
Base 280 mm Dense Bitumen Macadam (DBM50)

Option 6:
Surfacing (wearing course) 50 mm Porous Asphalt (PA)
Binder course 60 mm Dense Bitumen Macadam (DBM50)
Base 245 mm Dense Bitumen Macadam (DBM50)

Choosing a PA surfacing with a standard 50mm thickness, the contribution to design thickness from PA will be taken to be 20mm only.

Foundation design

Restricted Foundation Design with Subbase only provided. The design traffic is > 80 million standard axles (msa). Subbase to be MCHWI 821 or 822: strength C8/10 (see Foundation materials section).

Subgrade CBR (%)  
CBR=3.5 %  

Subgrade Stiffness Modulus  
E=17.6*(CBR)^0.64=39.239 MPa  

Subbase layer thickness  
slt=TABLE 3.14 for E=39.239  
=312.85 mm  
=315 mm (rounded up)
NOTE: Base could be in two layers (i.e. upper base & lower base).
Subbase could be in two layers (i.e. upper Subbase & lower Subbase)
The structural design of bituminous roads

The Highways Agency Design Manual for Roads and Bridges HD26/06 will be adopted for the upper pavement design. This standard provides details of permitted materials and thickness for the construction of pavements for new trunk roads. The total thickness of the combined bituminous layer will be determined from Fig 2.1 - Design Thickness for Flexible Pavements. The upper pavement thickness entails the surface course, binder course and base. The pavement foundation entails the Subbase and Capping over the Subgrade (Soil). The overall thickness of the pavement foundation will be determined in accordance with HD25 assuming either Restricted Foundation Design (Classes 1,2 & 3) or Performance Foundation Design (Classes 1,2,3 & 4). Interim Advice Note IAN 73/06 Rev 1 (2009), will be utilised by this proforma as currently HD25 is in DRAFT form. Standard HD26/06 (Chapter 3 under Materials section) states that all materials within 450mm of the road surface, where the mean annual frost index (MAFI) of the site is ≥ 50 must be frost susceptible in the long-term. Where the MAFI is <50 the thickness of non-frost susceptible material may be 350mm.

Design Criteria

The designs are based on the design manual for roads and bridges, which in turn is based on the work of the Transport Research Laboratory. This design manual is only applicable to roads to be built in the UK and only for trunk roads, motorways and other multi-laned roads.

When comparing the relative benefits of the types of road, it is necessary to compare both over a similar time period. This is normally the design life, which is typically 20 years for flexible pavements. As such, it is necessary to take into consideration all maintenance costs.

Upper pavement overall design thickness

Design life (flexible pavement) life=20 years
Design traffic in msa units dtr=75 msa
Upper pavement design thickness dt=TABLE 6 for dtr=75
=325 mm
=330 mm (rounded up)

Upper pavement design options

(A) The following three options use HDM50 for binder & base courses

Option 1:
Surfacing (wearing course) 45 mm Hot Rolled Asphalt (HRA)
Binder course 55 mm High Density Macadam (HDM50)
Base 230 mm High Density Macadam (HDM50)
Option 2:
Surfacing (wearing course) 45 mm Hot Rolled Asphalt (HRA)
Base 285 mm High Density Macadam (HDM50)

Option 3:
Surfacing (wearing course) 50 mm Porous Asphalt (PA)
Binder course 60 mm High Density Macadam (HDM50)
Base 250 mm High Density Macadam (HDM50)

Choosing a PA surfacing with a standard 50mm thickness, the contribution to design thickness from PA will be taken to be 20mm only.

(B) The following three options use DBM50 for binder & base courses

Option 4:
Surfacing (wearing course) 45 mm Hot Rolled Asphalt (HRA)
Binder course 55 mm Dense Bitumen Macadam (DBM50)
Base 230 mm Dense Bitumen Macadam (DBM50)

Option 5:
Surfacing (wearing course) 45 mm Hot Rolled Asphalt (HRA)
Base 285 mm Dense Bitumen Macadam (DBM50)

Option 6:
Surfacing (wearing course) 50 mm Porous Asphalt (PA)
Binder course 60 mm Dense Bitumen Macadam (DBM50)
Base 250 mm Dense Bitumen Macadam (DBM50)

Choosing a PA surfacing with a standard 50mm thickness, the contribution to design thickness from PA will be taken to be 20mm only.

**Foundation design**

Performance Foundation Design with Subbase only layer provided. The design traffic is > 80 million standard axles (msa). The foundation completed surface must meet all the relevant criteria in Series 700 of the specification.

Subgrade CBR (%) CBR=3 %

For performance design, the CBR must be converted to the Subgrade Stiffness Modulus (E) using the expression derived from work on certain soils (Powell et al, 1984), where CBR is a % value.

Subgrade Stiffness Modulus $E=17.6 \times (CBR)^{0.64}=35.553$ MPa

Assumed Subbase layer stiffness $Sst=1000$ MPa

Subbase layer thickness $clt=TABLE 4.51$ for $E=35.553$

The structural design of bituminous roads

The Highways Agency Design Manual for Roads and Bridges HD26/06 will be adopted for the upper pavement design. This standard provides details of permitted materials and thickness for the construction of pavements for new trunk roads. The total thickness of the combined bituminous layer will be determined from Fig 2.1 - Design Thickness for Flexible Pavements. The upper pavement thickness entails the surface course, binder course and base. The pavement foundation entails the Subbase and Capping over the Subgrade (Soil). The overall thickness of the pavement foundation will be determined in accordance with HD25 assuming either Restricted Foundation Design (Classes 1, 2 & 3) or Performance Foundation Design (Classes 1, 2, 3 & 4). Interim Advice Note IAN 73/06 Rev 1 (2009), will be utilised by this proforma as currently HD25 is in DRAFT form. Standard HD26/06 (Chapter 3 under Materials section) states that all materials within 450mm of the road surface, where the mean annual frost index (MAFI) of the site is ≥ 50 must be frost susceptible in the long-term. Where the MAFI is <50 the thickness of non-frost susceptible material may be 350mm.

Design Criteria

The designs are based on the design manual for roads and bridges, which in turn is based on the work of the Transport Research Laboratory. This design manual is only applicable to roads to be built in the UK and only for trunk roads, motorways and other multi-laned roads.

When comparing the relative benefits of the types of road, it is necessary to compare both over a similar time period. This is normally the design life, which is typically 20 years for flexible pavements. As such, it is necessary to take into consideration all maintenance costs.

Upper pavement overall design thickness

Design life (flexible pavement) life=20 years
Design traffic in msa units dtr=20 msa
Upper pavement design thickness dt=TABLE 3 for dtr=20
                           =320 mm
                           =325 mm (rounded up)

Upper pavement design options

(A) The following three options use HDM50 for binder & base courses

Option 1:
Surfacing (wearing course) 45 mm Hot Rolled Asphalt (HRA)
Binder course 55 mm High Density Macadam (HDM50)
Base 225 mm High Density Macadam (HDM50)
**Flexible pavement design to HD26/06 & HD25 (IAN 73)**

Option 2:
- **Surfacing (wearing course)**: 45 mm Hot Rolled Asphalt (HRA)
- **Base**: 280 mm High Density Macadam (HDM50)

Option 3:
- **Surfacing (wearing course)**: 50 mm Porous Asphalt (PA)
- **Binder course**: 60 mm High Density Macadam (HDM50)
- **Base**: 245 mm High Density Macadam (HDM50)

Choosing a PA surfacing with a standard 50mm thickness, the contribution to design thickness from PA will be taken to be 20mm only.

(B) The following three options use DBM50 for binder & base courses

Option 4:
- **Surfacing (wearing course)**: 45 mm Hot Rolled Asphalt (HRA)
- **Binder course**: 55 mm Dense Bitumen Macadam (DBM50)
- **Base**: 225 mm Dense Bitumen Macadam (DBM50)

Option 5:
- **Surfacing (wearing course)**: 45 mm Hot Rolled Asphalt (HRA)
- **Base**: 280 mm Dense Bitumen Macadam (DBM50)

Option 6:
- **Surfacing (wearing course)**: 50 mm Porous Asphalt (PA)
- **Binder course**: 60 mm Dense Bitumen Macadam (DBM50)
- **Base**: 245 mm Dense Bitumen Macadam (DBM50)

Choosing a PA surfacing with a standard 50mm thickness, the contribution to design thickness from PA will be taken to be 20mm only.

**Foundation design**

Performance Foundation Design with Capping only layer provided. The design traffic is ≤ 20 million standard axles (msa). The foundation completed surface must meet all the relevant criteria in Series 700 of the specification.

- Subgrade CBR (%): CBR=3 %
- For performance design, the CBR must be converted to the Subgrade Stiffness Modulus (E) using the expression derived from work on certain soils (Powell et al, 1984), where CBR is as a % value.
- Subgrade Stiffness Modulus: $E=17.6 \times (CBR)^{0.64}=35.553$ MPa
- Assumed Capping layer stiffness: $Cst=50$ MPa
- Subbase layer thickness: $clt=TABLE \ 4.21$ for $E=35.553$
  - $=462.26$ mm
  - $=465$ mm (rounded up)
NOTE: Base could be in two layers (i.e. upper base & lower base)
Location: Example of soil pressures due to coal stack

Soil pressures due to coal and other stacks

It is sometimes necessary to pile in the vicinity of coal and other stacks. The stack produces a vertical and horizontal stress and accompanying shear stress thus:

\[
\begin{align*}
\text{N.B. when } Y \text{ increases, } & \text{ stress } \text{ABS}(P_x) \text{ decreases.} \\
\text{Consider the pressure at point } G, & \text{ distance H below soil surface } \\
& \text{H varies from } H(1) \text{ to } H(nh). \\
\text{Density of stack } & \gamma = 11 \text{ kN/m}^3 \\
\text{Height of stack } & h_s = 6 \text{ m} \\
\text{Distance between A & B } & a_b = 7.2 \text{ m} \\
\text{Distance between B & C } & b_c = 15 \text{ m} \\
\text{Distance from stack c.l. to } G & x_1 = 24.6 \text{ m} \\
\text{Number of values of } H() & n_h = 2
\end{align*}
\]
**Location: Example 5.1(b)**

**Stresses due to concentrated load**

![Stress Diagram]

Concentrated load \( Q = 1500 \text{ kN} \)
Depth to point X \( z' = 5 \text{ m} \)
Horizontal distance \( r = 2 \text{ m} \)
Poisson's ratio (typically 0.5) \( \nu = 0.5 \)

Radial stress: 
\[
sigma_r = \frac{Q}{2\pi} \left( 3r^2z'/d^{2.5} - (1-2\nu)/(d+z'*d^{0.5}) \right)
\]
\[
= 3.1628 \text{ kN/m}^2
\]

Tangential stress: 
\[
sigma_t = -\frac{Q}{2\pi} \left( 1-2\nu \right) \left( z'/d^{1.5} - 1/(d+z'*d^{0.5}) \right)
\]
\[
= 0 \text{ kN/m}^2
\]

Shear stress: 
\[
tau_z = 3Q/(2\pi) \left( r^2z'^2/d^{2.5} \right)
\]
\[
= 7.9069 \text{ kN/m}^2
\]
Location: Example 5.1(b)

**Vertical stress due to general loading**

- General loading (positive into figure) \( q(1) \rightarrow q(n) \) at coordinates \( x(1), y(1), 0 \) to \( x(n), y(n), 0 \). Position where stresses required may be anywhere within positive quadrant at coordinates \( x, y, z \) (\( z \) is positive into figure).

General loading modelled by 'n' concentrated loads.

X coordinate where stress reqd: \( x = 1 \) m
Y coordinate where stress reqd: \( y = 1 \) m
Z coordinate where stress reqd: \( z = 5 \) m
Number of concentrated loads: \( n = 4 \)
Magnitude of load No. 1: \( q(1) = 375 \) kN
X coordinate of load position: \( x(1) = 0.5 \) m
Y coordinate of load position: \( y(1) = 1.5 \) m
Magnitude of load No. 2: \( q(2) = 375 \) kN
X coordinate of load position: \( x(2) = 1.5 \) m
Y coordinate of load position: \( y(2) = 1.5 \) m
Magnitude of load No. 3: \( q(3) = 375 \) kN
X coordinate of load position: \( x(3) = 0.5 \) m
Y coordinate of load position: \( y(3) = 0.5 \) m
Magnitude of load No. 4: \( q(4) = 375 \) kN
X coordinate of load position: \( x(4) = 1.5 \) m
Y coordinate of load position: \( y(4) = 0.5 \) m
Total vertical stress: \( \sigma_{zz} = 27.264 \) kN/m²
Location: Example 5.1

Elastic stresses resulting from UDL on rectangular area

Position where stresses required may be anywhere within positive quadrant at coordinates x, y, z (z is positive downwards).

Length of foundation X = 2 m
Breadth of foundation Y = 2 m
Total load on foundation Q = 1500 kN
X coordinate where stresses reqd. x = 1 m
Y coordinate where stresses reqd. y = 1 m
Depth where stresses required z = 5 m
Number of strips parallel to X nx = 4
Number of strips parallel to Y ny = 4
UDL from rectangular foundation q = Q / (X * Y) = 375 kN/m²
Load on each element delQ = Q / (nx * ny) = 93.75 kN
Vertical stress at coords (x, y, z) oz = 26.955 kN/m²
Location: Typical calc for straight shafted bored pile in clay

Vertical loads on straight bored piles in clay

Unfactored load on top of pile \( W = 550 \text{ kN} \)
Pile diameter \( D = 400 \text{ mm} \)
Concrete cube strength \( f_{cu} = 35 \text{ N/mm}^2 \)
Adhesion factor \( \alpha = 0.45 \)
Factor of safety for friction \( FOS_f = 2.5 \)
Factor of safety for end bearing \( FOS_b = 2.5 \)
Cut off level \( \text{cut} = 50.4 \text{ m} \)
Level at underside of made ground \( \text{lev}(0) = 48.4 \text{ m} \)
Shear strength u/side made ground \( C(0) = +C(0) \text{ kN/m}^2 \)
Number of soil increments \( n = 3 \)
Level at u/side increment 1 \( \text{lev}(1) = 40.4 \text{ m} \)
Shear strength at u/side inc 1 \( C(1) = 90 \text{ kN/m}^2 \)
Level at u/side increment 2 \( \text{lev}(2) = 30.4 \text{ m} \)
Shear strength at u/side inc 2 \( C(2) = 140 \text{ kN/m}^2 \)
Level at u/side increment 3 \( \text{lev}(3) = 24.4 \text{ m} \)
Shear strength at u/side inc 3 \( C(3) = 200 \text{ kN/m}^2 \)

Location: Large diameter belled pile in clay

Large diameter belled piles in clay

Safe working load on pile is least of:

\[ \text{SWL}(1) = \frac{(U_f + U_b)}{2.5} \]
\[ \text{SWL}(2) = \frac{U_f + U_b}{3} \]
\[ \text{SWL}(3) = U_f + lws \times A_b \]

where

- \( A_b \) = area of bell
- base stress is limited to \( lws \) kN/m² working.

Shaft friction value alpha varies from 0.25 to 0.35. Advice sought from soils investigation specialist.

Ignore shaft cohesion for length of 2 x bell diameter.

Bell diameter BD normally 2.5 x shaft diameter max 3 x shaft diameter.

Bearing capacity factor typically 0.75x9 used for circular piles. Advice sought from soils investigation specialist.

Unfactored load on top of pile \( W = 2500 \text{ kN} \)

Pile diameter \( D = 0.9 \text{ m} \)

Bell diameter \( BD = 2.25 \text{ m} \)

Limiting working stress on base \( lws = 500 \text{ kN/m}^2 \)

Concrete cube strength \( f_{cu} = 35 \text{ N/mm}^2 \)

Shaft friction value \( \alpha = 0.35 \)

Bearing capacity factor \( N_c = 6.75 \)

Soil properties

Each soil layer must be greater than 4.5 m for design method used.

The levels at underside of each of 'n' soil increments are given with corresponding shear strengths of clay.

Cut off level \( \text{cut}=50 \text{ m} \)

Level at underside of made ground \( \text{lev}(0)=48 \text{ m} \)

Shear strength u/side made ground \( C(0)=70 \text{ kN/m}^2 \)

Number of soil increments \( n=3 \)

Level at u/side increment 1 \( \text{lev}(1)=40 \text{ m} \)

Shear strength at u/side inc 1 \( C(1)=90 \text{ kN/m}^2 \)

Level at u/side increment 2 \( \text{lev}(2)=30 \text{ m} \)
Shear strength at u/side inc 2 \( C(2)=140 \text{ kN/m}^2 \)
Level at u/side increment 3 \( lev(3)=20 \text{ m} \)
Shear strength at u/side inc 3 \( C(3)=250 \text{ kN/m}^2 \)

**DESIGN SUMMARY**

- Pile load: 2500 kN
- Pile capacity: 2501.9 kN
- Pile diameter: 0.9 m
- Pile bell diameter: 2.25 m
- Cut off level: 50 m
- Pile length: 23.1 m
- Concrete cube strength: 35 N/mm²
Location:

Large diameter belled piles in clay

Safe working load on pile is least of:  
\[
\text{SWL}(1) = \frac{(U_f + U_b)}{2.5} \\
\text{SWL}(2) = \frac{U_f + U_b}{3} \\
\text{SWL}(3) = U_f + \frac{l_{ws} \times A_b}{2}
\]

- Load on pile 3 from crane: 145 kN
- Load on pile 4 from crane: 145 kN
Location: Pile group analysis

A simple elastic analysis of a vertical load on a group of piles can be determined from the formula:

\[ P_n = W/N + \text{or} - (AY_n) + \text{or} - (BX_n) \]

where

\[ A = W(ExIy - EyIxy) / (IxIy - Ixy^2) \]
\[ B = W(EyIx - ExIxy) / (IxIy - Ixy^2) \]

W is the resultant vertical load on the pile group
N is the number of piles in the group
Xn and Yn are the co-ordinates of the individual piles relative to the centroidal XX and YY axes

Number of piles                   N=5
Pile No | X Co-Ord (m) | Y Co-Ord (m) |
---|---|---|
1 | 0.5 | 0.5 |
2 | 2.5 | 0.5 |
3 | 0.5 | 2.5 |
4 | 2.5 | 2.5 |
5 | 1.5 | 1.5 |

Number of loads                   NL=1
Position | Weight (kN) | X Co-Ord (m) | Y Co-Ord (m) |
---|---|---|---|
1 | 1000 | 1.5 | 1.5 |

Sum of X Co ordinates             SX=7.5
Sum of Y Co ordinates             SY=7.5
Pile centroid X Co ord             XB=SX/N=1.5
Pile centroid Y Co ord             YB=SY/N=1.5

Co-ordinates of piles relative to XX and YY axes
Pile No | X Co-Ordinate (m) | Y Co-Ordinate (m) |
---|---|---|
1 | -1 | -1 |
2 | 1  | -1 |
3 | -1 | 1  |
4 | 1  | 1  |
5 | 0  | 0  |

2nd Moment of area of Pile Grp     Ix=4 m^4
                                  Iy=4 m^4
Product of Area moments about centroidal axes  XY=0

Forces in piles are as follows:

- Unfactored force in tie at level 32.5: 262.66 kN/m
- Factored force in tie at level 32.5: 525.31 kN/m
  (factor is 2.0 - see CIRIA Report 104)
- Founding level for unity F.O.S.: 23.689 m
- Founding level for required F.O.S.: 22.3 m
- Overall length of sheet retaining wall: 12.7 m
- Unfactored BM for section design: 566.47 kNm/m
- Factored BM for section design: 849.71 kNm/m
  (factor is 1.5 - see CIRIA Report 104)
Location: Anchored sheet-pile wall Example 8.14 Basic Soil Mechanics

Single tied wall

\[ \text{d5 kN/m}^2 \text{ surcharge} \]

Downhill (passive) side. \hspace{1cm} Uphill (active) side.

\[ \text{Surcharge} \ d6 \ kN/m^2 \]

\[ \text{Passive water level} \]

Active water level

Retained height \[ h1=9 \text{ m} \]

Free-earth support method: It assumes the wall is embedded a sufficient distance into the soil to prevent translation, but is able to rotate at toe providing the wall with a pinned support. With this method the factor of safety against rotation will be taken as 1. Once the pile embedment depth required for equilibrium is found this will be multiplied by a factor of safety on embedment (Fd) to obtain the design embedment depth.

Safety factor on embedment \[ Fd=1.2 \]

Inclination of active ground \[ b=0^\circ \]

Active water level \[ p1=0 \text{ m} \]

Passive water level \[ p2=0 \text{ m} \]

Increment of calculation \[ d1=0.1 \text{ m} \]

Number of horizontal line loads \[ d3=0 \]

Minimum fluid pressure \[ d4=0 \text{ kN/m}^3 \]

Active vertical surcharge \[ d5=0 \text{ kN/m}^2 \]

Passive vertical surcharge \[ d6=0 \text{ kN/m}^2 \]

Number of soil strata \[ N=1 \]

- Soil data for stratum 1 of 1

Top level \[ TL(1)=100 \text{ m} \]

Bulk density \[ \text{Gam}(1)=20 \text{ kN/m}^3 \]

Angle of internal friction \[ \text{Phi}(1)=28^\circ \]

Cohesion \[ C'(1)=0 \text{ kN/m}^2 \]

Angle of active wall friction \[ Da(1)=18.67^\circ \]

Angle of passive wall friction \[ Dp(1)=14^\circ \]

Wall adhesion \[ Cw(1)=0 \text{ kN/m}^2 \]

K factors for stratum

\[ \text{Ka}(1)=0.30438 \]
\[ \text{Kac}(1)=1.1034 \]
\[ \text{Kp}(1)=4.292 \]
\[ \text{Kpc}(1)=4.0972 \]

Tie level \[ TiL=98.5 \text{ m} \]

</table>

Unfactored force in tie at level 98.5: 131.97 kN/m
Factored force in tie at level 98.5: 263.93 kN/m
(factor is 2.0 - see CIRIA Report 104)

Founding level for unity F.O.S.: 88.484 m
Founding level for required F.O.S.: 87.76 m
Overall length of sheet retaining wall: 12.24 m
Unfactored BM for section design: 381.33 kNm/m
Factored BM for section design: 572 kNm/m
(factor is 1.5 - see CIRIA Report 104)
Location: Cantilever sheet-pile wall Ex 8.13 Basic Soil Mechanics

Cantilever wall

Downhill (passive) side.

\[ d_5 \text{ kN/m}^2 \text{ surcharge} \]

Surcharge \( d_6 \) kN/m²

\[ p_2 /\//\// \]

Passive water level

Active water level

Density of water=9.8067 kN/m³

Retained height \( h_1 = 3 \) m

Free-earth support method: It assumes the wall is embedded a sufficient distance into the soil to prevent translation, but is able to rotate at toe providing the wall with a pinned support. With this method the factor of safety against rotation will be taken as 1. Once the pile embedment depth required for equilibrium is found this will be multiplied by a factor of safety on embedment (Fd) to obtain the design embedment depth.

Safety factor on embedment \( F_d = 1.2 \)

Inclination of active ground \( b = 0^\circ \)

Active water level \( p_1 = 0 \) m

Passive water level \( p_2 = 0 \) m

Increment of calculation \( d_1 = 0.1 \) m

Number of horizontal line loads \( d_3 = 0 \)

Minimum fluid pressure \( d_4 = 0 \) kN/m³

Active vertical surcharge \( d_5 = 0 \) kN/m²

Passive vertical surcharge \( d_6 = 0 \) kN/m²

Number of soil strata \( N = 1 \)

- Soil data for stratum 1 of 1
  - Top level \( TL(1) = 100 \) m
  - Bulk density \( \Gamma_{\text{m}}(1) = 20 \) kN/m³
  - Angle of internal friction \( \Phi(1) = 30^\circ \)
  - Cohesion \( C'(1) = 0 \) kN/m²
  - Angle of active wall friction \( D_a(1) = 0^\circ \)
  - Angle of passive wall friction \( D_p(1) = 0^\circ \)
  - Wall adhesion \( C_w(1) = 0 \) kN/m²
  - K factors for stratum
    - \( K_a(1) = 0.448 \)
    - \( K_{ac}(1) = 1.338 \)
    - \( K_p(1) = 2.232 \)
    - \( K_{pc}(1) = 2.9879 \)

Founding level for rotational stability 92.7 m
Resultant shear difference at this level 173.96 kN/m
Passive pressure available on active side 287.34 kN/m²
Additonal length required for toe shear 0.6054 m
Founding level required 91.12 m
Overall length of sheet retaining wall 8.88 m
Unfactored BM for section design 132.3 kNm/m
Factored BM for section design 198.44 kNm/m
(factor is 1.5 - see CIRIA Report 104)
Unfactored BM for stability 132.3 kNm/m
Factored stability BM for section design 132.3 kNm/m
(factor is 1.0 - see CIRIA Report 104)
NOTE: The overall length of the sheet retaining wall is the actual length required and includes the additional length required for toe shear.
Location: Tied Sheet Retaining Wall

Single tied wall

\[d_5 \text{ kN/m}^2 \text{ surcharge}\]

Downhill (passive) side.  \(d_5\) \[\text{ kN/m}^2\] surcharge

\(p_2\) \[\text{ kN/m}^2\]  \(p_1\) \[\text{ kN/m}^2\]  \(h_1\) \[\text{ m}\]

Uphill (active) side.

\(\text{Active water level}\)

\(\text{Density of water}=9.8067 \text{ kN/m}^3\)

Retained height \(h_1=2.2\) m

Free-earth support method: It assumes the wall is embedded a sufficient distance into the soil to prevent translation, but is able to rotate at toe providing the wall with a pinned support. With this method the factor of safety against rotation will be taken as 1. Once the pile embedment depth required for equilibrium is found this will be multiplied by a factor of safety on embedment \(F_d\) to obtain the design embedment depth.

Safety factor on embedment \(F_d=1.2\)

Inclination of active ground \(b=25^\circ\)

Active water level \(p_1=100.5\) m

Passive water level \(p_2=99.7\) m

Increment of calculation \(d_1=0.1\) m

Number of horizontal line loads \(d_3=0\)

Minimum fluid pressure \(d_4=4.7\) kN/m\(^3\)

Active vertical surcharge \(d_5=0\) kN/m\(^2\)

Passive vertical surcharge \(d_6=0\) kN/m\(^2\)

Number of soil strata \(N=1\)

- Soil data for stratum 1 of 1

Top level \(T_L(1)=102.2\) m

Bulk density \(\gamma_m(1)=19.25\) kN/m\(^3\)

Angle of internal friction \(\Phi(1)=30^\circ\)

Cohesion \(C'(1)=0\) kN/m\(^2\)

Angle of active wall friction \(D_a(1)=15^\circ\)

Angle of passive wall friction \(D_p(1)=0^\circ\)

Wall adhesion \(C_w(1)=0\) kN/m\(^2\)

Tie level \(T_{IL}=101.7\) m

Embedded depths of holding down bolts

Using the method adopted in 'Steel Designer's Manual (5th Edition)' and based on the assumptions listed below:

- bolts are arranged symmetrically about major axis
- the failure mode of bolts pulled from a concrete foundation is based on a conical pull-out, such that the surface area is $4.44D^2$, where $D$ is the depth of embedment of the bolts
- holding down bolts should be anchored into the foundation by a washer (anchor) plate or other load distributing member embedded in the concrete
- bolts have been previously checked for combined shear and tension.

Factored design tensile force $F_t=44$ kN

Length of baseplate $D_p=560$ mm
Breadth of baseplate $B_p=200$ mm
Edge distance to bolt centre line $ed=60$ mm

Steel Grade $S\ 275$
Bolt grade 4.6
Concrete strength $f_{cu}=20\ \text{N/mm}^2$

Holding down bolt details

Number of bolts to be used $n=4$
Number of bolts in tension $n_t=2$
Bolt diameter $b_d=20$ mm
Embedded depth of bolts $D=100$ mm
Half the bolts subject to tension.

Location: Ex3 - Example based on bond length

Embedded depths of holding down bolts

Using the method adopted in 'Joints in Steel Construction - moment connections' and based on the assumptions listed below:

- The anchorage is developed by the bond along the embedded length of the holding bolt
- The bolt is regarded as a reinforcing bar and the requirements are based on BS8110 clauses 3.12.8.3 and 3.12.8.4.

Factored design tensile force: $F_t = 120$ kN
Length of baseplate: $D_p = 600$ mm
Breadth of baseplate: $B_p = 600$ mm
Edge distance to bolt centre line: $e_d = 75$ mm
Steel Grade: S 275
Bolt grade: 4.6
Concrete strength: $f_{cu} = 30$ N/mm²

**Holding down bolt details**

- Number of bolts to be used: $n = 4$
- Number of bolts in tension: $n_t = 4$
- Bolt diameter: $b_d = 24$ mm
- Embedded depth of bolts: $D = 450$ mm
- All bolts subject to tension.

**Anchorage**

Assumed cover to reinforcement: $c_v = 50$ mm
Since $F_t' \leq P_t$ (30 kN ≤ 141.2 kN), tensile load per bolt is allowable.

Embedded depths of holding down bolts

Length of baseplate \( \text{hp}=600 \text{ mm} \)
Breadth of baseplate \( \text{bp}=600 \text{ mm} \)
Edge distance to bolt centre line \( k=75 \text{ mm} \)

Steel Grade \( S \text{ 275} \)
The grade of anchor bolts is grade 8.8 (Table 3.1 EC3 Part 1-8).
Char cube compressive strength \( f_{cu}=30 \text{ N/mm}^2 \) (concrete)

Holding down bolt details

Number of bolts to be used \( n=8 \)
Number of bolts in tension \( nt=4 \)
Bolt diameter \( bd=24 \text{ mm} \)

Overall embedded depth \( Lo=450 \text{ mm} \)
Assumed cover to reinforcement \( cv=50 \text{ mm} \)
Assumed percentage area of tension reinforcement \( Asp=0.15 \% \)
Punching shear force \( V_{Ed}=ABS(F_{tlEd})=674.16 \text{ kN} \)
Shear stress at control perimeter \( v_{Ed}=\beta*v_{Ed}*1000/(u_1*d_\text{av}) \)
\( \text{=0.31363 N/mm}^2 \)
Design punching shear resistance \( v_{Rdc}=(0.18/gamc)*k*(100*p_1*f_{ck})^{0.333}=0.31812 \text{ N/mm}^2 \)
Shear enhancement \( 2d/av \) \( \text{senh}=1 \)
The min design punching shear resistance governs and will be adopted.
Design punching shear resistance \( v_{Rdc}=\text{senh}*(0.035*k^1.5*f_{ck})^{0.5} \)
\( \text{=0.39033 N/mm}^2 \)

As \( v_{Ed} \leq v_{Rdc} \) \( (0.31363 \text{ N/mm}^2 \leq 0.39033 \text{ N/mm}^2) \), the anchorage arrangement is considered suitable.

Tension per anchor bolt \( F_{td}=ABS(F_{tlEd})/nt=168.54 \text{ kN} \)
Tensile resistance per anchor \( F_{Rd}=0.9*f_{ub}*As/(\text{gamM2}*10^3)=203.33 \text{ kN} \)
As \( F_{td} \leq F_{Rd} \) \( (168.54 \text{ kN} \leq 203.33 \text{ kN}) \), tensile load per bolt is OK.

Angle seat connection

Analysis of connection follows treatment in 'Manual on Connections for Beam and Column Construction, Conforming with the requirements of BS 449 Part 2:1969', published by BCSA.

Vertical shear on seat \( V = 156 \text{ kN} \)

Serial length of angle seat \( A = 150 \text{ mm} \)
Serial width of angle cleat \( B = 90 \text{ mm} \)
Thickness of angle seat \( t_{\text{seat}} = 10 \text{ mm} \)
Grade of angle seat \( \text{agrade}=43 \)
Length of angle seat into paper \( l_s = 150 \text{ mm} \)
Bolt diameter \( \text{dia}=20 \text{ mm} \)
Bolt grade (4.6 or 8.8) \( \text{bgrade}=8.8 \)
Grade of supporting member \( \text{sgrade}=43 \)
Total thickness of support memb \( t_t = 14.2 \text{ mm} \)
Available thick this connection \( t_s = 14.2 \text{ mm} \)
Grade of supported beam \( \text{grade}=43 \)
533 x 210 x 92 UB.
Root radius of angle seat \( r_1 = 12 \text{ mm} \)
Stiff bearing length at top of seat for 30 degree spread from tangent to root radius:
Bearing stress at root of seat \( f_b = V \times 1000/(l_d \times t_{\text{seat}}) = 104 \text{ N/mm}^2 \)
Permissible bearing stress \( p_b = \text{TABLE 9 for agrade}=43 \)
\( = 210 \text{ N/mm}^2 \)

Since \( f_b \leq p_b \) ( \( 104 \text{ N/mm}^2 \leq 210 \text{ N/mm}^2 \) )
Bearing stress at root of seat within allowable in TABLE 9.

</tr>
</tbody>
</table>

Check bolts for shear

The calculated shear stress based on the nominal bolt diameter

Shear per bolt \( v = \frac{V \times 1000}{ns} = 13333 \) N

Gross area of bolt \( g\text{area} = \pi \times d^2 / 4 = 314.16 \) mm²

Since \( fs \leq ps \) (42.441 N/mm² ≤ 187 N/mm²) shear stress in bolts within allowable.

Check bolts for tension

Tension per bolt \( f = \frac{F \times 1000}{nt} = 58125 \) N

Approx. bolt tensile stress area \( t\text{area} = 0.75 \times \pi \times d^2 / 4 = 235.62 \) mm²

Tensile stress in bolts \( ft = \frac{f}{t\text{area}} = 246.69 \) N/mm²

Since \( ft \leq pt \) (246.69 N/mm² ≤ 281 N/mm²) tensile stress in bolts within allowable.

Check for combined shear and tension

The interaction formula of BS449, Subclause 50.d is used for this investigation

factor = \( \frac{fs}{ps} + \frac{ft}{pt} = 1.1049 \)

Combined stress factor does not exceed 1.4, therefore bolts are satisfactory.
Location: Ex1 - Bolts in tension and shear

Bolts in tension and shear

Calculations are in accordance with BS EN 1993-1-8:2005 and publication entitled 'Joints in Steel Construction: Simple Joints to EC3' by SCI.

Number of bolts in tension \( nt = 4 \)

Tension on group \( N_{Ed} = 232.5 \) kN

Number of bolts in shear \( ns = 6 \)

Shear force on group \( V_{Ed} = 80 \) kN

Bolt diameter \( bd = 20 \) mm

**DESIGN**

Number of bolts in shear \( 6 \)

Number of bolts in tension \( 4 \)

Design shear force per bolt \( 13.333 \) kN

**Design assumptions**

Loading is deemed to act at 1.1 metres above the datum level. Vertical posts are assumed to be attached to the side of the platform or walkway, 100 mm below datum level.

**Characteristic loading**

- Horizontal UDL on top rail: $w_r = 0.22 \text{ kN/m}$
- Horizontal UDL on infill: $w_i = 0 \text{ kN/m}^2$
- Horizontal Point Load on infill: $W_j = 0 \text{ kN}$

**Design of top rail**

- Design BM due to rail UDL: $M_{Edr} = g Q w_r L_1 / 8 = 0.13814 \text{ kNm}$
- Maximum design bending moment: $M_{Edr\text{max}} = 0.13814 \text{ kNm}$
- Actual horiz deflection of rail: $D_{r\text{max}} = 9.4727 \text{ mm}$
- Permiss horiz deflection of rail: $D_{r\text{maxp}} = 15.25 \text{ mm}$
- Design bending moment (rail): $M_{Edr\text{max}} = 0.13814 \text{ kNm}$
- Design moment resistance: $M_{Crdr} = f_y W_{elr} 10^3 / g M_0 = 0.33589 \text{ kNm}$

**Design of vertical post**

- Unfactored horizontal load at top of post: $W_{wr} = 0.4026 \text{ kN}$
- Design BM at base of post due to UDL on rail: $M_{Edpwr} = g Q w_r 1.2 = 0.72468 \text{ kNm}$
- Max design BM is due to the horizontal UDL on the rail.
- Maximum design bending moment: $M_{Edp\text{max}} = 0.72468 \text{ kNm}$
Try 40 mm Nominal Bore Medium-Duty Tubular Steel Post
Actual deflection (post) \[ D_{pmax} = \frac{W_{max} \times 1.2^3}{3 \times E \times I_p} \times 1000 \]
\[ = 8.9895 \text{ mm} \]
Permissible deflection (post) \[ D_{pmaxp} = 10 \text{ mm} \]
Design bending moment (post) \[ M_{Edpmax} = 0.72468 \text{ kNm} \]
Design moment resistance \[ M_{Crdp} = f_y \times W_{elp} \times 10^3 / \gamma_M0 = 1.4243 \text{ kNm} \]

**DESIGN SUMMARY**

Limiting deflection criterion \[ \text{span}/120 \]

Minimum 2nd Moment of area of rail \[ I_r = 1.615 \text{ cm}^4 \]
Location: Ex2 - All 3 loads applied

Design of Guardrailing

Material: Steel hollow tubular section or solid circular section.

Design assumptions

Loading is deemed to act at 1.1 metres above the datum level. Vertical posts are assumed to be attached to the side of the platform or walkway, 100 mm below datum level.

Characteristic loading

Horizontal UDL on top rail \( wr = 3 \text{ kN/m} \)
Horizontal UDL on infill \( wi = 1.5 \text{ kN/m}^2 \)
Horizontal Point Load on infill \( Wj = 1.5 \text{ kN} \)

Design of top rail

Design bending moments:
Due to rail UDL \( ME_{dr} = \gamma Q \cdot W_{wr} \cdot L_1 / 8 = 0.5625 \text{ kNm} \)
Due to infill UDL \( ME_{dzi} = \gamma Q \cdot W_{wi} \cdot L_1 / 8 = 0.15469 \text{ kNm} \)
Due to infill PL at mid-span \( ME_{dWj} = \gamma Q \cdot W_{j} \cdot L_1 / 4 = 0.5625 \text{ kNm} \)
Maximum design bending moment \( ME_{dmax} = 0.5625 \text{ kNm} \)
Actual horiz deflection of rail \( Dr_{max} = 6.1655 \text{ mm} \)
Permiss horiz deflection of rail \( Dr_{maxp} = 8.3333 \text{ mm} \)
Design bending moment (rail) \( ME_{drmax} = 0.5625 \text{ kNm} \)
Design moment resistance \( MC_{Rdr} = f_y \cdot W_{elr} \cdot 10^3 / \gamma M_0 = 0.781 \text{ kNm} \)
Design of vertical post

Unfactored horizontal load at top of post:
Due to horizontal UDL on rail \( W_{wr} = 3 \) kN
Due to horizontal UDL on Infill \( W_{wi} = 0.825 \) kN
Due to Point Load on infill \( W_j = 1.5 \) kN

Design bending moments at base of post:
Due to rail UDL \[ M_{Edpwr} = \gamma Q \cdot W_{wr} \cdot 1.2 = 5.4 \text{ kNm} \]
Due to infill UDL \[ B_{pwi} = \gamma Q \cdot W_{wi} \cdot 1.2 = 1.485 \text{ kNm} \]
Due to infill PL \[ B_{pWj} = \gamma Q \cdot W_j \cdot 1.2 = 2.7 \text{ kNm} \]
Max design BM is due to the horizontal UDL on the rail.
Maximum design bending moment \( M_{Edpmax} = 5.4 \text{ kNm} \)

Try 88.9 mm Outside Diam CHS Post, with Wall thickness 4 mm
Actual deflection (post) \[ D_{pmax} = \frac{W_{pmax} \cdot 1.2^3}{3 \cdot E \cdot I_p} \cdot 1000 = 8.5447 \text{ mm} \]
Permissible deflection (post) \( D_{pmaxp} = 10 \text{ mm} \)
Design bending moment (post) \( M_{Edpmax} = 5.4 \text{ kNm} \)
Design moment resistance \[ M_{Crdp} = f_y \cdot W_{elp} \cdot 10^3 / \gamma M_0 = 7.7035 \text{ kNm} \]

DESIGN SUMMARY

Limiting deflection criterion \( \text{span/120} \)

POST : 88.9 mm Outside Diam CHS Post
Post Wall thickness 4 mm
Minimum 2nd Moment of area of post \( I_p = 96.3 \text{ cm}^4 \)

RAIL : 28 mm Diameter Solid Circular-section Steel Rail
Minimum 2nd Moment of area of rail \( I_r = 3.017 \text{ cm}^4 \)
