SCALE - Structural CALculations Ensemble

The output from SCALE is a set of pages, neatly titled, dated and numbered, containing calculations and component details made to a standard suitable for submission to a checking authority.

Sample output calculations, detailing drawings, analysis runs and plots of results for nearly 4000 runs of SCALE, LUCID, SPADE and NL-STRESS, are included in this document. To jump directly to these calculations click on the bookmarks which should be displayed to the left of this document, or click on the highlighted proformas below to jump directly to sample output from that proforma.

Where a SCALE proforma has a # sign following its number, this indicates that that proforma pulls forward the moments, shears etc. from an NL-STRESS analysis into the proforma.

All proformas allow full workings to the Eurocodes and full workings to the British Standard, or are analytical and applicable to both. There are now over 600 proformas ready for the Eurocodes.

SCALE - Mathematics and Miscellaneous

sc020  Pages with heading only
sc021  Invoice for structural work
sc022  First page of calculations
sc027  Solution of triangles
sc028  Solution of simultaneous equations
sc029  Solution of quadratic, cubic & quartic equations
sc030  Coordinate geometry
sc031  Differentiation of standard forms
sc032  Differentiation of a general function
sc033  Integration of standard forms
sc034  Integration of a general function
sc035  Mensuration of plane areas and solids
sc036  Statistics and quality control
sc037  Latent roots
sc038  Centre of gravity
sc039  Matrix inversion
sc042  Verifying the correctness of SCALE proformas & NL-STRESS models
sc044  For testing only, automated running of all examples
sc050  Greek alphabet and SCALE character set
sc051  Conversion between Imperial and metric and vice versa
sc052  Compound interest for mortgage and loan payments
sc053  Expressing a set of data points as a polynomial.
sc055  Cross referencing of numerical variables in proforma files
sc070  Simple test example
SCALE - Reinforced Concrete Design to Eurocode 2 and BS8110

sc072  Rectangular beam - flexure only
sc073  Rectangular beam - flexure, span/depth, curtailment, laps
sc074  Tee beam - flexure only
sc075  Tee beam - flexure, span/depth check
sc076  Design of walls
sc077  Wall to wall intersection
sc078  Rectangular and Tee beam - shear only
sc079  Rectangular and Tee beam - shear only
sc080  Solid slab - flexure, tension steel only, span/d /m width
sc081  Solid slab - flexure, tension & comp steel, span/d /m width
sc082  Solid slab - flexure, tans & comp steel, span/d given width
sc083  Solid slab - shear only
sc084  Slab rib - shear only
sc085  Two way slabs - moments only
sc086  Two way slabs - with design
sc087  Flat slabs - simplified method
sc088  Slabs - punching shear
sc089  Annular column
sc090  Stocky column - biaxial bending
sc091  Slender rectangular column - uniaxial bending
sc092  Slender rectangular column - biaxial bending
sc093  Circular column - design for ultimate
sc094  Circular column - cracking
sc095  Circular column - cracking with tension stiffening
sc096  Rectangular column uniaxial bending - rigorous procedure
sc097  Rectangular column biaxial bending - rigorous procedure
sc098  Circular column in accordance with IStructE/ICE manual
sc100  Simply supported rectangular beam/slab with general loading
sc101  RC beam on elastic piles subj. to train of moving point loads
sc102#  Rectangular beam/slab section
sc103  Rectangular beam/slab section - checking aid
sc104#  Biaxially bent stocky column
sc105  Rectangular column section - checking aid
sc106#  Flanged beam section design to IStructE manual
sc107#  Flanged beam section design to Clause 3.4.4.4
sc108  Torsion steel for rectangular section
sc109  Ground-supported concrete slabs for industrial buildings
sc110  Pad footing with uniaxial bending, including section design
sc111  Deep beams - Kong's method
sc112  Modular-ratio design of reinforcement for circular column
sc113  Modular-ratio calculation of stresses for circular column
sc117  Simply supported R.C. staircase
sc118  Concrete nibs
sc119  Fire resistance

SCALE - Reinforced & Prestressed Concrete Design: Eurocode 2/BS5400/DOT

sc122  General reinforced concrete section - design
sc123  General reinforced concrete section - assessment
sc124  Early thermal cracking
sc125  Half joint
sc126  Torsion in reinforced concrete - design
sc127  Torsion in reinforced concrete - assessment
sc128  Temperature effects

sc225 Temperature effects in composite bridge decks - BS5400 & D. Tp.
sc226 Differential shrinkage in composite bridge decks - BS5400 & D.Tp.

SCALE - Timber Design to Eurocode 5 and BS5268

sc250# Rectangular section with axial load & bending
sc251# Rectangular Glulam column/tie with axial load
sc252 Domestic floor joist
sc253 Biaxial bending of timber section
sc254 Simply supported beam with general loading
sc255 Simply supported Glulam beam with general loading
sc256 Simply supported flitched beam with general loading
sc257 Spaced timber column
sc258 Ply web and box beam
sc259 Stressed skin timber floor joist
sc260 Howe truss
sc262 Pratt truss
sc266 Fink truss
sc267 Racking resistance of timber stud panels
sc268 Fire design of timber beam
sc269 Residential floor vibration check to EC5
sc271 Nailed joint
sc272 Screwed joint
sc273 Bolted joint
sc274 Spliced timber joint
sc275 Toothed plate connector
sc280 Rafter or sloping beam
sc284 Couple roof
sc286 Collar-tie roof
sc288 Lean-to roof
sc290 Trussed beam
sc292 Braced sheds (for attic and other frames, see NL-STRESS below)

SCALE - Steel Design to Eurocode 3 and BS5400/DOT

sc356 List of proformas
sc357 Design objectives and partial safety factors
sc358 Steel grades to BS EN 10 025 & BS4360
sc359 Nominal yield stress
sc360 Notch toughness
sc361 Stress analysis; allowance for shear lag
sc362 Shape limitations for flanges
sc363 Openings in webs and compression flanges
sc364 Shape limitations for flat stiffeners
sc365 Shape limitations for bulb flat stiffeners
sc366 Shape limitations for angle stiffeners
sc367 Shape limitations for tee stiffeners
sc368 Shape limitations for closed stiffeners
sc369 Shape limitations for flanges curved in elevation
sc370 Shape limitations for circular hollow sections
sc371 Effective section
sc372 Evaluation of stresses
sc373 Effective length for lateral torsional buckling
sc374 Slenderness, moment and shear resistance
sc381  Bearing stiffeners at end support  
sc382  Transverse web stiffeners other than at supports

SCALE - Steel Design to Eurocode 3 and BS5950-1:2000

sc351  Balluster base plate - either concentric or not with baseplate
sc355  Steel runeway beam
sc384  Stainless steel circular hollow section design
sc385  Stainless steel hollow section design
sc386  Simply supported stainless steel beam (CHS, SHS, RHS, Channel)
sc387  Axially loaded stainless steel column (CHS, SHS, RHS, Channel)
sc388  Axially loaded stainless steel angle
sc390#  Concrete filled square and rectangular hollow section column
sc391#  Concrete filled circular hollow section column
sc392  Fire design of concrete filled structural hollow section column
sc396  Moment connection between RHS column and column base
sc407  Simple design, builder's arithmetic, general check, safe loads
sc408  SS beam (UB, UC, Joist, or Channel) general loading
sc409  UB, UC or RSJ with bottom flange plate
sc410#  I beam section design
sc411#  Portal frame rafter design
sc412#  RHS beam section design
sc414#  CHS beam and column section design
sc415  Checking aid for Universal Beams
sc416  Design of RHS Slimflor edge beam
sc418  Slim floor design
sc419  Slim floor design using deep decking
sc421  Base plate subject to load and moment
sc422  Extended bolted end plate connection beam to column
sc423  Flush bolted end plate connection beam to column
sc424  Beam splice - Extended end plate connection
sc425  Beam splice - Flush end plate connection
sc426  Welded beam to column connection
sc427  Flush beam splice with end plates and single flange plate
sc428  Cantilevered beam
sc429#  Cantilevered beam - alternative linking with NL-STRESS
sc431  Beam (UB, UC or Channel) with biaxial bending
sc432  Fully restrained SS I beam with UDL and point load/s
sc434  SS I Beam with UDL - restrained at ends only
sc436  SS I Beam with UDL & point loads restrained or unrestrained
sc437  SHS/RHS/CHS beam restrained at ends and loads
sc438  Purlin on sloping roof
sc439  Side rail
sc440#  Column (UB, UC or Channel) with biaxial bending
sc441#  Cased I section column
sc442#  H Section column with biaxial bending
sc443  Effective length of compression members
sc444#  SHS and RHS column section design (axial load and bending)
sc445#  Plastic design of stanchions
sc446  Single angle - section design
sc447  Design of "I" beam curved on plan
sc448  Design of SHS beam curved on plan
sc449  Design of CHS beam curved on plan
sc450  Pin ended I, H, or channel section column
sc451  SHS, RHS and CHS column section design (axial load only)
List of SCALE proformas.

sc452 I column in simple construction
sc453 SHS, RHS and CHS column in simple construction
sc454 Channel bending about minor axis
sc455 Steel stair with flat plate stringers
sc456 Laced or battened strut
sc457 Design of SHS section curved on elevation
sc458 Design of CHS section curved on elevation
sc459 Design of "I" beam curved in the vertical plane
sc460 Portal frame design - plastic analysis
sc462 Portal frame in boundary conditions (fire)
sc463 Channel subject to eccentric loading
sc464 Beam subject to eccentric loading
sc465 RHS beam - eccentric loading
sc466 Steel beam with openings in the web
sc467 Cellular and castellated beams
sc468 Beams formed from single angle
sc470 Stiffened plate girder
sc472 Design of Structural T-sections
sc474 Gantry girder
sc476 Wind moment design of unbraced frames
sc477 Axially loaded steel lattice connections
sc478 Chord and bracing connections with moments incl. knee joints
sc479 Hollow section chords w. gusset plates/universal section brace
sc480 Angle cleat connection
sc481 Fin plate connection
sc482 Angle seat connection
sc483 Shelf angle supporting slab
sc484 Flexible end plate
sc485 Full-depth end plate connection
sc486 Flush end plate haunched connection
sc487 Extended end plate haunched connection
sc488 Axially loaded column base for I sections
sc489 Axially loaded column base for SHS/RHS/CHS
sc490 Column splice
sc491 Bolted end column splice
sc492 Beam splice
sc493 Universal section chord with hollow section brace
sc494 Portal apex connection
sc495 Cast-in plate to connect structural steel beam to concrete wall
sc496 Load bearing stiffener design
sc497 Section properties of haunched section
sc498 Bolts subject to eccentric loading
sc499 Stability checks for notched "I" beam to EC3

SCALE - Masonry Design to Eurocode 6, BS5628 and MEXE

sc503 Cantilever wall spanning horizontally
sc505 Wall panel
sc506 Panel with opening
sc508 Single leaf wall
sc509 Single leaf wall by effective eccentricities
sc510 Lateral resistance of wall by arching
sc511 Column
sc512 Bed joint reinforcement for laterally loaded masonry walls
sc520 Freestanding wall
List of SCALE proformas.

sc521  Brick beam
sc525  Bearing
sc528  Simplified sub-frame analysis to EC6
sc529  Internal masonry wall
sc530  External cavity wall
sc532  External cavity wall - by vertical arching
sc535  Shear wall
sc536  Fin wall
sc537  Reinforced brick retaining wall
sc538  Reinforced brick column
sc540  Load distribution to shear walls
sc541  Support angles
sc543  Pippard/MEXE analysis for unit applied load
sc546  Pippard/MEXE analysis for C&U, EC and user defined bogies
sc547  Pippard/MEXE analysis for user defined loading
sc548  Assessment of masonry arch bridges by modified MEXE
sc550  Mechanism analysis of arches
sc552  Masonry dams
sc554  Masonry gravity wall

SCALE - Drainage and Surveying

sc560  Drain & sewer pipe sizing
sc565  Gutters and rain water pipes
sc565  Road alignment vertical curve
sc566  Road alignment horizontal curves
sc569  Areas and volumes for cuttings and embankments
sc570  Volumes from spot levels
sc571  Simpson's rule for volumes
sc580  Setting out piles
sc581  Analytical geometry based on the COGO approach
sc582  Traverse survey - open or closed
sc590  Crack movements - by tell-tales

SCALE - Analysis by Traditional Methods

sc601  Table of deflections for checking beams
sc602  Shears, moments, etc. for beams
sc603  Beams under combined axial and transverse loading
sc604  Continuous beam - moment distribution
sc605  Cantilever beam with varying section properties
sc606  Simply supported beam
sc608  Cranked or dogleg beam
sc610  Influence lines
sc611  Pigeaud's tables for concentrated loads on slabs
sc612  Rectangular culverts
sc614  Circular plate with UDL
sc615  Rectangular plates
sc620  Subframe analysis
sc621  Plane truss analysis - joint by joint
sc622  Plane truss analysis
sc623  Multi storey and multi bay frames
sc624  Multi storey frames
sc626  Vierendeel girders
List of SCALE pro formas.

email: ian@fitzroy.com

sc628 Shear legs
sc632 Rectangular portal
sc634 Ridged portal
sc635 Two bay ridged portal
sc636 Couple roof
sc638 Circular arch
sc639 Helical stair
sc640 Deep beams
sc642 Roof trusses
sc643 Section design for UB's UC's SHS's RHS's & CHS's
sc649 Plastic section properties
sc650 Section properties - general
sc651 Section properties with weightings
sc652 Section properties - plate girder with welded connections
sc653 Section properties - plate girder with angle connections
sc659 Influence surfaces of elastic plates - Pucher's charts
sc660 Yield-lines
sc662 Suspension bridges
sc663 Suspension cable analysis
sc664 Dynamical behaviour
sc666 Elastic stability

SCALE - Pre and Post Processors for Structural Analysis

sc674 Derives moments and principal stresses from plate deflections
sc678 Guyed masts
sc679 Circular tanks
sc680 Joint coordinates of circular members
sc682 Beta angle for space frame members
sc684 Member stiffness matrices
sc686 Loss of stiffness due to partial plasticity
sc687 Equilibrium & compatibility check: plane frame & truss members
sc688 Equilibrium & compatibility check: plane grid members
sc689 Equilibrium & compatibility check: space frame & truss members
sc690 Support displacements to model for guy pretension
sc692 Modelling of guys for analysis by stiffness method
sc694 Loads on continuous beams - used in sheet pile design

SCALE - Loadings

sc701 Snow loading
sc702 Wind loads to BS6399-2:1997 and Eurocode 1
sc704 Lateral earth pressure from surcharge
sc705 Pressures from retained materials
sc706 Moments and forces in hopper bottoms
sc707 Moments and forces in cylindrical containers
sc710 Loading on strip footing
sc711 Column & foundation loads
sc715 Unit loads
sc716 Loading on domestic lintel
sc717 Unit loads for steel frames
sc718 Steel beam with welded bottom flange
sc720 Weighting of items comprising several parts
sc725 Factored load summary sheet
sc726  Eurocode load combinations

SCALE - Foundations

sc731  Notes on pilecaps
sc732  Pilecap for 2 piles - truss analogy
sc734  Pilecap for 4 piles - truss analogy
sc735  Pilecap for 5 piles - truss analogy
sc742  Pilecap for 2 piles - bending theory
sc743  Pilecap for 3 piles - bending theory
sc744  Pilecap for 4 piles - bending theory
sc745  Pilecap for 5 piles - bending theory
sc746  Pilecap for 6 piles - bending theory
sc747  Pilecap for 7 piles - bending theory
sc748  Pilecap for 8 piles - bending theory
sc749  Pilecap for 9 piles - bending theory
sc750  Concrete retaining wall
sc751  Active pressure on retaining wall to BS8002:1994 or Eurocode 7
sc752  Stability calculations for a retaining wall
sc754  Biaxial bending on pad base
sc755  Pad base
sc756  Preliminary sizing of trapezoidal combined base
sc758  Preliminary sizing of T-shaped combined base
sc759  Preliminary sizing of rectangular combined base
sc760  Combined base
sc761  Traditional raft foundation design.
sc764  Beam on elastic foundation with load train - Hetenyi
sc765  Beam on elastic foundation
sc767  Active thrust on wall: cohesionless soil w. horizontal surface
sc768  Active & passive pressures on sheet pile wall - with two soils
sc769  Active wall pressure (Rankine) retaining soil slope
sc770  Slip circle analysis - Taylor's stability numbers
sc771  Slip circle analysis - Swedish method
sc772  Coefficient of volume compressibility and compression index
sc773  One dimensional consolidation beneath rectangular raft
sc775  Safe bearing pressures
sc776  Structural design of bituminous roads
sc777  Flexible pavement design to HD26/06
sc780  Soil pressures due to stacks
sc781  Elastic stresses within foundation material
sc782  Elastic stresses resulting from UDL on rectangular area
sc786  Vertical loads on straight bored piles in clay
sc787  Large diameter belled piles in clay
sc788  Pile loads from a crane base
sc789  Pile group analysis
sc790  Loads on piles in groups
sc791  Pile types and characteristics
sc792  Sheet retaining structures
sc793  Laterally loaded piles
sc794  Sheet pile wall - Das
sc796  Embedded depths of holding down bolts
SCALE - Steel Design to BS449 including Amendment 8, 1989

sc345 Column base
sc350 Steel guardrailing
Location: Triangle for main setting out of New Annexe

Solution of triangle given 2 sides and included angle

\[
\begin{align*}
\text{Length of side } b &= 10 \text{ m} \\
\text{Length of side } c &= 10 \text{ m} \\
\text{Included angle } A' &= 30^\circ \\
\text{From cosine formula} & \\
\text{a} &= \sqrt{(b^2 + c^2 - 2bc \cos A')} = 5.1764 \text{ m} \\
\text{B'} &= \text{DEG}(B) = 75^\circ \\
\text{C'} &= \text{DEG}(C) = 75^\circ
\end{align*}
\]
Simultaneous linear equations

\[
\begin{align*}
\text{a1} &= 2 \\
\text{b1} &= 1 \\
\text{c1} &= 1 \\
\text{d1} &= 1 \\
\text{e1} &= 11
\end{align*}
\]

with four unknowns

\[
\begin{align*}
\text{c2} &= 3 \\
\text{d2} &= 2 \\
\text{e2} &= 22 \\
\end{align*}
\]

The solution of four simultaneous equations:

\[
\begin{align*}
\text{a1}\cdot x + \text{b1}\cdot y + \text{c1}\cdot z + \text{d1}\cdot u &= \text{e1} \\
\text{a2}\cdot x + \text{b2}\cdot y + \text{c2}\cdot z + \text{d2}\cdot u &= \text{e2} \\
\text{a3}\cdot x + \text{b3}\cdot y + \text{c3}\cdot z + \text{d3}\cdot u &= \text{e3} \\
\text{a4}\cdot x + \text{b4}\cdot y + \text{c4}\cdot z + \text{d4}\cdot u &= \text{e4}
\end{align*}
\]

having coefficients:

\[
\begin{align*}
\text{a2} &= 1 \\
\text{b2} &= 2 \\
\text{a3} &= 3 \\
\text{b3} &= -1 \\
\text{a4} &= 7 \\
\text{b4} &= -6 \\
\text{c3} &= -1 \\
\text{d3} &= -1 \\
\text{c4} &= 1 \\
\text{d4} &= 5 \\
\text{e2} &= 22 \\
\text{e3} &= -6 \\
\text{e4} &= 18
\end{align*}
\]

Value of \(x\)

\[
x = 1
\]

Value of \(y\)

\[
y = 2
\]

Value of \(z\)

\[
z = 3
\]

Value of \(u\)

\[
u = 4
\]

Check by substitution in original equations

\[
\begin{align*}
\text{error1} &= \text{a1}\cdot x + \text{b1}\cdot y + \text{c1}\cdot z + \text{d1}\cdot u - \text{e1} = 0 \\
\text{error2} &= \text{a2}\cdot x + \text{b2}\cdot y + \text{c2}\cdot z + \text{d2}\cdot u - \text{e2} = 0 \\
\text{error3} &= \text{a3}\cdot x + \text{b3}\cdot y + \text{c3}\cdot z + \text{d3}\cdot u - \text{e3} = 0 \\

Length \( L = 10 \text{ m} \)
Offset at centre of arc \( H = 1 \text{ m} \)
Location: To find slope of function

Derivative of $x^n$ is $n \cdot x^{(n-1)}$.
Value of $x$ $x = 2$
Exponent $n = 3$
Derivative $dy/dx$ $y' = n \cdot x^{(n-1)} = 12$
Location: To find slope of water surface

Differentiation of a general function

Suppose that \( y_m2, y_m1, y_0, y_1 \) and \( y_2 \) are the values of \( f(x) \) at \( a-2h, a-h, a, a+h \) and \( a+2h \) respectively. Then by applying Taylor’s theorem it can be shown that, if \( h \) is small,

\[
f'(a) \approx \frac{8(y_1 - y_m1) - (y_2 - y_m2)}{12h}
\]

and

\[
f''(a) \approx \frac{16(y_1 + y_m1) - (y_2 + y_m2) - 30y_0}{12h^2}
\]

Increment taken as \( h = 1E-6 \)

Value of \( x \) at which derivative \( (dy/dx) \) required: \( a = 1 \)

Expression

\[ f(x) = 2x^2 \]

\[
\begin{align*}
 f(x) & \text{ at } a-2h \\
 y_{m2} & = 2x^2 = 1.999992 \\
 f(x) & \text{ at } a-h \\
 y_{m1} & = 2x^2 = 1.999996 \\
 f(x) & \text{ at } a \\
 y_0 & = 2x^2 = 2 \\
 f(x) & \text{ at } a+h \\
 y_1 & = 2x^2 = 2.000004 \\
 f(x) & \text{ at } a+2h \\
 y_2 & = 2x^2 = 2.000008
\end{align*}
\]

\[
\begin{align*}
 \frac{dy}{dx} & = \frac{8(y_1 - y_{m1}) - (y_2 - y_{m2})}{12h} = 4 \\
 \frac{d^2y}{dx^2} & = \frac{16(y_1 + y_{m1}) - (y_2 + y_{m2}) - 30y_0}{12h^2} = 3.999171364
\end{align*}
\]
Location: Area beneath pressure function

\[
\int_{a}^{b} c \cdot x^{n} \, dx = \left[ \frac{c \cdot x^{n+1}}{n+1} \right]_{a}^{b} \quad \text{for} \quad n \neq -1
\]

Constant \( c = 1 \)
Exponent \( n = 3 \)
Lower limit \( a = 1 \)
Upper limit \( b = 3 \)
Integral \( I = c \left( \frac{(b^{n+1})}{n+1} - \frac{(a^{n+1})}{n+1} \right) = 20 \)
Location: Revolve area under y=\(e^x\) about y axis from \(x=1\) to \(2\)

Integration of a general function using Simpson's rule

If \(y_1,y_2,y_3\) are the ordinates at \(a-h\), \(a\) and \(a+h\) respectively, Simpson's rule may be written:

\[
\int_{a-h}^{a+h} f(x) \, dx \approx \frac{h}{3} \left( f(a-h) + 4f(a) + f(a+h) \right)
\]

Usually Simpson's rule is applied by dividing the area between the ordinates \(y_1\) and \(y_{2n+1}\) into \(2n\) strips. This gives for 12 strips:

\[
\int_{a}^{b} f(x) \, dx \approx \frac{h}{3} \left( y_1 + y_{13} + 4(y_2 + y_4 + y_6 + y_8 + y_{10} + y_{12}) + 2(y_3 + y_5 + y_7 + y_9 + y_{11}) \right)
\]

where \(h = \frac{(b-a)}{12}\)

Lower limit \(a=1\)
Upper limit \(b=2\)
Width of strip \(h=\frac{(b-a)}{12}=0.08333333333\)
Function of \(x\) \(f(x)=2\pi x e^x\)
Writing \(k=4*(y(2)+y(4)+y(6)+y(8)+y(10)+y(12))=1111.327032\)
Integral \(I=\frac{h}{3}*(y(1)+y(13)+k+2*(y(3)+y(5)+y(7)+y(9)+y(11)))=46.42685176\)

Check on span/effective depth ratio

Basic ratio for simp.-sup.beam \( bs'd=20 \) see Table 3.9
As applied-moment factor \( M'bd2=M*1000*1000/(b*d^2)=1.0682 \) N/mm²
Mod.factor for tension steel from equation 7 (Table 3.10) \( \text{modf}_1=0.55+(477-fs)/(120*(.9+M'bd2))=1.4682 \)
Mod.factor for no comp.steel \( \text{modf}_2=1 \)
Maximum permissible \( \text{span/effective-depth ratio} \) \( ps'd=bs'd*\text{modf}_1*\text{modf}_2=29.364 \)
Span of beam (see Cls.3.4.1.2-4) \( \text{span}=5 \) m
Actual span/effective-depth ratio \( as'd=1000*\text{span}/d=21.097 \)
As this does not exceed 29.364, this is Acceptable.

Bending-moment capacities at steel curtailment points

As there are only two bars in tension, no curtailment is possible.

Anchorage and lap lengths – Clause 3.12.8 of BS8110: Part 1

Type 2 deformed bars: bond coefficient \( \beta=0.50 \) (Table 3.26)
Tension reinforcement:
Force in tension bar at yield \( Ft=fy/gammaS*PI*dia^2/4=34148 \) N
Ultimate anchorage bond stress \( fbu=\beta*SQR(fcu)=2.958 \) N/mm²
Anchorage and tension lap length \( \text{lap}=Ft/(PI*dia*fbu)=367.46 \) mm
\( =370 \) mm (rounded)
1.4 * tension lap length \( =520 \) mm (rounded)
2 * tension lap length \( =740 \) mm (rounded)

Shear reinforcement

Shear calculations are in accordance with Clauses 3.4.5 of Code
Support \( \text{av} \):
Design section

Location for shear calculation: 0.25 m from support
Effective breadth for shear \( bv=200 \) mm
Shear force due to ultimate load \( V=100 \) kN
Distance from support \( av=250 \) mm
No.of tension bars effective at section \( nbars=2 \)
Number of legs to be provided \( nlegs=2 \)
Chosen link spacing \( sv'=140 \) mm

Use 8 mm links (two legs), spaced at 140 mm centres along beam.

As overall depth h exceeds 750 mm bars to control cracking must be provided on side faces of beam (Clause 3.12.5.4 & 3.12.11.2.6).
Check on span/effective depth ratio

Basic ratio for continuous beam  \( bs'd=26 \)  see Table 3.9
As applied-moment factor \( M'bd^2=M*1000*1000/(b*d^2)=4.455 \text{ N/mm}^2 \)
Mod.factor for tension steel from equation 7 (Table 3.10) \( \text{modf1}=0.55+(477-fs)/(120*(.9+M'bd^2))=1.0387 \)
Mod.factor for no comp.steel \( \text{modf2}=1 \)
Maximum permissible span/effective-depth ratio \( ps'd=bs'd*\text{modf1}*\text{modf2}=27.007 \)
Span of beam (see Cls.3.4.1.2-4) \( \text{span}=12 \text{ m} \)
As span exceeds 10 m and partitions/finishes are sensitive to deflection multiply basic ratio by 10/span (in m) \( \text{ps'}d=\text{ps}'d*10/\text{span}=22.506 \)
Actual span/effective-depth ratio as\( d'=1000*\text{span}/d=13.873 \)
As this does not exceed 22.506, this is Acceptable.

Bending-moment capacities at steel curtailment points

The number of tension bars is even, so reduce in pairs.

With 12 tension bars, effective steel area \( Asrd=5890.5 \text{ mm}^2 \)
Reduced design moment \( M_{\text{red}}=M*\text{nbtr}/n\text{bart}=857.14 \text{ kNm} \)

With 10 tension bars, effective steel area \( Asrd=4908.7 \text{ mm}^2 \)
Reduced design moment \( M_{\text{red}}=M*\text{nbtr}/n\text{bart}=714.29 \text{ kNm} \)

With 8 tension bars, effective steel area \( Asrd=3927 \text{ mm}^2 \)
Reduced design moment \( M_{\text{red}}=M*\text{nbtr}/n\text{bart}=571.43 \text{ kNm} \)

With 6 tension bars, effective steel area \( Asrd=2945.2 \text{ mm}^2 \)
Reduced design moment \( M_{\text{red}}=M*\text{nbtr}/n\text{bart}=428.57 \text{ kNm} \)

With 4 tension bars, effective steel area \( Asrd=1963.5 \text{ mm}^2 \)
Reduced design moment \( M_{\text{red}}=M*\text{nbtr}/n\text{bart}=285.71 \text{ kNm} \)

With 2 tension bars, effective steel area \( Asrd=981.75 \text{ mm}^2 \)
Reduced design moment \( M_{\text{red}}=M*\text{nbtr}/n\text{bart}=142.86 \text{ kNm} \)

No further curtailment is possible. However, bars must extend beyond the theoretical curtailment points as required below.

Min.extension to tension bars equal to effective depth \( d \) of 865 mm as this is not less than 12*tension bar diameter, i.e. 300 mm.
Anchorage and lap lengths - Clause 3.12.8 of BS8110: Part 1

Type 2 deformed bars: bond coefficient $\beta = 0.50$ (Table 3.26)

Tension reinforcement:
- Force in tension bar at yield $F_t = \frac{f_y}{\gamma_s} \pi d^2 / 4 = 106712$ N
- Ultimate anchorage bond stress $f_{bu} = \beta \sqrt{f_{cu}} = 2.7386$ N/mm²
- Anchorage and tension lap length $l_{ap} = \frac{F_t}{\pi d f_{bu}} = 496.13$ mm
  - $1.4 \times$ tension lap length $= 700$ mm (rounded)
  - $2 \times$ tension lap length $= 1000$ mm (rounded)

Shear reinforcement

Shear calculations are in accordance with Clauses 3.4.5 of Code

Support $\downarrow$ av $\uparrow$ Design section

Location for shear calculation: 0.5 m from support
- Effective breadth for shear $b_v = 300$ mm
- Shear force due to ultimate load $V = 500$ kN
- Distance from support $a_v = 500$ mm
- No. of tension bars effective at section $n_{bars} = 14$
- Number of legs to be provided $n_{legs} = 2$
- Chosen link spacing $s_v' = 160$ mm

Use 12 mm links (two legs), spaced at 160 mm centres along beam.

**Check on span/effective depth ratio**

| Basic ratio for continuous beam | $bs'd=26$ see Table 3.9 |
| As applied-moment factor | $M'bd2=M*1000*1000/(b*d^2)=6.5909$ N/mm² |
| Mod.factor for tension steel from equation 7 (Table 3.10) | $modf1=0.55+(477-fs)/(120*(.9+M'bd2))=0.72752$ |
| Area of comp.steel provided | $As'pr=1244.1$ mm² |
| Percentage of compression steel | $per'n=100*As'pr/(b*d)=1.1844$ % |
| From equation 9 of BS8110, with percentage of comp.steel=1.1844 %, Mod.factor for compression steel | $modf2=1+per'n/(3+per'n)=1.283$ |
| Maximum permissible span/effective-depth ratio | $ps'd=bs'd*modf1*modf2=24.27$ |
| Span of beam (see Cls.3.4.1.2-4) | $span=2.4$ m |
| Actual span/effective-depth ratio as $d=1000*span/d=23.077$ | |
| As this does not exceed 24.27, this is Acceptable. | |

**Bending-moment capacities at steel curtailment points**

The number of tension bars is even, so reduce in pairs.

With 20 tension bars, effective steel area $Asrd=2261.9$ mm²
Reduced design moment $Mred=M*nbtr/nbart=65.455$ kNm
Reduced area of comp.steel reqd.
Provide 2 compression bars, giving an area of $As'rd=2261.9$ mm²
Provide 2 compression bars, giving an area of $As'rd=As'rd=2261.9$ mm²

With 18 tension bars, effective steel area $Asrd=2035.8$ mm²
Reduced design moment $Mred=M*nbtr/nbart=58.909$ kNm
No compression steel is now required.

With 16 tension bars, effective steel area $Asrd=1809.6$ mm²
Reduced design moment $Mred=M*nbtr/nbart=52.364$ kNm

With 14 tension bars, effective steel area $Asrd=1583.4$ mm²
Reduced design moment $Mred=M*nbtr/nbart=45.818$ kNm
With 12 tension bars, effective steel area $A_{sr}=1357.2$ mm$^2$
Reduced design moment $M_{red}=M*nbtr/nbart=39.273$ kNm

With 10 tension bars, effective steel area $A_{sr}=1131$ mm$^2$
Reduced design moment $M_{red}=M*nbtr/nbart=32.727$ kNm

With 8 tension bars, effective steel area $A_{sr}=904.78$ mm$^2$
Reduced design moment $M_{red}=M*nbtr/nbart=26.182$ kNm

With 6 tension bars, effective steel area $A_{sr}=678.58$ mm$^2$
Reduced design moment $M_{red}=M*nbtr/nbart=19.636$ kNm

With 4 tension bars, effective steel area $A_{sr}=452.39$ mm$^2$
Reduced design moment $M_{red}=M*nbtr/nbart=13.091$ kNm

With 2 tension bars, effective steel area $A_{sr}=226.19$ mm$^2$
Reduced design moment $M_{red}=M*nbtr/nbart=6.5455$ kNm

No further curtailment is possible. However, bars must extend beyond the theoretical curtailment points as required below.

Min. extension to tension bars equal to $12*bar$ diameter, i.e. 144 mm, as this is not less than the effective depth $d$ of 104 mm.

Min. extension to comp. bars equal to $12*bar$ diameter, i.e. 144 mm as this is not less than the effective depth $d$ of 104 mm.

**Anchorage and lap lengths - Clause 3.12.8 of BS8110: Part 1**

Plain bars: bond coefficient $\beta=0.28$ (Table 3.26)

Tension reinforcement:
Force in tension bar at yield $F_t=fy/\gamma_S*\pi*dia^2/4=41797$ N
Ultimate anchorage bond stress $f_{bu}=\beta*\sqrt{f_{cu}}=1.7709$ N/mm$^2$
Anchorage and tension lap length $lap=F_t/(\pi*dia*f_{bu})=626.07$ mm

$1.4* $ tension lap length = 880 mm (rounded)
$2* $ tension lap length = 1260 mm (rounded)

Compression reinforcement:

Plain bars: bond coefficient $\beta=0.35$ (Table 3.26)

Force in comp. bar at yield $F_{sc}=fy/\gamma_S*\pi*diac^2/4=41797$ N
Ultimate anchorage bond stress $f_{bu}=\beta*\sqrt{f_{cu}}=2.2136$ N/mm$^2$
Anchorage length in compression $lac=F_{sc}/(\pi*diac*f_{bu})=500.86$ mm

Compression lap length $(1.25*lac) = 630$ mm (rounded)

**Shear reinforcement**

Shear calculations are in accordance with Clauses 3.4.5 of Code

Location for shear calculation: 100 mm from support
Effective breadth for shear \( bv = 1010 \text{ mm} \)

Shear force due to ultimate load \( V = 50 \text{ kN} \)

Distance from support \( av = 100 \text{ mm} \)

No. of tension bars effective at section \( nbars = 22 \)

As \( bv \) exceeds 350 mm note the conditions in Clause 3.4.5.5:

i) that no longitudinal bar should be more than 150 mm from a vertical leg, and

ii) (because \( bv \) exceeds \( d \)), that the transverse spacing of the legs must not exceed the effective depth \( d \) (i.e. 104 mm).

Number of legs to be provided \( nlegs = 2 \)

Chosen link spacing \( sv' = 50 \text{ mm} \)

Use 8 mm links (two legs), spaced at 50 mm centres along beam.

When detailing steel, watch carefully the requirements of Cl.3.4.5.5.

Nominal concrete cover cover=50 mm
Overall depth of section h=1000 mm
Effective depth of section d=874 mm
Breadth of section b=1010 mm

Longitudinal reinforcement

| TENSION | Characteristic strength 250 N/mm² |
| REINFORCEMENT | Diameter of bars 40 mm |
| SUMMARY | Number of bars 26 |
|          | arranged in 3 layers. |
|          | Cover to all steel 50 mm |
|          | Area of steel required 31877 mm² |
|          | Area of steel provided 32673 mm² |
|          | Percentage provided 3.2349 % |
|          | Weight of steel provided 256.48 kg/m |
|          | Max.permissible spacing 289 mm |
|          | Link size assumed 16 mm |

As overall depth h exceeds 750 mm bars to control cracking must be provided on side faces of beam (Clause 3.12.5.4 & 3.12.11.2.6).
Check on span/effective depth ratio

Basic ratio for continuous beam  \( bs'd=26 \)  see Table 3.9
As applied-moment factor  \( M'bd2=M*1000*1000/(b*d^2)=6.4808 \) N/mm²
Mod.factor for tension steel from equation 7 (Table 3.10)  
\[
\text{modf1}=0.55+(477-fs)/(120*(.9+M'bd2)) =0.90497
\]
Mod.factor for no comp.steel  \( \text{modf2}=1 \)
Maximum permissible span/effective-depth ratio  \( ps'd=bs'd*\text{modf1}*\text{modf2}=23.529 \)
Span of beam (see C1s.3.4.1.2-4)  \( \text{span}=14 \) m
As span exceeds 10 m and partitions/finishes are sensitive to deflection multiply basic ratio by 10/span (in m)  \( ps'd=ps'd*10/\text{span} \)
\( =16.807 \)
Actual span/effective-depth ratio as  \( ps'd=1000*\text{span}/d=16.018 \)
As this does not exceed 16.807, this is Acceptable.

Bending-moment capacities at steel curtailment points

The number of tension bars is even, so reduce in pairs.

With 24 tension bars, effective steel area  \( Asrd=30159 \) mm²
Reduced design moment  \( Mred=M*nbtr/nbart=4615.4 \) kNm

With 22 tension bars, effective steel area  \( Asrd=27646 \) mm²
Reduced design moment  \( Mred=M*nbtr/nbart=4230.8 \) kNm

With 20 tension bars, effective steel area  \( Asrd=25133 \) mm²
Reduced design moment  \( Mred=M*nbtr/nbart=3846.2 \) kNm

With 18 tension bars, effective steel area  \( Asrd=22619 \) mm²
Reduced design moment  \( Mred=M*nbtr/nbart=3461.5 \) kNm

With 16 tension bars, effective steel area  \( Asrd=20106 \) mm²
Reduced design moment  \( Mred=M*nbtr/nbart=3076.9 \) kNm

With 14 tension bars, effective steel area  \( Asrd=17593 \) mm²
Reduced design moment  \( Mred=M*nbtr/nbart=2692.3 \) kNm

With 12 tension bars, effective steel area  \( Asrd=15080 \) mm²
Reduced design moment  \( Mred=M*nbtr/nbart=2307.7 \) kNm

With 10 tension bars, effective steel area  \( Asrd=12566 \) mm²
Reduced design moment  \( Mred=M*nbtr/nbart=1923.1 \) kNm

With 8 tension bars, effective steel area  \( Asrd=10053 \) mm²
Reduced design moment  \( Mred=M*nbtr/nbart=1538.5 \) kNm

With 6 tension bars, effective steel area  \( Asrd=7539.8 \) mm²
Reduced design moment  \( Mred=M*nbtr/nbart=1153.8 \) kNm
With 4 tension bars, effective steel area $A_{sr}=5026.5 \, \text{mm}^2$
Reduced design moment $M_{red}=M*nbtr/nbart=769.23 \, \text{kNm}$

With 2 tension bars, effective steel area $A_{sr}=2513.3 \, \text{mm}^2$
Reduced design moment $M_{red}=M*nbtr/nbart=384.62 \, \text{kNm}$

No further curtailment is possible. However, bars must extend beyond the theoretical curtailment points as required below.

Min. extension to tension bars equal to effective depth $d$ of 874 mm as this is not less than $12 \times$ tension bar diameter, i.e. 480 mm.

**Anchorage and lap lengths - Clause 3.12.8 of BS8110: Part 1**

Plain bars: bond coefficient $\beta=0.28$ (Table 3.26)

Tension reinforcement:

Force in tension bar at yield $F_t=f_y/gamma_S*PI*dia^2/4=273182 \, \text{N}$
Ultimate anchorage bond stress $f_{bu}=\beta*SQR(f_{cu})=1.9799 \, \text{N/mm}^2$
Anchorage and tension lap length $l_{ap}=F_t/(PI*dia*f_{bu})=1098 \, \text{mm}$
1.4 * tension lap length = 1500 mm (rounded)
2 * tension lap length = 2200 mm (rounded)

**Shear reinforcement**

Shear calculations are in accordance with Clauses 3.4.5 of Code

Location for shear calculation: 0.457 m from support
Effective breadth for shear $b_v=1010 \, \text{mm}$
Shear force due to ultimate load $V=1450 \, \text{kN}$
Distance from support $a_v=457 \, \text{mm}$
No. of tension bars effective at section $n_bars=26$
As $b_v$ exceeds 350 mm note the conditions in Clause 3.4.5.5:

i) that no longitudinal bar should be more than 150 mm from a vertical leg, and

ii) (because $b_v$ exceeds $d$), that the transverse spacing of the legs must not exceed the effective depth $d$ (i.e. 874 mm).

Number of legs to be provided $n_{legs}=2$
Chosen link spacing $s_v'=150 \, \text{mm}$

Use 16 mm links (two legs), spaced at 150 mm centres along beam.

When detailing steel, watch carefully the requirements of Cl.3.4.5.5.

**Summary**

- **Shear:** Characteristic strength 250 N/mm²
- **Reinforcement:** Diameter of links 16 mm
- **Summary:** Number of legs 2
- **Spacing:** 150 mm
- **Approx. weight of links:** 38.425 kg/m
Location: Ex1 - Beam with compression reinforcement

Bending in rectangular beams

Calculations are in accordance with EC2: Design of concrete structures and assume the use of a simplified rectangular concrete stress-block and that the depth to the neutral axis is restricted to 0.45\*d.

Design BM before redistribution \( M_{\text{bef}} = 150 \text{ kNm} \)
Beam being analysed is considered as non-continuous.
Char yield strength of reinforc'ment \( f_{\text{yk}} = 500 \text{ N/mm}^2 \)
Max.aggregate size (for bar spc.) \( h_{\text{agg}} = 20 \text{ mm} \)
Diameter of tension bars \( \text{dia} = 25 \text{ mm} \)
Diameter of link legs \( \text{dia}_l = 8 \text{ mm} \)

Section properties

| Effective depth of section | \( d = 340 \text{ mm} \) |
| Diameter of compression bars | \( \text{dia}_c = 12 \text{ mm} \) |

Location: Small beam - high-yield steel - no compression steel

Design of flanged beams to resist bending

Calculations are in accordance with Clause 3.4.4.4 of BS8110: Part 1 and thus assume the use of a simplified rectangular concrete stress-block and that the depth to the neutral axis is restricted to 0.5*d.

Design to BS8110(1997) with partial safety factor for steel \( \gamma_S = 1.15 \)

Moment before redistribution \( M_{bef} = 12 \, \text{kNm} \)

Beam being analysed is considered as non-continuous.

Characteristic concrete strength \( f_{cu} = 35 \, \text{N/mm}^2 \)

Max. aggregate size (for bar spc.) \( h_{agg} = 15 \, \text{mm} \)

Char. strength of long'1 bars \( f_y = 500 \, \text{N/mm}^2 \)

Longitudinal reinforcement is high-yield steel.

Diameter of tension bars \( \text{dia} = 12 \, \text{mm} \)

Diameter of link legs \( \text{dial} = 6 \, \text{mm} \)

Designated exposure class is XC1

Specified fixing tolerance \( \text{tol} = 10 \, \text{mm} \)

Nominal concrete cover \( \text{cover} = 25 \, \text{mm} \)

Overall depth of section \( h = 275 \, \text{mm} \)

Effective depth of section \( d = 238 \, \text{mm} \)

Breadth of flange \( b = 400 \, \text{mm} \)

Breadth of rib \( bw = 200 \, \text{mm} \)

Thickness of flange \( hf = 100 \, \text{mm} \)

Location: Small beam - high-yield steel - no compression steel

Bending in flanged beams with optional calculations for shear, lap lengths, bar curtailment and limiting span/effective-depth ratio

Calculations are in accordance with Clause 3.4.4.4 of BS8110: Part 1 and thus assume the use of a simplified rectangular concrete stress-block, and that the depth to the neutral axis is restricted to 0.5*d.

Design to BS8110(1997) with partial safety factor for steel gammaS=1.15
Ultimate BM before redistribution Mbef=12 kNm
Beam being analysed is considered as non-continuous.
Characteristic concrete strength fcu=35 N/mm²
Max.aggregate size (for bar spc) hagg=15 mm
Char.strength of long'1 bars fy=500 N/mm²
Longitudinal reinforcement is high-yield steel.
Diameter of tension bars dia=12 mm
Char.strength of link steel fyv=500 N/mm²
Diameter of link legs dial=6 mm
High-yield steel shear reinforcement.
Designated exposure class is XC1
Specified fixing tolerance tol=10 mm
Nominal concrete cover cover=25 mm
Overall depth of section h=275 mm
Effective depth of section d=238 mm
Breadth of flange b=400 mm
Breadth of rib bw=200 mm
Thickness of flange hf=100 mm

Longitudinal reinforcement

| TENSION | Characteristic strength 500 N/mm² |
| REINFORCEMENT | Diameter of bars 12 mm |
| SUMMARY | Number of bars 2 |
| | arranged in a single layer |
| | Cover to all steel 25 mm |
| | Area of steel required 122.07 mm² |
| | Area of steel provided 226.19 mm² |
| | Percentage provided: |
| | of gross section 0.30159 % |

| | Weight of steel provided 1.7756 kg/m |
| | Max.permissible spacing 261 mm |
| | Link size assumed 6 mm |
Check on span/effective-depth ratio

Interpolating from Table 3.9 with $bw/b=0.5$

Basic ratio for simply-sup. span $bs'd=17.143$

As applied-moment factor $M'bd2=M*1000*1000/(b*d^2)$

$=0.52962 \text{ N/mm}^2$

Mod.factor for tension steel from
equation 7 (Table 3.10) $\text{modf1}=0.55+(477-fs)/(120*(0.9$ $+M'bd2))=2.2819$

but this cannot exceed 2, so $\text{modf1}=2$

Mod.factor for no comp.steel $\text{modf2}=1$

Maximum permissible
span/effective-depth ratio $ps'd=bs'd*\text{modf1}*\text{modf2}=34.286$

Span of beam (Clause 3.4.1.2-4) $\text{span}=7 \text{ m}$

Actual span/effective-depth ratio as $d'=1000*\text{span}/d=29.412$

As this does not exceed $34.286$, this is Acceptable.

Bending-moment capacities at steel curtailment points

As there are only two bars in tension, no curtailment is possible.

Anchorage and lap lengths (Clause 3.12.8 of BS8110: Part 1)

Type 2 deformed bars: bond coefficient $\beta=0.50$ (Table 3.26)

Tension reinforcement:
Force in tension bar at yield $F_t=f_y/\gamma_S*\pi*dia^2/4=49173 \text{ N}$

Ultimate anchorage bond stress $f_{bu}=\beta*SQR(f_{cu})=2.958 \text{ N/mm}^2$

Anchorage and tension lap length $lap=F_t/(\pi*dia*f_{bu})=440.95 \text{ mm}$ $=450 \text{ mm (rounded)}$

$1.4 \times \text{ tension lap length}$ $=620 \text{ mm (rounded)}$

$2 \times \text{ tension lap length}$ $=890 \text{ mm (rounded)}$

Shear reinforcement

Shear calculations are in accordance with Clauses 3.4.5 of Code.

Support $\uparrow$ Design section $\leftarrow av$

Location for shear calculation: $0.25 \text{ m from support}$

Effective breadth for shear $bv=200 \text{ mm}$

Shear force due to ultimate load $V=100 \text{ kN}$

Distance from support $av=250 \text{ mm}$

No. of tension bars effective at section $nbars=2$

Number of legs to be provided $n\text{legs}=2$

Chosen link spacing $sv'=80 \text{ mm}$

Use 6 mm links (two legs), spaced at 80 mm centres along beam.

</table>

As overall depth h exceeds 750 mm, bars to control cracking must be provided on side faces of beam ( Cl. 3.12.5.4 and 3.12.11.2.9 )
Check on span/effective-depth ratio

Interpolating from Table 3.9 with $bw/b=0.2$
Basic ratio for continuous span $bs'd=20.8$
As applied-moment factor $M'bd^2=M*1000*1000/(b*d^2)=0.8407 \text{ N/mm}^2$
Mod.factor for tension steel from equation 7 (Table 3.10) $\text{modf1}=0.55+(477-fs)/(120*(0.9+M'bd^2))=2.097$
but this cannot exceed 2, so $\text{modf1}=2$
Mod.factor for no comp.steel $\text{modf2}=1$
Maximum permissible span/effective-depth ratio $ps'd=bs'd*\text{modf1}*\text{modf2}=41.6$
Span of beam (Clause 3.4.1.2-4) span=17 m
As span exceeds 10 m and partitions/finishes are sensitive to deflection multiply basic ratio by 10/span (in m) $ps'd=ps'd*10/span=24.471$
Actual span/effective-depth ratio as $d=1000*\text{span}/d=19.09$
As this does not exceed 24.471, this is Acceptable.

Bending-moment capacities at steel curtailment points

The number of tension bars is even, so reduce in pairs.

With 10 tension bars, effective steel area $Asrd=4908.7 \text{ mm}^2$
Reduced design moment $Mred=M*nbtr/nbart=833.33 \text{ kNm}$

With 8 tension bars, effective steel area $Asrd=3927 \text{ mm}^2$
Reduced design moment $Mred=M*nbtr/nbart=666.67 \text{ kNm}$

With 6 tension bars, effective steel area $Asrd=2945.2 \text{ mm}^2$
Reduced design moment $Mred=M*nbtr/nbart=500 \text{ kNm}$

With 4 tension bars, effective steel area $Asrd=1963.5 \text{ mm}^2$
Reduced design moment $Mred=M*nbtr/nbart=333.33 \text{ kNm}$

With 2 tension bars, effective steel area $Asrd=981.75 \text{ mm}^2$
Reduced design moment $Mred=M*nbtr/nbart=166.67 \text{ kNm}$

No further curtailment is possible. However, bars must extend beyond the theoretical curtailment points as required below.

Min.extension to tension bars equal to eff.depth $d$ of 890.5 mm as this is not less than 12*tension bar diameter, i.e. 300 mm.
Anchorage and lap lengths (Clause 3.12.8 of BS8110: Part 1)

Plain bars: bond coefficient  \( \beta = 0.28 \) (Table 3.26)

Tension reinforcement:

- Force in tension bar at yield:  \( F_t = \frac{f_y}{\gamma_S} \pi d^2}{4} = 106712 \text{ N} \)
- Ultimate anchorage bond stress:  \( f_{bu} = \beta \sqrt{f_{cu}} = 1.5336 \text{ N/mm}^2 \)
- Anchorage and tension lap length:  \( \text{lap} = \frac{F_t}{\pi d f_{bu}} = 885.94 \text{ mm} \)
  
  = 890 mm (rounded)

- \( 1.4 \times \text{tension lap length} = 1250 \text{ mm (rounded)} \)
- \( 2 \times \text{tension lap length} = 1780 \text{ mm (rounded)} \)

Shear reinforcement

Shear calculations are in accordance with Clauses 3.4.5 of Code.

Location for shear calculation: 0.5 m from support

- Effective breadth for shear:  \( b_v = 300 \text{ mm} \)
- Shear force due to ultimate load:  \( V = 800 \text{ kN} \)
- Distance from support:  \( a_v = 500 \text{ mm} \)
- Diameter of tension bars:  \( d_{as} = 25 \text{ mm} \)
- No. of tension bars effective at section:  \( n_{bars} = 12 \)
- Number of legs to be provided:  \( n_{legs} = 2 \)
- Chosen link spacing:  \( s_v' = 75 \text{ mm} \)

Use 12 mm links (two legs), spaced at 75 mm centres along beam.

Diameter of bars  16 mm

SUMMARY  
Number of bars  2
arranged in a single layer
Cover to all steel  30 mm
Area of steel required  300.47 mm²
Area of steel provided  402.12 mm²
Percentage provided:
of gross section  0.38298 %
of web area  0.76595 %
of flange area  0.53617 %
Weight of steel provided 3.1567 kg/m
Minimum poss.link size  6 mm
Maximum spacing of links  192 mm

Check on span/effective-depth ratio

Interpolating from Table 3.9 with bw/b=0.3
Basic ratio for continuous span  bs'd=20.8
As applied-moment factor  M'bd2=M*1000*1000/(b*d²)=4.712 N/mm²
Mod.factor for tension steel from equation 7 (Table 3.10)  modf1=0.55+(477-fs)/(120*(0.9
+M'bd2))=0.78425
Area of comp.steel provided  As'pr=402.12 mm²
Percentage of compression steel  per'n=As'pr/(b*d)=0.31663 %
From Equation 9 of BS8110, with percentage of comp.steel=0.31663 %,
Mod.factor for compression steel  modf2=1+per'n/(3+per'n)=1.0955
Maximum permissible
span/effective-depth ratio  ps'd=bs'd*modf1*modf2=17.87
Span of beam (Clause 3.4.1.2-4)  span=2.3 m

WARNING:
Actual span/effective-depth ratio 18.11
Permissible span/effective-depth ratio 17.87
Hence unacceptable.
Location: Large beam - high-yield steel - with compression steel

Bending in flanged beams with optional calculations for shear, lap lengths, bar curtailment and limiting span/effective-depth ratio

Calculations are in accordance with Clause 3.4.4.4 of BS8110: Part 1 and thus assume the use of a simplified rectangular concrete stress-block, and that the depth to the neutral axis is restricted to 0.5*d.

Design to BS8110(1997) with partial safety factor for steel gammaS=1.15
Ultimate BM before redistribution Mbef=9567 kNm
Beam being analysed is considered as continuous.

Max.aggregate size (for bar spc) hagg=15 mm
Char.strength of long'l bars fy=500 N/mm²
Longitudinal reinforcement is high-yield steel.
Diameter of tension bars dia=40 mm
Char.strength of link steel fyv=500 N/mm²
Diameter of link legs dial=12 mm
High-yield steel shear reinforcement.
Designated exposure class is XC3

Specified fixing tolerance tol=10 mm
Nominal concrete cover cover=50 mm
Overall depth of section h=1000 mm
Effective depth of section d=918 mm
Breadth of flange b=2000 mm
Breadth of rib bw=500 mm
Thickness of flange hf=175 mm

Longitudinal reinforcement

Depth to compression bars d'=72 mm

Weight of steel provided 217.02 kg/m
Max.permissible spacing 139 mm
Link size assumed 12 mm
### COMPRESSION
- Characteristic strength: 500 N/mm²

### REINFORCEMENT
- Diameter of bars: 20 mm
- Number of bars: 10
- Arranged in a single layer

### SUMMARY
- Cover to all steel: 50 mm
- Area of steel required: 3135.3 mm²
- Area of steel provided: 3141.6 mm²
- Percentage provided:
  - of gross section: 0.41201%
  - of web area: 0.62832%
  - of flange area: 0.8976%
- Weight of steel provided: 24.662 kg/m
- Minimum poss. link size: 6 mm
- Maximum spacing of links: 240 mm

As overall depth h exceeds 750 mm, bars to control cracking must be provided on side faces of beam (Cl. 3.12.5.4 and 3.12.11.2.9)

Check on span/effective-depth ratio

Interpolating from Table 3.9 with bw/b=0.25
Basic ratio for continuous span: bs'd=20.8

**WARNING:**
As $f_s$ exceeds 333.3 N/mm² Table 3.10 is invalid (Cl. 3.4.6.5).
Either the steel yield stress is too high or the moment redistribution from the midspan section is excessive.
Location: Ex1 - Continuous T-beam

Bending in flanged beams

Calculations are in accordance with EC2: Design of concrete structures and assume the use of a simplified rectangular concrete stress-block, and that the depth to the neutral axis is restricted to 0.45*d.

Distance between beam supports \( L = 8.2 \text{ m} \)
Design BM before redistribution \( M_{bef} = 600 \text{ kNm} \)
Beam being analysed is considered as continuous.
Section considered has a sagging moment.
Overall depth of section \( h = 650 \text{ mm} \)
Average web width \( b_w = 350 \text{ mm} \)
Flange thickness \( h_f = 200 \text{ mm} \)
Char yield strength of reinft \( f_yk = 500 \text{ N/mm}^2 \)
Max.aggregate size (for bar spc.) \( h_{agg} = 20 \text{ mm} \)
Diameter of tension bars \( d_{ia} = 25 \text{ mm} \)
Diameter of link legs \( d_{ial} = 10 \text{ mm} \)
Effective depth of section \( d = 560 \text{ mm} \)

Section being considered is a T-beam.

**DESIGN**

Overall depth 650 mm

**SUMMARY**

Effective depth 560 mm
Flange width 2194 mm
Web width 350 mm

**FLEXURE**

Parameter K 0.0291

Design of concrete walls containing reinforcement to BS8110

Design to BS8110 (1997)
Total length of wall section \( b = 3000 \text{ mm} \)
Thickness of wall section \( h = 300 \text{ mm} \)
Concrete grade \( f_{cu} = 30 \text{ N/mm}^2 \)
Steel strength \( f_y = 250 \text{ N/mm}^2 \)
Number of rows of bars (1 or 2) \( \text{rows} = 2 \)
Vertical bar size \( d_i = 20 \text{ mm} \)
Designated exposure class is XC2
Specified fixing tolerance \( \text{tol} = 10 \text{ mm} \)
Cover to main bars \( c = 35 \text{ mm} \)
Vertical bar spacing \( \text{space} = 125 \text{ mm} \)
Clear height of wall \( \text{lo} = 3.5 \text{ m} \)
The end condition at the top of the wall in accordance with Clause 3.8.1.6.2 of BS8110 is condition 2
The end condition at the bottom of the wall in accordance with Clause 3.8.1.6.2 of BS8110 is condition 1

BS8110 Classification: Stocky braced reinforced-concrete wall of normal-weight concrete

Maximum load supported

\[
nw = h \times (0.35 \times f_{cu} + 0.67 \times f_y \times \rho_1)\\
= 3991.9 \text{ kN per metre}
\]

Design of concrete walls containing reinforcement to BS8110

Design to BS8110 (1997)
Total length of wall section \( b = 4000 \text{ mm} \)
Thickness of wall section \( h = 750 \text{ mm} \)
Density of concrete \( \text{density} = 1200 \text{ kg/m}^3 \)
Concrete grade \( f_{cu} = 30 \text{ N/mm}^2 \)
Steel strength \( f_y = 500 \text{ N/mm}^2 \)
Number of rows of bars (1 or 2) \( \text{rows} = 2 \)
Vertical bar size \( d_i = 25 \text{ mm} \)
Designated exposure class is XC3
Specified fixing tolerance \( \text{tol} = 10 \text{ mm} \)
Cover to main bars \( c = 45 \text{ mm} \)
Vertical bar spacing \( \text{space} = 200 \text{ mm} \)
Clear height of wall \( h_0 = 3.5 \text{ m} \)

The end condition at the top of the wall in accordance with Clause 3.8.1.6.2 of BS8110 is condition 3
The end condition at the bottom of the wall in accordance with Clause 3.8.1.6.2 of BS8110 is condition 1

BS8110 Classification: Stocky unbraced reinforced-concrete wall

Since wall supports an approximately-symmetrical beam or slab system, requirements of Clause 3.9.3.3 of BS8110 apply.
Design section to resist axial thrust plus nominal moment corresponding to an eccentricity of 0.05\(h\) (i.e. 37.5 mm or 20 mm, whichever is greater.

Max. resistance \( n_w = \frac{h^2 (k_1 (d-k_2 h)+r_{h0} f_y (d-h/2))}{(d+e_x-h/2)} \)
\( = 11137 \text{ kN per metre} \)

Since the maximum load supported by a stocky braced wall is \( n_w = \frac{h^2 (0.35 f_{cu} + 0.7 f_y r_{h0})}{(d+e_x-h/2)} \)
\( = 9593.1 \text{ kN per metre} \),
it would be sensible to restrict the load-carrying capacity of a similar unbraced section to this value.

Design of concrete walls containing reinforcement to BS8110

\[ \text{Design to BS8110(1997)} \]
Total length of wall section \( b = 3000 \text{ mm} \)
Thickness of wall section \( h = 100 \text{ mm} \)
Concrete grade \( f_{cu} = 30 \text{ N/mm}^2 \)
Steel strength \( f_y = 500 \text{ N/mm}^2 \)
Number of rows of bars (1 or 2) \( \text{rows=} 2 \)
Vertical bar size \( d_i = 12 \text{ mm} \)
Designated exposure class is XC1
Specified fixing tolerance \( \text{tol=} 10 \text{ mm} \)
Cover to main bars \( c = 25 \text{ mm} \)
Vertical bar spacing \( \text{space=} 100 \text{ mm} \)
Clear height of wall \( l_o = 3.5 \text{ m} \)
The end condition at the top of the wall in accordance with Clause 3.8.1.6.2 of BS8110 is condition 1
The end condition at the bottom of the wall in accordance with Clause 3.8.1.6.2 of BS8110 is condition 1

BS8110 Classification: Slender braced reinforced-concrete wall of normal-weight concrete

In this case the requirements of Clause 3.9.3.7.1 of BS8110 apply. First determine in-plane forces on section, due to in-plane axial loads plus moments resulting from horizontal forces, by an elastic analysis assuming that no tension occurs in the concrete. Then calculate effects of transverse moments separately, and combine with axial force acting at point concerned, obtained from previous calculation, using rigorous limit-state analysis. Total transverse moment must sum an additional moment due to slenderness with that resulting from applied loads, by considering wall as slender column bending about minor axis (i.e. use Proforma 91). If wall is reinforced by single central layer such additional moments must be doubled (see BS8110, Cl.3.9.3.7.3).
Location: Medium thick wall using normal-weight concrete

Design of concrete walls containing reinforcement to EC2

Char yield strength of reinforcement $f_{yk}=500 \text{ N/mm}^2$
Number of rows of bars (1 or 2) $\text{rows}=2$
Vertical bar diameter $\text{dia}=16 \text{ mm}$
Horizontal bar diameter $\text{dia}=12 \text{ mm}$

Number of bars provided

nbars=8 /m

DESIGN SUMMARY

Wall thickness
300 mm

Clear wall height
3.5 m

Design axial load
2000 kN/m

Design BM (Z-Z axis)
129.38 kNm/m

Vert.reinf.diameter
16 mm

Area of steel required
600 mm²/m

Area of steel provided
1608.5 mm²/m

Horiz.reinf.diameter
12 mm

Horiz.reinf.spacing
400 mm
Location: EX2 - Thick wall using normal-weight concrete

Design of concrete walls containing reinforcement to EC2

\[ h = \text{wall thickness} \]
\[ \text{horizontal bars to lie outside vertical bars} \]
\[ \text{vertical reinforcement} \]

Char yield strength of reinforcement \( f_{yk} = 500 \text{ N/mm}^2 \)
Number of rows of bars (1 or 2) \( \text{rows} = 2 \)
Vertical bar diameter \( \text{dia} = 25 \text{ mm} \)
Horizontal bar diameter \( \text{dial} = 10 \text{ mm} \)

**Section properties**

Wall thickness \( h = 750 \text{ mm} \)
Length of wall section \( b = 1000 \text{ mm} \)
Depth of comp. reinforcement \( d_2 = 68 \text{ mm} \)

**Loading details**

Clear height between restraints \( l = 3.5 \text{ m} \)
Design ultimate axial load \( N = 3000 \text{ kN/m} \)
Larger initial end mt. (positive) \( M_2 = 100 \text{ kNm/m} \)
Smaller initial end moment \( M_1 = 0 \text{ kNm/m} \)

**Slenderness (EC2 Clause 5.8.3.2)**

About Y-Y axis:
Wall is considered to be unbraced about the stronger axis.
Fixity condition at top (1-3) \( c_{ty} = 1 \)
Fixity condition at bottom (1-3) \( c_{by} = 1 \)
About Z-Z axis:
Wall is considered to be braced about the weaker axis.
Fixity condition at top (1-3) \( c_{tz} = 1 \)
Fixity condition at bottom (1-3) \( c_{bz} = 1 \)
For Y-Y stronger axis:
Slenderness \( l_{amy} = l_{oy}/l_{iy} = 14.549 \)
Design moments (Clause 5.8.8.2)

Design moment

\[ M_{Ed} = M_{o2} = 119.69 \times 10^6 \text{ Nmm} \]

Axial load and moment considerations

Effective/overall-depth ratio

\[ \frac{d_2}{h} = \frac{d_2}{h} = 0.090667 \]

Axial load ratio

\[ N_{rat} = \frac{N_{Ed}}{b \times h \times f_{ck}} = 0.16 \]

Moment ratio

\[ M_{rat} = \frac{M_{Ed}}{b \times h^2 \times f_{ck}} = 0.0085111 \]

Longitudinal reinforcement

Chart data for rectangular columns is taken from 'The Concrete Centre' publication entitled 'Worked Examples to Eurocode 2: Volume 1'.

Area of steel required

\[ A_s = \frac{A_{val} \times f_{ck}}{f_{yk} \times b \times h} = 0 \text{ mm}^2/\text{m} \]

Minimum permitted area of steel

\[ A_{smin} = 0.002 \times b \times h = 1500 \text{ mm}^2/\text{m} \]

Provide minimum steel

\[ A_s = A_{smin} = 1500 \text{ mm}^2/\text{m} \]

Number of bars provided

\[ n_{bars} = 8 /\text{m} \]

DESIGN SUMMARY

**Design of concrete walls containing reinforcement to EC2**

![Diagram of wall section with reinforcement](Image)

- **Char yield strength of reinforcement (fyk):** 500 N/mm²
- **Number of rows of bars (1 or 2):** rows = 2
- **Vertical bar diameter:** dia = 10 mm
- **Horizontal bar diameter:** dia = 10 mm

**Section properties**

- **Wall thickness:** h = 300 mm
- **Length of wall section:** b = 1000 mm
- **Depth of comp. reinforcement:** d2 = 50 mm

**Loading details**

- **Clear height between restraints:** l = 3.5 m
- **Design ultimate axial load:** N = 2000 kN/m
- **Larger initial end moment (positive):** M2 = 10 kNm/m
- **Smaller initial end moment:** M1 = 0 kNm/m

**Slenderness (EC2 Clause 5.8.3.2)**

**About Y-Y axis:**
- Wall is considered to be braced about the stronger axis.
- Fixity condition at top (1-3): cty = 2
- Fixity condition at bottom (1-3): cby = 2

**About Z-Z axis:**
- Wall is considered to be braced about the weaker axis.
- Fixity condition at top (1-2): ctz = 2
- Fixity condition at bottom (1-2): cbz = 2

**For Y-Y stronger axis:**
- Slenderness: lamy = loy/iy = 10.306
- Axial resistance: Nrd = 1950.5 kN per metre.
**Location: Ex5 - RC Wall**

**Design of concrete walls containing reinforcement to EC2**

---

**h = wall thickness**

- **horizontal bars to lie outside vertical bars**

- **vertical reinforcement**

---

Char yield strength of reinforcement $f_{yk}=500 \text{ N/mm}^2$

- Number of rows of bars (1 or 2) $\text{rows}=2$
- Vertical bar diameter $\text{dia}=25 \text{ mm}$
- Horizontal bar diameter $\text{dial}=10 \text{ mm}$

---

**Section properties**

- Wall thickness $h=250 \text{ mm}$
- Length of wall section $b=1000 \text{ mm}$
- Depth of comp. reinforcement $d_2=58 \text{ mm}$

---

**Loading details**

- Clear height between restraints $l=3.5 \text{ m}$
- Design ultimate axial load $N=3000 \text{ kN/m}$
- Larger initial end mt. (positive) $M_2=100 \text{ kNm/m}$
- Smaller initial end moment $M_1=0 \text{ kNm/m}$

---

**Slenderness (EC2 Clause 5.8.3.2)**

**About Y-Y axis:**

- Wall is considered to be braced about the stronger axis.
- Fixity condition at top (1-3) $cty=3$
- Fixity condition at bottom (1-3) $cby=3$

**About Z-Z axis:**

- Wall is considered to be braced about the weaker axis.
- Fixity condition at top (1-3) $ctz=3$

**For Y-Y stronger axis:**

- Slenderness $l_\text{amy}=loy/iy=12.124$
Design moments (Clause 5.8.8.2)

The design moment is taken as the maximum of:

\[
\begin{align*}
Mo_2 &= 126.25 \times 10^6 \text{ Nmm} \\
M_{Ed1} &= M_{oe} + M_2 = 156.98 \times 10^6 \text{ Nmm} \\
M_{Ed2} &= M_{o1} + 0.5 \times M_2 = 61.613 \times 10^6 \text{ Nmm}
\end{align*}
\]

Design Moment

\[
M_{Ed} = 156.98 \times 10^6 \text{ Nmm}
\]

Axial load and moment considerations

Effective/overall-depth ratio \(d_2h = d_2/h = 0.232\)
Axial load ratio \(N_{rat} = N_{Ed}/(b \times h \times f_{ck}) = 0.48\)
Moment ratio \(M_{rat} = M_{Ed}/(b \times h^2 \times f_{ck}) = 0.10047\)

Longitudinal reinforcement

Chart data for rectangular columns is taken from 'The Concrete Centre' publication entitled 'Worked Examples to Eurocode 2: Volume 1'.

Area of steel required \(A_s = \text{val} \times f_{ck}/f_{yk} \times b \times h = 3891.8 \text{ mm}^2/\text{m}\)
Number of bars provided \(n_{bars} = 8 /\text{m}\)

Minimum permissible link steel
Chosen size of link
Provide 5 No/20 mm size links at corner.

Minimum radius of bend for main U-bars according to C&CA Report:

DESIGN SUMMARY

Area of main steel required
Area of main steel provided
Percentage of main steel provided
Area of splay steel required
Area of splay steel provided
Area of link steel required
Area of link steel provided
Main steel: 25 mm bars at 90 mm centres (5454.2 mm²/m)
Splay steel: 16 mm bars at 90 mm centres (2234 mm²/m)
Link steel: 5 No/20 mm links/metre (3141.6 mm²/m)
Ratio of splay steel/main steel required
Ratio of splay steel/main steel provided
Minimum radius of bend for main U-bars 300 mm
Location: Ex2 - Thick wall, mild steel, low moment w. concrete splay

Calculation of reinforcement for wall-to-wall intersections

Calculations are in accordance with BS8110-1:1997.

Concrete grade \( f_{cu} = 30 \text{ N/mm}^2 \)
Main steel strength \( f_y = 250 \text{ N/mm}^2 \)
Ultimate moment \( M = 30 \text{ kNm/m} \)
Overall wall thickness \( h = 1000 \text{ mm} \)
Depth of splay (if provided) \( h_s = 250 \text{ mm} \)
Bar diameter \( d = 25 \text{ mm} \)
Partial safety factor for steel \( \gamma_S = 1.15 \)

Cover to bars

Designated exposure class is XC2
Specified fixing tolerance \( t_{ol} = 10 \text{ mm} \)
Cover to main bars \( c = 40 \text{ mm} \)
Distance between bar centres \( z = h - 2c - d = 895 \text{ mm} \)
Effective depth \( d = h - c - d/2 = 947.5 \text{ mm} \)
Extra eff. depth due to splay \( a = h_s + c + d/2 = 302.5 \text{ mm} \)

Noor formula 1

This design method is based on an article by Dr F.A. Noor, which appeared in 'Concrete' in July 1977.
Main steel

Chosen ratio of splay/main steel  ratio=0.5
Area of main steel required:
compute  \( c_1 = \frac{10200000 \cdot M - 1000 \cdot d^2 \cdot \text{SQR}(f_{cu})}{1000} \)
compute  \( c_2 = \frac{d \cdot \left( 350 \cdot \text{SQR}(f_{cu}) + 3.11 \cdot \text{ratio} \cdot f_y \right)}{2.1847E6} \)
Area of main steel required  \( A_{st} = \frac{c_1}{c_2} = -2110.7 \text{ mm}^2/\text{m} \)
Limiting bar spacing (c.to c.)  \( S_{\text{Max}} = 5 \cdot \text{INT} \left( \frac{\text{dia} + S_{\text{Max}}}{5} \right) = 625 \text{ mm} \)
Chosen bar spacing  \( \text{space}_2 = 120 \text{ mm} \)
Area of main steel provided  \( A_{st\text{pro}} = \frac{\pi}{4} \cdot \text{dia}^2 \cdot 1000 / \text{space}_2 = 4090.6 \text{ mm}^2/\text{m} \)

Splay reinforcement

Area of splay steel required  \( A_{ss} = \text{ratio} \cdot A_{st} = 2000 \text{ mm}^2/\text{m} \)
Chosen size of splay bar  \( d_{S2} = 20 \text{ mm} \)
Area of splay bars provided  \( A_{ss\text{pro}} = \frac{\pi}{4} \cdot d_{S2}^2 \cdot 1000 / \text{space}_2 = 2618 \text{ mm}^2/\text{m} \)

Location: Ex1 - Thin wall, HY steel, high moment, no concrete splay

Calculation of reinforcement for wall-to-wall intersections

The detail below entails intersecting pairs of vertical U-bars together with diagonal splay bars and diagonal links binding splay reinforcement and trimming bars round outside of corner (if required). Calculations are in accordance with BS EN 1992-1-1.

Design data

Char yield strength of r'ment \( f_yk = 500 \text{ N/mm}^2 \)
Design moment \( \text{MED} = 125 \text{ kNm/m} \)
Overall wall thickness \( h = 150 \text{ mm} \)
Depth of splay (if provided) \( hs = 0 \text{ mm} \)
Bar diameter (vertical U-bars) \( dia = 25 \text{ mm} \)
Partial safety factor for steel \( \gamma_{S} = 1.15 \)

Cover to main reinforcement

Distance between bar centres \( z = h - 2c - dia = 55 \text{ mm} \)
Effective depth \( d = h - c - dia/2 = 102.5 \text{ mm} \)
Extra eff. depth due to splay \( a = hs + c + dia/2 = 47.5 \text{ mm} \)

Design method by C&CA (basic detail)

Method based on data given in 'Reinforcement detailing of frame corner joints' by P.S. Balint & H.P.J. Taylor (C&CA pub. 42.462. 1972).

SCALE 5.48 Office 1007 Proforma 77
Main steel

Absolute maximum permitted clear bar spacing is 400 mm.
Limiting bar spacing (c.to c.) \( \text{SMax}=5\times\text{INT}((\text{dia}+3\times\text{d})/5)=330 \text{ mm} \)
Maximum allowable bar spacing to accommodate steel required=90 mm
Chosen bar spacing \( \text{space1}=90 \text{ mm} \)
Area of main steel provided \( \text{Astpro}=\pi/4\times\text{dia}^2\times1000/\text{space1} =5454.2 \text{ mm}^2/\text{m} \)
Corresponding steel percentage \( \text{perpro}=100\times\text{Astpro}/(1000\times\text{h})=3.6361 \% \)

Splay reinforcement

Although a splay is not provided within the corner, diagonal bars will still need to be included within the corner itself.
Calculated area of splay reinforcement:
\[
\text{Ass}=\sqrt{2}\times(\text{Med}\times1E6-0.6\times\text{Ast}\times\text{fyk}/\text{gamS}\times\text{z})/(\text{fyk}/\text{gamS}\times(a+z))=1586.7 \text{ mm}^2
\]
Chosen size of splay bar \( \text{diS1}=16 \text{ mm} \)
Area of splay bars provided \( \text{Asspro}=\pi/4\times\text{diS1}^2\times1000/\text{space1} =2234 \text{ mm}^2/\text{m} \)

Link reinforcement

Link steel strength \( \text{fyv}=500 \text{ N/mm}^2 \)
Minimum permissible link steel \( \text{Asv}=0.6\times\text{fyk}\times\text{Ast}/\text{fyv}=3136.4 \text{ mm}^2/\text{m} \)
Number of links required per metre 5 No.
Chosen size of link \( \text{Ldia}=20 \text{ mm} \)
Provide 5 No/20 mm size links at corner.
Area of link steel provided \( \text{Asvpro}=\text{Ldia}\times\text{Ldia}\times\pi/2\times\text{NumLink}/2 =3141.6 \text{ mm}^2/\text{m} \)
Minimum radius of bend in U-bars according to C&CA Report:
\[
\text{MinRad}=0.35\times\text{dia}\times\text{fyk}/\text{fcu}\times(5\times\text{dia}+2\times\text{c})/(\text{dia}+2\times\text{c})=299.34 \text{ mm}
\]
Min.radius of bend for main U-bars=300 mm.

**Location:** Ex2 - Thick wall, mild steel, low moment w. concrete splay

**Calculation of reinforcement for wall-to-wall intersections**

The detail below entails intersecting pairs of vertical U-bars together with diagonal splay bars and diagonal links binding splay reinforcement and trimming bars round outside of corner (if required). Calculations are in accordance with BS EN 1992-1-1.

**Design data**

- **Char yield strength of r'ment** \( f_yk = 500 \text{ N/mm}^2 \)
- **Design moment** \( M_{Ed} = 30 \text{ kNm/m} \)
- **Overall wall thickness** \( h = 1000 \text{ mm} \)
- **Depth of splay (if provided)** \( h_{s} = 250 \text{ mm} \)
- **Bar diameter (vertical U-bars)** \( d_{ia} = 25 \text{ mm} \)
- **Partial safety factor for steel** \( \gamma_S = 1.15 \)

**Cover to main reinforcement**

- **Cover to main bars** \( c = 40 \text{ mm} \)
- **Distance between bar centres** \( z = h - 2c - d_{ia} = 895 \text{ mm} \)
- **Effective depth** \( d = h - c - d_{ia}/2 = 947.5 \text{ mm} \)
- **Extra eff.depth due to splay** \( a = h - c - d_{ia}/2 = 302.5 \text{ mm} \)

**Design method by C&CA (basic detail)**

Method based on data given in 'Reinforcement detailing of frame corner joints' by P.S. Balint & H.P.J. Taylor (C&CA pub. 42.462. 1972).
Main steel

Absolute maximum permitted clear bar spacing is 400 mm.
Maximum allowable bar spacing to accommodate steel required = 245 mm
Chosen bar spacing = 245 mm
Area of main steel provided = \( \frac{\pi/4 \times \text{dia} \times \text{dia} \times 1000}{\text{space1}} \) = 2003.6 mm²/m
Corresponding steel percentage = \( \frac{100 \times \text{Astpro}}{1000 \times \text{h}} \) = 0.20036 %

Splay reinforcement

Calculated area of splay reinforcement:
\[ \text{Ass} = \sqrt{2} \times \left( \text{MED} \times 1E6 - 0.6 \times \text{Ast} \times \frac{\text{fyk}}{\gamma_S} \times \text{z} \right) / \left( \frac{\text{fyk}}{\gamma_S} \times (a + z) \right) \] = -1186.9 mm²

Link reinforcement

Minimum radius of bend in U-bars according to C&CA Report:
\[ \text{MinRad} = 0.35 \times \text{dia} \times \frac{\text{fyk}}{\text{fcu}} \times (5 \times \text{dia} + 2 \times c) / (\text{dia} + 2 \times c) \] = 284.72 mm
Min. radius of bend for main U-bars = 285 mm.

- Cover to main bars: \( c = 30 \text{ mm} \)
- Distance between bar centres: \( z = h - 2c - \text{dia} = 415 \text{ mm} \)
- Effective depth: \( d = h - c - \text{dia}/2 = 457.5 \text{ mm} \)
- Extra eff. depth due to splay: \( a = h_s + c + \text{dia}/2 = 292.5 \text{ mm} \)

**Design method by C&CA (basic detail)**

Method based on data given in 'Reinforcement detailing of frame corner joints' by P.S. Balint & H.P.J. Taylor (C&CA pub. 42.462.1972).
Main steel

Absolute maximum permitted clear bar spacing is 400 mm.
Limiting bar spacing (c.to c.) SMax=5*INT((dia+SMax)/5)=400 mm
Maximum allowable bar spacing to accommodate steel required=295 mm
Chosen bar spacing spacel=295 mm
Area of main steel provided Astpro=PI/4*dia*dia*1000/spacel =1664 mm²/m
Corresponding steel percentage perpro=100*Astpro/(1000*h)=0.3328%

Splay reinforcement

Calculated area of splay reinforcement:
Ass=SQR(2)*(MEd*1E6-0.6*Ast*fyk/gamS*z)/(fyk/gamS*(a+z))=551.69 mm²
Chosen size of splay bar diS1=16 mm
Area of splay bars provided Asspro=PI/4*diS1^2*1000/spacel =681.57 mm²/m

Link reinforcement

Minimum radius of bend in U-bars according to C&CA Report:
MinRad=0.35*dia*fyk/fcu*(5*dia+2*c)/(dia+2*c) =272.06 mm
Min. radius of bend for main U-bars=275 mm.

Location: Ex4 - Using Noor formula 1

Calculation of reinforcement for wall-to-wall intersections

The detail below entails intersecting pairs of vertical U-bars together with diagonal splay bars and diagonal links binding splay reinforcement and trimming bars round outside of corner (if required). Calculations are in accordance with BS EN 1992-1-1.

![Diagram of reinforcement layout]

Design data

- Char yield strength of reinforcement: $f_{yK}=500$ N/mm$^2$
- Design moment: $M_{Ed}=30$ kNm/m
- Overall wall thickness: $h=1000$ mm
- Depth of splay (if provided): $h_s=250$ mm
- Bar diameter (vertical U-bars): $diameter=25$ mm
- Partial safety factor for steel: $\gamma_{S}=1.15$

Cover to main reinforcement

- Cover to main bars: $c=40$ mm
- Distance between bar centres: $z=h-2c-diameter=895$ mm
- Effective depth: $d=h-c-diameter/2=947.5$ mm
- Extra eff. depth due to splay: $a=h-s+diame/2=302.5$ mm

Design method using Noor formula 1

This calculation deals with the design of the reinforcement to resist bending at wall-to-wall intersections where the design moment tends to 'open' the corner. Tests have shown that many details fail at well below their calculated strength, and the concrete details described in this proforma have been developed to overcome this problem. The design method adopted here is based on an article by Dr F.A. Noor, which appeared in a publication entitled 'Concrete' in July 1977.
Main steel

Chosen ratio of splay/main steel ratio=0.5
Area of main steel required:
compute \[ c1=(10200000*\text{MEd}-1000*d^2*\text{SQR}(\text{fcu})) \]
compute \[ c2=(d*(350*\text{SQR}(\text{fcu})+3.11*\text{ratio*fyk})) \]
Area of main steel required \[ Ast=c1/c2=-1806.1 \text{ mm}^2/\text{m} \]
Maximum allowable bar spacing=245 mm
Chosen bar spacing \[ \text{space2}=245 \text{ mm} \]
Area of main steel provided \[ Astpro=\text{PI}/4*\text{dia}^2*1000/\text{space2} =2003.6 \text{ mm}^2/\text{m} \]

Splay reinforcement

Area of splay steel required \[ Ass=\text{ratio}*Ast=1000 \text{ mm}^2/\text{m} \]
Chosen size of splay bar \[ \text{diS2}=20 \text{ mm} \]
Area of splay bars provided \[ Asspro=\text{PI}/4*\text{diS2}^2*1000/\text{space2} =1282.3 \text{ mm}^2/\text{m} \]

Link reinforcement

Minimum radius of bend in U-bars according to C&CA Report:
\[ \text{MinRad}=0.35*\text{dia*fyk}/\text{fcu}*(5*\text{dia}+2*c)/(\text{dia}+2*c) \]
\[ =284.72 \text{ mm} \]
Min. radius of bend for main U-bars=285 mm.

DESIGN SUMMARY

| Area of main steel required | 2000 \text{ mm}^2 \text{ per metre} |
| Area of main steel provided | 2003.6 \text{ mm}^2 \text{ per metre} |
| Percentage of main steel provided | 0.20036 \% |
| Area of splay steel required | 1000 \text{ mm}^2 \text{ per metre} |
| Area of splay steel provided | 1282.3 \text{ mm}^2 \text{ per metre} |
| Main steel : 25 mm bars at 245 mm centres ( 2003.6 \text{ mm}^2/\text{m} ) |
| Splay steel: 20 mm bars at 245 mm centres ( 1282.3 \text{ mm}^2/\text{m} ) |
| Ratio of splay steel/main steel required | 0.5 |
| Ratio of splay steel/main steel provided | 0.64 |
| Minimum radius of bend for main U-bars | 285 mm |
Location: Ex5 - Using Noor formula 2

Calculation of reinforcement for wall-to-wall intersections

The detail entails intersecting pairs of horizontal U-bars together with diagonal splay bars. This design method is based on an article by Dr F.A. Noor, published in 'Concrete' in July 1977. Calculations are in accordance with BS EN 1992-1-1.

Design data

Char yield strength of r'ment $f_{yk}=500$ N/mm²
Design moment $M_{Ed}=300$ kNm/m
Overall wall thickness $h=600$ mm
Depth of splay (if provided) $h_s=250$ mm
Bar diameter (horizontal U-bars) $dia=20$ mm
Partial safety factor for steel $\gamma_S=1.15$

Cover to main reinforcement

Cover to main bars $c=30$ mm
Distance between bar centres $z=h-2c-dia=520$ mm
Effective depth $d=h-c-dia/2=560$ mm
Extra eff. depth due to splay $a=h_s+c+dia/2=290$ mm

This design method is based on an article by Dr F.A. Noor, which appeared in 'Concrete' in July 1977.

Main steel

Chosen ratio of splay/main steel ratio=0.5
Area of main steel required=$973.14$ mm²/m.
Maximum allowable bar spacing 260 mm
Chosen bar spacing $space_3=260$ mm
Area of main steel provided $Astpro=\pi/4*dia*dia*1000/space_3$
  $=1208.3$ mm²/m
Splay reinforcement

Area of splay steel required: $\text{Ass} = \text{ratio} \times \text{Ast} = 600 \text{ mm}^2/\text{m}$
Size of splay bar: $d_{\text{S3}} = 16 \text{ mm}$
Area of splay bars provided: $\text{Ass}_{\text{pro}} = \frac{\pi}{4} \times d_{\text{S3}}^2 \times 1000 / \text{space}_3 = 773.32 \text{ mm}^2/\text{m}$

**Location:** Medium-sized section. Low shear force.

**Shear in rectangular and flanged beams, with choice of av enhancement**

The shear calculations are in accordance with the requirements of Clause 3.4.5

Design to BS8110 (1997) with partial safety factor for steel gammaS=1.15

Shear force due to ultimate loads $V=400 \text{ kN}$

Overall depth of section $h=550 \text{ mm}$

Effective depth of section $d=500 \text{ mm}$

Effective breadth for shear $b_v=200 \text{ mm}$

Characteristic concrete strength $f_{cu}=40 \text{ N/mm}^2$

Distance to support $a_v=500 \text{ mm}$

Diameter of compression bars $d_{iac}=0 \text{ mm}$

Diameter of tension bars $d_{ia}=25 \text{ mm}$

Diameter of link legs $d_{ial}=8 \text{ mm}$

Number of tension bars at section $n_{bars}=2$

Char. strength of link steel $f_{yv}=500 \text{ N/mm}^2$

Number of legs to be provided $n_{legs}=4$

Use 8 mm links (4 legs), spaced at 170 mm centres along beam.

Approx. total weight of links 5.8 kg per metre
Location: Large section. High shear force. High-yield steel.

Shear in rectangular and flanged beams, with choice of

av enhancement

The shear calculations are in accordance with the requirements of Clause 3.4.5

Design to BS8110(1997) with partial safety factor for steel gammaS=1.15

Shear force due to ultimate loads V=7000 kN

Overall depth of section h=1500 mm
Effective depth of section d=1450 mm
Effective breadth for shear bv=1000 mm
Characteristic concrete strength fcu=40 N/mm²
Distance to support av=3000 mm
Diameter of compression bars diac=25 mm
Diameter of tension bars dia=40 mm
Diameter of link legs dial=10 mm
Number of tension bars at section nbars=12
Char.strength of link steel fyv=500 N/mm²

Since bv exceeds 350 mm, note the condition in Clause 3.4.5.5 that no longitudinal bar should be more than 150 mm from a vertical leg.

Number of legs to be provided nlegs=10

Use 10 mm links (10 legs), spaced at 80 mm centres along beam.
Approx.total weight of links 159.5 kg per metre
Location: Small section. High shear enhancement.

Shear in rectangular and flanged beams, with choice of
av enhancement

The shear calculations are in accordance with the requirements of Clause 3.4.5

Design to BS8110 (1997) with partial safety factor for steel gammaS=1.15
It is assumed that nominal shear reinforcement at least will be provided
Shear force due to ultimate loads V=25 kN
Overall depth of section h=100 mm
Effective depth of section d=75 mm
Effective breadth for shear bv=75 mm
Characteristic concrete strength fcu=35 N/mm²
Distance to support av=25 mm
Diameter of compression bars diac=0 mm
Diameter of tension bars dia=12 mm
Diameter of link legs dial=8 mm
Number of tension bars at section nbars=2
Char.strength of link steel fyv=500 N/mm²
Number of legs to be provided nlegs=2
Proposed spacing sv greater than 0.75*d= 0.75*75 =56.25 mm
Reset link spacing to limiting value of 50 mm (rounded).

Use 8 mm links (two legs), spaced at 50 mm centres along beam.
Approx.total weight of links 1.8 kg per metre
Location: Ex1 - Default example

Shear in rectangular and flanged beams

Design shear force $V_{Ed}=345$ kN
Overall depth of section $h=600$ mm
Effective depth of section $d=550$ mm
Effective breadth for shear $b_w=350$ mm
Char yield strength (reinf'ment) $f_yk=500$ N/mm²
Diameter of links $d_{al}=10$ N/mm²

Shear reinforcement

Design shear stress $v_{Ed}=\frac{V_{Ed}*10^3}{(0.9*b_w*d)}=1.9913$ N/mm²
Concrete strut strength $v_{Rdm}=0.124*f_{ck}*(1-f_{ck}/250)$
$=3.2736$ N/mm²
Angle of inclination of strut $\theta'=22^\circ$
Number of shear legs $n_{sl}=2$
Area of shear legs $A_{sw}=n_{sl}*\pi/4*d_{al}^2=157.08$ mm²
Spacing of links $s_{max}=\text{INT}(A_{sw}/A_{sw}'s)=244$ mm
Chosen spacing $s=225$ mm

Check crushing strength

Angle of inclination of strut $\theta'=22^\circ$
compute $\text{comp}=\cot(\theta)=1/\tan(\theta)=2.4751$
Maximum shear resistance:
$V_{Rdmax}=0.36*b_w*d*(1-f_{ck}/250)*f_{ck}/((\text{comp}+1/\text{comp})*1000)=635.45$ kN
As $V_{Ed} \leq V_{Rdmax}$ (345 kN ≤ 635.45 kN), design shear force OK.

Check on span/effective-depth ratio

Basic ratio for continuous slab \(bs'd=26\) (see Table 3.9)
Area of tension steel provided \(Aspr=25132\) mm²
Service stress in this steel \(fs=2*fy*As/(3*Aspr)=141.94\) N/mm²
Mod.factor for tension steel \(modf1=0.99833\)
Mod.factor for no comp.steel \(modf2=1.0\)
Maximum permissible
span/effective-depth ratio \(ps'd=bs'd*modf1*modf2=25.956\)
Effective span of slab \(span=12\) m
Although span exceeds 10 m, partitions/finishes are not considered sensitive to deflection, so modification to basic ratio is unnecessary.
True span/effective-depth ratio \(as'd=1000*span/d=17.518\)
As this does not exceed 25.956, this is Acceptable.
Design of solid r.c. slabs reinforced in tension only.

Calculations for singly-reinforced slabs using formulae in Cl.3.4.4.4, i.e. assuming rectangular stress block and restricting NA depth to 0.4*d at supports (except supports to cantilevers) and 0.5*d near midspan (redistribution, if any, limited to 10%).

Design to BS8110(1997) with partial safety factor for steel $\gamma_S=1.15$

Section location: Near midspan of span with both ends continuous.

Ultimate moment (after redstrb.) $M=15 \text{ kNm/m}$

Characteristic concrete strength $f_{cu}=60 \text{ N/mm}^2$

Characteristic strength of steel $f_y=425 \text{ N/mm}^2$

$f_y$ has been set to less than the characteristic strength in order to achieve a design which satisfies span/effective-depth requirements.

Diameter of tension bars $\text{dia}=16 \text{ mm}$

Designated exposure class is XC4

Specified fixing tolerance $\text{tol}=10 \text{ mm}$

Nominal concrete cover $\text{cover}=30 \text{ mm}$

Overall thickness of slab $h=100 \text{ mm}$

Effective depth of section $d=62 \text{ mm}$

Chosen spacing of tension bars $\text{pch}=200 \text{ mm}$

Diameter of distribution bars $\text{diamn}=8 \text{ mm}$

Spacing of distribution bars $\text{pchDA}=190 \text{ mm}$

</tbody>
</table>
Check on span/effective-depth ratio

Basic ratio for continuous slab \( bs'd = 26 \) (see Table 3.9)
Area of tension steel provided \( Aspr = 1005 \text{ mm}^2 \)
Service stress in this steel \( fs = 2*fy*As/(3*Aspr) = 200.26 \text{ N/mm}^2 \)
Mod.factor for tension steel \( modf1 = 1.0302 \)
Mod.factor for no comp.steel \( modf2 = 1.0 \)
Maximum permissible
span/effective-depth ratio \( ps'd = bs'd*modf1*modf2 = 26.786 \)
Effective span of slab \( span = 8 \text{ m} \)
True span/effective-depth ratio \( as'd = 1000*span/d = 129.03 \)
Perm. span/effective-depth ratio 26.786
Hence unacceptable.

WARNING:
Either provide a thicker slab, or reduce the service stress.
This can be achieved by repeating the calculations and employing a lower value for the characteristic steel strength.
Location: Ex1 - Continuous slab

Bending in solid slabs (with comp.steel if reqd.),
designed per metre width, with checks on minimum steel

and span/effective-depth ratio

Calculations to EN 1992-1-1:2004

Eurocode 2 : Design of concrete structures & assume the use of a simplified rectangular concrete stress-block, and that the depth to the NA is restricted to 0.45d

Design BM before redistribution Mbef=625 kNm
Section being analysed is considered as continuous.
Section considered has a hogging moment.
Design BM (after redistribution) M=600 kNm

Char yield strength of reinft fyk=500 N/mm²
Max.aggregate size (for bar spc.) hagg=20 mm
Diameter of tension bars dia=25 mm
Diameter of distribution bars diad=12 mm
Effective depth of section d=350 mm

DESIGN

Overall depth 400 mm
Effective depth 350 mm

SUMMARY

- Interior spans: 20

**Shear**

Location for shear calculation: 250mm from support
Shear force due to ultimate load \( V_{Ed} = 125 \text{ kN} \)
Term for shear resistance \( v_{Rdc} = (\rho_1 \times f_{ck})^{(1/3)} = 2.227 \)
Shear resistance \( V_{Rdc} = C R_{dc} \times k_s \times V_{Rdc} \times b \times d/1000 = 124.6 \text{ kN} \)
Minimum stress \( v_{min} = 0.035 \times k_s \times 1.5 \times f_{ck} \times 0.5 = 0.5438 \text{ N/mm}^2 \)
Minimum shear resistance \( V_{Rdm} = v_{min} \times b \times d/1000 = 133.2 \text{ kN} \)
Modified shear resistance \( V_{Rdc} = V_{Rdm} = 133.2 \text{ kN} \)

**SHEAR SUMMARY**

- Design shear force: 125 kN
- Design shear resistance: 133.2 kN
Location: Typical continuous slab reinforced with high-yield steel

Bending in solid slabs (with comp.steel if reqd.),
designed per metre width, with checks on minimum steel
and span/effective-depth ratio

Calculations are based on formulae in Clause 3.4.4.4 of BS8110: Part 1 and thus assume the use of a simplified rectangular concrete stress-block, and that the depth to the neutral axis is restricted to d/2.

Design to BS8110(1997) with partial safety factor for steel gammaS=1.15

Moment before redistribution \(M_{bef}=625\,\text{kNm/m}\)
Slab containing section being analysed is considered as continuous.
Design moment (after redistrib.) \(M=600\,\text{kNm/m}\)
Characteristic concrete strength \(f_{cu}=25\,\text{N/mm}^2\)
Characteristic steel strength \(f_y=500\,\text{N/mm}^2\)
Longitudinal reinforcement is high-yield steel.

\[ \begin{align*}

Check on span/effective-depth ratio

Basic ratio for slab
continuous at one edge  
bs'd=23

Mod.factor for tension steel  
modf1=0.79755

Area of compression steel prov.  
As'pr=804 mm²

Percentage of compression steel  
per'=0.201 %

From Equation 9 of BS8110, with percentage of comp.steel=0.201 %,
Mod.factor for compression steel  
modf2=1+per'/(3+per')=1.0628

Maximum permissible
span/effective-depth ratio  
ps'd=bs'd*modf1*modf2=19.496

Effective span of slab  
span=5 m

True span/effective-depth ratio  
as'd=1000*span/d=13.699

As this does not exceed  
19.496, this is Acceptable.
Location: Thick, heavily-loaded continuous slab, mild steel reinfmt.

Bending in solid slabs (with comp.steel if reqd.),
designed per metre width, with checks on minimum steel
and span/effective-depth ratio

Calculations are based on formulae in Clause 3.4.4.4 of BS8110: Part 1 and thus assume the use of a simplified rectangular concrete stress-block, and that the depth to the neutral axis is restricted to d/2.

Design to BS8110(1997) with partial safety factor for steel gammaS=1.15

Moment before redistribution \( M_{\text{bef}} = 3000 \text{ kNm/m} \)

Slab containing section being analysed is considered as continuous.

Design moment (after redistrib.) \( M = 2500 \text{ kNm/m} \)

Characteristic concrete strength \( f_{\text{cu}} = 35 \text{ N/mm}^2 \)

Characteristic steel strength \( f_y = 250 \text{ N/mm}^2 \)

Longitudinal reinforcement is mild steel.

Diameter of tension bars \( \text{dia} = 40 \text{ mm} \)

Designated exposure class is XC2

Specified fixing tolerance \( \text{tol} = 10 \text{ mm} \)

Nominal concrete cover \( \text{cover} = 45 \text{ mm} \)

Overall thickness of slab \( h = 750 \text{ mm} \)

Effective depth of section \( d = 685 \text{ mm} \)

Diameter of compression bars \( \text{diac} = 25 \text{ mm} \)

Depth to compression steel \( d' = 57.5 \text{ mm} \)

Chosen comp.bar spacing (c.to c.) \( pchCA = 325 \text{ mm} \)

Chosen spacing of tension bars \( pch = 60 \text{ mm} \)

Diameter of distribution bars \( \text{diamn} = 20 \text{ mm} \)

Spacing of distribution bars \( \text{pchDA} = 170 \text{ mm} \)

DISTRIBUTION

Characteristic strength 250 N/mm²

REINFORCEMENT

Diameter of bars 20 mm
Spacing of bars 170 mm

SUMMARY

Depth to bar centres 655 mm
Area of steel required 1800 mm²/m
Area of steel provided 1847 mm²/m
Percentage provided 0.24627 %
Weight of steel provided 14.5 kg/m²

Check on span/effective-depth ratio

Basic ratio for continuous slab bs’d=26 (see Table 3.9)
Mod.factor for tension steel modf₁=0.92476
Area of compression steel prov. As’pr=1510 mm²
Percentage of compression steel per’=0.20133 %
From Equation 9 of BS8110, with percentage of comp.steel=0.20133 %,
Mod.factor for compression steel modf₂=1+per’/(3+per’)=1.0629
Maximum permissible
span/effective-depth ratio ps’d=bs’d*modf₁*modf₂=25.556
Effective span of slab span=12 m
Although span exceeds 10 m, partitions/finishes are not considered
sensitive to deflection, so modification to basic ratio is unnecessary.
True span/effective-depth ratio as’d=1000*span/d=17.518
As this does not exceed 25.556, this is Acceptable.
Location: Lightly-loaded thin slab with non-standard reinforcement

Bending in solid slabs (with comp.steel if reqd.),
designed per metre width, with checks on minimum steel
and span/effective-depth ratio

Calculations are based on formulae in Clause 3.4.4.4 of BS8110: Part 1 and thus assume the use of a simplified rectangular concrete stress-block, and that the depth to the neutral axis is restricted to d/2.

Design to BS8110(1997) with partial safety factor for steel gammaS=1.15

Moment before redistribution Mbef=15 kNm/m
Slab containing section being analysed is considered as non-continuous.
Characteristic concrete strength $f_{cu}=60 \text{ N/mm}^2$
Characteristic steel strength $f_y=425 \text{ N/mm}^2$
Steel strength other than those given in Table 3.1 of BS8110.
Specified min.steel percentage $\permin=0.16\%$
Specified min.slab thickness $\mindep=215 \text{ mm}$
Diameter of tension bars $\dia=16 \text{ mm}$
Designated exposure class is XC4
Specified fixing tolerance $\tol=10 \text{ mm}$
Nominal concrete cover $\cover=30 \text{ mm}$
Overall thickness of slab $h=100 \text{ mm}$
Effective depth of section $d=62 \text{ mm}$
Chosen spacing of tension bars $p_{ch}=200 \text{ mm}$
Diameter of distribution bars $\diamn=8 \text{ mm}$

Shear check

Location for shear calculation: 350mm from internal support
Shear force due to ultimate load $V_{Ed} = 250$ kN
Term for shear resistance $v_{Rdc} = (\rho_1^1 * f_{ck})^{1/(1/3)} = 3.478$
Shear resistance $VR_{dc} = CR_{dc} * k_s * bw * d / 1000 = 256.5$ kN
Minimum stress $v_{min} = 0.035^1 * ks^1.5 * f_{ck}^0.5 = 0.4461$ N/mm²
Minimum shear resistance $VR_{dm} = v_{min} * bw * d / 1000 = 156.1$ kN

SHEAR SUMMARY
Design shear force 250 kN
Design shear resistance 256.5 kN

Crack control check

Unfactored permanent load on slab $G_k = 100$ kN
Unfactored variable load on slab $Q_k = 40$ kN
Permanent load factor $\gamma_G = 1.35$
Variable load factor $\gamma_Q = 1.5$
Factor $\psi_2$ for variable load $\psi_2 = 0.3$
SLS stress in reinforcement $\sigma_s = 500/1.15 * (A_s/A_{spr}) * \text{ratio} * 1/\delta = 253.1$ N/mm²
Design crack width $w_k = 0.3$ mm
Max allowable SLS stress $\sigma_s = \text{TABLE 7.3 for } p_{ch} = 100 = 320$ N/mm²

The bar spacing 100 mm used complies with Table 7.3N of EC2 Part 1:2004 hence satisfactory.

Actual span to depth ratio            l'd=L*1000/d=23.24
Allowable span(depth ratio           l'da=k*N*F1*F2*F3=23.73

DESIGN                                 Actual l/d ratio         23.24
SUMMARY                                Basic l/d ratio          18.25
DEFLECTION                             Span factor              1.3
Flange beam factor F1                 1
Long spans factor F2                   1
Steel stress factor F3                 1
Allowable l/d ratio                    23.73

Note: Care should be taken with the EC2 values as the deflection equations used give unrealistically high values. National Annex to EC2 Part 1:2004, Table NA.5 gives span/effective depth ratios for highly stressed concrete (C30/37 & ρ=1.5%) as follows:

Simply supported spans     14
End spans                                      18
Interior spans                 20

Shear check

Location for shear calculation: 200 mm from support
Shear force due to ultimate load       VEd=68 kN
Term for shear resistance            vRdc=(rho1*fck)^(1/3)=2.104
Shear resistance                   VRdc=CRdc*ks*vRdc*bw*d/1000=93.4 kN
Minimum stress                     vmin=0.035*ks^1.5*fck^0.5=0.5422 N/mm²
Minimum shear resistance            VRdm=vmin*bw*d/1000=100.3 kN
Modified shear resistance           VRdc=VRdm=100.3 kN

SHEAR SUMMARY                      Design shear force       68 kN
                                      Design shear resistance 100.3 kN

Crack control check

Unfactored permanent load on slab Gk=40 kN
Unfactored variable load on slab    Qk=20 kN
Permanent load factor              gamG=1.35
Variable load factor               gamQ=1.5
Factor ψ2 for variable load        psi2=0.3
SLS stress in reinforcement σs     SLSs=500/1.15*(As/Aspr)*ratio*1/delta=238.1 N/mm²
Design crack width                 wk=0.3 mm
Max allowable SLS stress σs         SLSs1=TABLE 7.2 for dia=16
                                      =240 N/mm²

The bar size 16 mm used complies with Table 7.2N of EC2 Part 1:2004 hence satisfactory.
Location: Ex5 - Simply supported slab

Bending in solid slabs (with comp. steel if reqd.),
designed per metre width, with checks on minimum steel

and span/effective-depth ratio

Calculations to EN 1992-1-1:2004

Eurocode 2 : Design of concrete structures & assume the use of a simplified rectangular concrete stress-block, and that the depth to the NA is restricted to 0.45d

Design BM before redistribution $M_{bef}=150$ kNm

Section being analysed is considered as non-continuous.

Char yield strength of reinfor. $f_{yk}=500$ N/mm²

Max. aggregate size (for bar spc.) $h_{agg}=20$ mm

Diameter of tension bars $d_{ia}=16$ mm

Diameter of distribution bars $d_{iad}=8$ mm

Effective depth of section $d=245$ mm

#### SHEAR SUMMARY
- Design shear force: 125 kN
- Design shear resistance: 133.2 kN
Location: Typical continuous slab reinforced with high-yield steel

Bending in solid slabs (with comp.steel if reqd.),
designed for a given width, with checks on minimum steel
and span/effective-depth ratio

Calculations are in accordance with
Clause 3.4.4.4 of BS8110: Part 1 and
thus assume the use of a simplified
rectangular concrete stress-block
and that the depth to the neutral
axis is restricted to d/2.

Design to BS8110(1997) with partial safety factor for steel gammaS=1.15
Moment before redistribution Mbef=1875 kNm
Slab containing section being analysed is considered as continuous.
Design moment (after redistrib.) M=1800 kNm
Characteristic concrete strength fcu=30 N/mm²
Characteristic steel strength fy=500 N/mm²
Longitudinal reinforcement is high-yield steel.
Diameter of tension bars dia=20 mm
Designated exposure class is XCl
Specified fixing tolerance tol=10 mm
Nominal concrete cover cover=25 mm
Overall thickness of slab h=400 mm
Effective depth of section d=365 mm
Breadth of slab b=3000 mm
Chosen spacing of tension bars pch=60 mm
Diameter of distribution bars diamn=12 mm
Spacing of distribution bars pchDA=200 mm

TENSION
REINFORCEMENT
SUMMARY
Characteristic strength 500 N/mm²
Diameter of bars 20 mm
Number of bars 49
Spacing of bars 60 mm
Effective depth 365 mm
Area of steel required 14386 mm²
Area of steel provided 15393 mm²
Percentage provided 1.2828 %
Weight of steel provided 120.84 kg/m

DISTRIBUTION
REINFORCEMENT
SUMMARY
Characteristic strength 500 N/mm²
Diameter of bars 12 mm
Depth to bar centres 349 mm
Area of steel required 520 mm²/m
Area of steel provided 565 mm²/m
Percentage provided 0.14125 %
Weight of steel provided 4.44 kg/m²
Check on span/effective-depth ratio

Basic ratio for slab
continuous at one edge  bs'd=23
Mod.factor for tension steel  modf1=0.78517
Mod.factor for no comp.steel  modf2=1.0
Maximum permissible
span/effective-depth ratio  ps'd=bs'd*modf1*modf2=18.059
Effective span of slab  span=5 m
True span/effective-depth ratio  as'd=1000*span/d=13.699
As this does not exceed  18.059, this is Acceptable.
Location: Thick, heavily-loaded continuous slab, mild steel reinfmt.

Bending in solid slabs (with comp.steel if reqd.),
designed for a given width, with checks on minimum steel
and span/effective-depth ratio

Calculations are in accordance with Clause 3.4.4.4 of BS8110: Part 1 and thus assume the use of a simplified rectangular concrete stress-block and that the depth to the neutral axis is restricted to d/2.

Design to BS8110(1997) with partial safety factor for steel gammaS=1.15
Moment before redistribution Mbef=6000 kNm
Slab containing section being analysed is considered as continuous.
Design moment (after redistrib.) M=5000 kNm
Characteristic concrete strength fcu=35 N/mm²
Characteristic steel strength fy=250 N/mm²
Longitudinal reinforcement is mild steel.
Diameter of tension bars dia=40 mm
Designated exposure class is XC2
Specified fixing tolerance tol=10 mm
Nominal concrete cover cover=45 mm
Overall thickness of slab h=750 mm
Effective depth of section d=685 mm
Breadth of slab b=2000 mm
Diameter of compression bars diac=25 mm
Depth to compression steel d'=57.5 mm
Chosen comp.bar spacing (c.to c.) pchCA=260 mm
Chosen spacing of tension bars pch=50 mm
Diameter of distribution bars diamn=20 mm
Spacing of distribution bars pchDA=170 mm

COMPRESSION
Characteristic strength 250 N/mm²

REINFORCEMENT
Diameter of bars 25 mm
Number of bars 8
Spacing of bars 260 mm
Depth to bar centres 57.5 mm
Area of steel required 3000 mm²
Area of steel provided 3927 mm²
Percentage provided 0.2618%
Weight of steel provided 30.83 kg/m

SUMMARY
Number of bars 8
Spacing of bars 260 mm
Depth to bar centres 57.5 mm
Area of steel required 3000 mm²
Area of steel provided 3927 mm²
Percentage provided 0.2618%
Weight of steel provided 30.83 kg/m

DISTRIBUTION
Characteristic strength 250 N/mm²

REINFORCEMENT
Diameter of bars 20 mm
Spacing of bars 170 mm
Depth to bar centres 655 mm
Area of steel required 1800 mm²/m
Area of steel provided 1847 mm²/m
Percentage provided 0.24627%
Weight of steel provided 14.5 kg/m²

SUMMARY
Spacing of bars 170 mm
Depth to bar centres 655 mm
Area of steel required 1800 mm²/m
Area of steel provided 1847 mm²/m
Percentage provided 0.24627%
Weight of steel provided 14.5 kg/m²

Check on span/effective-depth ratio

Basic ratio for continuous slab bs'd=26 (see Table 3.9)
Mod.factor for tension steel modf1=0.95713
Area of compression steel prov. As'pr=3927 mm²
Percentage of comp.steel per'=0.2618%

From Equation 9 of BS8110, with percentage of comp.steel=0.2618 %,
Mod.factor for compression steel modf2=1+per'/(3+per')=1.0803
Maximum permissible
span/effective-depth ratio ps'd=bs'd*modf1*modf2=26.883
Effective span of slab span=12 m

Although span exceeds 10 m, partitions/finishes are not considered sensitive to deflection, so modification to basic ratio is unnecessary.

True span/effective-depth ratio as'd=1000*span/d=17.518

As this does not exceed 26.883, this is Acceptable.
Location: Lightly-loaded thin slab with non-standard reinforcement

Bending in solid slabs (with comp.steel if reqd.),
designed for a given width, with checks on minimum steel
and span/effective-depth ratio

Calculations are in accordance with Clause 3.4.4.4 of BS8110: Part 1 and thus assume the use of a simplified rectangular concrete stress-block and that the depth to the neutral axis is restricted to d/2.

Design to BS8110(1997) with partial safety factor for steel gammaS=1.15
Moment before redistribution Mbef=60 kNm
Slab containing section being analysed is considered as non-continuous.
Characteristic concrete strength fcu=60 N/mm²
Characteristic steel strength fy=425 N/mm²
Steel strength other than those given in Table 3.1 of BS8110.
Specified min.steel percentage permin=0.16 %
Specified min.slab thickness mindep=215 mm
Diameter of tension bars dia=16 mm
Designated exposure class is XC4
Specified fixing tolerance tol=10 mm
Nominal concrete cover cover=30 mm
Overall thickness of slab h=100 mm
Effective depth of section d=62 mm
Breadth of slab b=4000 mm
Chosen spacing of tension bars pch=200 mm
Diameter of distribution bars diamn=8 mm
Spacing of distribution bars pchDA=190 mm

Spacing of bars - tension reinforcement

Maximum pitch of bars (<3h) $p_{chmx}=400$ mm
Calculated pitch of bars $pitch=b*PI*dia^2/(4*As)=102.8$ mm
Chosen spacing of tension bars $p_{ch}=100$ mm
Spacing of distribution steel

Diameter of distribution bars \( d_{iad} = 12 \text{ mm} \)
Chosen spacing of distn. bars \( p_{chd} = 110 \text{ mm} \)

**TENSION REINFORCEMENT**

- Diameter of bars \( 25 \text{ mm} \)
- Spacing of bars \( 100 \text{ mm} \)
- Area of steel required \( 4776 \text{ mm}^2 \)
- Area of steel provided \( 4908 \text{ mm}^2 \)

**DISTRIBUTION REINFORCEMENT**

- Diameter of bars \( 12 \text{ mm} \)
- Spacing of bars \( 110 \text{ mm} \)
- Area of steel required \( 955.2 \text{ mm}^2/\text{m} \)
- Area of steel provided \( 1028 \text{ mm}^2/\text{m} \)

Shear check

Location for shear calculation: 350mm from internal support
Shear force due to ultimate load \( V_{Ed} = 250 \text{ kN} \)
Term for shear resistance \( v_{Rdc} = (\rho_{1} f_{ck})^{(1/3)} = 3.478 \)
Shear resistance \( V_{Rdc} = C_{Rdc} \cdot k_{s} \cdot v_{Rdc} \cdot b_{w} \cdot d/1000 = 256.5 \text{ kN} \)
Minimum stress \( v_{min} = 0.035 \cdot k_{s}^{1.5} \cdot f_{ck}^{0.5} = 0.4461 \text{ N/mm}^2 \)
Minimum shear resistance \( V_{Rdm} = v_{min} \cdot b_{w} \cdot d/1000 = 156.1 \text{ kN} \)

**SHEAR SUMMARY**

- Design shear force \( 250 \text{ kN} \)
- Design shear resistance \( 256.5 \text{ kN} \)

Crack control check

Unfactored permanent load on slab \( G_k = 100 \text{ kN} \)
Unfactored variable load on slab \( Q_k = 40 \text{ kN} \)
Permanent load factor \( \gamma_{G} = 1.35 \)
Variable load factor \( \gamma_{Q} = 1.5 \)
Factor \( \psi_2 \) for variable load \( \psi_2 = 0.3 \)
SLS stress in reinforcement \( \sigma_{SLS} = 500/1.15 \cdot (A_s/Aspr) \cdot \text{ratio} \cdot 1 \)
\( /\delta = 253.1 \text{ N/mm}^2 \)
Design crack width \( w_{k} = 0.3 \text{ mm} \)
Max allowable SLS stress \( \sigma_{SLS} = 320 \text{ N/mm}^2 \)

The bar spacing 100 mm used complies with Table 7.3N of EC2 Part 1:2004 hence satisfactory.
Location: Ex2 - Simply supported slab

Bending in solid slabs (with comp. steel if reqd.),

Location: High shear on moderately thick slab (High-yield steel)

Shear in longitudinal zone of solid slab of given width

Since distance from support varies throughout zone considered, enhancement of shear resistance due to proximity to support is not applicable.

The calculations for shear in the zone of solid slab are in accordance with Clauses 3.5.5 of BS8110 throughout. Support $d$ zone $d$ = effective depth.

Design to BS8110(1997) with partial safety factor for steel $\gamma_S = 1.15$

Effective depth $d = 400$ mm

Breadth of slab zone $b = 1000$ mm

Characteristic concrete strength $f_{cu} = 30$ N/mm²

Diameter of tension bars $dia = 25$ mm

Number of tension bars $nbars = 4$

Shear force due to ult.loads $V = 900$ kN

Design shear stress of $2.25$ N/mm² exceeds critical stress of $0.52979$ N/mm², so links to resist balance of shear forces are necessary.

Characteristic strength of links $f_{yv} = 500$ N/mm²

Number of transverse legs $nlegs = 4$

Diameter of link legs $dial = 12$ mm

Use 4 No. 12 mm dia. legs transversely ($f_{yv} = 500$ N/mm²) and spaced at 110 mm centres in direction of span. Transverse spacing must not exceed effective depth of 400 mm
Location: High shear on thin wide slab (High-yield steel)

Shear in longitudinal zone of solid slab of given width

Since distance from support varies throughout zone considered, enhancement of shear resistance due to proximity to support is not applicable.

The calculations for solid slab in accordance with Clauses 3.5.5 of BS8110 throughout. In the case of a uniform load, the design section to be considered need not be less than a minimum distance from support equal to effective depth.

Design to BS8110(1997) with partial safety factor for steel gammaS=1.15

Effective depth d=200 mm
Breadth of slab zone b=5000 mm
Characteristic concrete strength fcu=35 N/mm²
Diameter of tension bars dia=16 mm
Number of tension bars nbars=50
Shear force due to ult.loads V=2200 kN

Design shear stress of 2.2 N/mm² exceeds critical stress of 0.84227 N/mm², so links to resist balance of shear forces are necessary.

Characteristic strength of links fyv=500 N/mm²
Number of transverse legs nlegs=26
Diameter of link legs dial=8 mm

Use 26 No. 8 mm dia. legs transversely (fyv=500 N/mm²) and spaced at 80 mm centres in direction of span. Transverse spacing must not exceed effective depth of 200 mm.
**Location: Low shear on deep narrow slab (High-yield steel)**

Shear in longitudinal zone of solid slab of given width

Since distance from support varies throughout zone considered, enhancement of shear resistance due to proximity to support is not applicable.

The calculations for shear in the zone of solid slab are in accordance with Clauses 3.5.5 of BS8110 throughout.

Design to BS8110(1997) with partial safety factor for steel $\gamma_S=1.15$

Effective depth $d=1000$ mm

Breadth of slab zone $b=200$ mm

Characteristic concrete strength $f_{cu}=30$ N/mm$^2$

Diameter of tension bars $d_{ia}=20$ mm

Number of tension bars $n_{bars}=2$

Shear force due to ult.loads $V=50$ kN

**WARNING:**

As $v_c=0.36309$ N/mm$^2$ exceeds $v=0.25$ N/mm$^2$ no shear links are needed.
Location: Low shear slab

Design data

Design shear force $\text{VE}_d = 51 \text{ kN}$
Overall depth of section $h = 250 \text{ mm}$
Effective depth of section $d = 204 \text{ mm}$
Effective breadth for shear $b_w = 1000 \text{ mm}$
Char yield strength (reinf'ment) $f_{yk} = 500 \text{ N/mm}^2$
Diameter of tension bars $\text{dia} = 10 \text{ mm}$
Number of tension bars $n_{bars} = 10$
Term for shear resistance $v_{Rdc} = (\rho_1 \cdot f_{ck})^{(1/3)} = 2.3096$
Shear resistance $V_{Rdc} = C_{Rdc} \cdot v_{Rdc} \cdot b_w \cdot d / 1000 = 112.52 \text{ kN}$
Minimum stress $v_{min} = 0.035 \cdot ks^{1.5} \cdot f_{ck}^{0.5}$
= 0.55587 $\text{N/mm}^2$
Minimum shear resistance $V_{Rdm} = v_{min} \cdot b_w \cdot d / 1000 = 113.4 \text{ kN}$
Modified shear resistance $V_{Rdc} = V_{Rdm} = 113.4 \text{ kN}$

SHEAR SUMMARY

Design shear force $51 \text{ kN}$
Design shear resistance $113.4 \text{ kN}$

Shear in rib of ribbed slab (no enhancement)

As distance from support varies throughout zone considered, enhancement of shear resistance due to proximity to support is not applicable.

Calculations for ribbed slab in accordance with Clauses 3.6.4 and 3.6.1.3 of BS8110.

Design to BS8110(1997) with partial safety factor for steel $\gamma_S=1.15$

With uniform load, design section considered need not be nearer to support than effective depth

Effective depth $d=300$ mm
Average rib width $b_v=400$ mm
Characteristic concrete strength $f_{cu}=30$ N/mm$^2$
Diameter of tension bars $d_{ia}=20$ mm
Number of tension bars in rib $n_{bars}=3$
Ultimate shear force in rib $V=320$ kN

Design shear stress of 2.6667 N/mm$^2$ exceeds critical stress of 0.66585 N/mm$^2$, so links to resist balance of shear forces are essential.

Characteristic strength of links $f_{yv}=500$ N/mm$^2$
Number of transverse legs $n_{legs}=4$
Diameter of link legs $d_{ial}=10$ mm

**LINK SUMMARY**

- Reinforcement strength 500 N/mm$^2$
- Bar diameter 10 mm
- Number of legs 4
- Area 314 mm$^2$
- Centres 170 mm
Location: Large rib. Low shear. High-yield steel.

Shear in rib of ribbed slab (no enhancement)

As distance from support varies throughout zone considered, enhancement of shear resistance due to proximity to support is not applicable.

Calculations for ribbed slab in accordance with Clauses 3.6.4 and 3.6.1.3 of BS8110.

Design to BS8110(1997) with partial safety factor for steel $\gamma_S=1.15$

With uniform load, design section considered need not be nearer to support than effective depth

Effective depth $d=600$ mm
Average rib width $b_v=300$ mm
Characteristic concrete strength $f_{cu}=25$ N/mm$^2$
Diameter of tension bars $d_{ia}=20$ mm
Number of tension bars in rib $n_{bars}=3$
Ultimate shear force in rib $V=50$ kN

Since design shear stress of $0.27778$ N/mm$^2$ is less than critical shear stress of $0.46029$ N/mm$^2$, no special shear reinforcement is required.

However as there are 3 bars in rib, links to ensure cover are recommended at 1 to 1.5m spacing (See Clause 3.6.6.3).
**Location:** Small rib. High shear. High-yield steel.

Shear in rib of ribbed slab (no enhancement)

As distance from support varies throughout zone considered, enhancement of shear resistance due to proximity to support is not applicable.

Calculations for ribbed slab in accordance with Clauses 3.6.4 and 3.6.1.3 of BS8110.

Design to BS8110(1997) with partial safety factor for steel $\gamma_S=1.15$

With uniform load, design section considered need not be nearer to support than effective depth.

Effective depth $d=300 \text{ mm}$
Average rib width $b_v=150 \text{ mm}$
Characteristic concrete strength $f_{cu}=35 \text{ N/mm}^2$
Diameter of tension bars $d_{ia}=20 \text{ mm}$
Number of tension bars in rib $n_{bars}=2$
Ultimate shear force in rib $V_{ult}=210 \text{ kN}$

Design shear stress of $4.6667 \text{ N/mm}^2$ exceeds critical stress of $0.84915 \text{ N/mm}^2$, so links to resist balance of shear forces are essential.

Characteristic strength of links $f_{yv}=500 \text{ N/mm}^2$
Number of transverse legs $n_{legs}=2$
Diameter of link legs $d_{ial}=10 \text{ mm}$

Design yield strength of links \( f_{yd} = \frac{f_{yk}}{\gamma_{ams}} = 434.78 \text{ N/mm}^2 \)
Minimum ratio area to spacing \( A_{sw} = 0.08 \times bw \times f_{ck}^{0.5} / f_{yk} = 0.32 \)
Number of shear legs \( n_{sl} = 2 \)
Diameter of link legs \( \text{dial} = 8 \text{ mm} \)
Area of shear legs \( A_{sw} = \text{nsl} \times \pi / 4 \times \text{dial}^2 = 100.53 \text{ mm}^2 \)
Spacing of links \( s_{max} = \text{INT} (A_{sw} / A_{sw}'s) = 184 \text{ mm} \)
Chosen spacing \( s = 175 \text{ mm} \)

Check crushing strength

Angle of inclination of strut \( \theta' = 22^\circ \)
compute \( \text{comp} = \cot(\theta) = 1 / \tan(\theta) = 2.4751 \)
Maximum shear resistance:

\[
VR_{dmax} = 0.36 \times bw \times d \times (1 - f_{ck} / 250) \times f_{ck} / ((\text{comp} + 1 / \text{comp}) \times 1000) = 675.21 \text{ kN}
\]
As \( V_{Ed} \leq VR_{dmax} \) (320 kN \( \leq 675.21 \text{ kN} \)), design shear force OK.

**Shear Summary**

</table>
Location: Ex3 - Small rib. High shear. High-yield steel.

Shear in ribbed slab

Effective depth  d=300 mm
Average rib width  bw=400 mm
Char cylinder compress strength  fck=35 N/mm²
Char yield strength of links  fyk=500 N/mm²
Diameter of tension bars  dia=20 mm
Number of tension bars in rib  nbars=2
Ultimate shear force in rib  VEd=480 kN

Shear reinforcement

Partial safety factor for r'ment  gams=1.15
Partial safety factor for conc.  gamc=1.5
Design yield strength of links  fyd=fyk/gams=434.78 N/mm²
Minimum ratio area to spacing  Aswm=0.08*bw*fck^0.5/fyk=0.37863
Number of shear legs  nsl=2
Diameter of link legs  dial=12 mm
Area of shear legs  Asw=nsl*PI/4*dial^2=226.19 mm²
Spacing of links  smax=INT(Asw/Asw's)=125 mm

Check crushing strength

Angle of inclination of strut  theta'=23.792°
compute  comp=cot(θ)=1/tan(θ)=2.2681
Maximum shear resistance:
VRdmax=0.36*bw*d*(1-fck/250)*fck/((comp+1/comp)*1000)=480 kN
As VEd ≤ VRdmax ( 480 kN ≤ 480 kN ), design shear force OK.

SHEAR SUMMARY

Shear force  480 kN
Design shear strength  4.4444 N/mm²
Concrete strut capacity  3.7324 N/mm²
Area/spacing ratio  1.8028
Area of links  226 mm²
Maximum spacing  125 mm
Actual spacing  125 mm
Location: Ex4 - Low shear (no shear links needed).

Shear in ribbed slab

Effective depth $d=600$ mm
Average rib width $bw=300$ mm
Char cylinder compress strength $f_{ck}=20$ N/mm$^2$
Char yield strength of links $f_{yk}=500$ N/mm$^2$
Diameter of tension bars $dia=20$ mm
Number of tension bars in rib $nbars=3$
Ultimate shear force in rib $V_{Ed}=50$ kN

As $V_{Ed} < V_{Rdc}$ (50 kN < 74.535 kN), shear r'ment is not required. However, consider providing nominal links to allow for fabrication.
Location: Large square slab with all edges free

Design moments in uniformly loaded two-way slabs to BS8110

Calculation of design moments according to Clauses 3.5.3 of BS8110.

\[
\text{dead load} = g_k \text{ kN/m}^2 \\
\text{live load} = q_k \text{ kN/m}^2
\]

Length of shorter side \( l_x = 20 \text{ m} \)
Length of longer side \( l_y = 20 \text{ m} \)
Characteristic dead load \( g_k = 4 \text{ kN/m}^2 \)
Characteristic imposed load \( q_k = 5 \text{ kN/m}^2 \)

All four edges simply supported

\[
\begin{array}{c}
g_k \text{ kN/m}^2 \\
q_k \text{ kN/m}^2
\end{array}
\]

Design moment for short span \( l_x \)
\[
msx = alpx \times n \times 1y \times l_x^2 = 6800 \text{ kNm}
\]

Design moment for long span \( l_y \)
\[
msy = alpsy \times n \times l_x^3 = 6800 \text{ kNm}
\]

Reinforcement must be provided over full width.
No torsion steel is required.
Location: Long rectangular slab with all edges fixed

Design moments in uniformly loaded two-way slabs to BS8110

Calculation of design moments according to Clauses 3.5.3 of BS8110.

dead load = gk kN/m²
live load = qk kN/m²

At midspan  \( msym = \text{betsyp} \times n \times \text{mstrwx} \times lx^2 = 71.053 \text{ kNm} \)
Location: Typical two-way slab with all edges fixed

Design of two-way slabs rectangular slabs supporting uniform loads

Design to BS8110(1997) with partial safety factor for steel \( \gamma_S = 1.15 \)

Calculation of design moments in accordance with Clauses 3.5.3 of BS8110 throughout.

\[
\text{dead load} = g_k \, \text{kN/m}^2 \\
\text{live load} = q_k \, \text{kN/m}^2
\]

Length of shorter side \( l_x = 6 \, \text{m} \)
Length of longer side \( l_y = 8 \, \text{m} \)
Characteristic dead load \( g_k = 4 \, \text{kN/m}^2 \)
Characteristic imposed load \( q_k = 5 \, \text{kN/m}^2 \)
Overall depth of slab \( h = 200 \, \text{mm} \)
Characteristic concrete strength \( f_{cu} = 30 \, \text{N/mm}^2 \)
Characteristic strength of steel \( f_y = 500 \, \text{N/mm}^2 \)
Bond type (0, 1 or 2) Type = 2
Size of upper bars in x-direction \( d_{aux} = 20 \, \text{mm} \)
Size of lower bars in x-direction \( d_{ax} = 20 \, \text{mm} \)
Size of upper bars in y-direction \( d_{auy} = 16 \, \text{mm} \)
Size of lower bars in y-direction \( d_{ay} = 16 \, \text{mm} \)
Designated exposure class is XC2
Specified fixing tolerance \( t_{ol} = 10 \, \text{mm} \)
Designated exposure class is XC2
Specified fixing tolerance \( t_{ol} = 10 \, \text{mm} \)
Nominal cover at top of slab \( t_{cover} = 35 \, \text{mm} \)
Nominal cover at bottom of slab \( b_{cover} = 35 \, \text{mm} \)
Effective depths:
Of top steel:
in x-direction \( d_{ux} = 155 \, \text{mm} \)
in y-direction \( d_{uy} = d_{ux} - (d_{aux} + d_{auy})/2 = 137 \, \text{mm} \)
Of bottom steel:
in x-direction \( d_{dx} = 155 \, \text{mm} \)
in y-direction \( d_{dy} = d_{dx} - (d_{ax} + d_{ay})/2 = 137 \, \text{mm} \)

Coefficients from Table 3.14

All four edges continuous
Chosen pitch for tension steel \( \text{pitchC}=480 \text{ mm} \)
Chosen pitch for tension steel \( \text{pitchC}=420 \text{ mm} \)
Chosen pitch for tension steel \( \text{pitchC}=480 \text{ mm} \)
Chosen pitch for tension steel \( \text{pitchC}=420 \text{ mm} \)

Mod.factor for tension steel:
From equation 7 (Table 3.10) \( \text{modf1}=0.55+(477-fs)/(120*(0.9+M'bd2))=2.3092 \)
but this cannot exceed 2, so \( \text{modf1}=2 \)
Mod.factor for no comp.steel \( \text{modf2}=1 \)
Thus maximum permissible
span/effective-depth ratio \( \text{ps}'d=bs'd*\text{modf1*modf2}=52 \)
Actual span/effective-depth ratio \( \text{as}'d=1000*\text{span}/dx=38.71 \)
This does not exceed permr.ratio of 52, and is thus acceptable.

SUMMARY OF REINFORCEMENT REQUIRED ( \( f_y=500 \text{ N/mm}^2 \) )

At edges in x-direction:
\[
\begin{array}{ll}
\text{Characteristic strength} & 500 \text{ N/mm}^2 \\
\text{Area of steel required} As_x & 2171.9 \text{ mm}^2 \\
\text{Area of steel provided} As_{px} & 4084.1 \text{ mm}^2 \\
\text{Percentage of steel provided} & 0.34034 \% \\
\text{Size of bars} & 20 \text{ mm} \\
\text{Number of bars provided} & 13 \\
\text{Spacing of bars} & 480 \text{ mm centres} \\
\text{Minimum bond length required} & 425 \text{ mm} \\
\text{Effective depth adopted} & 155 \text{ mm} \\
\text{Weight of steel provided} & 32.06 \text{ kg/m run} \\
\end{array}
\]

At midspan in x-direction:
\[
\begin{array}{ll}
\text{Characteristic strength} & 500 \text{ N/mm}^2 \\
\text{Area of steel required} As_x & 1636.5 \text{ mm}^2 \\
\text{Area of steel provided} As_{px} & 4084.1 \text{ mm}^2 \\
\text{Percentage of steel provided} & 0.34034 \% \\
\text{Size of bars} & 20 \text{ mm} \\
\text{Number of bars provided} & 13 \\
\text{Spacing of bars} & 480 \text{ mm centres} \\
\text{Minimum bond length required} & 320 \text{ mm} \\
\text{Effective depth adopted} & 155 \text{ mm} \\
\text{Weight of steel provided} & 32.06 \text{ kg/m run} \\
\end{array}
\]

At edges in y-direction:
\[
\begin{array}{ll}
\text{Characteristic strength} & 500 \text{ N/mm}^2 \\
\text{Area of steel required} As_y & 1245.9 \text{ mm}^2 \\
\text{Area of steel provided} As_{py} & 2211.7 \text{ mm}^2 \\
\text{Percentage of steel provided} & 0.24574 \% \\
\text{Size of bars} & 16 \text{ mm} \\
\text{Number of bars provided} & 11 \\
\text{Spacing of bars} & 420 \text{ mm centres} \\
\text{Minimum bond length required} & 360 \text{ mm} \\
\text{Effective depth adopted} & 137 \text{ mm} \\
\text{Weight of steel provided} & 17.362 \text{ kg/m run} \\
\end{array}
\]
At midspan in y-direction:

- Characteristic strength: 500 N/mm²
- Area of steel required Asym: 1170 mm²
- Area of steel provided Asym: 2211.7 mm²
- Percentage of steel provided: 0.24574 %
- Size of bars: 16 mm
- Number of bars provided: 11
- Spacing of bars: 420 mm centres
- Minimum bond length required: 270 mm
- Effective depth adopted: 137 mm
- Weight of steel provided: 17.362 kg/m run

Minimum tension reinforcement in edge strips

- Min. tension area (Table 3.25) = \( \frac{\text{Asmin}}{100} \times 1000 \times h \)
  \( = 260 \) mm² per metre
- Diameter of distribution bars: diamin = 12 mm
- Maximum pitch (c.to c.of bars) = \( 3 \times d_{uy} + \text{diamin} = 423 \) mm

As this is less than 750 mm, this is satisfactory.

Chosen pitch for tension steel = pitchC = 420 mm

Minimum reinforcement in edge strips:

- Characteristic strength: 500 N/mm²
- Minimum area required Asmin: 260 mm² per m
- Steel area provided Asmpro: 269 mm² per m
- Percentage of steel provided: 0.1345 %
- Size of bars: 12 mm
- Spacing of bars: 420 mm centres
- Minimum lap length required: 300 mm
- Weight of steel provided: 2.1117 kg/m²

No torsion reinforcement is required (see Rule 7 in Cl. 3.5.3.5).
Location: Large thick two-way slab reinforced with mild steel

Design of two-way slabs rectangular slabs supporting uniform loads

Design to BS8110(1997) with partial safety factor for steel \( \gamma_S = 1.15 \)

Calculation of design moments in accordance with Clauses 3.5.3 of BS8110 throughout.

\[
\begin{align*}
\text{dead load} &= g_k \text{kN/m}^2 \\
\text{live load} &= q_k \text{kN/m}^2 \\
\end{align*}
\]

Length of shorter side \( lx = 10 \) m
Length of longer side \( ly = 20 \) m
Characteristic dead load \( g_k = 3 \) kN/m²
Characteristic imposed load \( q_k = 4 \) kN/m²

Overall depth of slab \( h = 500 \) mm
Characteristic concrete strength \( f_{cu} = 25 \) N/mm²
Characteristic strength of steel \( f_y = 250 \) N/mm²
Specified min. steel percentage \( \text{permin} = 0.24 \% \)
Specified min. slab thickness \( \text{mindep} = 250 \) mm
Bond type (0, 1 or 2) \( \text{Type} = 0 \)
Size of upper bars in x-direction \( \text{dia}_x = 25 \) mm
Size of lower bars in x-direction \( \text{dia}_x = 25 \) mm
Size of upper bars in y-direction \( \text{dia}_y = 20 \) mm
Size of lower bars in y-direction \( \text{dia}_y = 20 \) mm
Designated exposure class is XC1
Specified fixing tolerance \( \text{tol} = 10 \) mm

Effective depths:
Of top steel: in x-direction \( \text{dux} = 462.5 \) mm
in y-direction \( \text{duy} = \text{dux} - (\text{dia}_x + \text{dia}_y)/2 = 440 \) mm
Of bottom steel: in x-direction \( \text{dx} = 462.5 \) mm
in y-direction \( \text{dy} = \text{dx} - (\text{dia}_x + \text{dia}_y)/2 = 440 \) mm

Two adjacent edges discontinuous

Coefficients from Table 3.14
Chosen pitch for tension steel pitchC=400 mm
Chosen pitch for tension steel pitchC=260 mm
Chosen pitch for tension steel pitchC=400 mm
Chosen pitch for tension steel pitchC=260 mm

Mod. factor for tension steel:
From equation 7 (Table 3.10) modf1=0.55+(477-fs)/(120*(0.9 +M'bd2))=2.6631
but this cannot exceed 2, so modf1=2
Mod. factor for no comp. steel modf2=1
Thus maximum permissible
span/effective-depth ratio ps'd=bs'd*modf1*modf2=46
Actual span/effective-depth ratio as'd=1000*span/dx=21.622
This does not exceed permis.ratio of 46, and is thus acceptable.

</table>

Area calculated is the minimum requirement given in Table 3.25.
At midspan in y-direction:

- Characteristic strength: 250 N/mm²
- Area of steel required (Asym): 9000 mm²
- Area of steel provided (Asym): 9110.6 mm²
- Percentage of steel provided: 0.24295%
- Size of bars: 20 mm
- Number of bars provided: 29
- Spacing of bars: 260 mm centres
- Minimum bond length required: 445 mm
- Effective depth adopted: 440 mm
- Weight of steel provided: 71.518 kg/m run

Area calculated is the minimum requirement given in Table 3.25.

Use minimum steel as detailed above for edge strips.

See Rules 5 and 6 in Cl.3.5.3.5 for details of torsion r'ment.
Location: Thin heavily-loaded square slab, one freely supported edge

Design of two-way slabs rectangular slabs supporting uniform loads

Design to BS8110(1997) with partial safety factor for steel gammaS=1.15

Calculation of design moments in accordance with Clauses 3.5.3 of BS8110 throughout.

Length of shorter side \( lx = 5 \text{ m} \)
Length of longer side \( ly = 5 \text{ m} \)
Characteristic dead load \( gk = 4 \text{ kN/m}^2 \)
Characteristic imposed load \( qk = 5 \text{ kN/m}^2 \)
Overall depth of slab \( h = 150 \text{ mm} \)

Nominal cover at bottom of slab \( b_{cover} = 30 \text{ mm} \)
Effective depths:
Of top steel: in y-direction \( du_y = 112 \text{ mm} \)
in x-direction \( du_x = du_y - (dia_x + dia_y)/2 = 96 \text{ mm} \)
Of bottom steel: in y-direction \( dy = 112 \text{ mm} \)
in x-direction \( dx = dy - (dia_x + dia_y)/2 = 96 \text{ mm} \)

One long edge discontinuous

Coefficients from Table 3.14
Chosen pitch for tension steel    pitchC=350 mm
Chosen pitch for tension steel    pitchC=300 mm
Chosen pitch for tension steel    pitchC=350 mm
Chosen pitch for tension steel    pitchC=300 mm

Mod.factor for tension steel:
From equation 7 (Table 3.10)      modf1=0.55+(477-fs)/(120*(0.9
+M'bd2))=2.0199
but this cannot exceed 2, so      modf1=2
Mod.factor for no comp.steel      modf2=1
Thus maximum permissible
span/effective-depth ratio         ps'd=bs'd*modf1*modf2=46
Actual span/effective-depth ratio as'd=1000*span/dx=52.083
This exceeds permissible ratio of 46, and is thus not acceptable.

SUMMARY OF REINFORCEMENT REQUIRED ( fy=500 N/mm² )

At edges in x-direction:
Characteristic strength        500 N/mm²
Area of steel required Asxe    1254 mm²
Area of steel provided Aspxe   2613.8 mm²
Percentage of steel provided   0.46468 %
Size of bars                   16 mm
Number of bars provided        13
Spacing of bars                300 mm centres
Minimum bond length required   220 mm
Effective depth adopted        96 mm
Weight of steel provided       20.518 kg/m run

At midspan in x-direction:
Characteristic strength        500 N/mm²
Area of steel required Asxm    964.64 mm²
Area of steel provided Aspxm   2613.8 mm²
Percentage of steel provided   0.46468 %
Size of bars                   16 mm
Number of bars provided        13
Spacing of bars                300 mm centres
Minimum bond length required   195 mm
Effective depth adopted        96 mm
Weight of steel provided       20.518 kg/m run

At edges in y-direction:
Characteristic strength        500 N/mm²
Area of steel required Asye    1019.8 mm²
Area of steel provided Aspye   2211.7 mm²
Percentage of steel provided   0.39319 %
Size of bars                   16 mm
Number of bars provided        11
Spacing of bars                350 mm centres
Minimum bond length required   210 mm
Effective depth adopted        112 mm
Weight of steel provided       17.362 kg/m run

SCALE 5.48                Office 1007                Proforma 86
At midspan in y-direction:

- **Characteristic strength**: 500 N/mm²
- **Area of steel required Asym**: 771.71 mm²
- **Area of steel provided Asym**: 2211.7 mm²
- **Percentage of steel provided**: 0.39319 %
- **Size of bars**: 16 mm
- **Number of bars provided**: 11
- **Spacing of bars**: 350 mm centres
- **Minimum bond length required**: 195 mm
- **Effective depth adopted**: 112 mm
- **Weight of steel provided**: 17.362 kg/m run

Minimum tension reinforcement in edge strips

- **Min. tension area (Table 3.25)**: \( A_{\text{min}} = \frac{\text{permin}}{100} \times 100 \times h \)
  \( = 195 \text{ mm}^2 \) per metre
- **Diameter of distribution bars**: \( d_{\text{amin}} = 12 \text{ mm} \)
- **Maximum pitch (c.to c.of bars)**: \( p_{\text{chm}} = 3 \times d_{\text{x}} + d_{\text{amin}} = 300 \text{ mm}, \)
- As this is less than 750 mm, this is satisfactory.
- **Chosen pitch for tension steel**: \( \text{pitchC} = 300 \text{ mm} \)

Minimum reinforcement in edge strips:

- **Characteristic strength**: 500 N/mm²
- **Minimum area required Asmin**: 195 mm² per m
- **Steel area provided Asmpro**: 376 mm² per m
- **Percentage of steel provided**: 0.25067 %
- **Size of bars**: 12 mm
- **Spacing of bars**: 300 mm centres
- **Minimum lap length required**: 300 mm
- **Weight of steel provided**: 2.9516 kg/m²

See Rule 6 in Clause 3.5.3.5 for details of torsion reinforcement.
**Location:** Ex1 - Typical two-way slab with all edges fixed

**Design of two-way slabs rectangular slabs supporting uniform loads**

The calculations are in accordance with EC2 Part 1-1 and the IStructE "Manual for the design of concrete building structures to EC2".

Partial safety factor for steel \( g_{ms} = 1.15 \)
Partial safety factor for conc. \( g_{mc} = 1.5 \)
Partial safety factor for bond \( g_{mb} = 1.5 \)

![Diagram of a two-way slab](image)

- Length of shorter side \( lx = 6 \) m
- Length of longer side \( ly = 8 \) m
- Characteristic permanent load \( g_k = 4 \) kN/m²
- Characteristic variable load \( q_k = 5 \) kN/m²
- Permanent load factor \( g_{mG} = 1.35 \)
- Variable load factor \( g_{mQ} = 1.5 \)
- Overall depth of slab \( h = 200 \) mm
- Size of upper bars in x-direction \( d_{aux} = 20 \) mm
- Size of lower bars in x-direction \( d_{ax} = 20 \) mm
- Size of upper bars in y-direction \( d_{auy} = 16 \) mm
- Size of lower bars in y-direction \( d_{ay} = 16 \) mm
- Nominal cover at top of slab \( t_{cover} = 35 \) mm
- Nominal cover at bottom of slab \( b_{cover} = 35 \) mm
- Effective depths:
  - Of top steel: in x-direction \( d_{ux} = 155 \) mm
  - In y-direction \( d_{uy} = d_{ux} - (d_{aux} + d_{auy})/2 = 137 \) mm
  - Of bottom steel: in x-direction \( d_{dx} = 155 \) mm
  - In y-direction \( d_{dy} = d_{dx} - (d_{ax} + d_{ay})/2 = 137 \) mm

The coefficients for the edges of the slab are given as follows:

- **All four edges continuous**
  - Coefficients from the ISE Manual to EC2, Table 5.3.
Chosen spacing of tension bars  pchxe=400 mm
Chosen spacing of tension bars  pchye=400 mm
Chosen spacing of tension bars  pchxm=400 mm
Chosen spacing of tension bars  pchym=400 mm

Check on span/effective-depth ratio (in lx direction)

Actual span to depth ratio  l'd=L*1000/d=43.8
Allowable span/depth ratio  l'da=k*N*F1*F2*F3=145.6
Absolute value of span/depth  l'da=40*k=60

DESIGN
SUMMARY
DEFLECTION

NOTE: Care should be taken with the EC2 values as the deflection equations used give unrealistically high values. National Annex to EC2 Part 1:2004, Table NA.5 gives span/effective depth ratios for lightly stressed concrete (C30/37 & f=0.5%) as follows:
Simply supported spans  20
End spans  26
Interior spans  30

SUMMARY OF REINFORCEMENT REQUIRED  ( f=500 N/mm² )

At edges in x-direction:
Characteristic strength  500 N/mm²
Area of steel required Asxe  2060 mm²
Area of steel provided Aspxe  5027 mm²
Percentage of steel provided  0.4189 %
Size of bars  20 mm
Number of bars provided  16
Spacing of bars  400 mm centres
Minimum bond length required  330 mm
Effective depth adopted  155 mm

At midspan in x-direction:
Characteristic strength  500 N/mm²
Area of steel required Asxm  1552 mm²
Area of steel provided Aspxm  5027 mm²
Percentage of steel provided  0.4189 %
Size of bars  20 mm
Number of bars provided  16
Spacing of bars  400 mm centres
Minimum bond length required  249 mm
Effective depth adopted  155 mm
At edges in y-direction:

- Characteristic strength: $500 \text{ N/mm}^2$
- Area of steel required $A_{sy}$: $1182 \text{ mm}^2$
- Area of steel provided $A_{psy}$: $2413 \text{ mm}^2$
- Percentage of steel provided: $0.2681\%$
- Size of bars: $16 \text{ mm}$
- Number of bars provided: $12$
- Spacing of bars: $400 \text{ mm centres}$
- Minimum bond length required: $316 \text{ mm}$
- Effective depth adopted: $137 \text{ mm}$

At midspan in y-direction:

- Characteristic strength: $500 \text{ N/mm}^2$
- Area of steel required $A_{sm}$: $886.3 \text{ mm}^2$
- Area of steel provided $A_{spym}$: $2413 \text{ mm}^2$
- Percentage of steel provided: $0.2681\%$
- Size of bars: $16 \text{ mm}$
- Number of bars provided: $12$
- Spacing of bars: $400 \text{ mm centres}$
- Minimum bond length required: $237 \text{ mm}$
- Effective depth adopted: $137 \text{ mm}$

Minimum tension reinforcement in edge strips

- Diameter of distribution bars: $d_{\text{amin}}=12 \text{ mm}$
- Chosen spacing of tension bars: $p_{\text{chmin}}=400 \text{ mm}$

Minimum reinforcement in edge strips:

- Characteristic strength: $500 \text{ N/mm}^2$
- Minimum area required $A_{\text{min}}$: $206 \text{ mm}^2$ per m
- Steel area provided $A_{\text{smpro}}$: $282 \text{ mm}^2$ per m
- Size of bars: $12 \text{ mm}$
- Spacing of bars: $400 \text{ mm centres}$

Shear check

Case 1

- Area of steel required: $A_{s}=2060 \text{ mm}^2$
- Area of tension steel provided: $A_{\text{spr}}=5027 \text{ mm}^2$
- Effective depth of section: $d=155 \text{ mm}$
- Location for shear calculation: Shear on long side of slab
- Shear force due to ultimate load: $V_{Eд}=235 \text{ kN}$
- Effective breadth for shear: $b_w=6000 \text{ mm}$
- Term for shear resistance: $v_{\text{Rdc}}=(\rho_{\text{1}}\cdot f_{\text{ck}})^{(1/3)}=2.382$
- Shear resistance: $V_{\text{Rdc}}=C_{\text{Rdc}}\cdot k_s\cdot v_{\text{Rdc}}\cdot b_w\cdot d/1000=531.6 \text{ kN}$
- Minimum stress: $v_{\text{min}}=0.035\cdot k_s^{1.5}\cdot f_{\text{ck}}^{0.5}=0.495 \text{ N/mm}^2$
- Minimum shear resistance: $V_{\text{Rdm}}=v_{\text{min}}\cdot b_w\cdot d/1000=460.3 \text{ kN}$
SHEAR SUMMARY

- Design shear force: 235 kN
- Design shear resistance: 531.6 kN

Crack control check

Measures to control cracking are not necessary where the overall depth does not exceed 200 mm as per Clause 7.3.3(1).
Location: Ex2 - Large thick two-way slab reinforced with mild steel

Design of two-way slabs rectangular slabs supporting uniform loads

The calculations are in accordance with EC2 Part 1-1 and the IStructE "Manual for the design of concrete building structures to EC2".

Partial safety factor for steel $\gamma_m = 1.15$
Partial safety factor for conc. $\gamma_c = 1.5$
Partial safety factor for bond $\gamma_b = 1.5$

$$
\begin{align*}
g_k &\text{ kN/m}^2 \\
q_k &\text{ kN/m}^2 \\

SUMMARY OF REINFORCEMENT REQUIRED ( fy=500 N/mm² )

At midspan in x-direction:

Characteristic strength  500 N/mm²
Area of steel required  Asxm  749.1 mm²
Area of steel provided  Aspxm  804.2 mm²
Percentage of steel provided  0.1577 %
Size of bars  16 mm
Number of bars provided  4
Spacing of bars  340 mm centres
Minimum bond length required  439 mm
Effective depth adopted  322 mm

At midspan in y-direction:

Characteristic strength  500 N/mm²
Area of steel required  Asym  711.9 mm²
Area of steel provided  Aspym  804.2 mm²
Percentage of steel provided  0.1577 %
Size of bars  16 mm
Number of bars provided  4
Spacing of bars  360 mm centres
Minimum bond length required  417 mm
Effective depth adopted  306 mm

Minimum tension reinforcement in edge strips

Diameter of distribution bars  diamin=16 mm
Chosen spacing of tension bars  pchmin=280 mm

Minimum reinforcement in edge strips:

Characteristic strength  500 N/mm²
Minimum area required  Asmin  678 mm² per m
Steel area provided  Aspro  718 mm² per m
Size of bars  16 mm
Spacing of bars  280 mm centres

Shear check

Case 1

Area of steel required  As=675 mm²
Area of tension steel provided  Aspr=1810 mm²
Effective depth of section  d=372 mm
Location for shear calculation:
Shear force due to ultimate load  VEd=65 kN
Effective breadth for shear  bw=1000 mm
Term for shear resistance  vRdc=(rho1*fck)^(1/3)=2.135
Shear resistance  VRdc=CRdc*ks*vRdc*bw*d/1000=165.2 kN
Minimum stress  vmin=0.035*ks^1.5*fck^0.5=0.5051 N/mm²
Minimum shear resistance  VRdm=vmin*bw*d/1000=187.9 kN
Modified shear resistance  VRdc=VRdm=187.9 kN

Bending moments to EC2 for flat slabs without drop panels

This simplified method assumes that the flat slab has at least three spans or bays in each direction and the ratio of the longest span to the shortest does not exceed 1.2. The max values of the bending moment and shear forces in each direction will be obtained from Table 5.4 in the IStructE Manual for the design of concrete building structures to Eurocode 2. This assumes 20% redistribution of bending moments.

Shorter span of slab panel \( l_x = 20 \text{ m} \)
Longer span of slab panel \( l_y = 20 \text{ m} \)
Plan dim. of columns in x-dir. \( C_x = 400 \text{ mm} \)
Plan dim. of columns in y-dir. \( C_y = 400 \text{ mm} \)
Moment transfer to columns \( d = 350 \text{ mm} \)
Characteristic permanent load \( g_k = 4 \text{ kN/m}^2 \)
Characteristic variable load \( q_k = 2 \text{ kN/m}^2 \)

Support conditions:

Effective diameter of column \( h_c = \sqrt{\frac{4 \times C_x \times C_y}{\pi}} = 451.35 \text{ mm} \)
Design ult load per unit area \( n = 1.35 \times g_k + 1.5 \times q_k = 8.4 \text{ kN/m}^2 \)
Total design load on panel \( F = n \times l_x \times l_y = 3360 \text{ kN} \)
Summary of design moments (moments in kNm/metre width)

All moments are in kNm per metre width.

\[
\begin{align*}

**Location:** High shear force on small area of moderately-thick slab

**Punching shear round concentrated load in accordance with BS8110**

Calculations are in accordance with Clauses 3.7.7 of Part 1 of BS8110. First steel perimeter located at d/2 from load face (see Cl.3.7.7.6). Design to BS8110:1997, partial safety factor for steel gams=1.15.

Average flexural steel percentage $p=1.2\%$

Characteristic concrete strength $f_{cu}=40\,N/mm^2$

Design ult. load per unit area $n=10\,kN/m^2$

Char. strength of shear reinf. $f_{yv}=500\,N/mm^2$

Initial dia. for shear reinf. $d_{ial}=12\,mm$

According to Clause 3.4.5.8 of BS8110, absolute maximum shear stress must not exceed $5\,N/mm^2$ and thus $v_{lim}=5\,N/mm^2$.

Maximum design shear stress $v_{max}=1000\cdot V_{eff}/(u_0\cdot d)=4.9342\,N/mm^2$

**Calculations for Zone 1 i.e. for Steel Perimeters 0 and 1**

Distance from load face to shear perimeter being checked $l_p=480\,mm$

Number of legs to be provided along inner steel perimeter 0 $n_i=23$

Location of Steel Perimeter 0 : 160 mm from face of loaded area.
Along Steel Perimeter 0 : provide 12 mm dia legs at 130 mm spacing.
Number of legs on perimeter 0 $n_i=\text{INT}(\text{usi}/\text{spi})+1=25$

Location of Steel Perimeter 1 : 400 mm from face of loaded area.
Along Steel Perimeter 1 : provide 12 mm dia legs at 150 mm spacing.
Number of legs on perimeter 1 $n_o=\text{INT}(\text{uso}/\text{sp})+1=35$
Calculations for Zone 2 i.e. for Steel Perimeter 2

Distance from load face to shear perimeter being checked = 720 mm

Location of Steel Perimeter 2: 640 mm from face of loaded area.
Along Steel Perimeter 2: provide 12 mm dia legs at 480 mm spacing.
Number of legs on perimeter 2 = INT(uso/sp)+1 = 15

Calculations for Zone 3 i.e. for Steel Perimeter 3

Distance from load face to shear perimeter being checked = 960 mm

Location of Steel Perimeter 3: 880 mm from face of loaded area.
Along Steel Perimeter 3: provide 12 mm dia legs at 480 mm spacing.
Number of legs on perimeter 3 = INT(uso/sp)+1 = 19

Calculations for Zone 4 i.e. for Steel Perimeter 4

Distance from load face to shear perimeter being checked = 1200 mm

As v does not exceed vc, no shear reinforcement is required on steel perimeter 4 and thus the calculations are complete.

Total number of 12 mm links required is 94

Note: All shear reinforcement must be anchored round at least one layer of tension steel (Clause 3.7.7.6)
**Location:** Moderate shear force on thin slab using mild steel

**Punching shear round concentrated load in accordance with BS8110**

Calculations are in accordance with Clauses 3.7.7 of Part 1 of BS8110. First steel perimeter located at d/2 from load face (see Cl.3.7.7.6). Design to BS8110:1997, partial safety factor for steel gains=1.15.

Average flexural steel percentage \( p = 0.4 \% \)

Characteristic concrete strength \( f_{cu} = 30 \, \text{N/mm}^2 \)

Design ult.load per unit area \( n = 10 \, \text{kN/m}^2 \)

Char. strength of shear reinf. \( f_{y} = 250 \, \text{N/mm}^2 \)

Initial dia. for shear reinf. \( d_{ial} = 6 \, \text{mm} \)

According to Clause 3.4.5.8 of BS8110, absolute maximum shear stress must not exceed 0.8 \( f_{cu} \) and thus \( v_{lim} = 0.8 \times \text{SQR}(f_{cu}) = 4.3818 \, \text{N/mm}^2 \)

Maximum design shear stress \( v_{max} = 1000 \times \text{Ve}ff/(uo \times d) = 2.0833 \, \text{N/mm}^2 \)

**Calculations for Zone 1 i.e. for Steel Perimeters 0 and 1**

Distance from load face to shear perimeter being checked \( l_p = 180 \, \text{mm} \)

Number of legs to be provided along inner steel perimeter 0 \( n_i = 23 \)

Location of Steel Perimeter 0 : 60 mm from face of loaded area.

Along Steel Perimeter 0 : provide 6 mm dia legs at 100 mm spacing.

Number of legs on perimeter 0 \( n_i = \text{INT}(us_i/sp_i) + 1 = 25 \)

Location of Steel Perimeter 1 : 150 mm from face of loaded area.

Along Steel Perimeter 1 : provide 6 mm dia legs at 100 mm spacing.

Number of legs on perimeter 1 \( n_o = \text{INT}(us_o/sp) + 1 = 33 \)
Calculations for Zone 2 i.e. for Steel Perimeter 2

Distance from load face to shear perimeter being checked \( l_p = 270 \) mm

Location of Steel Perimeter 2 : 240 mm from face of loaded area.
Along Steel Perimeter 2 : provide 6 mm dia legs at 180 mm spacing.
Number of legs on perimeter 2 \( \text{no} = \text{INT}(uso/sp) + 1 = 22 \)

Calculations for Zone 3 i.e. for Steel Perimeter 3

Distance from load face to shear perimeter being checked \( l_p = 360 \) mm

Location of Steel Perimeter 3 : 330 mm from face of loaded area.
Along Steel Perimeter 3 : provide 6 mm dia legs at 180 mm spacing.
Number of legs on perimeter 3 \( \text{no} = \text{INT}(uso/sp) + 1 = 26 \)

Calculations for Zone 4 i.e. for Steel Perimeter 4

Distance from load face to shear perimeter being checked \( l_p = 450 \) mm

Location of Steel Perimeter 4 : 420 mm from face of loaded area.
Along Steel Perimeter 4 : provide 6 mm dia legs at 180 mm spacing.
Number of legs on perimeter 4 \( \text{no} = \text{INT}(uso/sp) + 1 = 30 \)

Calculations for Zone 5 i.e. for Steel Perimeter 5

Distance from load face to shear perimeter being checked \( l_p = 540 \) mm

As \( v \) does not exceed \( v_c \), no shear reinforcement is required on steel perimeter 5 and thus the calculations are complete.

Total number of 6 mm links required is 136

Note: All shear reinforcement must be anchored round at least one layer of tension steel (Clause 3.7.7.6)
Location: High shear force on thick slab using high-yield steel

Punching shear round concentrated load in accordance with BS8110

Calculations are in accordance with Clauses 3.7.7 of Part I of BS8110. First steel perimeter located at d/2 from load face (see Cl.3.7.7.6). Design to BS8110:1997, partial safety factor for steel gams=1.15.

Note:
As the first plane that must be considered is at 1.5*d from face of concentrated load (see Figure 3.17 in Code), no enhancement of vc (Clause 3.7.7.4) is applicable.

Average flexural steel percentage p=0.15 %
Characteristic concrete strength \( f_{cu} = 30 \text{ N/mm}^2 \)
Design ult.load per unit area \( n = 14 \text{ kN/m}^2 \)
Char. strength of shear reinf. \( f_{yv} = 500 \text{ N/mm}^2 \)
Initial dia. for shear reinf. \( \text{dial} = 8 \text{ mm} \)
According to Clause 3.4.5.8 of BS8110, absolute maximum shear stress must not exceed 0.8 \( f_{cu} \) and thus \( v_{lim} = 0.8 \times \text{SQR}(f_{cu}) = 4.3818 \text{ N/mm}^2 \)
Maximum design shear stress \( v_{max} = 1000 \times \text{Ve}/(uo \times d) = 2.8571 \text{ N/mm}^2 \)

Calculations for Zone 1 i.e. for Steel Perimeters 0 and 1

Distance from load face to shear perimeter being checked \( l_p = 1500 \text{ mm} \)
Number of legs to be provided along inner steel perimeter 0 \( n_i = 104 \)
Location of Steel Perimeter 0 : 500 mm from face of loaded area.
Along Steel Perimeter 0 : provide 8 mm dia legs at 50 mm spacing.
Number of legs on perimeter 0 \( n_i = \text{INT}(usi/spi)+1=123 \)
Location of Steel Perimeter 1 : 1250 mm from face of loaded area.
Along Steel Perimeter 1 : provide 8 mm dia legs at 80 mm spacing.
Number of legs on perimeter 1 \( n_o = \text{INT}(uso/sp)+1=152 \)
Calculations for Zone 2 i.e. for Steel Perimeter 2

Distance from load face to shear perimeter being checked \( l_p = 2250 \text{ mm} \)

As \( v \) does not exceed \( v_c \), no shear reinforcement is required on steel perimeter 2 and thus the calculations are complete.

Total number of 8 mm links required is 275

Note: All shear reinforcement must be anchored round at least one layer of tension steel (Clause 3.7.7.6)
Location: Ex1 - High shear force on moderately-thick slab

Punching shear round concentrated load in accordance with EC2

Calculations are in accordance with Section 6.4 of EC2, Part 1-1.
Partial safety factor (steel)  \( g_{\text{ams}} = 1.15 \)
Partial safety factor (concrete)  \( g_{\text{amc}} = 1.5 \)

Definitions:
- loaded area refers to the cross-sectional area of the column
- load perimeter refers to the column perimeter
- load face refers to the column face
- face of the load refers to the face of the column
- loaded area dimensions refers to column area dimensions

Design applied shear force  \( V_{\text{Ed}} = 2300 \text{ kN} \)
Average effective depth  \( d = 320 \text{ mm} \)
Dimension of loaded area  \( c_x = 400 \text{ mm} \)
Dimension of loaded area  \( c_y = 550 \text{ mm} \)

Check shear stress at the load perimeter

Punching shear force  \( V_{\text{Ed}} = 2300 \text{ kN} \)
Shear stress at load perimeter  \( v_{\text{Ed}} = \beta V_{\text{Ed}} / (u_0 d) = 4.3503 \text{ N/mm}^2 \)
Maximum punching shear resistance  \( v_{\text{Rdmax}} = 0.5 v f_{\text{cd}} = 5.5808 \text{ N/mm}^2 \)
As \( v_{\text{Ed}} \leq v_{\text{Rdmax}} \), shear stress at load perimeter is within the maximum punching shear resistance. Hence satisfactory.

Check shear stress at control perimeter \( u_1 \) at 2d from load face

Reinforcement ratio in x-dir  \( p_{\text{lx}} = 0.012 \)
Reinforcement ratio in y-dir  \( p_{\text{ly}} = 0.012 \)
As \( v_{\text{Ed}} > v_{\text{Rdc}} \), punching shear reinforcement needs to be provided.

Outer control perimeter where shear links are no longer required
Outer control perimeter $U_{out} = \beta \times V_{Ed} \times 1000 / (d \times v_{Rdc}) = 11416 \text{ mm}$
Radius to $U_{out}$ $r_{out} = (U_{out} - l_{cf}) / (2 \times \pi) = 1514.5 \text{ mm}$
The outer perimeter of shear reinforcement should be at a distance not greater than $1.5d$ from the outer control perimeter $U_{out}$. Radius to outer perimeter of shear reinforcement $Out_{per} = r_{out} - 1.5 \times d = 1034.5 \text{ mm from load face}$

**Shear links on basic control perimeter $u_1$**

Spac. inside 2d control perimeter $St = 450 \text{ mm}$
Spac. outside control perimeter $u_1 St' = 600 \text{ mm}$
Char. yield strength of reinft. $f_{yk} = 500 \text{ N/mm}^2$
Diameter of shear reinforcement $dial = 12 \text{ mm}$
Spacing of links to be used $spac = 270 \text{ mm}$
Use minimum H 12 (113.1 mm²) legs of links @ 270 mm c/c around perimeter $u_1$ (i.e. in the tangential direction).

**Summary of punching shear links**

In the following calculation the first perimeter will be taken at $0.5d$ from the face of the load and subsequent perimeters will be spaced at $0.75d$ apart.

Links on perimeter 1:
Use minimum H 12 (113.1 mm²) legs of links @ 130 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeter 2:
Use minimum H 12 (113.1 mm²) legs of links @ 200 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeter 3:
Use minimum H 12 (113.1 mm²) legs of links @ 270 mm c/c in the tangential direction and 240 mm c/c in the radial direction.
Links on perimeters beyond basic control perimeter u1

Links on perimeter 4:
Use minimum H 12 (113.1 mm²) legs of links @ 340 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeter 5:
Use minimum H 12 (113.1 mm²) legs of links @ 410 mm c/c in the tangential direction and 240 mm c/c in the radial direction.
Location: Ex2 - Moderate shear force on thin slab

Punching shear round concentrated load in accordance with EC2

Calculations are in accordance with Section 6.4 of EC2, Part 1-1.
Partial safety factor (steel) \( g_{ams} = 1.15 \)
Partial safety factor (concrete) \( g_{amc} = 1.5 \)

Definitions:
- loaded area refers to the cross-sectional area of the column

\[
\begin{align*}
\text{First link perimeter} & \leq 0.5d \text{ from face of loaded area.} \\
\text{Link perimeters} & \leq 0.75d \text{ apart.} \\
\text{\( \leq 1.5d \quad \leq 0.5d \)}
\end{align*}
\]

Design applied shear force \( V_{Ed} = 400 \text{ kN} \)
Average effective depth \( d = 120 \text{ mm} \)
Dimension of loaded area \( cx = 400 \text{ mm} \)
Dimension of loaded area \( cy = 600 \text{ mm} \)

Check shear stress at the load perimeter

Punching shear force \( V_{Ed} = 400 \text{ kN} \)
Shear stress at load perimeter \( v_{Ed} = \beta_{Ed} V_{Ed} \frac{1000}{(u_{o}d)} = 1.9167 \text{ N/mm}^2 \)
Maximum punching shear resistance \( V_{Rd}\text{max} = 0.5v_{fcd} = 5.5808 \text{ N/mm}^2 \)
As \( v_{Ed} \leq V_{Rd}\text{max} \), shear stress at load perimeter is within the maximum punching shear resistance. Hence satisfactory.

Check shear stress at control perimeter \( u_1 \) at 2d from load face

Reinforcement ratio in x-dir \( p_{lx} = 0.004 \)
Reinforcement ratio in y-dir \( p_{ly} = 0.004 \)
As \( V_{Ed} > V_{Rdc} \) punching shear reinforcement needs to be provided.

Outer control perimeter where shear links are no longer required
Outer control perimeter: \( U_{out} = \beta \cdot \frac{V_{Ed} \cdot 1000}{d \cdot v_{Rdc}} \) = 6833.8 mm

Radius to \( U_{out} \): \( r_{out} = \frac{(U_{out} - lcf)}{(2 \cdot \pi)} \) = 769.33 mm

The outer perimeter of shear reinforcement should be at a distance not greater than 1.5d from the outer control perimeter \( U_{out} \). Radius to outer perimeter of shear reinforcement: \( \text{Outper} = r_{out} - 1.5 \cdot d \) = 589.33 mm from load face

**Shear links on basic control perimeter \( u_1 \)**

Spac. inside 2d control perimeter: \( S_t = 180 \text{ mm} \)

Spac. outside control perimeter \( u_1 \): \( S'_t = 240 \text{ mm} \)

Char. yield strength of reinft.: \( f_{yk} = 500 \text{ N/mm}^2 \)

Diameter of shear reinforcement: \( d_{al} = 6 \text{ mm} \)

Spacing of links to be used: \( S_{pc} = 180 \text{ mm} \)

Use minimum H 6 (28.274 mm²) legs of links @ 180 mm c/c around perimeter \( u_1 \) (i.e. in the tangential direction).

**Summary of punching shear links**

In the following calculation the first perimeter will be taken at 0.5d from the face of the load and subsequent perimeters will be spaced at 0.75d apart.

![Diagram of punching shear links](image)

Links on perimeter 1:
Use minimum H 6 (28.274 mm²) legs of links @ 130 mm c/c in the tangential direction and 90 mm c/c in the radial direction.

Links on perimeter 2:
Use minimum H 6 (28.274 mm²) legs of links @ 160 mm c/c in the tangential direction and 90 mm c/c in the radial direction.

Links on perimeter 3:
Use minimum H 6 (28.274 mm²) legs of links @ 180 mm c/c in the tangential direction and 90 mm c/c in the radial direction.
Links on perimeters beyond basic control perimeter u1

Links on perimeter 4:
Use minimum H 6 (28.274 mm²) legs of links @ 225 mm c/c in the tangential direction and 90 mm c/c in the radial direction.

Links on perimeter 5:
Use minimum H 6 (28.274 mm²) legs of links @ 240 mm c/c in the tangential direction and 90 mm c/c in the radial direction.

Links on perimeter 6:
Use minimum H 6 (28.274 mm²) legs of links @ 240 mm c/c in the tangential direction and 90 mm c/c in the radial direction.

Links on perimeter 7:

Location: Ex7 - Internal rectangular load head

Punching shear round concentrated load in accordance with EC2

Calculations are in accordance with Section 6.4 of EC2, Part 1-1.
Partial safety factor (steel) \( g_{ams} = 1.15 \)
Partial safety factor (concrete) \( g_{amc} = 1.5 \)

Definitions:
- loaded area refers to the cross-sectional area of the column head
- load perimeter refers to the column head perimeter
- load head face refers to the column head face
- face of the load head refers to the face of the column head
- loaded area dimensions refers to column head area dimensions

For circular columns/piles
\( cx = cy = \text{diameter of loaded area} \)

Basic control perimeter is at \( 2d \) from the vertical face of the load head.
\( Sr = \text{spacing of links in the radial direction}. \)

Design applied shear force \( V_{Ed} = 2300 \, \text{kN} \)
Average effective depth \( d = 320 \, \text{mm} \)
Projection of head from load \( 1H_1 = 500 \, \text{mm} \)
Load head height below slab \( h_H = 300 \, \text{mm} \)
Load dimension \( c_1 = 400 \, \text{mm} \)
Projection of head from load \( 1H_2 = 500 \, \text{mm} \)
Load head height below slab \( h_H = 300 \, \text{mm} \)
Load dimension \( c_2 = 550 \, \text{mm} \)

Check shear stress at the load head perimeter

Punching shear force \( V_{Ed} = 2300 \, \text{kN} \)
Shear stress at load head \( \nu_{Ed} = \beta \times V_{Ed} \times 1000 / (u_0 \times d) = 1.401 \, \text{N/mm}^2 \)
Maximum punching shear resistance \( \nu_{Rd_{max}} = 0.5 \times \nu \times f_{cd} = 5.5808 \, \text{N/mm}^2 \)
As \( \nu_{Ed} \leq \nu_{Rd_{max}} \), shear stress at load head perimeter is within the maximum punching shear resistance. Hence satisfactory.
Check shear stress at control perimeter u1 at 2d

from load head vertical face

Reinforcement ratio in x-dir \( p1x = 0.012 \)
Reinforcement ratio in y-dir \( p1y = 0.012 \)
As \( vEd > vRdc \) punching shear reinforcement needs to be provided.

Outer control perimeter where shear links are no longer required

Outer control perimeter \( Uout = \beta VEd \times 1000 / (d \times vRdc) = 11416 \text{ mm} \)
Radius to \( Uout \) \( r_{out} = (Uout - lcf) / (2 \times PI) = 877.93 \text{ mm} \)
The outer perimeter of shear reinforcement required should be placed at a distance not greater than 1.5d from the outer control perimeter \( Uout \).
Radius to outer perimeter of shear reinforcement from the load head vertical face is as follows:
\[ \text{Outper} = r_{out} - 1.5 \times d = 397.93 \text{ mm} \]

Shear links on basic control perimeter u1

Spac.inside 2d control perimeter \( S_t = 450 \text{ mm} \)
Spac.outside control perimeter u1 \( S'_t = 600 \text{ mm} \)
Char yield strength of reinft. \( f_{yk} = 500 \text{ N/mm}^2 \)
Diameter of shear reinforcement \( d_{ail} = 12 \text{ mm} \)
Spacing of links to be used \( s_{pac} = 450 \text{ mm} \)
Use minimum H 12 (113.1 mm²) legs of links @ 450 mm c/c around perimeter u1 (i.e. in the tangential direction).

NOTE:
Punching shear links on perimeter 3 (i.e. at 2d from the load head) shown below are optional and could be omitted. This is because the radius \( \text{Outper} < 1.25 \times d \) (397.93 mm < 400 mm).

**Check shear stress at the load head perimeter**

Punching shear force\( V_{Ed}=2300 \text{ kN} \)
Shear stress at load head\( v_{Ed}=\beta V_{Ed}*1000/(u_0*d)=1.8793 \text{ N/mm}^2 \)
Maximum punching shear resistance\( v_{Rd,max}=0.5*v*f_{cd}=5.5808 \text{ N/mm}^2 \)
As\( v_{Ed} \leq v_{Rd,max} \), shear stress at load head perimeter is within the maximum punching shear resistance. Hence satisfactory.

**Check shear stress at control perimeter \( u_1 \) at 2\( d \)**

from load head vertical face

Reinforcement ratio in x-dir\( p_{1x}=0.012 \)
Reinforcement ratio in y-dir\( p_{1y}=0.012 \)
As\( v_{Ed} > v_{Rd,c} \), punching shear reinforcement needs to be provided.
Outer control perimeter where shear links are no longer required

Outer control perimeter  

Uout = \beta \cdot VEd \cdot 1000 \div (d \cdot vRdc) = 11416 \text{ mm}

Radius to Uout  

rout = (Uout - lcf) \div (2 \cdot PI) = 1116.9 \text{ mm}

The outer perimeter of shear reinforcement required should be placed at a distance not greater than 1.5d from the outer control perimeter Uout. Radius to outer perimeter of shear reinforcement from the load head vertical face is as follows:

Outper = rout - 1.5 \cdot d = 636.94 \text{ mm}

Shear links on basic control perimeter u1

Spac. inside 2d control perimeter  
St = 450 \text{ mm}

Spac. outside control perimeter u1  
St' = 600 \text{ mm}

Char yield strength of reinft.  
fyk = 500 \text{ N/mm}^2

Diameter of shear reinforcement  
dial = 12 \text{ mm}

Spacing of links to be used  
spac = 450 \text{ mm}

Use minimum H 12 (113.1 \text{ mm}^2) legs of links @ 450 mm c/c around perimeter u1 (i.e. in the tangential direction).

Summary of punching shear links

Links on perimeter 1:
Use minimum H 12 (113.1 \text{ mm}^2) legs of links @ 340 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeter 2:
Use minimum H 12 (113.1 \text{ mm}^2) legs of links @ 435 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeter 3:
Use minimum H 12 (113.1 \text{ mm}^2) legs of links @ 450 mm c/c in the tangential direction and 240 mm c/c in the radial direction.
Links on perimeters beyond basic control perimeter u1

Load head dimensions - circular

Internal load:

SECTION THROUGH LOAD HEAD
**Location:** Ex9 - Edge rectangular load with load head

**Punching shear round concentrated load in accordance with EC2**

Calculations are in accordance with Section 6.4 of EC2, Part 1-1.

Partial safety factor (steel) $g_{ams}=1.15$

Partial safety factor (concrete) $g_{mac}=1.5$

Definitions:
- loaded area refers to the cross-sectional area of the column head
- load perimeter refers to the column head perimeter
- load head face refers to the column head face
- face of the load head refers to the face of the column head
- loaded area dimensions refers to column head area dimensions

For circular columns/piles $cx=cy=diameter$ of loaded area

Basic control perimeter is at 2d from the vertical face of the load head.

$Sr$ = spacing of links in the radial direction.

First link perimeter at $\leq 0.5d$ from face of load head.

Link perimeters at $\leq 0.75d$ apart.

$\leq 1.5d$ $\leq 0.5d$

Design applied shear force $V_{Ed}=609.58$ kN

Average effective depth $d=250$ mm

Projection of head from load $l_{H1}=500$ mm

Load head height below slab $h_{H1}=300$ mm

Load dimension $c_{1}=400$ mm

Projection of head from load $l_{H2}=500$ mm

Load head height below slab $h_{H2}=300$ mm

Load dimension $c_{2}=400$ mm

**Check shear stress at the load head perimeter**

Punching shear force $V_{Ed}=609.58$ kN

Shear stress at load head $v_{Ed}=\beta*V_{Ed}*1000/(uo*d)=1.5877$ N/mm²

Maximum punching shear resistance $v_{Rdmax}=0.5*v_{fcd}=5.28$ N/mm²

As $v_{Ed} \leq v_{Rdmax}$, shear stress at load head perimeter is within the maximum punching shear resistance. Hence satisfactory.
Check shear stress at control perimeter u1 at 2d

from load head vertical face

Reinforcement ratio in x-dir \( p_{lx} = 0.0089 \)
Reinforcement ratio in y-dir \( p_{ly} = 0.0069 \)
As \( v_{Ed} > v_{Rdc} \) punching shear reinforcement needs to be provided.

Outer control perimeter where shear links are no longer required

Outer control perimeter \( U_{out} = \beta V_{Ed} \times 1000 / (d \times v_{Rdc}) = 5247.3 \text{ mm} \)
Radius to \( U_{out} \) \( r_{out} = (U_{out} - lcf) / (\pi) = 985.9 \text{ mm} \)
The outer perimeter of shear reinforcement required should be placed at a distance not greater than 1.5d from the outer control perimeter \( U_{out} \).
Radius to outer perimeter of shear reinforcement from the load head vertical face is as follows:
\[ \text{Outper} = r_{out} - 1.5 \times d = 610.9 \text{ mm} \]

Shear links on basic control perimeter u1

Spac.inside 2d control perimeter \( S_t = 350 \text{ mm} \)
Spac.outside control perimeter u1 \( S_t' = 500 \text{ mm} \)
Char yield strength of reinft. \( f_{yk} = 500 \text{ N/mm}^2 \)
Diameter of shear reinforcement \( d_{al} = 8 \text{ mm} \)
Spacing of links to be used \( S_{ac} = 295 \text{ mm} \)
Use minimum H 8 (50.265 mm²) legs of links @ 295 mm c/c around perimeter u1 (i.e. in the tangential direction).

Summary of punching shear links

Links on perimeter 1:
Use minimum H 8 (50.265 mm²) legs of links @ 200 mm c/c in the tangential direction and 185 mm c/c in the radial direction.
Links on perimeter 2:
Use minimum H 8 (50.265 mm²) legs of links @ 245 mm c/c in the tangential direction and 185 mm c/c in the radial direction.

Links on perimeter 3:
Use minimum H 8 (50.265 mm²) legs of links @ 295 mm c/c in the tangential direction and 185 mm c/c in the radial direction.

**Links on perimeters beyond basic control perimeter u1**

Links on perimeter 4:
Use minimum H 8 (50.265 mm²) legs of links @ 340 mm c/c in the tangential direction and 185 mm c/c in the radial direction.

**Load head dimensions - rectangular**

Edge load:

```

+----------------+----------------+-----------------+-----------------
```

**SECTION THROUGH LOAD HEAD (Y-direction)**
**Location:** Ex10 - Corner rectangular load with load head

**Punching shear round concentrated load in accordance with EC2**

Calculations are in accordance with Section 6.4 of EC2, Part 1-1.
Partial safety factor (steel)  \( g_{ams} = 1.15 \)
Partial safety factor (concrete)  \( g_{amc} = 1.5 \)

Definitions:
- loaded area refers to the cross-sectional area of the column head
- load perimeter refers to the column head perimeter
- load head face refers to the column head face
- face of the load head refers to the face of the column head
- loaded area dimensions refers to column head area dimensions

For circular columns/piles
\[ cx = cy = \text{diameter of loaded area} \]

Basic control perimeter is at 2\( d \) from the vertical face of the load head.
\[ Sr = \text{spacing of links in the radial direction.} \]

\[ \leq 1.5d \quad \leq 0.5d \]

Design applied shear force  \( V_{Ed} = 300 \text{ kN} \)
Average effective depth  \( d = 250 \text{ mm} \)
Projection of head from load  \( l_{H1} = 500 \text{ mm} \)
Load head height below slab  \( h_{H} = 300 \text{ mm} \)
Load dimension  \( c_1 = 400 \text{ mm} \)
Projection of head from load  \( l_{H2} = 500 \text{ mm} \)
Load head height below slab  \( h_{H} = 300 \text{ mm} \)
Load dimension  \( c_2 = 400 \text{ mm} \)

**Check shear stress at the load head perimeter**

Punching shear force  \( V_{Ed} = 300 \text{ kN} \)
Shear stress at load head  \[ v_{Ed} = \frac{\beta \cdot V_{Ed} \cdot 1000}{(u_0 \cdot d)} = 2.4 \text{ N/mm}^2 \]
Maximum punching shear resistance  \( v_{Rd_{max}} = 0.5 \cdot v \cdot f_{cd} = 5.28 \text{ N/mm}^2 \)
As  \( v_{Ed} \leq v_{Rd_{max}} \), shear stress at load head perimeter is within the maximum punching shear resistance. Hence satisfactory.
Check shear stress at control perimeter \( u_1 \) at 2d

from load head vertical face

Reinforcement ratio in x-dir \( p_{1x} = 0.0089 \)
Reinforcement ratio in y-dir \( p_{1y} = 0.0069 \)
As \( v_{Ed} > v_{Rdc} \) punching shear reinforcement needs to be provided.

Outer control perimeter where shear links are no longer required

Outer control perimeter \( U_{out} = \beta \cdot V_{Ed} \cdot 1000 / (d \cdot v_{Rdc}) = 2766.9 \text{ mm} \)
Radius to \( U_{out} \) \( r_{out} = (U_{out} - lcf) / (\pi / 2) = 1284 \text{ mm} \)
The outer perimeter of shear reinforcement required should be placed at a distance not greater than 1.5\( d \) from the outer control perimeter \( U_{out} \).
Radius to outer perimeter of shear reinforcement from the load head vertical face is as follows:
\[ \text{Outper} = r_{out} - 1.5 \cdot d = 908.98 \text{ mm} \]

Shear links on basic control perimeter \( u_1 \)

Spac.inside 2d control perimeter \( S_t = 350 \text{ mm} \)
Spac.outside control perimeter \( u_1 \) \( S'_t = 500 \text{ mm} \)
Char yield strength of reinft. \( f_{yk} = 500 \text{ N/mm}^2 \)
 Diameter of shear reinforcement \( d_{al} = 8 \text{ mm} \)
Spacing of links to be used \( s_{pc} = 185 \text{ mm} \)
Use minimum H 8 (50.265 mm\(^2\)) legs of links @ 185 mm c/c around perimeter \( u_1 \) (i.e. in the tangential direction).

Summary of punching shear links

Links on perimeter 1:
Use minimum H 8 (50.265 mm\(^2\)) legs of links @ 110 mm c/c in the tangential direction and 185 mm c/c in the radial direction.
Links on perimeter 2:
Use minimum H 8 (50.265 mm²) legs of links @ 150 mm c/c in the tangential direction and 185 mm c/c in the radial direction.

Links on perimeter 3:
Use minimum H 8 (50.265 mm²) legs of links @ 185 mm c/c in the tangential direction and 185 mm c/c in the radial direction.

**Links on perimeters beyond basic control perimeter ul**

Links on perimeter 4:
Use minimum H 8 (50.265 mm²) legs of links @ 220 mm c/c in the tangential direction and 185 mm c/c in the radial direction.

Links on perimeter 5:
Use minimum H 8 (50.265 mm²) legs of links @ 255 mm c/c in the tangential direction and 185 mm c/c in the radial direction.

Links on perimeter 6:
Use minimum H 8 (50.265 mm²) legs of links @ 290 mm c/c in the tangential direction and 185 mm c/c in the radial direction.

**Load head dimensions - rectangular**

Corner load:

![SECTION THROUGH LOAD HEAD (X-direction)](image)

Corner load:

![SECTION THROUGH LOAD HEAD (Y-direction)](image)
Location: Ex11 - As Ex1 but using circular column 400mm diameter

Punching shear round concentrated load in accordance with EC2

Calculations are in accordance with Section 6.4 of EC2, Part 1-1.
Partial safety factor (steel) $\gamma_{ms} = 1.15$
Partial safety factor (concrete) $\gamma_{mc} = 1.5$

Definitions:
- loaded area refers to the cross-sectional area of the column
- load perimeter refers to the column perimeter
- load face refers to the column face
- face of the load refers to the face of the column
- loaded area dimensions refers to column area dimensions

First link perimeter at $\leq 0.5d$ from face of loaded area.
Link perimeters at $\leq 0.75d$ apart.

$\leq 1.5d$ $\leq 0.5d$

Design applied shear force $V_{Ed} = 1400$ kN
Average effective depth $d = 320$ mm
Dimension of loaded area $cx = 300$ mm
Dimension of loaded area $cy = 300$ mm

Check shear stress at the load perimeter

Punching shear force $V_{Ed} = 1400$ kN
Shear stress at load perimeter $v_{Ed} = \beta_{v} V_{Ed} \times 1000/(u_{o}d) = 4.1927$ N/mm²
Maximum punching shear resistance $V_{RD_{max}} = 0.5v_{fcd} = 5.5808$ N/mm²
As $v_{Ed} \leq v_{RD_{max}}$, shear stress at load perimeter is within the maximum punching shear resistance. Hence satisfactory.

Check shear stress at control perimeter $u_1$ at 2d from load face

Reinforcement ratio in x-dir $p_{lx} = 0.012$
Reinforcement ratio in y-dir $p_{ly} = 0.012$
As $v_{Ed} > v_{Rdc}$ punching shear reinforcement needs to be provided.

Outer control perimeter where shear links are no longer required
Outer control perimeter

\[ U_{out} = \beta \cdot V_{Ed} \cdot 1000 / (d \cdot v_{Rdc}) = 6949 \text{ mm} \]

Radius to \( U_{out} \)

\[ r_{out} = (U_{out} - l_{cf}) / (2 \cdot \pi) = 914.98 \text{ mm} \]

The outer perimeter of shear reinforcement should be at a distance not greater than 1.5d from the outer control perimeter \( U_{out} \). Radius to outer perimeter of shear reinforcement \( Out_{per} = r_{out} - 1.5 \cdot d \)

= 434.98 mm from load face

**Shear links on basic control perimeter u1**

- Spac.inside 2d control perimeter \( St = 450 \text{ mm} \)
- Spac.outside control perimeter u1 \( St' = 600 \text{ mm} \)
- Char yield strength of reinft. \( f_{yk} = 500 \text{ N/mm}^2 \)
- Diameter of shear reinforcement \( d_{al} = 12 \text{ mm} \)
- Spacing of links to be used \( s_{pc} = 450 \text{ mm} \)

Use minimum H 12 (113.1 mm²) legs of links @ 450 mm c/c around perimeter u1 (i.e. in the tangential direction).

**Summary of punching shear links**

In the following calculation the first perimeter will be taken at 0.5d from the face of the load and subsequent perimeters will be spaced at 0.75d apart.

![Diagram of shear links](attachment: shear_links_diagram.png)

Links on perimeter 1:
Use minimum H 12 (113.1 mm²) legs of links @ 230 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeter 2:
Use minimum H 12 (113.1 mm²) legs of links @ 390 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeter 3:
Use minimum H 12 (113.1 mm²) legs of links @ 450 mm c/c in the tangential direction and 240 mm c/c in the radial direction.
Links on perimeters beyond basic control perimeter u1
Location: Ex12 - Assume zero load head dimensions (lH=hH=0 mm)

Punching shear round concentrated load in accordance with EC2

Calculations are in accordance with Section 6.4 of EC2, Part 1-1.
Partial safety factor (steel) \( g_{ams} = 1.15 \)
Partial safety factor (concrete) \( g_{mc} = 1.5 \)

Definitions:
- loaded area refers to the cross-sectional area of the column head

For circular columns/piles
\( cx = cy = \text{diameter of loaded area} \)

Basic control perimeter is at 2d from the vertical face of the load head.
\( Sr = \text{spacing of links in the radial direction.} \)

\( \leq 1.5d \)
\( \leq 0.5d \)

Design applied shear force \( V_{Ed} = 1400 \text{ kN} \)
Average effective depth \( d = 320 \text{ mm} \)
Projection of head from load \( l_H = 0 \text{ mm} \)
Load head height below slab \( h_H = 0 \text{ mm} \)
Load dimension (i.e. diameter) \( c = 400 \text{ mm} \)

Check shear stress at the load head perimeter

Punching shear force \( V_{Ed} = 1400 \text{ kN} \)
Shear stress at load head \( v_{Ed} = \beta \frac{V_{Ed} \cdot 1000}{(u_0 \cdot d)} = 4.0037 \text{ N/mm}^2 \)
Maximum punching shear resistance \( v_{Rdmax} = 0.5 \cdot v \cdot f_{cd} = 5.5808 \text{ N/mm}^2 \)
As \( v_{Ed} \leq v_{Rdmax} \), shear stress at load head perimeter is within the maximum punching shear resistance. Hence satisfactory.

Check shear stress at control perimeter \( u_1 \) at 2d from load head vertical face

Reinforcement ratio in x-dir \( p_{lx} = 0.012 \)
Reinforcement ratio in y-dir \( p_{ly} = 0.012 \)
As \( v_{Ed} > v_{Rd} \) punching shear reinforcement needs to be provided.
Outer control perimeter where shear links are no longer required

Outer control perimeter \( \text{Uout}=\beta VEd*1000/(d*vRdc) = 6949 \text{ mm} \)
Radius to \( \text{Uout} \) \( \text{rout}=(\text{Uout}-lcf)/(2*\text{PI}) = 905.96 \text{ mm} \)
The outer perimeter of shear reinforcement required should be placed at a distance not greater than 1.5d from the outer control perimeter \( \text{Uout} \).
Radius to outer perimeter of shear reinforcement from the load head vertical face is as follows:
\( \text{Outper} = \text{rout}-1.5*d = 425.96 \text{ mm} \)

Shear links on basic control perimeter \( \text{u1} \)

Spac.inside 2d control perimeter \( \text{St}=450 \text{ mm} \)
Spac.outside control perimeter \( \text{u1} \) \( \text{St}'=600 \text{ mm} \)
Char yield strength of reinft. \( \text{fyk}=500 \text{ N/mm}^2 \)
Diameter of shear reinforcement \( \text{dial}=12 \text{ mm} \)
Spacing of links to be used \( \text{spac}=450 \text{ mm} \)
Use minimum H 12 (113.1 mm²) legs of links @ 450 mm c/c around perimeter \( \text{u1} \) (i.e. in the tangential direction).

Summary of punching shear links

Links on perimeter 1:
Use minimum H 12 (113.1 mm²) legs of links @ 240 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeter 2:
Use minimum H 12 (113.1 mm²) legs of links @ 405 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeter 3:
Use minimum H 12 (113.1 mm²) legs of links @ 450 mm c/c in the tangential direction and 240 mm c/c in the radial direction.
Links on perimeters beyond basic control perimeter ul
Location: Ex13 - As Ex1 but with opening near loaded area

Punching shear round concentrated load in accordance with EC2

Calculations are in accordance with Section 6.4 of EC2, Part 1-1.
Partial safety factor (steel) gams=1.15
Partial safety factor (concrete) gamc=1.5

Definitions:
- loaded area refers to the cross-sectional area of the column
- load perimeter refers to the column perimeter
- load face refers to the column face
- face of the load refers to the face of the column
- loaded area dimensions refers to column area dimensions

\[ cx \text{ and } cy \text{ are the loaded area dimensions.} \]
\[ \text{Basic control perimeter is at 2d from the face of the loaded area.} \]
\[ Sr = \text{spacing of links in the radial direction.} \]

First link perimeter at \( \leq 0.5d \) from face of loaded area.
Link perimeters at \( \leq 0.75d \) apart.

Design applied shear force \( VEd=2300 \text{ kN} \)
Average effective depth \( d=320 \text{ mm} \)
Dimension of loaded area \( cx=400 \text{ mm} \)
Dimension of loaded area \( cy=550 \text{ mm} \)

Check shear stress at the load perimeter

Punching shear force \( VEd=2300 \text{ kN} \)
Shear stress at load perimeter \( vEd=\beta*VEd*1000/(\muo*d)=4.3503 \text{ N/mm}^2 \)
Maximum punching shear resistance \( VRdmax=0.5*v*fcd=5.5808 \text{ N/mm}^2 \)
As \( VEd \leq VRdmax \), shear stress at load perimeter is within the maximum punching shear resistance. Hence satisfactory.
Ineffective perimeter due to opening

For loaded areas situated near openings the ineffective perimeter needs to be considered in the punching shear calculation (Clause 6.4.2(3)).

![Diagram of ineffective perimeter]

\[ L = 1500 \text{ mm} \]
\[ \leq 6d \]

The part of the control perimeter contained between the two tangents drawn to the outline of the opening from the centre of the loaded area considered to be ineffective is:

\[ \text{Ineffective perimeter} = \frac{2 \times d + L_3}{2} \times L_2 \times (L + L_3/2) = 197.65 \text{ mm} \]

Check shear stress at control perimeter \( u_1 \) at 2d from load face

Reinforcement ratio in x-dir \( p_{1x} = 0.012 \)
Reinforcement ratio in y-dir \( p_{1y} = 0.012 \)
As \( v_{Ed} > v_{Rdc} \) punching shear reinforcement needs to be provided.

Outer control perimeter where shear links are no longer required

Outer control perimeter \( U_{out} = \beta \times V_{Ed} \times 1000 / (d \times v_{Rdc}) = 11416 \text{ mm} \)
Radius to \( U_{out} \) \( \text{rou}= (U_{out} - lcf) / (2 \times PI) = 1514.5 \text{ mm} \)

The outer perimeter of shear reinforcement should be at a distance not greater than 1.5d from the outer control perimeter \( U_{out} \). Radius to outer perimeter of shear reinforcement \( \text{Outper}= \text{rou} - 1.5 \times d = 1034.5 \text{ mm} \) from load face

Shear links on basic control perimeter \( u_1 \)

Spac.inside 2d control perimeter \( \text{St}=450 \text{ mm} \)
Spac.outside control perimeter \( u_1 \) \( \text{St}'=600 \text{ mm} \)
Char yield strength of reinft. \( f_{yk}=500 \text{ N/mm}^2 \)
Diameter of shear reinforcement \( \text{dial}=12 \text{ mm} \)
Spacing of links to be used \( \text{spac}=255 \text{ mm} \)
Use minimum H 12 (113.1 mm²) legs of links @ 255 mm c/c around perimeter \( u_1 \) (i.e. in the tangential direction).
Summary of punching shear links

In the following calculation the first perimeter will be taken at 0.5d from the face of the load and subsequent perimeters will be spaced at 0.75d apart.

Links on perimeter 1:
Use minimum H 12 (113.1 mm²) legs of links @ 125 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeter 2:
Use minimum H 12 (113.1 mm²) legs of links @ 190 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeter 3:
Use minimum H 12 (113.1 mm²) legs of links @ 255 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeters beyond basic control perimeter u1

Links on perimeter 4:
Use minimum H 12 (113.1 mm²) legs of links @ 320 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeter 5:
Use minimum H 12 (113.1 mm²) legs of links @ 390 mm c/c in the tangential direction and 240 mm c/c in the radial direction.
Punching shear round concentrated load in accordance with EC2

Calculations are in accordance with Section 6.4 of EC2, Part 1-1.
Partial safety factor (steel)  $g_{ams} = 1.15$
Partial safety factor (concrete)  $g_{mc} = 1.5$

Projection of head from load  $1H = 500 \text{ mm}$
Load head height below slab  $h_H = 300 \text{ mm}$
Load dimension (i.e. diameter)  $c = 400 \text{ mm}$

Check shear stress at the load head perimeter

Punching shear force  $V_{Ed} = 2300 \text{ kN}$
Shear stress at load head  $v_{Ed} = \beta \cdot V_{Ed} \cdot 1000/(u_0 \cdot d) = 1.8793 \text{ N/mm}^2$
Maximum punching shear resistance  $V_{Rd,max} = 0.5 \cdot v \cdot f_{cd} = 5.5808 \text{ N/mm}^2$
As $v_{Ed} \leq V_{Rd,max}$, shear stress at load head perimeter is within the maximum punching shear resistance. Hence satisfactory.
Ineffective perimeter due to opening

For loaded areas situated near openings the ineffective perimeter needs to be considered in the punching shear calculation (Clause 6.4.2(3)).

\[
\text{Ineffective perimeter} \quad \text{ip}(3) = \frac{(2*d + L3/2) * L2}{L + L3/2} = 487.27 \text{ mm}
\]

Check shear stress at control perimeter \( u_1 \) at 2d

from load head vertical face

Reinforcement ratio in x-dir \( p_{1x} = 0.012 \)
Reinforcement ratio in y-dir \( p_{1y} = 0.012 \)
As \( v_{Ed} > v_{Rdc} \) punching shear reinforcement needs to be provided.

Outer control perimeter where shear links are no longer required

Outer control perimeter \( U_{out} = \beta V_{Ed} * 1000 / (d * v_{Rdc}) = 11416 \text{ mm} \)
Radius to \( U_{out} \) \( r_{out} = (U_{out} - lcf) / (2 * \pi) = 1116.9 \text{ mm} \)
The outer perimeter of shear reinforcement required should be placed at a distance not greater than 1.5d from the outer control perimeter \( U_{out} \).
Radius to outer perimeter of shear reinforcement from the load head vertical face is as follows:
\( \text{Outper} = r_{out} - 1.5d = 636.94 \text{ mm} \)

Shear links on basic control perimeter \( u_1 \)

Spac.inside 2d control perimeter \( S_t = 450 \text{ mm} \)
Spac.outside control perimeter \( u_1 \) \( S_t' = 600 \text{ mm} \)
Char yield strength of reinft. \( f_yk = 500 \text{ N/mm}^2 \)
Diameter of shear reinforcement \( d_{al} = 12 \text{ mm} \)
Spacing of links to be used \( s_{pac} = 450 \text{ mm} \)
Use minimum H 12 (113.1 mm²) legs of links @ 450 mm c/c around perimeter \( u_1 \) (i.e. in the tangential direction).
Summary of punching shear links

Links on perimeter 1:
Use minimum H 12 (113.1 mm²) legs of links @ 300 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeter 2:
Use minimum H 12 (113.1 mm²) legs of links @ 380 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeter 3:
Use minimum H 12 (113.1 mm²) legs of links @ 450 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeters beyond basic control perimeter ul

Load head dimensions - circular

Internal load:

SECTION THROUGH LOAD HEAD
Location: Ex15 - As Ex13 but with edge load

Punching shear round concentrated load in accordance with EC2

Calculations are in accordance with Section 6.4 of EC2, Part 1-1.
Partial safety factor (steel)  \( g_{ams} = 1.15 \)
Partial safety factor (concrete)  \( g_{amc} = 1.5 \)

Definitions:
- loaded area refers to the cross-sectional area of the column
- load perimeter refers to the column perimeter
- load face refers to the column face
- face of the load refers to the face of the column
- loaded area dimensions refers to column area dimensions

Design applied shear force \( V_Ed = 1000 \text{ kN} \)
Average effective depth \( d = 320 \text{ mm} \)
Dimension of loaded area \( cx = 400 \text{ mm} \)
Dimension of loaded area \( cy = 550 \text{ mm} \)

Check shear stress at the load perimeter

Punching shear force \( V_Ed = 1000 \text{ kN} \)
Load dimension \( c_1 = 400 \text{ mm} \)
Load dimension \( c_2 = 550 \text{ mm} \)
Shear stress at load perimeter \( v_Ed = \beta V_Ed * 1000 / (u_o * d) = 3.2407 \text{ N/mm}^2 \)
Maximum punching shear resistance \( v_Rd_{max} = 0.5 * v * f_{cd} = 5.5808 \text{ N/mm}^2 \)
As \( v_Ed \leq v_Rd_{max} \), shear stress at load perimeter is within the maximum punching shear resistance. Hence satisfactory.
**Ineffective perimeter due to opening**

For loaded areas situated near openings the ineffective perimeter needs to be considered in the punching shear calculation (Clause 6.4.2(3)).

![Diagram of ineffective perimeter due to opening]

- L3 = 400 mm
- Loaded area dimension
- The part of the control perimeter contained between the two tangents drawn to the outline of the opening from the centre of the loaded area considered to be ineffective is:
  
  $\text{Effective perimeter} = (2d + \frac{L3}{2}) \times L2 = 197.65$ mm

**Check shear stress at control perimeter u1 at 2d from load face**

- Reinforcement ratio in x-dir $p1x = 0.012$
- Reinforcement ratio in y-dir $p1y = 0.012$
- As $vEd > vRdc$ punching shear reinforcement needs to be provided.

**Outer control perimeter where shear links are no longer required**

- Outer control perimeter $Uout = \beta \frac{VEd \times 1000}{(d \times vRdc)} = 6042.6$ mm
- Radius to $Uout = \frac{(Uout - lcf)}{(\pi)} = 1493.7$ mm
- The outer perimeter of shear reinforcement should be at a distance not greater than 1.5d from the outer control perimeter $Uout$. Radius to outer perimeter of shear reinforcement $Outer = \frac{rout - 1.5 \times d}{1013.7}$ mm from load face

**Shear links on basic control perimeter u1**

- Spac.inside 2d control perimeter $St = 450$ mm
- Spac.outside control perimeter u1 $St' = 600$ mm
- Char yield strength of reinft. $f_yk = 500$ N/mm$^2$
- Diameter of shear reinforcement $dial = 12$ mm
- Spacing of links to be used $spac = 255$ mm
- Use minimum H 12 (113.1 mm$^2$) legs of links @ 255 mm c/c around perimeter u1 (i.e. in the tangential direction).
Summary of punching shear links

In the following calculation the first perimeter will be taken at 0.5d from the face of the load and subsequent perimeters will be spaced at 0.75d apart.

Links on perimeter 1:
Use minimum H 12 (113.1 mm²) legs of links @ 155 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeter 2:
Use minimum H 12 (113.1 mm²) legs of links @ 215 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeter 3:
Use minimum H 12 (113.1 mm²) legs of links @ 255 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeters beyond basic control perimeter u1

Links on perimeter 4:
Use minimum H 12 (113.1 mm²) legs of links @ 350 mm c/c in the tangential direction and 240 mm c/c in the radial direction.

Links on perimeter 5:
Use minimum H 12 (113.1 mm²) legs of links @ 410 mm c/c in the tangential direction and 240 mm c/c in the radial direction.
**Location:** Ex1 - Low moment, high axial load & shear on small section

NOTE: According to BS8110 Clause 3.12.7.3, circular links or spiral reinforcement passing round all bars provide adequate lateral support in circular columns.
Location: Ex1 - Low moment, high axial load & shear on small section

Design of annular short column to EN 1992-1-1

Bars are assumed located at mid-thickness of wall section. Calculations for reinforcement are in accordance with EC2-1-1 and the IStructE/ICE 'Manual for the design of reinforced concrete building structures'. Min. steel = six bars arranged symmetrically. Any greater number of bars (eight shown) increases resistance moment of section.

Design ultimate moment \( M_{Ed} = 0 \) kNm
Shear force \( V_{Ed} = 275 \) kN
Design ultimate axial load \( N_{Ed} = 2200 \) kN
Effective height of column \( l = 4.5 \) m
Partial safety factor for steel \( \gamma_{ams} = 1.15 \)
Partial safety factor for conc. \( \gamma_{amc} = 1.5 \)
Diameter of cross-section \( h = 300 \) mm
Wall thickness \( h_2 = 125 \) mm
Char yield strength of r'ment \( f_yk = 500 \) N/mm²
Char yield strength of links \( f_yk' = 500 \) N/mm²
Diameter of longitudinal r'ment \( dia = 25 \) mm
Diameter of column links \( dial = 8 \) mm

Slenderness - EC2 Clause 5.8.3.2

About Y-Y axis:
Column is considered to be braced about the stronger axis.
Effective height \( l_{oy} = \beta_{ty} \times l \times 1000 = 4500 \) mm

About Z-Z axis:
Column is considered to be braced about the weaker axis.
Effective height \( l_{oz} = \beta_{tz} \times l \times 1000 = 4500 \) mm

Check slenderness

For Y-Y stronger axis:
Slenderness \( l_{amy} = l_{oy} / i_{y} = 59.184 \)
Smaller initial end moment \( M_{1} = 0 \) kNm
Limiting slenderness \( l_{amy} = 20 \times A \times B \times C / n^{0.5} = 32.565 \)
Column is classified as being slender in accordance with EC2 Part 1-1.

For Z-Z weaker axis:
Slenderness \( l_{amz} = l_{oz} / i_{z} = 59.184 \)
Limiting slenderness \( l_{amz} = 20 \times A \times B \times C / n^{0.5} = 32.565 \)
Column is classified as being slender in accordance with EC2 Part 1-1.
Design moments - Clause 5.8.8.2

Imperfections eccentricity \( e_1 = \frac{\text{loy}}{400} = 11.25 \text{ mm} \)
Load \( N_{Ed} \) eccentricity \( e_0 = \frac{h}{30} = 10 \text{ mm} \)
Design moment (\( y-y \) axis) \( M_{Ed} = Mo^2 \times 10^{-6} = 44 \text{ kNm} \)
Main steel diameter \( \text{dia} = 25 \text{ mm} \)
Number of bars to be provided \( \text{NumBar} = 6 \)

Shear in column - EN 1992-1-1 Clause 6.2

Shear resistance:
\[
VR_{dc} = (CR_{dc} \times k_s \times v_{Rdc} + 0.15 \times N_{Ed} \times 1000/A_c) \times bw \times d / 1000 = 343.99 \text{ kN}
\]

SHEAR SUMMARY

<table>
<thead>
<tr>
<th></th>
<th>Shear force</th>
<th>Shear resistance</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>275 kN</td>
<td>343.99 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.
No calculated reinforcement is required to resist shear. Provide nominal links passing round all column vertical bars.

Transverse reinforcement (links)

Maximum spacing is the minimum of the following distances:
Based on main bar diameter \( s_{mx1} = 20 \times \text{dia} = 500 \text{ mm} \)
Minimum column dimension \( s_{mx2} = h = 300 \text{ mm} \)
Maximum dimension \( s_{mx3} = 400 \text{ mm} \)
Maximum spacing of links \( s_v = 300 \text{ mm} \)
This spacing should be reduced by a factor of 0.6 within a distance equal to the larger dimension of the column cross-section above or below a beam or slab.

</table>

NOTE 1: Circular links or spiral reinforcement passing round all bars provide adequate lateral support in circular columns.

NOTE 2: The percentage of steel provided is 4.2857 % which is greater than the 4% maximum limit. However this is acceptable provided that the concrete can be placed and compacted sufficiently.
Location: Ex2 - High moment and no axial load with mild steel

Design of annular short column to EN 1992-1-1

Bars are assumed located at mid-thickness of wall section. Calculations for reinforcement are in accordance with EC2-1-1 and the IStructE/ICE 'Manual for the design of reinforced concrete building structures'. Min. steel = six bars arranged symmetrically. Any greater number of bars (eight shown) increases resistance moment of section.

Design ultimate moment \( M_{Ed} = 10000 \text{ kNm} \)
Shear force \( V_{Ed} = 500 \text{ kN} \)
Design ultimate axial load \( N_{Ed} = 0 \text{ kN} \)
Effective height of column \( l = 10 \text{ m} \)
Partial safety factor for steel \( \gamma_{ms} = 1.15 \)
Partial safety factor for conc. \( \gamma_{mc} = 1.5 \)
Diameter of cross-section \( h = 2000 \text{ mm} \)
Wall thickness \( h_2 = 325 \text{ mm} \)
Char yield strength of r'ment \( f_{yk} = 500 \text{ N/mm}^2 \)
Char yield strength of links \( f_{yk}' = 500 \text{ N/mm}^2 \)
Diameter of longitudinal r'ment \( \text{dia} = 40 \text{ mm} \)
Diameter of column links \( \text{dial} = 10 \text{ mm} \)

Slenderness - EC2 Clause 5.8.3.2

About Y-Y axis:
Column is considered to be braced about the stronger axis.
Effective height \( l_{oy} = \text{bety} \cdot l \cdot 1000 = 7500 \text{ mm} \)

About Z-Z axis:
Column is considered to be braced about the weaker axis.
Effective height \( l_{oz} = \text{betz} \cdot l \cdot 1000 = 7500 \text{ mm} \)

Check slenderness

For Y-Y stronger axis:
Slenderness \( \lambda_{my} = l_{oy} / i_{y} = 12.433 \)
Smaller initial end moment \( M_1 = 0 \text{ kNm} \)
Limiting slenderness \( \lambda_{my} = 20 \cdot A \cdot B \cdot C / n^{0.5} = 13205 \)
Column is classified as being short in accordance with EC2 Part 1-1.

For Z-Z weaker axis:
Slenderness \( \lambda_{lz} = l_{oz} / i_{z} = 12.433 \)
Limiting slenderness \( \lambda_{lz} = 20 \cdot A \cdot B \cdot C / n^{0.5} = 13205 \)
Column is classified as being short in accordance with EC2 Part 1-1.
WARNING: Check on validity of the input values

Ratio of reinforcement term       nu=1.1353
Relative axial force              n=4.1275E-6
Value of n at maximum moment     nbal=0.4
Correction factor for axial load  Kr=(nu-n)/(nu-nbal)
                                  =1.544

As this value is high, design the section as a beam.
Location: Ex3 - Typical jetty piles

Design of annular short column to EN 1992-1-1

Bars are assumed located at mid-thickness of wall section. Calculations for reinforcement are in accordance with EC2-1-1 and the IStructE/ICE 'Manual for the design of reinforced concrete building structures'. Min. steel = six bars arranged symmetrically. Any greater number of bars (eight shown) increases resistance moment of section.

Design ultimate moment MEd=120 kNm
Shear force VEd=50 kN
Design ultimate axial load NEd=2460 kN
Effective height of column l=5 m
Partial safety factor for steel gams=1.15
Partial safety factor for conc. gamc=1.5
Diameter of cross-section h=350 mm
Wall thickness h2=150 mm
Char yield strength of r'ment fyk=500 N/mm²
Char yield strength of links fyk'=500 N/mm²
Diameter of longitudinal r'ment dia=32 mm
Diameter of column links dial=8 mm

Slenderness - EC2 Clause 5.8.3.2

About Y-Y axis:
Column is considered to be braced about the stronger axis.
Effective height loy=bety*l*1000=3750 mm

About Z-Z axis:
Column is considered to be braced about the weaker axis.
Effective height loz=betz*l*1000=3750 mm

Check slenderness

For Y-Y stronger axis:
Slenderness lamy=loy/iy=42.426
Smaller initial end moment M1=0 kNm
Limiting slenderness lamly=20*A*B*C/n^0.5=38.185
Column is classified as being slender in accordance with EC2 Part 1-1.

For Z-Z weaker axis:
Slenderness lamz=loz/iz=42.426
Limiting slenderness lamlz=20*A*B*C/n^0.5=38.185
Column is classified as being slender in accordance with EC2 Part 1-1.
Design moments - Clause 5.8.8.2

Imperfections eccentricity \( e_1 = \frac{lo_y}{400} = 9.375 \text{ mm} \)
Load \( N_{Ed} \) eccentricity \( e_0 = \frac{h}{30} = 11.667 \text{ mm} \)
Design moment (\( y-y \) axis) \( M_{Ed} = Mo^2 \times 10^{-6} = 143.06 \text{ kNm} \)
Main steel diameter \( \text{dia} = 32 \text{ mm} \)
Number of bars to be provided \( \text{NumBar} = 7 \)

Shear in column - EN 1992-1-1 Clause 6.2

Shear resistance:
\[
VR_{dc} = (CR_{dc} \times ks \times v_{Rdc} + 0.15 \times N_{Ed} \times 1000 / Ac) \times bw \times d / 1000 = 402.04 \text{ kN}
\]

<table>
<thead>
<tr>
<th>SHEAR SUMMARY</th>

</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.
No calculated reinf'ment is required to resist shear. Provide nominal links passing round all column vertical bars.

Transverse reinforcement (links)

Maximum spacing is the minimum of the following distances:
Based on main bar diameter \( smx_1 = 20 \times \text{dia} = 640 \text{ mm} \)
Minimum column dimension \( smx_2 = h = 350 \text{ mm} \)
Maximum dimension \( smx_3 = 400 \text{ mm} \)
Maximum spacing of links \( sv = 350 \text{ mm} \)
This spacing should be reduced by a factor of 0.6 within a distance equal to the larger dimension of the column cross-section above or below a beam or slab.

Reinforcement summary

| VERTICAL | Characteristic strength | 500 \text{ N/mm}^2 |
| REINFORCEMENT SUMMARY | Number of bars | 7 |
| Diameter of bars | 32 \text{ mm} |
| Area of steel required | 5452.9 \text{ mm}^2 |
| Area of steel provided | 5629.7 \text{ mm}^2 |
| Percentage provided | 5.9733 % |
| Weight of main bars | 44.193 kg/m |

| LINK | Characteristic strength | 500 \text{ N/mm}^2 |
| REINFORCEMENT SUMMARY | Diameter of links | 8 \text{ mm} |
| Spacing | 350 \text{ mm} |
| Weight of links (approx) | 1.2184 kg/m |
| Total weight of steel | 45.412 kg/m |

NOTE 1: Circular links or spiral reinforcement passing round all bars provide adequate lateral support in circular columns.

NOTE 2: The percentage of steel provided is 5.9733 % which is greater than the 4% maximum limit. However this is acceptable provided that the concrete can be placed and compacted sufficiently.
**Location:** Ex4 - As Ex1 but with user defined cover

**Design of annular short column to EN 1992-1-1**

Bars are assumed located at mid-thickness of wall section. Calculations for reinforcement are in accordance with EC2-1-1 and the IStructE/ICE 'Manual for the design of reinforced concrete building structures'. Min. steel = six bars arranged symmetrically. Any greater number of bars (eight shown) increases resistance moment of section.

Design ultimate moment \( M_{Ed} = 0 \) kNm
Shear force \( V_{Ed} = 275 \) kN
Design ultimate axial load \( N_{Ed} = 2200 \) kN
Effective height of column \( l = 4.5 \) m
Partial safety factor for steel \( \gamma_{ms} = 1.15 \)
Partial safety factor for conc. \( \gamma_{mc} = 1.5 \)
Diameter of cross-section \( h = 300 \) mm
Wall thickness \( h_{2} = 125 \) mm
Char yield strength of r’ment \( f_{yk} = 500 \) N/mm²
Char yield strength of links \( f_{yk}' = 500 \) N/mm²
Diameter of longitudinal r’ment \( d_{ia} = 25 \) mm
Diameter of column links \( d_{ial} = 8 \) mm
Nominal cover to all steel \( c = 25 \) mm

**Slenderness - EC2 Clause 5.8.3.2**

About Y-Y axis:
Column is considered to be braced about the stronger axis.
Effective height \( \ell_{oy} = b_{ey} \times l \times 1000 = 4500 \) mm

About Z-Z axis:
Column is considered to be braced about the weaker axis.
Effective height \( \ell_{oz} = b_{etz} \times l \times 1000 = 4500 \) mm

**Check slenderness**

For Y-Y stronger axis:
Slenderness \( \lambda_{my} = \ell_{oy} / i_{y} = 59.184 \)
Smaller initial end moment \( M_{1} = 0 \) kNm
Limiting slenderness \( \lambda_{my} = 20 \times A \times B \times C / n^{0.5} = 31.309 \)
Column is classified as being slender in accordance with EC2 Part 1-1.

For Z-Z weaker axis:
Slenderness \( \lambda_{mz} = \ell_{oz} / i_{z} = 59.184 \)
Limiting slenderness \( \lambda_{mz} = 20 \times A \times B \times C / n^{0.5} = 31.309 \)
Column is classified as being slender in accordance with EC2 Part 1-1.
Design moments - Clause 5.8.8.2

- Imperfections eccentricity: $e_1 = \frac{loy}{400} = 11.25$ mm
- Load NEd eccentricity: $e_0 = \frac{h}{30} = 10$ mm
- Design moment (y-y axis): $M_{Ed} = M_0^2 \times 10^{-6} = 44$ kNm
- Main steel diameter: $dia = 20$ mm
- Number of bars to be provided: $NumBar = 12$

Shear in column - EN 1992-1-1 Clause 6.2

- Shear resistance:
  
  $VR_{dc} = (CR_{dc} \times ks \times v_{Rdc} + 0.15 \times N_{Ed} \times 1000 \times Ac) \times bw \times d / 1000 = 339.77$ kN

<table>

<th>SHEAR SUMMARY</th>
<th>Shear force</th>
<th>275 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>339.77 kN</td>
<td></td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.
No calculated reinforcement is required to resist shear. Provide nominal links passing round all column vertical bars.

Transverse reinforcement (links)

- Maximum spacing is the minimum of the following distances:
  - Based on main bar diameter: $smx_1 = 20 \times dia = 400$ mm
  - Minimum column dimension: $smx_2 = h = 300$ mm
  - Maximum dimension: $smx_3 = 400$ mm
  - Maximum spacing of links: $sv = 300$ mm

  This spacing should be reduced by a factor of 0.6 within a distance equal to the larger dimension of the column cross-section above or below a beam or slab.

NOTE 1: Circular links or spiral reinforcement passing round all bars provide adequate lateral support in circular columns.

NOTE 2: The percentage of steel provided is 5.4857 % which is greater than the 4% maximum limit. However this is acceptable provided that the concrete can be placed and compacted sufficiently.
Location: Column A3 (1st-2nd floor)

Short braced rectangular column subjected to biaxial bending and thrust

Design to BS8110(1997) with partial safety factor for steel $\gamma_S = 1.15$

The calculations for uniaxial or biaxial bending and axial force are in accordance with Clause 3.8.4.5 of BS8110, and are undertaken using data similar to that used to prepare the design charts in the IStructE/ICE 'Manual for the design of reinforced concrete building structures'.

- Depth of cross-section: $h = 600$ mm
- Width of cross-section: $b = 500$ mm
- Size of main bars: $\text{dia} = 25$ mm
- Chosen size of links: $\text{dial} = 10$ mm
- Characteristic concrete strength: $f_{\text{cu}} = 30$ N/mm$^2$
- Characteristic steel strength: $f_y = 500$ N/mm$^2$
- Designated exposure class is XC2
- Specified fixing tolerance: $\text{tol} = 10$ mm
- Nominal concrete cover: $\text{cover} = 35$ mm
- Effective depth about X-X axis: $h' = 542.5$ mm
- Effective depth about Y-Y axis: $b' = 442.5$ mm
- Design ultimate axial load: $N = 1600$ kN
- Ultimate moment about X-X axis: $M_x = 300$ kNm
- Ultimate moment about Y-Y axis: $M_y = 200$ kNm
- Effective height of column: $h_e = 3$ m
- Normal-weight concrete. Critical slenderness ratio for short braced column is 15 (see Clause 3.8.1.3 of BS8110: Part 1).

Maximum allowable effective height for braced short column: $h_{\text{el}} = b' \times \text{factor}/1000 = 7.5$ m

Consider bending about X-X axis, as $M_x/h'$ is not less than $M_y/b'$

Minimum permissible eccentricity: $\text{eccmn} = 20$ mm
As this is less than $0.05 \times h'$ (see Clause 3.8.2.4), adopt this value.
Eccentricity of applied load: $\text{eccx} = 1000 \times M_x / N = 187.5$ mm
As this exceeds the min.permissible value, design for this eccentricity.

Clause 3.12.7.2 states that links must pass round every corner bar and each alternate bar, and also that no bar may be more than 150 mm from a bar that is restrained by a link. Thus a set of at least 2 links must be provided at not more than the spacing specified above.

NOTE: As the distance between the bars exceeds 400 mm, a check on cracking may be necessary, if the face is in tension under service loading otherwise use smaller bars, more closely spaced.

Approx. total wt. of steel 31.505 kg/m
Location: Small square column. Max. high-yield steel. High mom & load

Short braced rectangular column subjected to biaxial bending and thrust

Design to BS8110(1997) with partial safety factor for steel $\gamma_S=1.15$

The calculations for uniaxial or biaxial bending and axial force are in accordance with Clause 3.8.4.5 of BS8110, and are undertaken using data similar to that used to prepare the design charts in the IStructE/ICE 'Manual for the design of reinforced concrete building structures'.

Width of cross section $b=200$ mm
Size of main bars $\text{dia}=16$ mm
Chosen size of links $\text{dial}=8$ mm
Characteristic concrete strength $f_{\text{cu}}=60$ N/mm$^2$
Characteristic steel strength $f_y=500$ N/mm$^2$
Designated exposure class is XC1
Specified fixing tolerance $\text{tol}=10$ mm
Nominal concrete cover $\text{cover}=25$ mm
Effective depth about X-X axis $h'=159$ mm
Effective depth about Y-Y axis $b'=159$ mm
Design ultimate axial load $N=400$ kN
Ultimate moment about X-X axis $M_x=41$ kNm
Ultimate moment about Y-Y axis $M_y=41$ kNm
Effective height of column $h_e=3$ m
Normal-weight concrete. Critical slenderness ratio for short braced column is 15 (see Clause 3.8.1.3 of BS8110: Part 1).

Maximum allowable effective height for braced short column $h_{\text{all}}=b'\times \text{factor}/1000=3$ m

Consider bending about X-X axis, as $M_x/h'$ is not less than $M_y/b'$

Minimum permissible eccentricity $\text{eccmn}_{X}=h\times 0.05=10$ mm
As this is less than 20 mm (see Clause 3.8.2.4), adopt this value.
Eccentricity of applied load $\text{eccx}=1000\times M_x/N=102.5$ mm
As this exceeds the min. permissible value, design for this eccentricity.
Design of main bars

Actual steel percentage required  \( p = 100 \times \alpha \frac{f_{cu}}{f_y} = 5.0866\% \)
Required area of reinforcement  \( A_{sc} = p \times b \times h / 100 = 2034.7 \text{ mm}^2 \)
Number of 16 mm bars required  \( n_{min} = 2 \times \text{INT}(A_{sc} / \text{area}) + 2 = 12 \)
Number of bars provided  \( n_{bars} = 12 \)

WARNING:
This exceeds the limit of 6% specified in Cl.3.12.6.2 of BS8110.
Please rerun with modified input.
Location: Large column. Minimum mild steel. Moment and low load.

Short braced rectangular column subjected to biaxial bending and thrust

Design to BS8110(1997) with partial safety factor for steel \( \gamma_S = 1.15 \)

The calculations for uniaxial or biaxial bending and axial force are in accordance with Clause 3.8.4.5 of BS8110, and are undertaken using data similar to that used to prepare the design charts in the IStructE/ICE 'Manual for the design of reinforced concrete building structures'.

Depth of cross-section \( h = 2000 \text{ mm} \)
Width of cross section \( b = 1500 \text{ mm} \)
Size of main bars \( \text{dia}=40 \text{ mm} \)
Chosen size of links \( \text{dial}=10 \text{ mm} \)
Characteristic concrete strength \( f_{cu} = 40 \text{ N/mm}^2 \)
Characteristic steel strength \( f_y = 250 \text{ N/mm}^2 \)
Nominal concrete cover \( \text{cover}=60 \text{ mm} \)
Effective depth about X-X axis \( h' = 1910 \text{ mm} \)
Effective depth about Y-Y axis \( b' = 1410 \text{ mm} \)
Design ultimate axial load \( N = 50 \text{ kN} \)
Ultimate moment about X-X axis \( M_x = 800 \text{ kNm} \)
Ultimate moment about Y-Y axis \( M_y = 1600 \text{ kNm} \)
Effective height of column \( h_e = 10 \text{ m} \)
Lightweight concrete. Critical slenderness ratio for short braced column is 10 (see Clause 5.7.2 of BS8110: Part 2).

Maximum allowable effective height for braced short column \( h_{eall} = b \times \text{factor}/1000 = 15 \text{ m} \)

Consider bending about Y-Y axis, as \( M_x/h' \) is less than \( M_y/b' \)

Minimum permissible eccentricity \( e_{ccmny} = 20 \text{ mm} \)
As this is less than \( 0.05 \times b \text{ mm} \) (see Clause 3.8.2.4), adopt this value.
Eccentricity of applied load \( e_{ccy} = 1000 \times M_y/N = 32000 \text{ mm} \)
As this exceeds the min. permissible value, design for this eccentricity.

As \( N_{ratio} \) does not exceed 0.1, the IStructE/ICE design charts do not strictly apply. Clause 3.4.4.1 states that you may, if desired, ignore the axial force and design the section as a beam resisting bending only.
Design of main bars

Actual steel percentage required \( p = 100 \times \alpha \times \frac{f_{cu}}{f_y} = 0.51204\% \)
Required area of reinforcement \( A_{sc} = \frac{p \times b \times h}{100} = 15361\text{ mm}^2 \)
Number of 40 mm bars required \( n_{min} = 2 \times \text{INT}(A_{sc}/\text{area}) + 2 = 14 \)
Number of bars provided \( n_{bars} = 14 \)

Location: Ex2 - Bending about a single axis

Isolated rectangular section subject bending and thrust

The main reinforcement design is based on balancing, by iterative means, of the two derived expressions for areas of reinforcing steel - one for axial load and the other for bending.
One layer of steel is assumed for the axis of bending.

Char yield strength of reinf' ment f_yk=500 N/mm²
Max.aggregate size (for bar spc.) hagg=25 mm
Diameter of compression bars dia=32 mm
Diameter of link legs dial=8 mm
Depth to comp. reinforcement d2=70 mm
Clear height between restraints l=5.2 m
Design ultimate axial load N=1650 kN
Larger initial end mt.(positive) M2=100 kNm
Smaller initial end moment M1=0 kNm
About Y-Y axis:
Column is considered to be braced about the stronger axis.
Fixity condition at top (1-3) cty=1
Fixity condition at bottom (1-3) cby=1
About Z-Z axis:
Column is considered to be braced about the weaker axis.
Fixity condition at top (1-3) ctz=3
Fixity condition at bottom (1-3) cbz=3

Axial load and moment considerations

Effective/overall-depth ratio d2h=d2/h=0.2
Axial load ratio Nrat=NEd/(b*h*fck)=0.44898
Moment ratio Mrat=MEd/(b*h^2*fck)=0.090253

Longitudinal reinforcement

Chart data for rectangular columns is taken from 'The Concrete Centre' publication entitled 'Worked Examples to Eurocode 2: Volume 1'.
Area of steel required: $A_s = \frac{f_{ck}}{f_{yk}} b h = 1516.7 \text{ mm}^2$
Number of bars provided: $n_{bars} = 4$

**DESIGN SUMMARY**
- Clear column height: $5.2 \text{ m}$
- Slenderness (Y-Y axis): $38.6$
- Slenderness (Z-Z axis): $51.467$
- Column is short
- Design axial load: $1650 \text{ kN}$
- Design bending moment: $116.09 \text{ kNm}$
- Designed area of steel: $1516.7 \text{ mm}^2$
- Area of steel provided: $3217 \text{ mm}^2$
- Minimum area of steel: $379.5 \text{ mm}^2$
- Maximum area of steel: $4900 \text{ mm}^2$
- Link diameter: $8 \text{ mm}$
- Maximum link spacing: $350 \text{ mm}$

**NOTE:** As the column is slender about Z-Z, the weaker axis, biaxial bending is recommended. Repeat calculations taking a small value or zero moment about the weaker axis.
Location: Column D1 (1st to 2nd floor)

Slender rectangular column subjected to uniaxial bending and thrust

Design to BS8110(1997) with partial safety factor for steel $\gamma_S=1.15$

Additional moments are calculated in accordance with Clause 3.8.3 of BS8110, and section design is undertaken using data similar to that used to prepare the design charts in the IStructE/ICE 'Manual for the design of reinforced concrete building structures'.

Depth of cross-section $h=200$ mm
Width of cross-section $b=200$ mm
Size of main bars $\text{dia}=16$ mm
Chosen size of links $\text{dial}=8$ mm
Characteristic concrete strength $f_{cu}=60$ N/mm$^2$
Characteristic steel strength $f_y=500$ N/mm$^2$
Designated exposure class is XC1
Specified fixing tolerance $\text{tol}=10$ mm
Nominal concrete cover $\text{cover}=25$ mm
Effective depth about X-X axis $h'=159$ mm
Effective depth about Y-Y axis $b'=159$ mm
Clear height between restraints $l_0=4$ m
Design ultimate axial load $N=500$ kN
Larger initial end mt. (positive) $M_2=70$ kNm
Smaller initial end moment $M_1=-50$ kNm
About X-X axis:
Fixity condition at top (1-4) $c_{tx}=1$
Fixity condition at bottom (1-3) $c_{bx}=1$
and column is braced about X-X axis.
About Y-Y axis:
Fixity condition at top (1-4) $c_{ty}=2$
Fixity condition at bottom (1-3) $c_{by}=3$
and column is braced about Y-Y axis.
Area assumed for this calculation $A_{se}=160$ mm$^2$
Design section for
N=500 kN
and moment about minor axis $M_y=70$ kNm
Number of bars provided $n_{bars}=10$

**MAIN**
Characteristic strength 500 N/mm$^2$

**REINFORCEMENT**
Area of steel required 1834.3 mm$^2$

**SUMMARY**
Area of steel provided 2010.6 mm$^2$
Percentage provided 5.0265 %
Weight of steel provided 15.783 kg/m
Diameter of bars 16 mm
Number of bars 10

to be placed along h-faces (spaced at 29 mm, assuming 1 layer)
(Spacing is close, hence pairs/bundles or several layers may be required).

Nominal concrete cover $\text{cover}=60$ mm
Effective depth about X-X axis $h'=1910$ mm
Effective depth about Y-Y axis $b'=1410$ mm
Clear height between restraints $l_0=25$ m
Design ultimate axial load $N=15000$ kN
Larger initial end mt. (positive) $M_2=2500$ kNm
Smaller initial end moment $M_1=-1800$ kNm
About X-X axis:
Fixity condition at top (1-4) $c_x=3$
Fixity condition at bottom (1-3) $c_b=1$
and column is unbraced about X-X axis.
About Y-Y axis:
Fixity condition at top (1-4) $c_y=3$
Fixity condition at bottom (1-3) $c_y=2$
and column is braced about Y-Y axis.
Area assumed for this calculation $A_{\text{se}}=12000$ mm$^2$
Design section for $N=15000$ kN
and moment about major axis $M_x=8500$ kNm
Number of bars provided $n_{\text{bars}}=10$

### MAIN
- Characteristic strength 250 N/mm$^2$

### REINFORCEMENT
- Area of steel required 12000 mm$^2$
  (represents minimum of 0.4%)
  (less theoretically needed.)
- Area of steel provided 12566 mm$^2$
- Percentage provided 0.41888 %
- Weight of steel provided 98.646 kg/m
- Diameter of bars 40 mm
- Number of bars 10

**SUMMARY**

**to be placed along b-faces (spaced at 330 mm, assuming 1 layer)**

SCALE 5.48 Office 1007 Proforma 91
Clause 3.12.7.2 states that links must pass round every corner bar and each alternate bar, and also that no bar may be more than 150 mm from a bar that is restrained by a link. Thus a set of at least 3 links must be provided at not more than the spacing specified above. As the distance between the bars exceeds 400 mm, a check on cracking may be necessary, if the face is in tension under service loading – otherwise use smaller bars, more closely spaced.

Approx. total wt. of steel 124.23 kg/m
Location: Ex1 - Slender column uniaxial bending

Isolated rectangular section subject bending and thrust

Design to BS EN 1992-1-1:2004
Eurocode 2: Design of concrete structures.
The main reinforcement design is based on balancing, by iterative means, of the two derived expressions for areas of reinforcing steel - one for axial load and the other for bending.
One layer of steel is assumed for the axis of bending.

Char yield strength of reinforcement $f_{yk}=500$ N/mm²
Max.aggregate size (for bar spc.) $h_{agg}=25$ mm
Diameter of compression bars $dia=25$ mm
Diameter of link legs $dial=8$ mm
Depth to comp. reinforcement $d2=61$ mm
Clear height between restraints $l=3.6$ m
Design ultimate axial load (kN) $N_{E,d}=1620$ kN
Larger initial end mt.(positive) $M_2=38.5$ kNm
Smaller initial end moment $M_1=0$ kNm
About $Y-Y$ axis:
Column is considered to be braced about the stronger axis.
Fixity condition at top (1-3) $c_{ty}=2$
Fixity condition at bottom (1-3) $c_{by}=2$
About $Z-Z$ axis:
Column is considered to be braced about the weaker axis.
Fixity condition at top (1-3) $c_{tz}=2$
Fixity condition at bottom (1-3) $c_{bz}=2$

Axial load and moment considerations

Effective/overall-depth ratio $d_{2h}=d_2/h=0.20333$
Axial load ratio $N_{rat}=N_{E,d}/(b*h*f_{ck})=0.6$
Moment ratio $M_{rat}=M_{E,d}/(b*h^2*f_{ck})=0.068765$

Longitudinal reinforcement

Chart data for rectangular columns is taken from 'The Concrete Centre' publication entitled 'Worked Examples to Eurocode 2: Volume 1'.
Area of steel required          $A_s = \frac{\alpha v f_{ck}}{f_{yk} b h} = 1485.8 \text{ mm}^2$
Number of bars provided         $n_{bars} = 4$

**Location:** Ex2 - Bending about a single axis

**Isolated rectangular section subject bending and thrust**

Design to BS EN 1992-1-1:2004

Eurocode 2: Design of concrete structures.

The main reinforcement design is based on balancing, by iterative means, of the two derived expressions for areas of reinforcing steel - one for axial load and the other for bending.

One layer of steel is assumed for the axis of bending.

Char yield strength of reinforcement $f_{yk}=500 \text{ N/mm}^2$

Max. aggregate size (for bar spc.) $h_{agg}=25 \text{ mm}$

Diameter of compression bars $d_{ia}=32 \text{ mm}$

Diameter of link legs $d_{ial}=8 \text{ mm}$

Depth to comp. reinforcement $d_{2}=70 \text{ mm}$

Clear height between restraints $l=5.2 \text{ m}$

Design ultimate axial load (kN) $N_{Ed}'=1650 \text{ kN}$

Larger initial end mt. (positive) $M_2=100 \text{ kNm}$

Smaller initial end moment $M_1=0 \text{ kNm}$

About Y-Y axis:

Column is considered to be braced about the stronger axis.

Fixity condition at top (1-3) $c_{ty}=1$

Fixity condition at bottom (1-3) $c_{by}=1$

About Z-Z axis:

Column is considered to be braced about the weaker axis.

Fixity condition at top (1-3) $c_{tz}=3$

Fixity condition at bottom (1-3) $c_{bz}=3$

**Axial load and moment considerations**

Effective/overall-depth ratio $d_{2h}=d_{2}/h=0.2$

Axial load ratio $N_{rat}=N_{Ed}/(b\cdot h\cdot f_{ck})=0.44898$

Moment ratio $M_{rat}=M_{Ed}/(b\cdot h^2\cdot f_{ck})=0.090253$

**Longitudinal reinforcement**

Chart data for rectangular columns is taken from 'The Concrete Centre' publication entitled 'Worked Examples to Eurocode 2: Volume 1'.
Area of steel required $A_s = \frac{f_{ck}}{f_{yk}} b h = 1516.7 \text{ mm}^2$
Number of bars provided $n_{bars} = 4$

**DESIGN SUMMARY**
- Clear column height 5.2 m
- Slenderness (Y-Y axis) 38.6
- Slenderness (Z-Z axis) 51.467
- Column is short
- Design axial load 1650 kN
- Design bending moment 116.09 kNm
- Designed area of steel 1516.7 mm$^2$
- Area of steel provided 3217 mm$^2$
- Minimum area of steel 379.5 mm$^2$
- Maximum area of steel 4900 mm$^2$
- Link diameter 8 mm
- Maximum link spacing 350 mm

**NOTE:** As the column is slender about Z-Z, the weaker axis, biaxial bending is recommended. Repeat calculations taking a small value or zero moment about the weaker axis.
Slender rectangular column subjected to biaxial bending and thrust

Design to BS8110(1997) with partial safety factor for steel gammaS=1.15

Additional moments are calculated in accordance with Clause 3.8.3 of BS8110, and section design is undertaken using data similar to that used to prepare the design charts in the IStructE/ICE 'Manual for the design of reinforced concrete building structures'.

Axial load and moment considerations

Effective/overall-depth ratio $d_{2h}=d_2/h=0.19714$
Axial load ratio $N_{rat}=N_{Ed}/(b*h*f_{ck})=0.44898$
Moment ratio $M_{rat}=M_{Ed}/(b*h^2*f_{ck})=0.090253$

Longitudinal reinforcement

Chart data for rectangular columns is taken from 'The Concrete Centre' publication entitled 'Worked Examples to Eurocode 2: Volume 1'.
Area of steel required $A_s=\text{val}*f_{ck}/f_{yk}*b*h=1507 \text{ mm}^2$
Number of bars provided $n_{bars}=4$

**NOTE:** As the column is slender about Z-Z, the weaker axis, biaxial bending is recommended. Repeat calculations taking a small value or zero moment about the weaker axis.

Design of circular section under bending and axial load

Design to BS8110(1997), partial safety factor for steel $\gamma_S = 1.15$

Calculations for reinforcement are in accordance with BS 8110. Solution is obtained by trial-and-adjustment procedure with check calculations printed out beneath. The concrete section is split into eight strips of equal depth. Eight steel bars arranged as shown are assumed, giving four steel areas.

Design axial load $N = 1$ kN
Design moment $M = 128$ kNm
Section diameter $D = 300$ mm
Size of links $d_{\text{dial}} = 8$ mm
Characteristic concrete strength $f_{\text{cu}} = 50$ N/mm$^2$
Characteristic steel strength $f_y = 500$ N/mm$^2$
Nominal cover to all steel $c = 25$ mm
SUMMARY ( $f_{cu}=50 \text{ N/mm}^2$ : $f_{y}=500 \text{ N/mm}^2$ )

(Note: 'microstrain' indicates true strain multiplied by 1,000,000.)

Location: Large column: minimum mild steel: axial load only

Analysis of circular section subjected to service bending moment and axial load, including crack-width assessment

(with tension stiffening)

Service-load calculations are based on the assumptions given in BS8110 (1985), with tension stiffening as given in Part 2. Solution is found by trial and adjustment, check calculations being printed out below. The concrete section is split into eight strips of equal depth. Eight steel reinforcing bars arranged as shown are assumed, paired to give four areas.

Diameter of section \(D=2000 \text{ mm}\)
Characteristic concrete strength \(f_{cu}=40 \text{ N/mm}^2\)
Characteristic steel strength \(f_y=250 \text{ N/mm}^2\)
Size of links \(\text{dial}=10 \text{ mm}\)
Designated exposure class is XC4
Specified fixing tolerance \(\text{tol}=10 \text{ mm}\)
Nominal cover to all steel \(\text{cover}=35 \text{ mm}\)
Size of main bars \(\text{diac}=40 \text{ mm}\)
Number of bars provided \(\text{num}=12\)
Applied axial service load \(N=85000 \text{ kN}\)
Applied service moment \(M=0 \text{ kNm}\)

SUMMARY \((f_{cu}=40 \text{ N/mm}^2 : f_y=250 \text{ N/mm}^2)\)

(Note: 'microstrain' indicates true strain multiplied by 1,000,000.)

Diameter of section \(2000 \text{ mm}\)
Cover to all reinforcement \(35 \text{ mm}\)
Size of main bars \(40 \text{ mm}\)
Number of main bars \(12\)
Percentage of steel provided \(0.48 \%\)
Comp. strain at outer conc. fibre \(2012.9 \text{ microstrain}\)
Strain at steel area As1 \(1934.7 \text{ microstrain}\)
Strain at steel area As4 \(942 \text{ microstrain}\)
Entire section is in compression, therefore no cracking occurs.
Crack width between two bottom bars is 0 mm

Depth of concrete in compression 73.415 mm
Crack width between two bottom bars is 0.3478 mm
Location: Typical column section reinforced with high-yield steel

Design of rectangular section for uniaxial bending and thrust

(using parabolic-rectangular stress-strain curve for concrete)

Design to BS8110(1997), partial safety factor for steel gammaS=1.15

Calculations based on assumptions given in BS 8110. Solution is found by trial and adjustment, with check calculations printed out beneath.

The concrete section is divided into eight strips of equal depth. Two symmetrically-placed layers of steel are assumed. (Only positive values of moment are valid.)

Design axial load \( N = 5000 \) kN
Design moment \( M = 1500 \) kNm
Section depth \( h = 900 \) mm
Section breadth \( b = 600 \) mm
Size of links \( \text{dial}=8 \) mm
Characteristic concrete strength \( f_{cu} = 30 \) N/mm²
Characteristic steel strength \( f_y = 500 \) N/mm²
Designated exposure class is XC2
Specified fixing tolerance \( \text{tol}=10 \) mm
Nominal cover to all steel \( \text{cover}=35 \) mm

Distances to centroids of strips
- \( d_1 = 0.4375 \times h = 393.75 \) mm
- \( d_2 = 0.3125 \times h = 281.25 \) mm
- \( d_3 = 0.1875 \times h = 168.75 \) mm
- \( d_4 = 0.0625 \times h = 56.25 \) mm
- \( d_5 = -0.0625 \times h = -56.25 \) mm
- \( d_6 = -0.1875 \times h = -168.75 \) mm
- \( d_7 = -0.3125 \times h = -281.25 \) mm
- \( d_8 = -0.4375 \times h = -393.75 \) mm

The forces in the strips are found by integrating the parabolic stress-strain curve. If a strip is partly in compression, the force is still assumed to act at the centroid positions as calculated above.
Calculation of strains and forces in concrete strips

Max. stress on stress-strain curve $f_u=0.444*f_{cu}=13.32 \text{ N/mm}^2$.

As strain at bottom $eb$ exceeds $e_1$, rectangular part of curve applies and
force on strip $f=A*f_u/1E3=899.1 \text{ kN}$

As strain at bottom $eb$ exceeds $e_1$, rectangular part of curve applies and
force on strip $f=A*f_u/1E3=899.1 \text{ kN}$

As strain at bottom $eb$ exceeds $e_1$, rectangular part of curve applies and
force on strip $f=A*f_u/1E3=899.1 \text{ kN}$

As strain at top of strip $et$ exceeds $e_1$, but strain at bottom $eb$ is
less than $e_1$, both parabolic and rectangular parts of curve apply. Thus
stress at strip bottom $f_{b}=f_u*(2*eb/e_1-eb^2/e_1^2)$

$=13.298 \text{ N/mm}^2$, and

force on strip $f=A*f_u*(1-0.333*(1-f_{b}/f_u)*(e_1-eb)/(et-eb))/1E3$

$=899.06 \text{ kN}$

As strain at top of strip $et$ does not exceed $e_1$, parabolic part of
stress-strain curve applies, and

force on strip $f=A*f_u*((et+eb)/e_1-(et^2+et*eb+eb^2)/e_1^2/3)$

$=777.21 \text{ kN}$

Strain at strip bottom is negative; only part of strip in compression.

As strain at top of strip $et$ does not exceed $e_1$,

force on strip $f=A*et/(et-eb)*f_u*(et/e_1-((et/e_1)^2)/3)/1E3$

$=200.59 \text{ kN}$

Size of main bars $diac=25$

---

| Resistance moment in kNm | 1500 | 1629.1 | 8.6 |
| Satisfactory            |      |        |     |

The above result is judged acceptable.
Location: Small column section, low axial load & substantial moment

Design of rectangular section for uniaxial bending and thrust

(using parabolic-rectangular stress-strain curve for concrete)

Design to BS8110(1997), partial safety factor for steel $\gamma_s = 1.15$

Calculations based on assumptions given in BS 8110. Solution is found by trial and adjustment, with check calculations printed out beneath. The concrete section is divided into eight strips of equal depth. Two symmetrically-placed layers of steel are assumed. (Only positive values of moment are valid.)

Design axial load $N = 250 \text{ kN}$
Design moment $M = 450 \text{ kNm}$
Section depth $h = 500 \text{ mm}$
Section breadth $b = 400 \text{ mm}$
Size of links $\text{dial} = 8 \text{ mm}$
Characteristic concrete strength $f_{cu} = 60 \text{ N/mm}^2$
Characteristic steel strength $f_y = 500 \text{ N/mm}^2$
Nominal cover to all steel $\text{cover} = 30 \text{ mm}$

**Distances to centroids of strips**

\[
\begin{align*}
\text{d1} &= 0.4375h = 218.75 \text{ mm} \\
\text{d2} &= 0.3125h = 156.25 \text{ mm} \\
\text{d3} &= 0.1875h = 93.75 \text{ mm} \\
\text{d4} &= 0.0625h = 31.25 \text{ mm} \\
\text{d5} &= -0.0625h = -31.25 \text{ mm} \\
\text{d6} &= -0.1875h = -93.75 \text{ mm} \\
\text{d7} &= -0.3125h = -156.25 \text{ mm} \\
\text{d8} &= -0.4375h = -218.75 \text{ mm}
\end{align*}
\]

The forces in the strips are found by integrating the parabolic stress-strain curve. If a strip is partly in compression, the force is still assumed to act at the centroid positions as calculated above.
Calculation of strains and forces in concrete strips

Max. stress on stress-strain curve \( f_u = 0.444 \times f_{cu} = 26.64 \, \text{N/mm}^2 \).

As strain at top of strip \( e_t \) exceeds \( e_1 \), but strain at bottom \( e_b \) is less than \( e_1 \), both parabolic and rectangular parts of curve apply. Thus

stress at strip bottom \( f_b = f_u \times \left(2 \times e_b / e_1 - e_b^2 / e_1^2\right) \)

= 19.632 \, \text{N/mm}^2, \text{ and}

force on strip \( f = A \times f_u \times \left(1 - 0.333 \times (1 - f_b / f_u) \times (e_1 - e_b) / (e_t - e_b)\right) / 1E3 \)

= 649.55 \, \text{kN}

Strain at strip bottom is negative; only part of strip in compression.

As strain at top of strip \( e_t \) does not exceed \( e_1 \),

force on strip \( f = A \times e_t / (e_t - e_b) \times f_u \times (e_t / e_1 - ((e_t / e_1)^2)/3) / 1E3 \)

= 72.78 \, \text{kN}

Size of main bars \( d_{ac} = 25 \)

SUMMARY (\( f_{cu} = 60 \, \text{N/mm}^2 \) : \( f_y = 500 \, \text{N/mm}^2 \))

(Note: 'microstrain' indicates true strain multiplied by 1,000,000.)

Section reinforced with the min permissible steel area of 0.4% can support the specified loading shown, and is accepted as the design.
Location: Typical column section reinforced with high-yield steel

Design of rectangular section for uniaxial bending and thrust

(using parabolic-rectangular stress-strain curve for concrete)

Calculations based on assumptions given in EC2. Solution is found by trial and adjustment, with check calculations printed out beneath. The concrete section is divided into eight strips of equal depth. Two symmetrically-placed layers of steel are assumed (only positive values of moment are valid).

Design axial load $N=5000$ kN
Design moment $M=1500$ kNm
Section depth $h=900$ mm
Section breadth $b=600$ mm
Partial safety factor for steel $\gamma_{ms}=1.15$
Characteristic steel strength $f_{yk}=500$ N/mm$^2$
Diameter of longitudinal reinft. $dia=25$ mm
Diameter of column links $dial=8$ mm
Diameter of longitudinal reint. $diac=25$

**SUMMARY** ($f_{ck}=25$ N/mm$^2$ : $f_{yk}=500$ N/mm$^2$ )

Total weight of steel 114.69 kg/m
According to Cl 3.12.7.3 of BS8110, circular links or spiral reinforcement passing round all bars provide adequate lateral support in circular columns.
Location: EX1 - Typical circular column

Design of circular column section to EC2

Reinforcement calculations are in accordance with EC2 Part 1-1 and the IStructE 'Manual for the design of concrete building structures to Eurocode 2'. Min. steel = six bars arranged symmetrically. Any greater number of bars (eight shown) increases resistance moment of section.

Larger initial end moment (+ve) $M_2=110$ kNm
Smaller initial end moment $M_1=0$ kNm
Design ultimate axial load $N_{Ed}=2000$ kN
Design ultimate shear force $V_{Ed}=0$ kN
Diameter of cross-section $h=375$ mm
Partial safety factor for steel $\gamma_{ms}=1.15$
Partial safety factor for conc. $\gamma_{mc}=1.5$
Clear height of column $l=3$ m
Char yield strength of reinforcement $f_{yk}=500$ N/mm$^2$
Diameter of longitudinal reinft. $d_{ia}=20$ mm
Diameter of column links $d_{il}=8$ mm
Effective depth $h'=300$ mm

Slenderness - EC2 Clause 5.8.3.2

About Y-Y axis:
Column is considered to be braced about the stronger axis.
Effective height $\ell_{oy}=b_{ey}*l*1000=2250$ mm

About Z-Z axis:
Column is considered to be braced about the weaker axis.
Effective height $\ell_{oz}=b_{ez}*l*1000=2250$ mm

Check slenderness

For Y-Y stronger axis:
Slenderness $\lambda_{my}=\ell_{oy}/i_{y}=24$
Limiting slenderness $\lambda_{my}'=20*A*B*C/n^{0.5}=39.743$
Column is classified as being short in accordance with EC2 Part 1-1.

For Z-Z weaker axis:
Slenderness $\lambda_{mz}=\ell_{oz}/i_{z}=24$
Limiting slenderness $\lambda_{mz}'=20*A*B*C/n^{0.5}=39.743$
Column is classified as being short in accordance with EC2 Part 1-1.
Design moments - Clause 5.8.8.2

Design moment (y-y axis) \( M_{Ed} = Mo \times 10^{-6} = 121.25 \text{ kNm} \)

Axial load and moment considerations

Effective/overall-depth ratio \( d' = h'/h = 0.8 \)
Axial load ratio \( N_{rat} = N_{Ed} \times 1000 / (h^2 \times f_{ck}) = 0.50794 \)
Moment ratio \( M_{rat} = M_{Ed} \times 10^6 / (h^3 \times f_{ck}) = 0.082116 \)

Longitudinal reinforcement

Chart data for circular columns is taken from 'The Concrete Centre' publication entitled 'Worked Examples to Eurocode 2: Volume 1'. The program initially evaluates the area of reinforcement taking \( K = 1 \). The value of \( N_u \) and hence a new value of \( K \) is then determined leading to a reduced area of reinforcement. This process is then repeated until the minimum area of reinforcement is found. For further guidance refer to the IStructE Manual to EC2, Section 5.5.4.3.

Calculated area of reinforcement \( A_{Sc} = val \times f_{ck} / f_{yk} \times h^2 = 4181.2 \text{ mm}^2 \)
Main steel diameter \( \text{dia} = 20 \text{ mm} \)
Number of bars to be provided \( \text{NumBar} = 14 \)

Transverse reinforcement (links)

Chosen diameter of links \( \text{dia} = 8 \text{ mm} \)
Maximum spacing \( smx = 375 \text{ mm} \)

NOTE: Circular links or spiral reinforcement passing round all bars provide adequate lateral support in circular columns.

Check for biaxial bending - EC2 Clause 5.8.9

Eccentricity due to imperfections about the weaker axis will be ignored as this was considered about the stronger axis. The calculations below will consider first order and second order moments about z-z axis only.
Design ultimate moment (if any) \( Mo_{2z} = 0 \) kNm  
Column is not slender about \( z-z \) axis and second order moments are not required to be evaluated.

Design ultimate moment (\( z-z \) axis) \( M_{Edz} = Mo_{2z} \times 10^6 = 40E6 \) Nmm

Larger initial end moment (+ve) \( M_2 = 125 \text{ kNm} \)
Smaller initial end moment \( M_1 = 0 \text{ kNm} \)
Design ultimate axial load \( N_{Ed} = 1750 \text{ kN} \)
Design ultimate shear force \( V_{Ed} = 100 \text{ kN} \)
Diameter of cross-section \( h = 400 \text{ mm} \)
Partial safety factor for steel \( \gamma_{ms} = 1.15 \)
Partial safety factor for conc. \( \gamma_{mc} = 1.5 \)
Clear height of column \( l = 4 \text{ m} \)
Char yield strength of reinft. \( f_yk = 500 \text{ N/mm}^2 \)
Diameter of longitudinal reinft. \( \text{dia} = 20 \text{ mm} \)
Diameter of column links \( \text{dial} = 8 \text{ mm} \)
Effective depth \( h' = 350 \text{ mm} \)

Slenderness - EC2 Clause 5.8.3.2

About Y-Y axis:
Column is considered to be braced about the stronger axis.
Effective height \( l_{oy} = 3000 \text{ mm} \)

About Z-Z axis:
Column is considered to be braced about the weaker axis.
Effective height \( l_{oz} = 3000 \text{ mm} \)

Check slenderness

For Y-Y stronger axis:
Slenderness \( \lambda_{my} = \frac{l_{oy}}{i_y} = 30 \)
Limiting slenderness \( \lambda_{my} = 43.126 \)
Column is classified as being short in accordance with EC2 Part 1-1.

For Z-Z weaker axis:
Slenderness \( \lambda_{mz} = \frac{l_{oz}}{i_z} = 30 \)
Limiting slenderness \( \lambda_{mz} = 43.126 \)
Column is classified as being short in accordance with EC2 Part 1-1.
Design moments - Clause 5.8.8.2

Design moment (y-y axis) \( M_{Ed} = Mo^2 \times 10^{-6} = 138.13 \text{ kNm} \)

**Axial load and moment considerations**

Effective/overall-depth ratio \( d'h = h'/h = 0.875 \)
Axial load ratio \( N_{rat} = N_{Ed} \times 1000 / (h^2 \times f_{ck}) = 0.21875 \)
Moment ratio \( M_{rat} = M_{Ed} \times 10^6 / (h^3 \times f_{ck}) = 0.043164 \)

**Longitudinal reinforcement**

Chart data for circular columns is taken from 'The Concrete Centre' publication entitled 'Worked Examples to Eurocode 2: Volume 1'. The program initially evaluates the area of reinforcement taking \( K = 1 \). The value of \( N_u \) and hence a new value of \( K \) is then determined leading to a reduced area of reinforcement. This process is then repeated until the minimum area of reinforcement is found. For further guidance refer to the IStructE Manual to EC2, Section 5.5.4.3.

Calculated area of reinforcement \( A_{sc} = \text{val} \times f_{ck} / f_{yk} \times h^2 = 0 \text{ mm}^2 \)
Main steel diameter \( \text{dia} = 12 \text{ mm} \)
Number of bars to be provided \( \text{NumBar} = 6 \)

**Shear in column**

Shear resistance:
\[ VR_{dc} = (CR_{dc} \times ks \times v_{Rdc} + 0.15 \times N_{Ed} \times 1000 / Ac) \times bw \times d / 1000 = 377.82 \text{ kN} \]

**SHEAR SUMMARY**

<table>
<thead>
<tr>
<th>Shear force</th>
<th>100 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shear resistance</td>
<td>377.82 kN</td>
</tr>
</tbody>
</table>

Hence section is satisfactory, no shear reinforcement is required.

**Transverse reinforcement (links)**

Chosen diameter of links \( \text{dial} = 8 \text{ mm} \)
Maximum spacing \( \text{smx} = 240 \text{ mm} \)

**WARNING:**
The durability check needs to be repeated. Please set the diameter of longitudinal reinforcement to 12 mm.
Location: Ex3 - Massive lightly-loaded column reinf. with mild steel

Design of circular column section to EC2

Reinforcement calculations are in accordance with EC2 Part 1-1 and the IStructE 'Manual for the design of concrete building structures to Eurocode 2'. Min. steel = six bars arranged symmetrically. Any greater number of bars (eight shown) increases resistance moment of section.

Larger initial end moment (+ve) \( M_2 = 10 \text{ kNm} \)
Smaller initial end moment \( M_1 = 0 \text{ kNm} \)
Design ultimate axial load \( N_{Ed} = 100 \text{ kN} \)
Design ultimate shear force \( V_{Ed} = 1000 \text{ kN} \)
Diameter of cross-section \( h = 2000 \text{ mm} \)
Partial safety factor for steel \( \gamma_{ms} = 1.15 \)
Partial safety factor for conc. \( \gamma_{mc} = 1.5 \)
Clear height of column \( l = 20 \text{ m} \)
Char yield strength of reinf'ment \( f_{yk} = 500 \text{ N/mm}^2 \)
Diameter of longitudinal reinf.t. \( \text{dia} = 20 \text{ mm} \)
Diameter of column links \( \text{dial} = 10 \text{ mm} \)
Effective depth \( h' = 1900 \text{ mm} \)

Slenderness - EC2 Clause 5.8.3.2

About Y-Y axis:
Column is considered to be braced about the stronger axis.
Effective height \( l_{oy} = \text{bety}*l*1000 = 15000 \text{ mm} \)

About Z-Z axis:
Column is considered to be braced about the weaker axis.
Effective height \( l_{oz} = \text{betz}*l*1000 = 15000 \text{ mm} \)

Check slenderness

For Y-Y stronger axis:
Slenderness \( l_{amy} = l_{oy}/iy = 30 \)
Limiting slenderness \( l_{amy} = 20*A*B*C/n^{0.5} = 514.27 \)
Column is classified as being short in accordance with EC2 Part 1-1.

For Z-Z weaker axis:
Slenderness \( l_{amz} = l_{oz}/iz = 30 \)
Limiting slenderness \( l_{amz} = 20*A*B*C/n^{0.5} = 514.27 \)
Column is classified as being short in accordance with EC2 Part 1-1.
WARNING: Check on validity of the input values

- Ratio of reinforcement term: \( n = 1.0246 \)
- Relative axial force: \( n = 0.0022469 \)
- Value of \( n \) at maximum moment: \( n_{bal} = 0.4 \)
- Correction factor for axial load: \( K_r = \frac{(n - n)}{(n - n_{bal})} = 1.6369 \)

As this value is high, design the section as a beam.
Design of circular column section to EC2

Reinforcement calculations are in accordance with EC2 Part 1-1 and the IStructE 'Manual for the design of concrete building structures to Eurocode 2'. Min. steel = six bars arranged symmetrically. Any greater number of bars (eight shown) increases resistance moment of section.

Larger initial end moment (+ve) \( M_2 = 40 \) kNm
Smaller initial end moment \( M_1 = 0 \) kNm
Design ultimate axial load \( N_{Ed} = 1700 \) kN
Design ultimate shear force \( V_{Ed} = 0 \) kN
Diameter of cross-section \( h = 350 \) mm
Partial safety factor for steel \( \gamma_{ams} = 1.15 \)
Partial safety factor for conc. \( \gamma_{amc} = 1.5 \)
Clear height of column \( l = 5 \) m
Char yield strength of reinforcement \( f_{yk} = 500 \) N/mm²
Diameter of longitudinal reinf. \( \text{dia} = 20 \) mm
Diameter of column links \( \text{dial} = 8 \) mm
Nominal cover to all steel \( \text{cover} = 35 \) mm
Effective depth \( h' = 295 \) mm

Slenderness - EC2 Clause 5.8.3.2

About Y-Y axis:
Column is considered to be braced about the stronger axis.
Effective height \( l_{oy} = \beta_{e,y} \times l \times 1000 = 3750 \) mm

About Z-Z axis:
Column is considered to be braced about the weaker axis.
Effective height \( l_{oz} = \beta_{e,z} \times l \times 1000 = 3750 \) mm

Check slenderness

For Y-Y stronger axis:
Slenderness \( \lambda_y = l_{oy}/l_y = 42.857 \)
Limiting slenderness \( \lambda_{ly} = 20 \times A \times B \times C/n^{0.5} = 36.187 \)
Column is classified as being slender in accordance with EC2 Part 1-1.

For Z-Z weaker axis:
Slenderness \( \lambda_z = l_{oz}/l_z = 42.857 \)
Limiting slenderness \( \lambda_{lz} = 20 \times A \times B \times C/n^{0.5} = 36.187 \)
Column is classified as being slender in accordance with EC2 Part 1-1.
Design moments - Clause 5.8.8.2

Design moment (y-y axis)  \( M_{Ed} = M_{o2} \times 10^{-6} = 55.938 \text{ kNm} \)

Axial load and moment considerations

- Effective/overall-depth ratio  \( d'h = h'/h = 0.84286 \)
- Axial load ratio  \( N_{rat} = N_{Ed} \times 1000/(h^2 \times f_{ck}) = 0.43367 \)
- Moment ratio  \( M_{rat} = M_{Ed} \times 10^6/(h^3 \times f_{ck}) = 0.040771 \)

Longitudinal reinforcement

Chart data for circular columns is taken from 'The Concrete Centre' publication entitled 'Worked Examples to Eurocode 2: Volume 1'. The program initially evaluates the area of reinforcement taking \( K=1 \). The value of \( N_u \) and hence a new value of \( K \) is then determined leading to a reduced area of reinforcement. This process is then repeated until the minimum area of reinforcement is found. For further guidance refer to the IStructE Manual to EC2, Section 5.5.4.3.

- Calculated area of reinforcement  \( A_{sc} = val \times f_{ck}/f_{yk} \times h^2 = 1891.7 \text{ mm}^2 \)
- Main steel diameter  \( \text{dia} = 12 \text{ mm} \)
- Number of bars to be provided  \( \text{NumBar} = 17 \)

Transverse reinforcement (links)

- Chosen diameter of links  \( \text{dial} = 8 \text{ mm} \)
- Maximum spacing  \( \text{smx} = 240 \text{ mm} \)

WARNING:
The durability check needs to be repeated. Please set the diameter of longitudinal reinforcement to 12 mm.
Location: Ex5

Design of circular column section to EC2

Reinforcement calculations are in accordance with EC2 Part 1-1 and the IStructE 'Manual for the design of concrete building structures to Eurocode 2'. Min. steel = six bars arranged symmetrically. Any greater number of bars (eight shown) increases resistance moment of section.

Larger initial end moment (+ve) \( M_2 = 40 \text{ kNm} \)
Smaller initial end moment \( M_1 = 0 \text{ kNm} \)
Design ultimate axial load \( N_{Ed} = 1720 \text{ kN} \)
Design ultimate shear force \( V_{Ed} = 0 \text{ kN} \)
Diameter of cross-section \( h = 350 \text{ mm} \)
Partial safety factor for steel \( \gamma_{ms} = 1.15 \)
Partial safety factor for conc. \( \gamma_{mc} = 1.5 \)
Clear height of column \( l = 4 \text{ m} \)
Char yield strength of reinf'ment \( f_{yk} = 500 \text{ N/mm}^2 \)
Diameter of longitudinal reinft. \( d = 20 \text{ mm} \)
Diameter of column links \( d_{al} = 8 \text{ mm} \)
Nominal cover to all steel \( c = 35 \text{ mm} \)
Effective depth \( h' = 295 \text{ mm} \)

Slenderness - EC2 Clause 5.8.3.2

About Y-Y axis:
Column is considered to be braced about the stronger axis.
Effective height \( l_{oy} = \beta_{ty} l \times 1000 = 3000 \text{ mm} \)

About Z-Z axis:
Column is considered to be braced about the weaker axis.
Effective height \( l_{oz} = \beta_{tz} l \times 1000 = 4000 \text{ mm} \)

Check slenderness

For Y-Y stronger axis:
Slenderness \( l_{amy} = l_{oy}/\gamma_{iy} = 34.286 \)
Limiting slenderness \( l_{amy} = 20*A*B*C/n^0.5 = 35.976 \)
Column is classified as being short in accordance with EC2 Part 1-1.

For Z-Z weaker axis:
Slenderness \( l_{amz} = l_{oz}/\gamma_{iz} = 45.714 \)
Limiting slenderness \( l_{amz} = 20*A*B*C/n^0.5 = 35.976 \)
Column is classified as being slender in accordance with EC2 Part 1-1.
Design moments - Clause 5.8.8.2

Design moment (y-y axis) \[ M_{Ed} = M_0 \times 10^{-6} = 52.9 \text{ kNm} \]

Axial load and moment considerations

Effective/overall-depth ratio \[ d'h = h'/h = 0.84286 \]
Axial load ratio \[ N_{rat} = N_{Ed} \times 1000 / (h^2 \times f_{ck}) = 0.43878 \]
Moment ratio \[ M_{rat} = M_{Ed} \times 10^6 / (h^3 \times f_{ck}) = 0.038557 \]

Longitudinal reinforcement

Chart data for circular columns is taken from 'The Concrete Centre' publication entitled 'Worked Examples to Eurocode 2: Volume 1'. The program initially evaluates the area of reinforcement taking \( K = 1 \). The value of \( N_u \) and hence a new value of \( K \) is then determined leading to a reduced area of reinforcement. This process is then repeated until the minimum area of reinforcement is found. For further guidance refer to the IStructE Manual to EC2, Section 5.5.4.3.

Calculated area of reinforcement \[ A_{sc} = \frac{va_1 \times f_{ck}}{f_{yk} \times h^2} = 1125.4 \text{ mm}^2 \]
Main steel diameter \[ d_{ia} = 12 \text{ mm} \]
Number of bars to be provided \[ N_{umb} = 10 \]

Transverse reinforcement (links)

Chosen diameter of links \[ d_{ia} = 8 \text{ mm} \]
Maximum spacing \[ s_{mx} = 240 \text{ mm} \]

WARNING:
The durability check needs to be repeated. Please set the diameter of longitudinal reinforcement to 12 mm.
Location: Typical problem

Design to BS8110(1997), partial safety factor for steel $\gamma_{S}=1.15$

---

**Effective span**  
$L=5\ m$

**Dead load factor**  
$\gamma_{d}=1.4$

**Imposed load factor**  
$\gamma_{i}=1.6$

**Distance from left support**  
$L_{c}(1)=1.4\ m$

**Characteristic dead load**  
$G_{k}(1)=6.4\ kN$

**Characteristic imposed load**  
$Q_{k}(1)=0\ kN$

**Distance from left support to start**  
$L_{a}(1)=0\ m$

**Distance from left support to end**  
$L_{b}(1)=1.4\ m$

**Characteristic dead load**  
$G_{k}(1)=8\ kN/m$

**Characteristic imposed load**  
$Q_{k}(1)=10\ kN/m$

**Distance from left support to start**  
$L_{a}(2)=1.4\ m$

**Distance from left support to end**  
$L_{b}(2)=5\ m$

**Characteristic dead load**  
$G_{k}(2)=12\ kN/m$

**Characteristic imposed load**  
$Q_{k}(2)=15\ kN/m$

**Overall depth of concrete section**  
$h=400\ mm$

**Breadth of concrete section**  
$b=200\ mm$

**Eff.depth of concrete section**  
$d=357.5\ mm$

**Depth to comp. reinforcement**  
$d'=40\ mm$

**Cover to all reinforcement**  
$cover=20\ mm$

**Characteristic concrete strength**  
$f_{cu}=40\ N/mm^2$

**Characteristic strength of links**  
$f_{y}=500\ N/mm^2$

**Diameter of tension reinforcement**  
$dia=25\ mm$

**Diameter of links**  
$dial=10\ mm$

**Characteristics**

- **TENSION**
  - Characteristic strength  
    $500\ N/mm^2$

- **REINFORCEMENT**
  - Diameter of bars  
    $25\ mm$

- **SUMMARY**
  - Number of bars  
    $2$
  - Area required  
    $979.97\ mm^2$
  - Area provided  
    $981.75\ mm^2$

See BS 8110 (Anchorage & tension lap)

- Part 1:  
  - 1.4 * tension lap  
    $860\ mm$
  - Cl.3.12.8.13 (2.0 * tension lap  
    $1730\ mm$

**Shear reinforcement**

- Design shear stress  
  $v=\frac{V*1000}{(b*v*d)}=1.4243\ N/mm^2$

- Longit. bars effective for shear  
  $n_{bars}=2$

As characteristic concrete strength exceeds 25 N/mm$^2$, therefore increase $v_{c}$ according to footnote in Table 3.8.

- Modified design shear stress  
  $v_{c}=v_{c}*(\frac{40}{25})^{(1/3)}=0.84499\ N/mm^2$

Design shear stress of 1.4243 N/mm$^2$ exceeds critical stress of 0.84499 N/mm$^2$, so links to resist balance of shear forces are necessary.

- Number of shear legs  
  $n_{legs}=2$

Provide links to take shear force in accordance with Table 3.7.
Spacing of links along member

\[ sv = \frac{fyv}{\gamma_S A_{sv}} (bv^2 (v-v_c)) \]

= 589.42 mm

Limit spacing to \( sv = 0.75d = 268.13 \text{ mm} \) (to Clause 3.4.5.5)

| Characteristic strength | 500 N/mm² |
| Diameter of bars | 8 mm |
| Spacing of bars | 150 mm |
| Area of steel required | 292.5 mm²/m |
| Area of steel provided | 335 mm²/m |

**Shear reinforcement**

Design shear stress \( v = \frac{V*1000}{(b*v*d)} = 0.19421 \) N/mm²

Longit. bars effective for shear \( n_bars=3 \)

As characteristic concrete strength exceeds 25 N/mm², therefore increase \( v_c \) according to footnote in Table 3.8.

Modified design shear stress \( v_c = v * (fcu/25)^{(1/3)} = 0.47958 \) N/mm²

As design shear stress of 0.19421 N/mm² does not exceed critical shear stress of 0.47958 N/mm², no shear reinforcement is required.
As actual span does not exceed permissible, deflection is satisfactory.
### Location: Typical problem

![Diagram of a beam/slab with labeled dimensions](image)

- **Effective span** \( L = 5 \text{ m} \)
- **Dead load factor** \( \gamma_d = 1.25 \)
- **Imposed load factor** \( \gamma_i = 1.5 \)
- **Distance from left support** \( L_c(1) = 1.4 \text{ m} \)
- **Characteristic dead load** \( G_{kc}(1) = 6.4 \text{ kN} \)
- **Characteristic imposed load** \( Q_{kc}(1) = 0 \text{ kN} \)
- **Distance from left support to start** \( L_{au}(1) = 0 \text{ m} \)
- **Distance from left support to end** \( L_{bu}(1) = 1.4 \text{ m} \)
- **Characteristic dead load** \( G_{ku}(1) = 8 \text{ kN/m} \)
- **Characteristic imposed load** \( Q_{ku}(1) = 10 \text{ kN/m} \)
- **Distance from left support to start** \( L_{au}(2) = 1.4 \text{ m} \)
- **Distance from left support to end** \( L_{bu}(2) = 5 \text{ m} \)
- **Characteristic dead load** \( G_{ku}(2) = 12 \text{ kN/m} \)
- **Characteristic imposed load** \( Q_{ku}(2) = 15 \text{ kN/m} \)
- **Overall depth of concrete section** \( h = 400 \text{ mm} \)
- **Breadth of concrete section** \( b = 200 \text{ mm} \)

### Materials

- **Char yield strength of reinf'ment** \( f_y = 500 \text{ N/mm}^2 \)
- **Max.aggregate size (for bar spc.)** \( h_{agg} = 20 \text{ mm} \)
- **Diameter of tension bars** \( \text{dia} = 25 \text{ mm} \)
- **Diameter of link legs** \( \text{dial} = 8 \text{ mm} \)
- **Effective depth of section** \( d = 345 \text{ mm} \)

Shear reinforcement

No. of long bars eff. for shear $n_{\text{bars}} = 2$

Design shear stress of $3.9683 \text{ N/mm}^2$ exceeds critical stress of $1.1966 \text{ N/mm}^2$, so links to resist balance of shear forces are necessary.
### SHEAR
- Characteristic strength: 500 N/mm²

### REINFORCEMENT
- Diameter of bars: 8 mm
- Number of legs: 2
- Spacing: 70 mm

### SUMMARY
Ensure that no longitudinal bar is more than 150 mm from vertical leg

### DEFLECTION
- Permissible span: 5.9363 m

### SUMMARY
- Actual span: 6 m

**WARNING:**
As actual span > permissible, deflection criteria are violated.
Location: Deep, narrow beam with minimum moment and shear

Design to BS8110 (1997) with partial safety factor for steel $\gamma_S = 1.15$

Rectangular beam/slab section

Calculations for reinforcement are in accordance with BS8110.

Normal-weight concrete only.

Moment before redistribution $M_{\text{befor}} = 10 \text{ kNm}$
Shear force due to ultimate loads $V = 5 \text{ kN}$
Axial load due to ultimate loads $N = 0 \text{ kN}$
Length of beam/slab $\text{len} = 6.75 \text{ m}$
Overall depth of concrete section $h = 1500 \text{ mm}$

**TENSION**

- Diameter of bars: 32 mm

**REINFORCEMENT**

- Number of bars: 10
- Area required: 7376.9 mm²
- Area provided: 8042.5 mm²

See BS 8110 Part 1 Clause 1.4 * tension lap: 900 mm

- 3.12.8.13 2.0 * tension lap: 1270 mm

**DISTRIBUTION**

- Diameter of distribution bars ($diamn$): 12 mm

**REINFORCEMENT**

- Diameter of bars: 12 mm
- Spacing of bars: 200 mm
- Area of steel required: 520 mm²/m
- Area of steel provided: 565 mm²/m

**Shear reinforcement**

- No. of long. bars eff. for shear: 10

As design shear stress of 1 N/mm² does not exceed critical shear stress of 1.0257 N/mm², no shear reinforcement is required.

**SHEAR SUMMARY**

- Design shear force: 100 kN
- Design shear resistance: 182.6 kN
Location: Columns C2-C6, D2-D6, E4 & E5

Design to BS8110(1997), partial safety factor for steel $\gamma_S = 1.15$

Biaxially bent stocky column

Calculations for reinforcement are in accordance with BS 8110 Clause 3.8.4.5 and ISE 'Manual for the design of reinforced concrete building structures'. For effective height of column see Clause 3.8.1.6 of BS8110.

Design ultimate moment about z-axis $M_z = 160$ kNm
Shear force in y-direction $F_y = 100$ kN
Design ultimate axial load $N = 2460$ kN
Effective height of column $h = 2.5$ m
Depth of column cross-section $h' = 450$ mm
Width of column cross-section $b = 250$ mm
Design ultimate moment about y-axis $M_y = 0$ kNm
Cover to all reinforcement $cover = 20$ mm
Effective depth in y-direction $h' = 394$ mm
Effective depth in z-direction $b' = 194$ mm
Characteristic strength of concrete $f_{cu} = 50$ N/mm²
Bar diameter for main steel $dia = 32$ mm

Due to the column being lightly loaded sufficient longitudinal steel must be provided to control cracking.
Location: Biaxial bending example

Isolated rectangular section subject bending and thrust

Design is based on EN 1992-1-1:2004, Eurocode 2: Design of concrete structures. The main reinforcement design is based on balancing, by iterative means, of the two derived expressions for areas of reinforcing steel - one for axial load and the other for bending. One layer of steel is assumed for the axis of bending.

Design ult.moment about y-axis \( M_{yy} = 146.1 \text{ kNm} \)
Shear force in z-direction \( V_{Ed} = 0 \text{ kN} \)
Design ultimate axial load \( N_{Ed} = 1650 \text{ kN} \)
Effective height of column \( l = 3.2 \text{ m} \)
Depth of column cross-section \( h = 350 \text{ mm} \)
Width of column cross-section \( b = 350 \text{ mm} \)
Char yield strength of reinf'ment \( f_{yk} = 500 \text{ N/mm}^2 \)
Max.aggregate size (for bar spc.) \( h_{agg} = 25 \text{ mm} \)
Diameter of compression bars \( \text{dia} = 32 \text{ mm} \)
Diameter of link legs \( \text{dial} = 8 \text{ mm} \)
Depth to comp. reinforcement \( d_2 = 88 \text{ mm} \)
Smaller initial end moment \( M_{1y} = 0 \text{ kNm} \)
Larger initial end mt. (z-z axis) \( M_{2z} = 114.5 \text{ kNm} \)
Smaller initial end moment \( M_{1z} = 0 \text{ kNm} \)

About Y-Y axis:
Column under consideration is braced.

About Z-Z axis:
Column under consideration is braced.

Number of bars provided \( n_{bars} = 8 \)

Designed steel exceeds 4% of gross area. However the maximum area can be increased provided that the concrete can be placed and compacted sufficiently.
Design of flanged beam-and-slab section to IStructE Manual

Effective width of flange = b mm

Flanged beam section

Calculations for reinforcement are in accordance with IStructE 'Manual for the design of reinforced concrete building structures' and based on simplified rectangular concrete stress-block.

BM before redistribution Mbefor=252 kNm
Ultimate shear force V=84 kN
Axial load due to ultimate loads N=0 kN
Length of flanged beam len=10 m
Overall depth of section h=500 mm
Actual flange width ba=2000 mm
Flange thickness hf=100 mm
Breadth of rib bw=300 mm
Ribbed slab=(1) flanged beam=(0) ribslab=0
Characteristic concrete strength fcu=35 N/mm²
Char.strength of long'¹ bars fy=500 N/mm²
High-yield steel reinforcement.
Bond type (0,1 or 2) Type=2
Characteristic strength of links fyv=500 N/mm²
Diameter of longitudinal bars dia=25 mm
Diameter of links dial=8 mm
Designated exposure condition is Moderate.
From Table 18 of IStructE Manual, minimum cover to all steel required for fcu=35 N/mm² and exposure condition 2 is 35 mm.
From Table 17 of IStructE Manual, minimum cover to main bars needed for continuous beam with a fire period of 2 hour/s is 50 mm.
As actual rib width of 300 mm exceeds minimum width of 150 mm specified in Table 17, cover may be decreased by 15 mm (Cl.4.4.2.1).
Thus min.cover to main bars to meet fire reqs. cover2=cover2-minus=35 mm
Thus minimum permissible cover to all steel is 35 mm
Concrete cover to all steel cover=35 mm
BM after redistribution M=252 kNm

TENSION

REINFORCEMENT

SUMMARY

Characteristic strength 500 N/mm²
Diameter of bars 25 mm
Number of bars 3
Area required 1386.5 mm²
Area provided 1472.6 mm²
Percentage provided (of rib area) 0.98175 %
See Manual
: Clause : 1.4 * tension lap 1150 mm
: 4.12.3 : 2.0 * tension lap 1630 mm

Weight of steel provided 11.56 kg/m
Shear reinforcement

Design shear stress \( v = \frac{V}{1000 \cdot (b \cdot d)} = 0.62992 \text{ N/mm}^2 \)
Size of tension bars at support \( d_{\text{ias}} = 25 \text{ mm} \)
No. of tension bars at support \( n_{\text{bars}} = 3 \)
From Table 27 of IStructE Manual, design concrete shear stress \( v_c = \text{TABLE 27 for percent}=1.1043, d=444.5 \)
\( = 0.68878 \text{ N/mm}^2 \)
As characteristic concrete strength is not equal to 30 N/mm², modify tabulated value of \( v_c \) according to footnote to Table 27.
Modification factor \( \text{factor} = \text{TABLE 27.1 for } f_{cu}=35 \)
\( = 1.053 \)
Modified concrete shear stress \( v_c = v_c \cdot \text{factor} = 0.72528 \text{ N/mm}^2 \)
Area of 2 legs of a link \( A_{sv} = n_{\text{legs}} \cdot \pi \cdot d_{\text{ias}}^2 / 4 = 100.53 \text{ mm}^2 \)
Provide minimum links as specified in Table 28 of Manual.
Spacing of links along member \( s_v = A_{sv} \cdot 0.87 \cdot f_{yv} / (0.4 \cdot b) = 364.42 \text{ mm} \)
Limit spacing to \( s_v = 0.75 \cdot d = 333.38 \text{ mm} \) (to Clause 4.4.5.3)

Location: Ribbed L-slab: low mom/high shear/mild steel/min exposure

Design of flanged beam-and-slab section to IStructE Manual

Effective width of flange = b mm

![Diagram of flanged beam section]

Flanged beam section

Calculations for reinforcement are in accordance with IStructE 'Manual for the design of reinforced concrete building structures' and based on simplified rectangular concrete stress-block.

BM before redistribution: M_{befor}=30 kNm
Ultimate shear force: V=204 kN
Axial load due to ultimate loads: N=100 kN
Length of flanged beam: len=6 m
Overall depth of section: h=250 mm
Actual flange width: b_a=1000 mm
Flange thickness: h_f=100 mm
Breadth of rib: b_w=300 mm
Ribbed slab=(1) flanged beam=(0) ribslab=1
Characteristic concrete strength: f_{cu}=30 N/mm²
Char. strength of long’l bars: f_y=250 N/mm²
Mild steel reinforcement.
Bond type (0,1 or 2): Type=0
Characteristic strength of links: f_{yv}=250 N/mm²
Diameter of longitudinal bars: d_{ia}=25 mm
Diameter of links: d_{il}=8 mm
Designated exposure condition is Mild.
From Table 18 of IStructE Manual, minimum cover to all steel required for f_{cu}=30 N/mm² and exposure condition 1 is 25 mm.
From Table 17 of Manual, minimum cover for main bars with simply-supported ribbed slab with a fire period of 1 hour/s is 25 mm.
Thus minimum permissible cover to all steel is 25 mm
Concrete cover to all steel: c_{over}=25 mm

Weight of steel provided: 7.7067 kg/m
Shear reinforcement

Design shear stress \( v = \frac{V}{1000 (bv \cdot d)} = 3.3252 \text{ N/mm}^2 \)

Longit. bars effective for shear \( n_{bars} = 2 \)

From Table 27 of IStructE Manual,

design concrete shear stress \( v_c = \text{TABLE 27 for percent}=1.6002, d=204.5 \text{ mm} \)

= \( 0.92429 \text{ N/mm}^2 \)

As \( v \) exceeds \( v_c \), shear reinforcement must be provided in a ribbed slab (see Clause 4.2.6.3).

Area of 2 legs of a link \( A_{sv} = n_{legs} \cdot \pi \cdot d_{ial}^2 / 4 = 100.53 \text{ mm}^2 \)

Provide links to resist shear force in accordance with Clause 4.2.6.3.

Spacing of links along member \( s_v = A_{sv} \cdot 0.87 \cdot f_{yv} / (bv \cdot (v - v_c)) = 30.357 \text{ mm} \)

Increase spacing to about one-half of the maximum distance permitted and increase the number of link legs correspondingly.

Increase number of link legs to \( n_{legs} = \text{INT}(n_{legs} \cdot 0.375 \cdot d / s_v) + 1 = 6 \)

at revised spacing of \( s_v = 0.375 \cdot d = 76.688 \text{ mm} \)

Ensure that no longitudinal bar is more than 150 mm from vertical leg.

| DEFLECTION | Permissible span 6.6184 m |
| SUMMARY    | Actual span 6 m |
Location: Large T-beam: high moment: low shear: severe exposure

Design of flanged beam-and-slab section to IStructE Manual

Effective width of flange = b mm

Flanged beam section

Calculations for reinforcement are in accordance with IStructE 'Manual for the design of reinforced concrete building structures' and based on simplified rectangular concrete stress-block.

BM before redistribution
M_{befor}=10000\ \text{kNm}

Ultimate shear force
V=1000\ \text{kN}

Axial load due to ultimate loads
N=0\ \text{kN}

Length of flanged beam
len=24\ \text{m}

Overall depth of section
h=2000\ \text{mm}

Actual flange width
ba=10000\ \text{mm}

Flange thickness
hf=250\ \text{mm}

Breadth of rib
bw=500\ \text{mm}

Ribbed slab=(1) flanged beam=(0) ribslab=0

Characteristic concrete strength
f_{cu}=50\ \text{N/mm}^2

Char.strength of long’l bars
f_{y}=500\ \text{N/mm}^2

High-yield steel reinforcement.

Bond type (0,1 or 2)
Type=2

Characteristic strength of links
f_{yv}=500\ \text{N/mm}^2

Diameter of longitudinal bars
dia=40\ \text{mm}

Diameter of links
dial=10\ \text{mm}

Designated exposure condition is Very Severe.

From Table 18 of IStructE Manual, minimum cover to all steel required for f_{cu}=40\ \text{N/mm}^2 and exposure condition 4 is 50 mm.

From Table 17 of IStructE Manual, minimum cover to main bars needed for continuous beam with a fire period of 4 hour/s is 70 mm.

As actual rib width of 500 mm exceeds minimum width of 240 mm specified in Table 17, cover may be decreased by 15 mm (Cl.4.4.2.1).

Thus min.cover to main bars to meet fire reqs. cover2=cover2-minus=55 mm

Thus minimum permissible cover to all steel is 50 mm

Concrete cover to all steel
cover=50\ \text{mm}

BM after redistribution
M=10000\ \text{kNm}

TENSION
Characteristic strength 500\ \text{N/mm}^2

REINFORCEMENT
Diameter of bars 40\ \text{mm}

Number of bars 11

Area required 12737\ \text{mm}^2

Area provided 13823\ \text{mm}^2

Percentage provided
(of rib area) 1.3823\%

SUMMARY
Weight of steel provided 108.51\ \text{kg/m}

See Manual

: Clause : 1.4 * tension lap 1660\ \text{mm}

: 4.12.3 : 2.0 * tension lap 2360\ \text{mm}
Shear reinforcement

Design shear stress \( v = \frac{V \times 1000}{(b \times d)} = 1.0417 \text{ N/mm}^2 \)

Size of tension bars at support \( d_{\text{ias}} = 40 \text{ mm} \)

No. of tension bars at support \( n_{\text{bars}} = 11 \)

From Table 27 of IStructE Manual,

design concrete shear stress \( v_c = \text{TABLE 27 for } \% = 1.4399, d = 1920 \)= 0.74918 \text{ N/mm}^2

As characteristic concrete strength is not equal to 30 \text{ N/mm}^2,
modify tabulated value of \( v_c \) according to footnote to Table 27.
Modification factor \( \text{factor = TABLE 27.1 for } f_{cu} = 50 \)= 1.1

Modified concrete shear stress \( v_c = v_c \times \text{factor} = 0.8241 \text{ N/mm}^2 \)

Area of 2 legs of a link \( A_{sv} = n_{legs} \times \pi \times d_{\text{ial}}^2 / 4 = 157.08 \text{ mm}^2 \)

Provide minimum links as specified in Table 28 of Manual.
Spacing of links along member \( s_v = A_{sv} \times 0.87 \times f_{yv} / (0.4 \times b_v) = 341.65 \text{ mm} \)

Increase spacing to 300 mm together with a corresponding increase
in the number of link legs to \( n_{legs} = \lfloor n_{legs} \times 300 / s_v \rfloor + 1 = 2 \)
at revised spacing of \( s_v = 300 \text{ mm} \)

Location: Ex2 - Hogging moment

Bending in flanged beams

Calculations are in accordance with EC2: Design of concrete structures and assume the use of a simplified rectangular concrete stress-block and that the depth to the neutral axis is restricted to 0.45*d.

Moment before redistribution \( M_{bef} = 600 \text{ kNm} \)
Shear force due to ultimate loads \( V_{Ed} = 267 \text{ kN} \)
Axial load due to ultimate loads \( N_{Ed} = 0 \text{ kN} \)
Length of beam/slab \( L = 8.2 \text{ m} \)
Overall depth of section \( h = 650 \text{ mm} \)
Actual flange width \( b_a = 3350 \text{ mm} \)
Flange thickness \( h_f = 200 \text{ mm} \)
Breadth of rib \( b_w = 350 \text{ mm} \)

Section being analysed is considered as continuous. Section considered has a hogging moment.
Char yield strength of reinforcement \( f_yk = 500 \text{ N/mm}^2 \)
Max. aggregate size (for bar spc.) \( h_{agg} = 20 \text{ mm} \)
Diameter of tension bars \( \text{dia} = 25 \text{ mm} \)
Diameter of link legs \( \text{dial} = 8 \text{ mm} \)
BM after redistribution \( M = 600 \text{ kNm} \)
Effective depth of section \( d = 580 \text{ mm} \)
Diameter of compression bars \( \text{diac} = 20 \text{ mm} \)
Depth to compression steel \( d_2 = 55 \text{ mm} \)

**DESIGN**

- Overall depth: 650 mm
- Effective depth: 580 mm
- Width of section: 350 mm

**SUMMARY**

- Parameter \( K \): 0.1699
- Parameter \( K' \): 0.1684
- Lever arm ratio \( z/d \): 0.8185

**FLEXURE**

Steel area provided: 2945 mm²
Diameter of bars: 25 mm
Number of bars: 6

**TENSION REINFORCEMENT**

Steel area provided: 2905 mm²
Steel percentage req.: 1.431 %
Minimum area of steel: 305.8 mm²
Maximum area of steel: 9100 mm²

**COMPRESSION REINFORCEMENT**

Steel area provided: 628.3 mm²
Diameter of bars: 20 mm
Number of bars: 2

Steel area required: 22.68 mm²
Minimum area required: 455 mm²
Shear check

Design shear stress
\[ v_{Ed} = \frac{V_{Ed} \times 10^3}{0.9 \times bw \times d} = 1.461 \, \text{N/mm}^2 \]

Concrete strut capacity
\[ v_{Rdm} = 0.124 \times f_{ck} \times (1 - f_{ck}/250) = 3.274 \, \text{N/mm}^2 \]

Angle of inclination of strut
\[ \theta' = 22^\circ \]

Number of shear legs
\[ n_{sl} = 2 \]

Chosen spacing
\[ s = 200 \, \text{mm} \]

REINFORCEMENT
Number of longitudinal bars 4

SUMMARY
Diameter of links 10 mm
Spacing of links 70 mm
Location: Ex1 - East stairwell edge beams

Rectangular section — torsion design to EC2

Calculations for torsion reinforcement in accordance with EC2 Part 1-1: General rules and rules for buildings.

- $d =$ effective depth

Design torsion moment $\text{TEd} = 13 \text{kNm}$
Design shear force $\text{VED} = 125 \text{kN}$
Overall depth of section $h = 350 \text{mm}$
Breadth of concrete section $b = 300 \text{mm}$
Char.strength of longitud.bars $f_{yk} = 500 \text{N/mm}^2$
Partial safety factor for steel $\gamma_{ms} = 1.15$
Diameter of closed link $d_{al} = 8 \text{mm}$
Diameter of long. reinf'ment $d_{long} = 20 \text{mm}$
Nominal cover (to links) $c_{ov} = 30 \text{mm}$

Design for shear using the "Variable Strut Inclination Method"

- $\text{comp} = \cot(\theta) = 1/\tan(\theta) = 2.4751$
- Maximum shear resistance: $\text{VR}_{d_{max}} = 0.36 * b * d * (1 - f_{ck}/250) * f_{ck}/((\text{comp} + 1/\text{comp}) * 1000) = 254.89 \text{kN}$
- $\text{Asw}/s$ based on area of two legs $\text{AswsS} = \text{VED} * 1000 / (0.78 * d * f_{yk} * \text{comp})$
  $= 0.42879$

Convert the rectangular section to an equivalent hollow box section

- Effective thickness $\text{tef} = h * b / (2 * (h + b)) = 80.769 \text{mm}$
- Limiting thickness $\text{tef} = 2 * (c_{ov} + d_{al} + d_{long}/2) = 96 \text{mm}$
- Area within centre line $\text{Ak} = (b - \text{tef}) * (h - \text{tef}) = 51816 \text{mm}^2$
- Perimeter of centreline $\text{uk} = 2 * (b + h - 2 * \text{tef}) = 916 \text{mm}$

Crushing limit for combined shear and torsion

The following check is in accordance with EN 1992-2 Clause 6.3.2(104).
- Effective thickness $\text{tef} = 96 \text{mm}$
- Area within centre line $\text{Ak}' = (b - \text{tef}) * (h - \text{tef}) = 51816 \text{mm}^2$
- Max torsional moment resistance $\text{TR}_{d_{max}} = 2 * v_1 * f_{ck}/1.5 * \text{Ak}' * \text{tef} * \text{comp1}$
  $/1E6 = 31.099 \text{kNm}$
- Interaction condition $\text{ratio} = \text{TEd} / \text{TR}_{d_{max}} + \text{VED} / \text{VR}_{d_{max}} = 0.90842$
- Therefore concrete section is adequate.

Total amount of link reinforcement (shear and torsion)

The area $\text{Asw}$ below is based on the area of two legs of the stirrup.
- $\text{Asw}/s$ required $\text{AswsS} + \text{AswsT} = 0.66182$
- Round link spacing down to $s_{v} = 10 \times \text{INT}(s_{v}/10) = 110 \text{mm}$
- $\text{Asw}/s$ provided $\text{Aswp} = \text{TABLE 4.4 for dial}=8, \text{sv}=110$
  $= 0.9256$

SCALE 5.48 Office 1007 Proforma 108
Links should be of closed type fully anchored by means of laps or hooked ends, as per EC2 Clause 9.2.3(1) Figure 9.6.

**Area of additional longitudinal reinforcement required for torsion**

Diameter long.tension reinf'ment \( ltbars = 16 \text{ mm} \)

Area of longitudinal bars provided for torsion \( \text{Aspro}=nbars \times (\pi \times ltbars^2/4) = 804.25 \text{ mm}^2 \)

Area of longitudinal bars reqd. \( 653.8 \text{ mm}^2 \)

This torsional steel is additional to that required for bending and shear. Additional longitudinal reinforcement required at the level of the tension steel may be provided by using larger bars than those required for bending alone.

4. Edge stress beneath single-leg loaded point R4:

Total stress at R1
\[ T_{qe1} = (q_{e1} + q_{i21} + q_{e31} + q_{e41}) \times 0.85 \]
\[ = 4763.9 \text{ kN/m}^2 \]

where 0.85 is the load-transfer factor at the edge.

Rack positioned at edge of slab - Arrangement 2

2. Edge stress beneath double-leg loaded point R2:
3. Edge stress beneath double-leg loaded point R3:
where 0.7 is the factor for load transfer at the corner.
Rack positioned internally

Leg stresses from racks:
1. Internal stress beneath double-leg loaded point R1:
2. Internal stress beneath single-leg loaded point R2:
3. Internal stress beneath single-leg loaded point R3:
4. Internal stress beneath double-leg loaded point R4:
5. Internal stress beneath double-leg loaded point R5:

Orientated about X-X axis:
Stress at R1 due to R2  \( q_{i21x} = q_{i2} \cdot P_{21x}/100 = -169.82 \text{ kN/m}^2 \)
Stress at R1 due to R3  \( q_{i31x} = q_{i3} \cdot P_{31x}/100 = -169.82 \text{ kN/m}^2 \)
Stress at R1 due to R4  \( q_{i41x} = q_{i4} \cdot P_{41x}/100 = 0 \text{ kN/m}^2 \)
Stress at R1 due to R5  \( q_{i51x} = q_{i5} \cdot P_{51x}/100 = 0 \text{ kN/m}^2 \)

Orientated about Y-Y axis:
Stress at R1 due to R2  \( q_{i21y} = q_{i2} \cdot P_{21y}/100 = 189.59 \text{ kN/m}^2 \)
Stress at R1 due to R3  \( q_{i31y} = q_{i3} \cdot P_{31y}/100 = 189.59 \text{ kN/m}^2 \)
Stress at R1 due to R4  \( q_{i41y} = q_{i4} \cdot P_{41y}/100 = -140.99 \text{ kN/m}^2 \)
Stress at R1 due to R5  \( q_{i51y} = q_{i5} \cdot P_{51y}/100 = -140.99 \text{ kN/m}^2 \)
WHEEL LOADING

Wheel stresses from forklift or other trucks:
1. Edge stress due to wheel load:
2. Corner stress due to wheel load:
3. Internal stress due to rack leg beneath double-leg point R1:

Wheel stress at the edge

\[
\begin{align*}
W2 & \quad 500 \quad W1 \\
\text{W1 and W2 are wheel loads} \\
\text{R1 is a double rack leg} \\
\text{All dimensions are in millimetres}
\end{align*}
\]

Total stress at W1
\[
T_{qwe} = (q_{ew} + q_{w1} + q_{1w1}) \times 0.85 = 3923.7 \text{ kN/m}^2
\]
where 0.85 is the load-transfer factor at the edge.

Wheel stress at the corner

\[
\begin{align*}
W1 & \quad / \quad W2 \\
627.75 & \quad / \quad / \\
\text{W1 and W2 are wheel loads} \\
\text{All dimensions are in millimetres}
\end{align*}
\]
where 0.7 is the load-transfer factor at the edge.
SUMMARY OF RESULTS

Concrete grade specified  
Allowable 90-day modulus of rupture 
Thus the calculated stresses are as follows:
Edge stress in slab due to rack 1  
Edge stress in slab due to rack 2  
Corner stress in slab due to rack 1  
Corner stress in slab due to rack 2  
Internal stress in slab due to rack 
Edge stress in slab due to wheel  
Corner stress in slab due to wheel  
Minimum suitable slab thickness

WARNING:
The load is too high for an unreinforced slab. Instead, design as a reinforced raft slab. This is beyond the scope of this proforma.
Location: Ex1 - Ground-supported steel fibre-reinforced slab

Design of ground-supported concrete slabs to TR34 (4th edition)

This proforma is for the design of ground-supported concrete floors for industrial buildings. The design method employed here is as per TR34 (4th edition) entitled 'Concrete Industrial Ground Floors' by The Concrete Society (March 2016 publication).

Assume a slab thickness           h=175 mm
Type of sub-base                  Granular material
Type of sub-base to be well graded granular material such as Type 1 or Type 2 complying with and laid in accordance with the Highway Agency Specification for Highway Works. All fill material should be checked for content of potentially expansive materials or reactions with lime and/or cement.
Sub-base thickness                sbb=150 mm
Modulus of subgrade reaction      k=0.05 N/mm²

Back-to-back pallet racking

Length of baseplate (in X-dir.)   Lr=100 mm
Breadth of baseplate (in Y-dir.)  br=100 mm
Radius of relative stiffness:

\[ l = \frac{Ecm \times h^3}{12 \times (1-u^2) \times k} \times 0.25 = 746.33 \text{ mm} \]

Dist.from edge to first rack leg  Defr=0 mm
Dist.between double rack legs     Dbr=250 mm
Reduced design load               Dldr=0.8xDld=115.2 kN

CASE 4: Check for punching shear
Punching shear may be critical for the edge loading condition and will be considered. The shear stress will be checked at the face of the loaded area and on a perimeter at a distance 2d from the loaded area.

\[ P1 = 72 \text{ kN} \]
\[ 2d = 262.5 \text{ mm} \]

PLAN SHOWING PUNCHING SHEAR PERIMETER

(1) At the face of the loaded area
Shear stress \( v_{Ed} = \frac{Dld*1000}{(u_o*d)} = 1.9948 \) 
Shear strength \( v_{Rd} = 0.5*k2*f_{cd} = 5.5808 \text{ N/mm}^2 \)
As \( v_{Rd} \geq v_{Ed} \) (5.5808 N/mm\(^2\) \geq 1.9948 N/mm\(^2\)), shear stress is OK.

(2) At the critical perimeter
Shear capacity for fibre-reinforced concrete:
The expression below is based on RILEM guidance which states that the presence of steel fibres will increase the design shear capacity over that of the plain concrete (an equivalent flexural strength ratio of \( Re3 = 0.5 \) will be assumed).
\[
0.035*k1^{1.5}*f_{ck}^{0.5} + 0.12*Re3*f_{ctk}/2 = 0.68848 \text{ N/mm}^2
\]
Slab load capacity \( P_p = \frac{v_{Rd}*u_1*d}{1000} = 124.22 \text{ kN} \)
Reduced design load \( Dldr = 0.8*Dld = 115.2 \text{ kN} \)
As \( Dldr \leq P_p \) (115.2 kN \leq 124.22 kN), this loading case is OK.

**General storage loading - random loading in kN/m**
Uniformly distributed load \( udl = 30 \text{ kN/m}^2 \) (unfactored)
Maximum UDL permitted \( w = 5.95*\lambda_2*M_n = 79.436 \text{ kN/m}^2 \)
As \( udl \leq w \) (30 kN/m\(^2\) \leq 79.436 kN/m\(^2\)), this loading case is OK.

**Internal wall loading - line load in kN/m**
Line load from wall (unfactored) \( ll = 30 \text{ kN/m} \)
For line loads remote from joints or slab edges:
Maximum line load permitted \( Plin = 4*\lambda_2*M_n = 55.793 \text{ kN/m} \)
As \( ll \leq Plin \) (30 kN/m \leq 55.793 kN/m), this loading case is OK.

For line loads adjacent to a free edge:
Maximum line load permitted \( Plin = 3*\lambda_2*M_n = 41.845 \text{ kN/m} \)
As \( ll \leq Plin \) (30 kN/m \leq 41.845 kN/m), this loading case is OK.

**Mezzanine floor**

---

Distance between columns \( x_1 = 5 \text{ m} \)
Distance between columns \( y_1 = 4 \text{ m} \)
Design column load (internal) \( W_{ci} = (x_1*y_1)*w_t = 183.75 \text{ kN} \)
Design column load (free edge) \( W_{ce} = (x_1*y_1)/2*w_t = 91.875 \text{ kN} \)
Length of baseplate (in X-dir.) \( L_m = 250 \text{ mm} \)
Breadth of baseplate (in Y-dir.) \( b_m = 250 \text{ mm} \)

CASE 1: Internal loading
Load capacity (rat=a1/l) \[ P_{ui} = P_{ui1} + \frac{(P_{ui2} - P_{ui1}) \times rat}{0.2} = 284.57 \text{ kN} \]
As \( W_{ci} \leq P_{ui} \ (183.75 \text{ kN/m} \leq 284.57 \text{ kN/m}) \), this loading case is OK.

CASE 2: Free edge loading
Load capacity (TR34 Eq. 23) \[ P_{ue1} = \frac{P_{i} \times (M_{n} + M_{p})}{2} + 2 \times M_{n} = 63.481 \text{ kN} \]
Load capacity (TR34 Eq. 24) \[ P_{ue2} = \frac{P_{i} \times (M_{n} + M_{p}) + 4 \times M_{n}}{1 - \frac{2 \times a_{1}}{3 \times l}} = 145.26 \text{ kN} \]
Load capacity (rat=a1/l) \[ P_{ue} = P_{ue1} + \frac{(P_{ue2} - P_{ue1}) \times rat}{0.2} = 140.76 \text{ kN} \]
As \( W_{ce} \leq P_{ue} \ (91.875 \text{ kN/m} \leq 140.76 \text{ kN/m}) \), this loading case is OK.

**Forklift truck loading**

Maximum wheel load (unfactored) \( W_{l} = 40 \text{ kN} \)
Design load per wheel \[ D_{lw} = \gamma_{D} \times W_{l} = 64 \text{ kN} \]

CASE 1: Internal loading
Load capacity (rat2=a2/l) \[ P_{u} = P_{u1} + \frac{(P_{u2} - P_{u1}) \times rat2}{0.2} = 181.28 \text{ kN} \]
As \( D_{lw} \leq P_{u} \ (64 \text{ kN} \leq 181.28 \text{ kN}) \), internal loading case is OK.

CASE 2: Loading at joints
Load capacity (a2/l=0) \[ P_{u1} = \frac{P_{i} \times (M_{p} + M_{n})}{2} + 2 \times M_{n} = 63.481 \text{ kN} \]
Load capacity (a2/l\leq0.2) \[ P_{u2} = \frac{P_{i} \times (M_{p} + M_{n}) + 4 \times M_{n}}{1 - \frac{2 \times a_{2}}{3 \times l}} = 132.38 \text{ kN} \]
Load capacity (rat2=a2/l) \[ P_{u} = P_{u1} + \frac{(P_{u2} - P_{u1}) \times rat2}{0.2} = 84.638 \text{ kN} \]
As \( D_{lw} \leq P_{u} \ (64 \text{ kN} \leq 84.638 \text{ kN}) \), this loading case is OK.

CASE 3: Corner loading
It is assumed that the corner loading is not relevant provided adequate load transfer is provided and the edge condition has been considered.

**Relative position of truck wheel and racking leg**

<table>
<thead>
<tr>
<th>racking leg</th>
<th>---o---</th>
<th>Design leg load =72 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>H</td>
</tr>
<tr>
<td>truck wheel</td>
<td>---o---</td>
<td>Design truck wheel load =64 kN</td>
</tr>
</tbody>
</table>

**EQUIVALENT LOADED AREAS FOR RACKING LEGS AND FORK LIFT TRUCK WHEELS**

Distance from wheel to baseplate \( H = 300 \text{ mm} \)

CASE 1: Internal loading
Load capacity (Rat=aeq/l) \[ P_{u} = P_{u1} + \frac{(P_{u2} - P_{u1}) \times Rat}{0.2} = 244.5 \text{ kN} \]
As \( D_{ld} \leq P_{u} \ (144 \text{ kN} \leq 244.5 \text{ kN}) \), internal loading case is OK.

CASE 2: Free edge loading (at a joint)
Load capacity (a/l=0) \[ P_{u1} = \frac{P_{i} \times (M_{p} + M_{n})}{2} + 2 \times M_{n} = 63.481 \text{ kN} \]
Load capacity (a/l\geq0.2) \[ P_{u2} = \frac{P_{i} \times (M_{p} + M_{n}) + 4 \times M_{n}}{1 - \frac{2 \times a}{3 \times l}} = 133.04 \text{ kN} \]
Load capacity (Rat=aeq/l) \[ P_{u} = P_{u1} + \frac{(P_{u2} - P_{u1}) \times Rat}{0.2} = 115.33 \text{ kN} \]
Reduced design load \( D_{ldr} = 0.8 \times D_{ld} = 115.2 \text{ kN} \)

As \( D_{ldr} \leq P_u \) (115.2 kN \( \leq \) 115.33 kN), this loading case is OK.

**Deflection check - Serviceability Limit State (SLS)**

The deflection expression below is by 'Westergaard' and can be used to obtain an approximate quantification of the slab deflection under a concentrated load \( P \).

\[
\text{Deflection (edge condition)} \quad \text{DEL} = \frac{c_1 \times P \times 1000}{k \times l^2} = 1.9044 \text{ mm}
\]

The design calculations assume 20% load-transfer across the joint. Ensure this can be accommodated by checking with the designer of the load transfer system.
Design of ground-supported concrete slabs to TR34 (4th edition)

This proforma is for the design of ground-supported concrete floors for industrial buildings. The design method employed here is as per TR34 (4th edition) entitled 'Concrete Industrial Ground Floors' by The Concrete Society (March 2016 publication).

Assume a slab thickness $h=175$ mm
Type of sub-base Granular material
Type of sub-base to be well graded granular material such as Type 1 or Type 2 complying with and laid in accordance with the Highway Agency Specification for Highway Works. All fill material should be checked for content of potentially expansive materials or reactions with lime and/or cement.
Sub-base thickness $s_{bb}=150$ mm
Modulus of subgrade reaction $k=0.05$ N/mm³

Back-to-back pallet racking

Length of baseplate (in X-dir.) $L_r=150$ mm
Breadth of baseplate (in Y-dir.) $b_r=150$ mm
Radius of relative stiffness:

$$l=(E_{cm}*h^3/(12*(1-u^2)*k))^{0.25}=746.33 \text{ mm}$$

Dist. from edge to first rack leg $D_{efr}=0$ mm
Dist. between double rack legs $D_{br}=300$ mm
Reduced design load $D_{ldr}=0.8*D_{ld}=115.2$ kN

CASE 4: Check for punching shear
Punching shear may be critical for the edge loading condition and will be considered. The shear stress will be checked at the face of the loaded area and on a perimeter at a distance $2d$ from the loaded area.

Punching shear: $P_1=72$ kN
Perimeter: $2d=262.5$ mm

(1) At the face of the loaded area
Shear stress \[ v_{Ed} = \frac{Dld \times 1000}{(uo \times d)} = 1.4629 \]
Shear strength \[ v_{Rd} = 0.5 \times k_2 \times f_{cd} = 5.5808 \text{ N/mm}^2 \]
As \[ v_{Rd} \geq v_{Ed} \ (5.5808 \text{ N/mm}^2 \geq 1.4629 \text{ N/mm}^2) \], shear stress is OK.

(2) At the critical perimeter
Shear capacity for fibre-reinforced concrete:
The expression below ignores the steel fibres in the concrete and assumes plain concrete (EC2 Part 1-1, expression 6.3N).
\[ v_{Rd} = 0.035 \times k_1^{1.5} \times f_{ck}^{0.5} = 0.56 \text{ N/mm}^2 \]
Slab load capacity \[ P_p = v_{Rd} \times u_1 \times d / 1000 = 115.74 \text{ kN} \]
Reduced design load \[ Dldr = 0.8 \times Dld = 115.2 \text{ kN} \]
As \[ Dldr \leq P_p \ (115.2 \text{ kN} \leq 115.74 \text{ kN}) \], this loading case is OK.

**General storage loading - random loading in kN/m²**

Uniformly distributed load \[ udl = 30 \text{ kN/m}^2 \] (unfactored)
Maximum UDL permitted \[ w = 5.95 \times \lambda^2 \times M_n = 79.436 \text{ kN/m}^2 \]
As \[ udl \leq w \ (30 \text{ kN/m}^2 \leq 79.436 \text{ kN/m}^2) \], this loading case is OK.

**Internal wall loading - line load in kN/m**

Line load from wall (unfactored) \[ ll = 30 \text{ kN/m} \]
For line loads remote from joints or slab edges:
Maximum line load permitted \[ Plin = 4 \times \lambda \times M_n = 55.793 \text{ kN/m} \]
As \[ ll \leq Plin \ (30 \text{ kN/m} \leq 55.793 \text{ kN/m}) \], this loading case is OK.

For line loads adjacent to a free edge:
Maximum line load permitted \[ Plin = 3 \times \lambda \times M_n = 41.845 \text{ kN/m} \]
As \[ ll \leq Plin \ (30 \text{ kN/m} \leq 41.845 \text{ kN/m}) \], this loading case is OK.

**Mezzanine floor**

\[\begin{align*}
&| & | & | & \text{slab edge} \\
| & -0- & -0- & | \\
| & \cdot & \cdot & | \\
| & \cdot & \cdot & | \\
| & -0- & -0- & | \\
& \text{Partial plan} \\
& \text{on mezzanine} \\
& \text{columns} \\
\end{align*}\]

Distance between columns \[ x_1 = 5 \text{ m} \]
Distance between columns \[ y_1 = 4 \text{ m} \]
Design column load (internal) \[ W_{ci} = (x_1 \times y_1) \times w_t = 183.75 \text{ kN} \]
Design column load (free edge) \[ W_{ce} = (x_1 \times y_1) / 2 \times w_t = 91.875 \text{ kN} \]
Length of baseplate (in X-dir.) \[ L_m = 250 \text{ mm} \]
Breadth of baseplate (in Y-dir.) \[ b_m = 250 \text{ mm} \]

**CASE 1: Internal loading**
Load capacity (rat = a1/l) \[ P_{ui} = P_{ui1} + (P_{ui2} - P_{ui1}) \times \text{rat} / 0.2 = 284.57 \text{ kN} \]
As \[ W_{ci} \leq P_{ui} \ (183.75 \text{ kN/m} \leq 284.57 \text{ kN/m}) \], this loading case is OK.
CASE 2: Free edge loading

Load capacity (TR34 Eq. 23)
$$P_{ue1} = \left( \pi \left( \frac{M_n + M_p}{2} \right) + 2M_n \right) = 63.481 \text{ kN}$$

Load capacity (TR34 Eq. 24)
$$P_{ue2} = \left( \pi \left( \frac{M_n + M_p + 4M_n}{1 - 2a_1/(3l)} \right) \right) = 145.26 \text{ kN}$$

Load capacity (rat=a1/l)
$$P_{ue} = P_{ue1} + \left( P_{ue2} - P_{ue1} \right) \cdot \frac{rat}{0.2} = 140.76 \text{ kN}$$

As $W_{ce} \leq P_{ue}$ (91.875 kN/m \leq 140.76 kN/m), this loading case is OK.

Forklift truck loading

Maximum wheel load (unfactored) $w_l = 40 \text{ kN}$

Design load per wheel $D_{lw} = \gamma D \cdot w_l = 64 \text{ kN}$

CASE 1: Internal loading

Load capacity (rat2=a2/l)
$$P_{u} = P_{u1} + \left( P_{u2} - P_{u1} \right) \cdot \frac{rat2}{0.2} = 181.28 \text{ kN}$$

As $D_{lw} \leq P_{u}$ (64 kN \leq 181.28 kN), internal loading case is OK.

CASE 2: Loading at joints

Load capacity (a2/l=0)
$$P_{u1} = \left( \pi \left( \frac{M_p + M_n}{2} \right) + 2M_n \right) = 63.481 \text{ kN}$$

Load capacity (a2/l\geq0.2)
$$P_{u2} = \left( \pi \left( \frac{M_p + M_n + 4M_n}{1 - 2a_2/(3l)} \right) \right) = 132.38 \text{ kN}$$

Load capacity (rat2=a2/l)
$$P_{u} = P_{u1} + \left( P_{u2} - P_{u1} \right) \cdot \frac{rat2}{0.2} = 84.638 \text{ kN}$$

As $D_{lw} \leq P_{u}$ (64 kN \leq 84.638 kN), this loading case is OK.

CASE 3: Corner loading

It is assumed that the corner loading is not relevant provided adequate load transfer is provided and the edge condition has been considered.

Relative position of truck wheel and racking leg

$$\text{Distance from wheel to baseplate } H = 300 \text{ mm}$$

CASE 1: Internal loading

Load capacity (Rat=aeq/l)
$$P_{u} = P_{u1} + \left( P_{u2} - P_{u1} \right) \cdot \frac{Rat}{0.2} = 263.43 \text{ kN}$$

As $D_{ld} \leq P_{u}$ (144 kN \leq 263.43 kN), internal loading case is OK.

CASE 2: Free edge loading (at a joint)

Load capacity (a/l=0)
$$P_{u1} = \left( \pi \left( \frac{M_p + M_n}{2} \right) + 2M_n \right) = 63.481 \text{ kN}$$

Load capacity (a/l\geq0.2)
$$P_{u2} = \left( \pi \left( \frac{M_p + M_n + 4M_n}{1 - 2a/(3l)} \right) \right) = 134.82 \text{ kN}$$

Load capacity (Rat=aeq/l)
$$P_{u} = P_{u1} + \left( P_{u2} - P_{u1} \right) \cdot \frac{Rat}{0.2} = 125.27 \text{ kN}$$

Reduced design load $D_{ldr} = 0.8 \cdot D_{ld} = 115.2 \text{ kN}$

As $D_{ldr} \leq P_{u}$ (115.2 kN \leq 125.27 kN), this loading case is OK.
Deflection check - Serviceability Limit State (SLS)

The deflection expression below is by 'Westergaard' and can be used to obtain an approximate quantification of the slab deflection under a concentrated load P.

Deflection (edge condition) \( DEL = \frac{c_1 \cdot P \cdot 1000}{k \cdot l^2} = 1.9044 \text{ mm} \)

The design calculations assume 20% load-transfer across the joint. Ensure this can be accommodated by checking with the designer of the load transfer system.
Design of ground-supported concrete slabs to TR34 (4th edition)

This proforma is for the design of ground-supported concrete floors for industrial buildings. The design method employed here is as per TR34 (4th edition) entitled 'Concrete Industrial Ground Floors' by The Concrete Society (March 2016 publication).

Assume a slab thickness \( h = 150 \text{ mm} \)
Type of sub-base Granular material
Type of sub-base to be well graded granular material such as Type 1 or Type 2 complying with and laid in accordance with the Highway Agency Specification for Highway Works. All fill material should be checked for content of potentially expansive materials or reactions with lime and/or cement.

Sub-base thickness \( s_{bb} = 150 \text{ mm} \)
Modulus of subgrade reaction \( k = 0.05 \text{ N/mm}^3 \)

Pallet racking (single leg)

Length of baseplate (in X-dir.) \( L_r = 100 \text{ mm} \)
Breadth of baseplate (in Y-dir.) \( b_r = 100 \text{ mm} \)
Radius of relative stiffness:
\[
l = \left( \frac{E_{cm} \cdot h^3}{12 \cdot (1 - u^2) \cdot k} \right)^{0.25} = 664.85 \text{ mm}
\]
Dist. from edge to first rack leg \( D_{efr} = 0 \text{ mm} \)
Reduced design load \( D_{ldr} = 0.8 \cdot S_{ld} = 57.6 \text{ kN} \)

CASE 4: Check for punching shear
Punching shear may be critical for the edge loading condition and will be considered. The shear stress will be checked at the face of the loaded area and on a perimeter at a distance 2\( d \) from the loaded area.

\[
v_{Ed} = \frac{S_{ld} \cdot 1000}{(u_0 \cdot d)} = 2.1333
\]

(1) At the face of the loaded area

Plan showing punching shear perimeter
Shear strength  \[ v_{Rd} = 0.5 \times k_2 \times f_{cd} = 5.5808 \text{ N/mm}^2 \]
As \( v_{Rd} \geq v_{Ed} \) (5.5808 N/mm² ≥ 2.1333 N/mm²), shear stress is OK.

(2) At the critical perimeter

Shear capacity for fibre-reinforced concrete:

\[ v_{Rd} = (0.035 \times k_1 \times 1.5 \times f_{ck} \times 0.5 + 0.12 \times R_3 \times f_{ctk}/2) = 0.68848 \text{ N/mm}^2 \]

Slab load capacity  \[ P_p = v_{Rd} \times u_1 \times d/1000 = 77.985 \text{ kN} \]
As \( S_{ld} \leq P_p \) (72 kN ≤ 77.985 kN), this loading case is OK.

**General storage loading - random loading in kN/m²**

Uniformly distributed load  \[ u_{dl} = 30 \text{ kN/m}^2 \] (unfactored)
Maximum UDL permitted  \[ w = 5.95 \times \lambda_{m}^2 \times M_n = 73.544 \text{ kN/m}^2 \]
As \( u_{dl} \leq w \) (30 kN/m² ≤ 73.544 kN/m²), this loading case is OK.

**Internal wall loading - line load in kN/m**

Line load from wall (unfactored)  \[ l_l = 30 \text{ kN/m} \]

For line loads remote from joints or slab edges:
Maximum line load permitted  \[ P_{lin} = 4 \times \lambda_{m} \times M_n = 46.014 \text{ kN/m} \]
As \( l_l \leq P_{lin} \) (30 kN/m ≤ 46.014 kN/m), this loading case is OK.

For line loads adjacent to a free edge:
Maximum line load permitted  \[ P_{lin} = 3 \times \lambda_{m} \times M_n = 34.511 \text{ kN/m} \]
As \( l_l \leq P_{lin} \) (30 kN/m ≤ 34.511 kN/m), this loading case is OK.

**Mezzanine floor**

\[ | O | O | \text{slab edge} \]
\[ | O | O | y_1 \]
\[ | . | . | \]
\[ | . | . | \]
\[ Y | O | O | \text{Partial plan} \]
\[ x_1 \text{ on mezzanine} \]
\[ \text{columns} \]

Distance between columns  \[ x_1 = 5 \text{ m} \]
Distance between columns  \[ y_1 = 4 \text{ m} \]
Design column load (internal)  \[ W_{ci} = (x_1 \times y_1) \times w_t = 183.75 \text{ kN} \]
Design column load (free edge)  \[ W_{ce} = (x_1 \times y_1)/2 \times w_t = 91.875 \text{ kN} \]
Length of baseplate (in X-dir.)  \[ L_m = 250 \text{ mm} \]
Breadth of baseplate (in Y-dir.)  \[ B_m = 250 \text{ mm} \]

**CASE 1: Internal loading**

Load capacity (rat=a1/l)  \[ P_{ui} = P_{ui1} + (P_{ui2} - P_{ui1}) \times \text{rat}/0.2 = 224.23 \text{ kN} \]
As \( W_{ci} \leq P_{ui} \) (183.75 kN/m ≤ 224.23 kN/m), this loading case is OK.

**CASE 2: Free edge loading**

Load capacity (TR34 Eq. 23)  \[ P_{ue1} = \left( \frac{P_{ui} \times (M_n + M_p)}{2} \right) + 2 \times M_n = 46.639 \text{ kN} \]
Load capacity (TR34 Eq. 24) \[ P_{ue2} = \frac{\pi (M_n + M_p) + 4M_n}{1 - \frac{2a_1}{3l}} = 108.64 \text{ kN} \]

Load capacity \( \text{rat} = \frac{a_1}{l} \) \[ P_u = P_{ue1} + \frac{(P_{ue2} - P_{ue1}) \cdot \text{rat}}{0.2} = 112.41 \text{ kN} \]  
As \( W_{ce} \leq P_u \) (91.875 kN/m \leq 112.41 kN/m), this loading case is OK.

Forklift truck loading

Maximum wheel load (unfactored) \( w_l = 40 \text{ kN} \)  
Design load per wheel \( D_{lw} = \gamma D \cdot w_l = 64 \text{ kN} \)

CASE 1: Internal loading
Load capacity \( \text{rat} = \frac{a_2}{l} \) \[ P_u = P_{u1} + \frac{(P_{u2} - P_{u1}) \cdot \text{rat}}{0.2} = 137.32 \text{ kN} \]  
As \( D_{lw} \leq P_u \) (64 kN \leq 137.32 kN), internal loading case is OK.

CASE 2: Loading at joints
Load capacity \( \frac{a_2}{l} = 0 \) \[ P_{u1} = \frac{\pi (M_p + M_n) + 2M_n}{2} = 46.639 \text{ kN} \]  
Load capacity \( \frac{a_2}{l} = 0.2 \) \[ P_{u2} = \frac{\pi (M_p + M_n) + 4M_n}{1 - \frac{2a_2}{3l}} = 97.771 \text{ kN} \]  
Load capacity \( \text{rat} = \frac{a_2}{l} \) \[ P_u = P_{u1} + \frac{(P_{u2} - P_{u1}) \cdot \text{rat}}{0.2} = 64.264 \text{ kN} \]  
As \( D_{lw} \leq P_u \) (64 kN \leq 64.264 kN), this loading case is OK.

CASE 3: Corner loading
It is assumed that the corner loading is not relevant provided adequate load transfer is provided and the edge condition has been considered.

Deflection check - Serviceability Limit State (SLS)

The deflection expression below is by 'Westergaard' and can be used to obtain an approximate quantification of the slab deflection under a concentrated load \( P \).  
Deflection (edge condition) \[ \text{DEL} = c_1 \cdot P \cdot 1000 / (k \cdot l^2) = 1.2499 \text{ mm} \]

Location: Ex4 - Ground-supported fabric-reinforced slab

Design of ground-supported concrete slabs to TR34 (4th edition)

This proforma is for the design of ground-supported concrete floors for industrial buildings. The design method employed here is as per TR34 (4th edition) entitled 'Concrete Industrial Ground Floors' by The Concrete Society (March 2016 publication).

Assume a slab thickness $h=200$ mm
Type of sub-base Granular material
Type of sub-base to be well graded granular material such as Type 1 or Type 2 complying with and laid in accordance with the Highway Agency Specification for Highway Works. All fill material should be checked for content of potentially expansive materials or reactions with lime and/or cement.
Sub-base thickness $s_{bb}=150$ mm
Modulus of subgrade reaction $k=0.05$ N/mm\(^3\)

Back-to-back pallet racking

Length of baseplate (in X-dir.) $L_r=100$ mm
Breadth of baseplate (in Y-dir.) $b_r=100$ mm
Radius of relative stiffness:

$$l=(E_{cm}h^3/(12(1-u^2)*k))^{0.25}=824.95 \text{ mm}$$

Dist. from edge to first rack leg $D_{efr}=0$ mm
Dist. between double rack legs $D_{br}=250$ mm
Characteristic strength of steel $f_{yk}=500$ N/mm\(^2\)
Effective depth of fabric-r'ment $d_1=150$ mm
Area of bottom fabric reinf'ment $A_{s}=142$ mm\(^2\)
Load-transfer across the joint $l_{tr}=24\%$
Reduced design load $D_{ldr}=D_{ld}-l_{tr}/100*D_{ld}=109.44$ kN

CASE 4: Check for punching shear
Punching shear may be critical for the edge loading condition and will be considered. The shear stress will be checked at the face of the loaded area and on a perimeter at a distance 2d from the loaded area.
punching shear perimeter

P1=72 kN
2d=300 mm
Lr=100 mm
L1=350 mm
Defr=0 mm
br=100 mm

PLAN SHOWING PUNCHING SHEAR PERIMETER

(1) At the face of the loaded area
Shear stress \( v_{Ed} = \frac{Dld \times 1000}{(u_0 \times d)} = 1.7455 \)
Shear strength \( v_{Rd} = 0.5 \times k_2 \times f_{cd} = 5.5808 \, N/mm^2 \)
As \( v_{Rd} \geq v_{Ed} \) (5.5808 N/mm\(^2\) \geq 1.7455 N/mm\(^2\)), shear stress is OK.

(2) At the critical perimeter
Shear capacity for fabric-reinforced concrete:
\[ v_{Rd} = (0.18/gamc) \times k_1 \times ((100 \times p_1 \times f_{ck})^{0.33} = 0.34598 \, N/mm^2 \]
Limiting capacity \( v_{Rd} = 0.035 \times k_1^{1.5} \times f_{ck}^{0.5} = 0.56 \, N/mm^2 \)
Slab load capacity \( P_p = v_{Rd} \times u_1 \times d / 1000 = 125.37 \, kN \)
Reduced design load \( Dldr = Dld - ltr / 100 \times Dld = 109.44 \, kN \)
As \( Dldr \leq P_p \) (109.44 kN \leq 125.37 kN), this loading case is OK.

General storage loading - random loading in kN/m\(^2\)
Uniformly distributed load \( u_{dl} = 30 \, kN/m^2 \) (unfactored)
Maximum UDL permitted \( w = 5.95 \times \lambda_1^2 \times M_n = 84.921 \, kN/m^2 \)
As \( u_{dl} \leq w \) (30 kN/m\(^2\) \leq 84.921 kN/m\(^2\)), this loading case is OK.

Internal wall loading - line load in kN/m
Line load from wall (unfactored) \( ll = 30 \, kN/m \)
For line loads remote from joints or slab edges:
Maximum line load permitted \( Plin = 4 \times \lambda_1 \times M_n = 65.928 \, kN/m \)
As \( ll \leq Plin \) (30 kN/m \leq 65.928 kN/m), this loading case is OK.

For line loads adjacent to a free edge:
Maximum line load permitted \( Plin = 3 \times \lambda_1 \times M_n = 49.446 \, kN/m \)
As \( ll \leq Plin \) (30 kN/m \leq 49.446 kN/m), this loading case is OK.

Mezzanine floor
Distance between columns \( x_1 = 5 \text{ m} \)
Distance between columns \( y_1 = 4 \text{ m} \)
Design column load (internal) \( W_{CI} = (x_1 \times y_1) \times w_t = 183.75 \text{ kN} \)
Design column load (free edge) \( W_{CE} = (x_1 \times y_1) / 2 \times w_t = 91.875 \text{ kN} \)
Length of baseplate (in X-dir.) \( L_m = 250 \text{ mm} \)
Breadth of baseplate (in Y-dir.) \( B_m = 250 \text{ mm} \)

**CASE 1: Internal loading**

Load capacity (rat = a1/l) \( P_{UI} = P_{UI1} + (P_{UI2} - P_{UI1}) \times \text{rat}/0.2 = 342.43 \text{ kN} \)
As \( W_{CI} \leq P_{UI} \ (183.75 \text{ kN/m} \leq 342.43 \text{ kN/m} ) \), this loading case is OK.

**CASE 2: Free edge loading**

Load capacity (TR34 Eq. 23) \( P_{UE1} = (P_I \times (M_n + M_p)/2) + 2 \times M_n = 81.784 \text{ kN} \)
Load capacity (TR34 Eq. 24) \( P_{UE2} = (P_I \times (M_n + M_p) + 4 \times M_n)/(1 - 2 \times a_1/(3 \times l)) = 184.61 \text{ kN} \)
Load capacity (rat = a1/l) \( P_{UE} = P_{UE1} + (P_{UE2} - P_{UE1}) \times \text{rat}/0.2 = 169.69 \text{ kN} \)
As \( W_{CE} \leq P_{UE} \ (91.875 \text{ kN/m} \leq 169.69 \text{ kN/m} ) \), this loading case is OK.

**Forklift truck loading**

Maximum wheel load (unfactored) \( w_l = 40 \text{ kN} \)
Design load per wheel \( D_{lw} = \gamma_D \times w_l = 64 \text{ kN} \)

**CASE 1: Internal loading**

Load capacity (rat2 = a2/l) \( P_u = P_{u1} + (P_{u2} - P_{u1}) \times \text{rat2}/0.2 = 225.28 \text{ kN} \)
As \( D_{lw} \leq P_u \ (64 \text{ kN} \leq 225.28 \text{ kN} ) \), internal loading case is OK.

**CASE 2: Loading at joints**

Load capacity \( (a_2 / l = 0) \) \( P_{u1} = (P_I \times (M_p + M_n)/2) + 2 \times M_n = 81.784 \text{ kN} \)
Load capacity \( (a_2 / l > 0.2) \) \( P_{u2} = (P_I \times (M_p + M_n) + 4 \times M_n)/(1 - 2 \times a_2/(3 \times l)) = 169.86 \text{ kN} \)
Load capacity (rat2 = a2/l) \( P_u = P_{u1} + (P_{u2} - P_{u1}) \times \text{rat2}/0.2 = 106.25 \text{ kN} \)
As \( D_{lw} \leq P_u \ (64 \text{ kN} \leq 106.25 \text{ kN} ) \), this loading case is OK.

**CASE 3: Corner loading**

It is assumed that the corner loading is not relevant provided adequate load transfer is provided and the edge condition has been considered.

**Relative position of truck wheel and racking leg**

- - - - - - - - - Design leg load = 72 kN
- - - - - - - - - Design truck wheel load = 64 kN

**Equivalent loaded areas for racking legs and forklift truck wheels**

Distance from wheel to baseplate \( H = 300 \text{ mm} \)
CASE 1: Internal loading
Load capacity (\(\text{Rat}=\text{aeq}/l\)) \(\text{Pu}=\text{Pu}_1+(\text{Pu}_2-\text{Pu}_1)*\text{Rat}/0.2=297.76\ \text{kN}\)
As \(\text{Dld} \leq \text{Pu}\ (144\ \text{kN} \leq 297.76\ \text{kN})\), internal loading case is OK.

CASE 2: Free edge loading (at a joint)
Load capacity \((a/l=0)\) \(\text{Pu}_1=(\pi*(\text{M}_{p}+\text{M}_{n})/2)+2*\text{M}_{n}=81.784\ \text{kN}\)
Load capacity \((a/l \geq 0.2)\) \(\text{Pu}_2=(\pi*(\text{M}_{p}+\text{M}_{n})+4*\text{M}_{n})/(1-2*a/(3*l))\)
\(=170.62\ \text{kN}\)
Reduced design load \(\text{Dldr}=\text{Dld}-\text{ltr}/100*\text{Dld}=109.44\ \text{kN}\)
As \(\text{Dldr} \leq \text{Pu}\ (109.44\ \text{kN} \leq 141.69\ \text{kN})\), this loading case is OK.

**Deflection check - Serviceability Limit State (SLS)**

The deflection expression below is by 'Westergaard' and can be used to obtain an approximate quantification of the slab deflection under a concentrated load \(P\).
Deflection (edge condition) \(\text{DEL}=c_1*P*1000/(k*l^2)=1.5588\ \text{mm}\)

Design calculations assume 24% load-transfer across the joint.
Location: Ex5 - Ground-supported fabric-reinforced slab

Design of ground-supported concrete slabs to TR34 (4th edition)

This proforma is for the design of ground-supported concrete floors for industrial buildings. The design method employed here is as per TR34 (4th edition) entitled 'Concrete Industrial Ground Floors' by The Concrete Society (March 2016 publication).

Assume a slab thickness $h=225$ mm
Type of sub-base Granular material
Type of sub-base to be well graded granular material such as Type 1 or Type 2 complying with and laid in accordance with the Highway Agency Specification for Highway Works. All fill material should be checked for content of potentially expansive materials or reactions with lime and/or cement.
Sub-base thickness $s_{bb}=200$ mm
Modulus of subgrade reaction $k=0.05$ N/mm²

Pallet racking (single leg)

Length of baseplate (in X-dir.) $L_r=100$ mm
Breadth of baseplate (in Y-dir.) $b_r=100$ mm
Radius of relative stiffness: $l=(E_c m h^3/(12*(1-u^2)*k))^{0.25}=913.55$ mm
Dist. from edge to first rack leg $D_{efr}=100$ mm
Characteristic strength of steel $f_{yk}=500$ N/mm²
Effective depth of fabric-reinforcement $d_1=175$ mm
Area of bottom fabric reinforcement $A_s=393$ mm²

CASE 4: Check for punching shear
Punching shear may be critical for the edge loading condition and will be considered. The shear stress will be checked at the face of the loaded area and on a perimeter at a distance $2d$ from the loaded area.

P1=72 kN
$2d=337.5$ mm
$L_r=100$ mm
$b_r=100$ mm
$D_{efr}=100$ mm

PLAN SHOWING PUNCHING SHEAR PERIMETER

(1) At the face of the loaded area
Shear stress
\[ v_{Ed} = \frac{Sld \times 1000}{(u_o \times d)} = 0.82286 \]
Shear strength
\[ v_{Rd} = 0.5 \times k_2 \times f_{cd} = 6.72 \text{ N/mm}^2 \]
As \( v_{Rd} \geq v_{Ed} \) (6.72 N/mm\(^2\) \geq 0.82286 N/mm\(^2\)), shear stress is OK.

(2) At the critical perimeter
Shear capacity for fabric-reinforced concrete:
\[ v_{Rd} = \frac{(0.18/\gamma_c) \times k_1 \times (100 \times p_1 \times f_{ck})^{0.33}}{0.33} = 0.49527 \text{ N/mm}^2 \]
Limiting capacity
\[ v_{Rd} = 0.035 \times k_1^{1.5} \times f_{ck}^{0.5} = 0.6261 \text{ N/mm}^2 \]
Slab load capacity
\[ P_p = \frac{v_{Rd} \times u_1 \times d}{1000} = 175.26 \text{ kN} \]
As \( Sld \leq P_p \) (72 kN \leq 175.26 kN), this loading case is OK.

General storage loading - random loading in kN/m\(^2\)

Uniformly distributed load
\[ u_{dl} = 30 \text{ kN/m}^2 \text{ (unfactored)} \]
Maximum UDL permitted
\[ w = 5.95 \times \lambda m^2 \times M_n = 98.865 \text{ kN/m}^2 \]
As \( u_{dl} \leq w \) (30 kN/m\(^2\) \leq 98.865 kN/m\(^2\)), this loading case is OK.

Internal wall loading - line load in kN/m

Line load from wall (unfactored)
\[ l_l = 30 \text{ kN/m} \]
For line loads remote from joints or slab edges:
Maximum line load permitted
\[ P_{lin} = 4 \times \lambda m \times M_p = 88.853 \text{ kN/m} \]
As \( l_l \leq P_{lin} \) (30 kN/m \leq 88.853 kN/m), this loading case is OK.
For line loads adjacent to a free edge:
Maximum line load permitted
\[ P_{lin} = 3 \times \lambda m \times M_p = 66.64 \text{ kN/m} \]
As \( l_l \leq P_{lin} \) (30 kN/m \leq 66.64 kN/m), this loading case is OK.

Mezzanine floor

Distance between columns
\[ x_1 = 5 \text{ m} \]
Distance between columns
\[ y_1 = 4 \text{ m} \]
Design column load (internal)
\[ W_{ci} = (x_1 \times y_1) \times w_t = 183.75 \text{ kN} \]
Design column load (free edge)
\[ W_{ce} = (x_1 \times y_1) / 2 \times w_t = 91.875 \text{ kN} \]
Length of baseplate (in X-dir.)
\[ L_m = 250 \text{ mm} \]
Breadth of baseplate (in Y-dir.)
\[ b_m = 250 \text{ mm} \]

CASE 1: Internal loading
Load capacity (rat=a1/l)
\[ P_{ui} = P_{ui1} + (P_{ui2} - P_{ui1}) \times \text{rat} / 0.2 = 648.08 \text{ kN} \]
As \( W_{ci} \leq P_{ui} \) (183.75 kN/m \leq 648.08 kN/m), this loading case is OK.

CASE 2: Free edge loading
Load capacity (TR34 Eq. 23) \[ P_{ue1} = \frac{\pi}{4} \left( M_n + M_p \right) + 2M_n = 141.65 \text{ kN} \]
Load capacity (TR34 Eq. 24) \[ P_{ue2} = \frac{\pi}{4} \left( M_n + M_p + 4M_n \right) / \left( 1 - 2a_1 / (3l) \right) = 315.82 \text{ kN} \]
Load capacity (rat=a1/l) \[ P_{ue} = P_{ue1} + \frac{P_{ue2} - P_{ue1}}{0.2} \times \text{rat} = 276.1 \text{ kN} \]
As \( W_{ce} \lesssim P_{ue} \) (91.875 kN/m \lesssim 276.1 kN/m), this loading case is OK.

**Forklift truck loading**

Maximum wheel load (unfactored) \( W_l \) = 40 kN
Design load per wheel \( D_{lw} = \gamma_D \times W_l = 64 \text{ kN} \)

CASE 1: Internal loading
Load capacity (rat2=a2/l) \[ P_u = P_{u1} + \frac{P_{u2} - P_{u1}}{0.2} \times \text{rat} = 439.81 \text{ kN} \]
As \( D_{lw} \lesssim P_u \) (64 kN \lesssim 439.81 kN), internal loading case is OK.

CASE 2: Loading at joints
Load capacity (a2/l=0) \[ P_{u1} = \frac{\pi}{4} \left( M_p + M_n \right) + 2M_n = 141.65 \text{ kN} \]
Load capacity (a2/l\geq0.2) \[ P_{u2} = \frac{\pi}{4} \left( M_p + M_n + 4M_n \right) / \left( 1 - 2a_2 / (3l) \right) = 293.11 \text{ kN} \]
Load capacity (rat2=a2/l) \[ P_u = P_{u1} + \frac{P_{u2} - P_{u1}}{0.2} \times \text{rat} = 179.65 \text{ kN} \]
As \( D_{lw} \lesssim P_u \) (64 kN \lesssim 179.65 kN), this loading case is OK.

CASE 3: Corner loading
Load capacity (rat2=a2/l) \[ P_u = P_{u1} + \frac{P_{u2} - P_{u1}}{0.2} \times \text{rat} = 69.422 \text{ kN} \]
As \( D_{lw} \lesssim P_u \) (64 kN \lesssim 69.422 kN), corner loading case is OK.

**Relative position of truck wheel and racking leg**

\[
\begin{array}{c}
\text{racking leg} \quad -o-\quad \text{Design leg load} = 72 \text{ kN} \\
\quad \quad \quad \quad \quad \quad \quad \quad \quad \quad \text{H} \\
\text{truck wheel} \quad -o- \quad \text{Design truck wheel load} = 64 \text{ kN} \\
\end{array}
\]

EQUIVALENT LOADED AREAS FOR RACKING LEGS AND FORK LIFT TRUCK WHEELS

Distance from wheel to baseplate \( H = 300 \text{ mm} \)

CASE 1: Internal loading
Load capacity (Rat=aeq/l) \[ P_u = P_{u1} + \frac{P_{u2} - P_{u1}}{0.2} \times \text{Rat} = 569.97 \text{ kN} \]
As \( D_{ld} \lesssim P_u \) (144 kN \lesssim 569.97 kN), internal loading case is OK.

CASE 2: Free edge loading (at a joint)
Load capacity (a/l=0) \[ P_{u1} = \frac{\pi}{4} \left( M_p + M_n \right) / 2 + 2M_n = 141.65 \text{ kN} \]
Load capacity (a/l\geq0.2) \[ P_{u2} = \frac{\pi}{4} \left( M_p + M_n + 4M_n \right) / \left( 1 - 2a / (3l) \right) = 294.29 \text{ kN} \]
Load capacity (Rat=aeq/l) \[ P_u = P_{u1} + \frac{P_{u2} - P_{u1}}{0.2} \times \text{Rat} = 234.6 \text{ kN} \]
As \( D_{ld} \lesssim P_u \) (144 kN \lesssim 234.6 kN), this loading case is OK.
Deflection check - Serviceability Limit State (SLS)

The deflection expression below is by 'Westergaard' and can be used to obtain an approximate quantification of the slab deflection under a concentrated load P.

\[
\text{Deflection (edge condition)} \quad \text{DEL} = c_1 \frac{P \times 1000}{k \times l^2} = 0.66202 \text{ mm}
\]

Location: Ex6 - Fabric-reinforced slab (TR34 Appendix E, 3rd Ed)

Design of ground-supported concrete slabs to TR34 (4th edition)

This proforma is for the design of ground-supported concrete floors for industrial buildings. The design method employed here is as per TR34 (4th edition) entitled 'Concrete Industrial Ground Floors' by The Concrete Society (March 2016 publication).

Assume a slab thickness h=175 mm
Type of sub-base Granular material
Type of sub-base to be well graded granular material such as Type 1 or Type 2 complying with and laid in accordance with the Highway Agency Specification for Highway Works. All fill material should be checked for content of potentially expansive materials or reactions with lime and/or cement.
Sub-base thickness sbb=150 mm
Modulus of subgrade reaction k=0.05 N/mm³

Back-to-back pallet racking

Length of baseplate (in X-dir.) Lr=100 mm
Breadth of baseplate (in Y-dir.) br=100 mm
Radius of relative stiffness:

\[ l = \left( \frac{Ecm \cdot h^3}{12 \cdot (1-u^2) \cdot k} \right)^{0.25} = 746.33 \text{ mm} \]

Dist. from edge to first rack leg Defr=80 mm
Dist. between double rack legs Db=250 mm
Characteristic strength of steel f_yk=500 N/mm²
Effective depth of fabric-reinforcement d=135 mm
Area of bottom fabric reinforcement A_s=142 mm²
Load-transfer across the joint ltr=24 %
Reduced design load Dldr=Dld-ltr/100*Dld=109.44 kN

CASE 4: Check for punching shear
Punching shear may be critical for the edge loading condition and will be considered. The shear stress will be checked at the face of the loaded area and on a perimeter at a distance 2d from the loaded area.
punching shear perimeter

slab edge

PLAN SHOWING PUNCHING SHEAR PERIMETER

(1) At the face of the loaded area

Shear stress \( v_{Ed} = D_{ld} \times 1000 / (u_o \times d) = 1.5023 \)

Shear strength \( v_{Rd} = 0.5 \times k_2 \times f_{cd} = 5.5808 \text{ N/mm}^2 \)

As \( v_{Rd} \geq v_{Ed} \) (5.5808 N/mm^2 \geq 1.5023 N/mm^2), shear stress is OK.

(2) At the critical perimeter

Shear capacity for fabric-reinforced concrete:

\( v_{Rd} = (0.18 / \gamma_c) \times k_1 \times (100 \times p_1 \times f_{ck})^{0.33} = 0.35822 \text{ N/mm}^2 \)

Limiting capacity \( v_{Rd} = 0.035 \times k_1 \times 1.5 \times f_{ck} \times 0.5 = 0.56 \text{ N/mm}^2 \)

Slab load capacity \( P_p = v_{Rd} \times u_1 \times d / 1000 = 117.8 \text{ kN} \)

Reduced design load \( D_{ldr} = D_{ld} - l_{tr} / 100 \times D_{ld} = 109.44 \text{ kN} \)

As \( D_{ldr} \leq P_p \) (109.44 kN \leq 117.8 kN), this loading case is OK.

General storage loading - random loading in kN/m²

Uniformly distributed load \( u_{dl} = 30 \text{ kN/m}² \) (unfactored)

Maximum UDL permitted \( w = 5.95 \times \lambda_1 \times 2 \times M_n = 79.436 \text{ kN/m}² \)

As \( u_{dl} \leq w \) (30 kN/m² \leq 79.436 kN/m²), this loading case is OK.

Internal wall loading - line load in kN/m

Line load from wall (unfactored) \( l_l = 30 \text{ kN/m} \)

For line loads remote from joints or slab edges:

Maximum line load permitted \( P_{lin} = 4 \times \lambda_1 \times M_n = 55.793 \text{ kN/m} \)

As \( l_l \leq P_{lin} \) (30 kN/m \leq 55.793 kN/m), this loading case is OK.

For line loads adjacent to a free edge:

Maximum line load permitted \( P_{lin} = 3 \times \lambda_1 \times M_n = 41.845 \text{ kN/m} \)

As \( l_l \leq P_{lin} \) (30 kN/m \leq 41.845 kN/m), this loading case is OK.

Partial plan on mezzanine columns

- SCALE 5.48
- Office 1007
- Proforma 109
Distance between columns \( x_1 = 5 \) m
Distance between columns \( y_1 = 4 \) m
Design column load (internal) \( W_{ci} = (x_1 \times y_1) \times wt = 183.75 \) kN
Design column load (free edge) \( W_{ce} = (x_1 \times y_1) / 2 \times wt = 91.875 \) kN
Length of baseplate (in X-dir.) \( L_m = 250 \) mm
Breadth of baseplate (in Y-dir.) \( b_m = 250 \) mm

**CASE 1: Internal loading**
Load capacity (rat=\( a_1 \)/\( l \)) \( P_{ui} = P_{ui1} + (P_{ui2} - P_{ui1}) \times \text{rat}/0.2 = 292.8 \) kN
As \( W_{ci} \leq P_{ui} \) (183.75 kN/m \( \leq 292.8 \) kN/m), this loading case is OK.

**CASE 2: Free edge loading**
Load capacity (TR34 Eq. 23) \( P_{ue1} = (P_1 \times (M_n + M_p) / 2) + 2 \times M_n = 64.473 \) kN
Load capacity (TR34 Eq. 24) \( P_{ue2} = (P_1 \times (M_n + M_p) + 4 \times M_n) / (1 - 2 \times a_1 / (3 \times l)) = 147.53 \) kN
Load capacity (rat=\( a_1 \)/\( l \)) \( P_{ue} = P_{ue1} + (P_{ue2} - P_{ue1}) \times \text{rat}/0.2 = 142.96 \) kN
As \( W_{ce} \leq P_{ue} \) (91.875 kN/m \( \leq 142.96 \) kN/m), this loading case is OK.

**Forklift truck loading**
Maximum wheel load (unfactored) \( w_l = 40 \) kN
Design load per wheel \( D_{lw} = \gamma_D \times w_l = 64 \) kN

**CASE 1: Internal loading**
Load capacity (rat2=\( a_2 \)/\( l \)) \( P_{u} = P_{u1} + (P_{u2} - P_{u1}) \times \text{rat}/0.2 = 186.52 \) kN
As \( D_{lw} \leq P_{u} \) (64 kN \( \leq 186.52 \) kN), internal loading case is OK.

**CASE 2: Loading at joints**
Load capacity (\( a_2 \)/\( l = 0 \)) \( P_{u1} = (P_1 \times (M_p + M_n) / 2) + 2 \times M_n = 64.473 \) kN
Load capacity (\( a_2 \)/\( l \geq 0.2 \)) \( P_{u2} = (P_1 \times (M_p + M_n) + 4 \times M_n) / (1 - 2 \times a_2 / (3 \times l)) = 134.45 \) kN
Load capacity (rat2=\( a_2 \)/\( l \)) \( P_{u} = P_{u1} + (P_{u2} - P_{u1}) \times \text{rat}/0.2 = 85.961 \) kN
As \( D_{lw} \leq P_{u} \) (64 kN \( \leq 85.961 \) kN), this loading case is OK.

**CASE 3: Corner loading**
It is assumed that the corner loading is not relevant provided adequate load transfer is provided and the edge condition has been considered.

**Relative position of truck wheel and racking leg**

```
        |---o---|
rack leg --- o ---
        |   H   |
        |---o---|
truck wheel --- o ---
```

Design leg load =72 kN
Design truck wheel load =64 kN

**Equivalent Loaded Areas for Racking Legs and Fork Lift Truck Wheels**

Distance from wheel to baseplate \( H = 300 \) mm
CASE 1: Internal loading
Load capacity (\(\text{Rat}=\text{aeq}/l\)) \(P_u=Pu_1+(Pu_2-Pu_1)\times\text{Rat}/0.2=251.56 \text{ kN}\)
As \(D_{ld} \leq P_u \ (144 \text{ kN} \leq 251.56 \text{ kN})\), internal loading case is OK.

CASE 2: Free edge loading (at a joint)
Load capacity (\(a/1=0\)) \(P_u_1=(\pi*(M_p+M_n)/2)+2*M_n=64.473 \text{ kN}\)
Load capacity (\(a/l\geq0.2\)) \(P_u_2=(\pi*(M_p+M_n)+4*M_n)/(1-2*a/(3*l))=135.12 \text{ kN}\)
Reduced design load \(D_{ldr}=D_{ld}-ltr/100*D_{ld}=109.44 \text{ kN}\)
As \(D_{ldr} \leq P_u \ (109.44 \text{ kN} \leq 117.13 \text{ kN})\), this loading case is OK.

**Deflection check - Serviceability Limit State (SLS)**

The deflection expression below is by 'Westergaard' and can be used to obtain an approximate quantification of the slab deflection under a concentrated load \(P\).

\[
\text{Deflection (edge condition)} \quad \text{DEL}=c_1*P*1000/(k*l^2)=1.9044 \text{ mm}
\]

Design calculations assume 24% load-transfer across the joint.
Location: Typical problem

Design of r.c. pad footing with shear checks

Design to BS8110(1997), partial safety factor for steel \( \gamma_S = 1.15 \)

All calculations to requirements in Clauses 3.4.4.4 and 3.11 of BS8110: Part 1.
Moment & shear are positive in directions shown.

Ultimate axial force in column: \( N = 1606 \text{ kN} \)
Ultimate moment in column: \( M = 163.6 \text{ kNm} \)
Ultimate shear force at base top: \( V = 73 \text{ kN} \)
Column dimension in X-direction: \( cx = 450 \text{ mm} \)
Column dimension in Y-direction: \( cy = 450 \text{ mm} \)
Base length [in bending (X) dir.]: \( lx = 3.6 \text{ m} \)
Width of base (i.e. in Y-dir.): \( ly = 2.8 \text{ m} \)
Note: A separate check should be made to ensure the resistance of the base against sliding due to this shear force.

Characteristic steel strength: \( f_y = 500 \text{ N/mm}^2 \)
Characteristic concrete strength: \( f_{cu} = 35 \text{ N/mm}^2 \)
Overall thickness of base: \( h = 500 \text{ mm} \)
Designated exposure class is XC2
Specified fixing tolerance: \( \text{tol} = 10 \text{ mm} \)
Cover to reinforcement: \( \text{cover} = 35 \text{ mm} \)
Diameter of X-direction bars $\text{dia}_x=16\text{ mm}$  
As actual shear stress ($v=0.45759\text{ N/mm}^2$) does not exceed design stress ($v_c=0.60348\text{ N/mm}^2$), no shear steel is needed across Y-direction faces.  
As actual shear stress ($v=0.45759\text{ N/mm}^2$) does not exceed design stress ($v_c=0.58906\text{ N/mm}^2$), no shear steel is needed across Y-direction faces.  

Diameter of Y-direction bars $\text{dia}_y=12\text{ mm}$  
As actual shear stress ($v=0.26974\text{ N/mm}^2$) does not exceed design stress ($v_c=0.5382\text{ N/mm}^2$), no shear steel is needed across X-direction faces.  
As actual shear stress ($v=0.26974\text{ N/mm}^2$) does not exceed design stress ($v_c=0.50729\text{ N/mm}^2$), no shear steel is needed across X-direction faces.  

### SUMMARY OF REINFORCEMENT REQUIRED IN X-DIRECTION

Since base width (2.8 m) exceeds (3cy/2+9dx/2)=2.7315 m, according to Cl.3.11.3.2, two-thirds of steel must be concentrated within central zone extending 1/2d from each column face (i.e. total width =1.821 m).

### QUANTITIES

- Total volume of concrete required: 5.04 m³
- Total area of formwork (base sides only): 6.4 m²
- Total volume of reinforcement: 18486 cm³
- Total weight of reinforcement: 145.11 kg

No shear reinforcement is required.
**Location:** Large square base. High moment. Mild steel reinforcement.

**Design of r.c.pad footing with shear checks**

Design to BS8110(1997), partial safety factor for steel $\gamma_S = 1.15$

All calculations to requirements in Clauses 3.4.4.4 and 3.11 of BS8110: Part 1.

Moment & shear are positive in directions shown.

**Ultimate axial force in column** $N = 1000 \text{ kN}$

**Ultimate moment in column** $M = 5000 \text{ kNm}$

**Ultimate shear force at base top** $V = 0 \text{ kN}$

**Column dimension in X-direction** $c_x = 500 \text{ mm}$

**Column dimension in Y-direction** $c_y = 500 \text{ mm}$

**Base length [in bending (X) dir.]** $l_x = 10 \text{ m}$

**Width of base (i.e. in Y-dir.)** $l_y = 10 \text{ m}$

**Characteristic steel strength** $f_y = 250 \text{ N/mm}^2$

**Characteristic concrete strength** $f_{cu} = 50 \text{ N/mm}^2$

**Overall thickness of base** $h = 800 \text{ mm}$

**Designated exposure class is XC3**

**Specified fixing tolerance** $\text{tol} = 10 \text{ mm}$

**Cover to reinforcement** $\text{cover} = 30 \text{ mm}$
Diameter of X-direction bars \( \text{dia}_{x} = 32 \text{ mm} \)

As actual shear stress \( (v = 0.15041 \text{ N/mm}^{2}) \) does not exceed design stress \( (v_{c} = 0.76039 \text{ N/mm}^{2}) \), no shear steel is needed across Y-direction faces.

As actual shear stress \( (v = 0.056528 \text{ N/mm}^{2}) \) does not exceed design stress \( (v_{c} = 0.56049 \text{ N/mm}^{2}) \), no shear steel is needed across Y-direction faces.

Diameter of Y-direction bars \( \text{dia}_{y} = 32 \text{ mm} \)

As actual shear stress \( (v = 0.056528 \text{ N/mm}^{2}) \) does not exceed design stress \( (v_{c} = 0.56576 \text{ N/mm}^{2}) \), no shear steel is needed across X-direction faces.

As actual shear stress \( (v = 0.056528 \text{ N/mm}^{2}) \) does not exceed design stress \( (v_{c} = 0.57237 \text{ N/mm}^{2}) \), no shear steel is needed across X-direction faces.

**SUMMARY OF REINFORCEMENT REQUIRED IN X-DIRECTION**

Since base width \( (10 \text{ m}) \) exceeds \( (3cy/2+9dx/2)=4.134 \text{ m} \), according to Cl.3.11.3.2, two-thirds of steel must be concentrated within central zone extending \( 1\frac{1}{4}d \) from each column face \( (\text{i.e. total width =2.756 m}) \).

Ref No: SC110 BS
SUMMARY OF REINFORCEMENT REQUIRED IN Y-DIRECTION
Since base width (10 m) exceeds (3cx/2+9dy/2=3.99 m),
according to Cl.3.11.3.2, two-thirds of steel must be concentrated
within central zone extending 1½d from each column face
(i.e. total width =2.66 m).

Characteristic strength 250 N/mm²
Diameter of bars 32 mm

CENTRAL ZONE
Number of bars required 7
Max spacing of bars 400 mm
Area required 5107.2 mm²
Area provided 5629.7 mm²
Percentage provided 0.26 %
(Note: steel area required is minimum
permitted by Table 3.25.)

EDGE ZONES
Number of bars required 20
Max spacing of bars 400 mm
(Note: reduce spacing of outermost
bars to obtain side cover.)
Area required 14093 mm²
Area provided 16085 mm²
Percentage provided 0.27 %
(Note: steel area required is minimum
permitted by Table 3.25.)

ACROSS ENTIRE BASE
Total number of bars 27
Effective depth 720 mm
Total steel area reqd. 19200 mm²
Total steel area prov. 21715 mm²
Av.percentage provided 0.27 %
Av.weight of steel prov. 17.046 kg/m²

QUANTITIES
Total volume of concrete required 80 m³
Total area of formwork (base sides only) 32 m²
Total volume of reinforcement 457758 cm³
Total weight of reinforcement 3593.4 kg

No shear reinforcement is required.
Location: Small base, Non-standard bars, no bar curtail./re-spacing

Design of r.c.pad footing with shear checks

Design to BS8110(1997), partial safety factor for steel gammaS=1.15

All calculations to requirements in Clauses 3.4.4.4 and 3.11 of BS8110: Part 1.  
Moment & shear are positive in directions shown.

Ultimate axial force in column  \( N=2500 \text{ kN} \)
Ultimate moment in column \( M=500 \text{ kNm} \)
Ultimate shear force at base top \( V=0 \text{ kN} \)
Column dimension in X-direction \( cx=350 \text{ mm} \)
Column dimension in Y-direction \( cy=350 \text{ mm} \)
Base length [in bending (X) dir.] \( lx=3 \text{ m} \)
Width of base (i.e. in Y-dir.) \( ly=2 \text{ m} \)
Characteristic steel strength \( f_y=350 \text{ N/mm}^2 \)
Characteristic concrete strength \( f_{cu}=40 \text{ N/mm}^2 \)
Min.permiss.proportion of steel \( P_{min1}=0.00196 \)
Critical depth for bar spacing \( h_{crit}=230 \text{ mm} \)
Ultimate bond stress \( f_{bu}=2.3274 \text{ N/mm}^2 \)
Overall thickness of base \( h=750 \text{ mm} \)

WARNING:
Estimated eff.depth of main steel is 0.6375 m.  As distance from base edge to column face in Y-direction (i.e. 0.825 m) is less than 1½ times this value, special consideration must be given to the location and configuration of planes controlling both direct and punching shear.  
This is beyond the scope of the current proforma.
Location: Typical problem

Design of reinforced concrete pad footing with shear checks

All calculations to EC2 Part 1-1 and IStructE Manual to EC2. Moment & shear are positive in directions shown.

Ultimate axial force in column \( N_{Ed} = 1606 \) kN
Ultimate moment in column \( M_{Ed} = 163.6 \) kNm
Ultimate shear force at base top \( V_{Ed}' = 73 \) kN
Column dimension in X-direction \( c_x = 450 \) mm
Column dimension in Y-direction \( c_y = 450 \) mm
Base length (bending in X-dir.) \( l_x = 3.6 \) m
Width of base (i.e. in Y-dir.) \( l_y = 2.8 \) m
Partial safety factor for steel \( \gamma_{a,m} = 1.15 \)
Partial safety factor for conc. \( \gamma_{c} = 1.5 \)
Note: A separate check should be made to ensure the resistance of the base against sliding due to this shear force.
Char yield strength of reinforc'ment \( f_{yk} = 500 \) N/mm²
Overall thickness of base \( h = 550 \) mm
Diameter of X-direction bars \( d_{ia} = 16 \) mm
Diameter of Y-direction bars \( d_{ia} = 12 \) mm

Ground pressures

Pressure at end A \( \frac{N_{Ed} + S_{w}}{l_x \times l_y} - \frac{N_{Ed} + S_{w}}{e/z} = 144.2 \) kN/m²
Pressure at end B

\[ pb = \frac{(NEd+Swt)}{(lx*ly)} + \frac{(NEd+Swt)*e}{z} = 211.58 \text{ kN/m}^2 \]

Ultimate moments and shears

Design shear force at 1.0dx

\[ Vdx = 566.4 \text{ kN} \]

Reinforcement to resist bending in X-direction

Diameter of X-direction bars

\[ diaX = 16 \text{ mm} \]

Area of tension steel required

\[ Asx = Mdx*10^6/(fyk/gams*z) = 3038 \text{ mm}^2 \]

Area of tension steel provided

\[ Asprx = Nox*\pi*diaX^2/4 = 3217 \text{ mm}^2 \]

Check spacing and proportion of steel

Percentage of steel provided

\[ per = \frac{Asprx}{10*widY*h} = 0.2089 \% \text{ of gross section.} \]

Shear across base in X-direction

Shear resistance

\[ VRdc = \beta' * CRdc * ks * VRdc * bw * d / 1000 = 1027 \text{ kN} \]

Modified shear resistance

\[ VRdc = VRdm = 1092 \text{ kN} \]

SHEAR SUMMARY

Check punching shear at column face

Punching shear at column face
VEd=beta*NEd=1847 kN

Maximum shear resistance
VRdmax=0.5*v*fcd*uo*dav/1000=4476 kN

The punching shear at column face (VEd=1847 kN) is less than the maximum shear resistance (VRdmax=4476 kN), hence OK.

Check punching shear at critical plane

Punching-shear resistance reqd.
VEd=pf*lx*ly-Vup=878 kN

Shear stress at control perimeter
vEd=beta*VEd*1000/(u1*dav)
=0.2498 N/mm²

Design punching shear resistance
VRdc=(0.18/gamc)*k*(100*p1 ^*fck)^0.333=0.3534 N/mm²

Enhanced punching shear resist.
VRdc=senh*VRdc=0.3534 N/mm²

Design punching shear resistance
VRdc=senh*0.035*k^1.5*fck^0.5
=0.3863 N/mm²
SUMMARY OF REINFORCEMENT REQUIRED IN X-DIRECTION

As base width (2.8 m) does not exceed \((3cy/2+9dx/2=4.2 \text{ m})\), bars should be spaced uniformly across base.

- Characteristic strength: 500 N/mm²
- Diameter of bars: 16 mm
- Total number of bars: 16
- Max spacing of bars: 180 mm
- Effective depth: 507 mm
- Total steel area req'd: 3038 mm²
- Total steel area prov'd: 3217 mm²

SUMMARY OF REINFORCEMENT REQUIRED IN Y-DIRECTION

Since base width (3.6 m) exceeds \((3cx/2+9dy/2=2.894 \text{ m})\), two-thirds of steel must be concentrated within central zone extending \(1/2d\) from each column face (i.e. total width =1.929 m).

- Characteristic strength: 500 N/mm²
- Diameter of bars: 12 mm
- Central zone: Number of bars required: 15
  - Max spacing of bars: 130 mm
  - Area required: 1591 mm²
  - Area provided: 1696 mm²
  - Percentage provided: 0.16%
- Edge zones: Number of bars required: 14
  - Max spacing of bars: 130 mm
  - Area required: 1379 mm²
  - Area provided: 1583 mm²
  - Percentage provided: 0.17%
- Across entire base: Total number of bars: 29
  - Effective depth: 493 mm
  - Total steel area req'd: 2970 mm²
  - Total steel area prov'd: 3280 mm²

QUANTITIES

- Total concrete volume: 5.544 m³
- Total area of formwork: 7.04 m² (base sides only).
Location: Large square base with high moment

Design of reinforced concrete pad footing with shear checks

All calculations to EC2 Part 1-1 and IStructE Manual to EC2. Moment & shear are positive in directions shown.

Ultimate axial force in column \( N_{Ed} = 1000 \text{ kN} \)

Location: Small base, non-standard bars, no bar curtail./re-spacing

Design of reinforced concrete pad footing with shear checks

All calculations to EC2 Part 1-1 and IStructE Manual to EC2.
Moment & shear are positive in directions shown.

Ultimate axial force in column \( N_{Ed} = 2500 \text{ kN} \)
Ultimate moment in column \( M_{Ed} = 500 \text{ kNm} \)
Ultimate shear force at base top \( V_{Ed}' = 0 \text{ kN} \)
Column dimension in X-direction \( c_x = 350 \text{ mm} \)
Column dimension in Y-direction \( c_y = 350 \text{ mm} \)
Base length (bending in X-dir.) \( l_x = 3 \text{ m} \)
Width of base (i.e. in Y-dir.) \( l_y = 2 \text{ m} \)
Partial safety factor for steel \( \gamma_{ams} = 1.15 \)
Partial safety factor for conc. \( \gamma_{mac} = 1.5 \)
Char yield strength of reinf'ment \( f_yk = 500 \text{ N/mm}^2 \)
Overall thickness of base \( h = 750 \text{ mm} \)

WARNING:
Estimated eff. depth of main steel is 0.6375 m. As distance from base edge to column face in Y-direction (i.e. 0.825 m) is less than 1½ times this value, special consideration must be given to the location and configuration of planes controlling both direct and punching shear.
This is beyond the scope of the current proforma.
Location: Typical uniformly-loaded deep beam with high-yield steel.

Design of deep beam using Kong simplified method

See Table 148 of Reinforced Concrete Designer's Handbook 10th edition.

Span between centres of supports \( l = 3 \) m
Overall depth of beam \( h = 2 \) m
Breadth of beam \( b = 0.5 \) m
Load per unit length (factored) \( w = 500 \) kN/m
Grade of concrete \( f_{cu} = 30 \) N/mm\(^2\)
Yield strength of reinforcement \( f_y = 500 \) N/mm\(^2\)
From table of data given by Kong, Robins and Sharp, concrete cylinder splitting tensile strength \( F_t = 2.74 \) N/mm\(^2\)
Designated exposure class is XC1
Specified fixing tolerance \( \text{tol} = 10 \) mm
Cover to all bars \( \text{cover} = 35 \) mm

Main reinforcement

shear bars above opening (if required)

typical steel arrangement
provide nominal vertical links throughout span (max. diameter assumed to be 12 mm in this proforma)

Diameter of main tension bars \( \text{dia} = 12 \) mm
Number of main bars \( \text{NumBar} = 12 \)
Effective depth of main bars \( d = 1925 \) mm
### MAIN TENSION

| Characteristic strength | 500 N/mm² |

### REINFORCEMENT

| Diameter of bars | 12 mm |

### SUMMARY

| Number of bars | 12 |
| Area required  | 1300 mm² |
| Area provided  | 1357.2 mm² |
| Percentage provided | 0.13572 % |

Shear reinforcement

From Table 148 in 'Reinforced Concrete Designer's Handbook' using formulae C and D, we get the following:

Shear resistance \( \text{VRd} = V_x1 + V_x2 = 1964.5 \text{ kN} \)

As \( \text{VRd} \geq \text{VED} \) \( (1964.5 \text{ kN} \geq 798.6 \text{ kN}) \), the applied shear force is within the shear resistance from the main bars. Hence provide nominal shear reinforcement only.

Diameter of anti-cracking bars \( L_{\text{dia}} = 12 \text{ mm} \)

Location: Typical circular column, tensile and compressive stress

Modular-ratio theory: design of reinforcement for circular column

Calculations for reinforcement are in accordance with normal modular-ratio theory (i.e. an 'effective' modular ratio of (mr-1) is considered where the steel is in compression). Min.steel = six bars arranged symmetrically.

Modular ratio \( mr = 15 \)
Diameter of column \( D = 600 \text{ mm} \)
Depth to centre of steel \( d' = 56 \text{ mm} \)
Axial load \( N = 1000 \text{ kN} \)
Applied bending moment \( M = 250 \text{ kNm} \)
Limiting concrete stress \( f_c = 15 \text{ N/mm}^2 \)
Limiting steel stress \( f_s = 250 \text{ N/mm}^2 \)
Main steel diameter \( \text{dia} = 12 \text{ mm} \)
Number of bars to be provided \( \text{NumBar} = 37 \)
Depth to neutral axis \( 316.65 \text{ mm} \)
Maximum stress in concrete \( 14.99 \text{ N/mm}^2 \) compression
Theoretical min.concrete stress \( 13.414 \text{ N/mm}^2 \) tension
Max.stress in steel near top \( 185.09 \text{ N/mm}^2 \) compression
Max.stress in steel near bottom \( 161.44 \text{ N/mm}^2 \) tension

Axial-load and moment resistance of section as designed

Axial resistance due to concrete:
\[
N_c = \frac{f_1}{2} \times D \times D / (1 - \cos(BE)) \times (\sin(BE)^3 / 3 - BE/2 \times \cos(BE) + \cos(BE) \times \sin(2 \times BE) / 4) = 968131 \text{ N}
\]

Axial resistance due to compression reinforcement:
\[
N_s1 = f_1 \times (mr-1) \times R_0 / \pi \times A_{prov} / (R - R_0 \times \cos(AL)) \times (\sin(AL) - AL \times \cos(AL)) = 239151 \text{ N}
\]

Axial resistance due to tension reinforcement:
\[
N_s2 = f_1 \times mr \times R_0 / \pi \times A_{prov} / (R - R_0 \times \cos(AL)) \times (\pi/2 - AL/2 + \sin(2 \times AL) / 4) = 206717 \text{ N}
\]

Total axial resistance provided \( N_{res} = (N_c + N_s1 - N_s2) / 1E3 = 1000.6 \text{ kN} \)

Resistance moment due to concrete:
\[
M_c = \frac{f_1}{4} \times D^3 / (1 - \cos(BE)) \times (BE/8 - \sin(4 \times BE) / 32 - \cos(BE) \times \sin(BE)^3 / 3) / 3 = 164.86E6 \text{ Nmm}
\]

Resistance moment due to compression reinforcement:
\[
M_s1 = f_1 \times (mr-1) \times R_0 / \pi \times A_{prov} / (R - R_0 \times \cos(AL)) \times (AL/2 - \sin(2 \times AL) / 4) = 44.892E6 \text{ Nmm}
\]

Resistance moment due to tension reinforcement:
\[
M_s2 = f_1 \times mr \times R_0 / \pi \times A_{prov} / (R - R_0 \times \cos(AL)) \times (\pi/2 - AL/2 + \sin(2 \times AL) / 4) = 40.413E6 \text{ Nmm}
\]

Total resistance moment provided \( M_{res} = (M_c + M_s1 + M_s2) / 1E6 = 250.16 \text{ kNm} \)
Location: Small-diameter circular column subjected to heavy load

Modular-ratio theory: design of reinforcement for circular column

Calculations for reinforcement are in accordance with normal modular-ratio theory (i.e. an 'effective' modular ratio of \( \text{mr}-1 \)) is considered where the steel is in compression.
Min.steel = six bars arranged symmetrically.

Modular ratio \( \text{mr}=15 \)
Diameter of column \( D=300 \) mm
Depth to centre of steel \( d'=48 \) mm
Axial load \( N=375 \) kN
Applied bending moment \( M=45 \) kNm
Limiting concrete stress \( f_c=15 \) N/mm²
Limiting steel stress \( f_s=250 \) N/mm²
Main steel diameter \( \text{dia}=20 \) mm
Number of bars to be provided \( \text{NumBar}=12 \)
Depth to neutral axis \( 174.94 \) mm
Maximum stress in concrete \( 14.701 \) N/mm² compression
Theoretical min.concrete stress \( 10.51 \) N/mm² tension
Max.stress in steel near top \( 160.01 \) N/mm² compression
Max.stress in steel near bottom \( 97.141 \) N/mm² tension

Axial-load and moment resistance of section as designed

Axial resistance due to concrete:
\[
N_c = f_1/2*D*D/(1-COS(BE))*(SIN(BE)^3/3-BE/2*COS(BE)+COS(BE)*SIN(2*BE))/4 = 276479 \text{ N}
\]

Axial resistance due to compression reinforcement:
\[
N_{s1} = f_1*(\text{mr}-1)*R_0/\pi*A_{Prov}/(R-R_0*COS(AL))*(SIN(AL)-AL*COS(AL)) = 207774 \text{ N}
\]

Axial resistance due to tension reinforcement:
\[
N_{s2} = f_1*mr*R_0/\pi*A_{Prov}/(R-R_0*COS(AL))*(\pi/2-AL/2+SIN(2*AL)/4) = 101698 \text{ N}
\]

Total axial resistance provided \( N_{res} = (N_c+N_{s1}-N_{s2})/1E3 = 382.56 \) kN

Resistance moment due to concrete:
\[
M_c = f_1/4*D^3/(1-COS(BE))*(BE/8-SIN(4*BE)/32-COS(BE)*SIN(2*BE)) = 21.791E6 \text{ Nmm}
\]

Resistance moment due to compression reinforcement:
\[
M_{s1} = f_1*(\text{mr}-1)*R_0/\pi*A_{Prov}/(R-R_0*COS(AL))*(AL/2-SIN(2*AL)/4) = 15.398E6 \text{ Nmm}
\]

Resistance moment due to tension reinforcement:
\[
M_{s2} = f_1*mr*R_0/\pi*A_{Prov}/(R-R_0*COS(AL))*(\pi/2-AL/2+SIN(2*AL)/4) = 8.725E6 \text{ Nmm}
\]

Total resistance moment provided \( M_{res} = (M_c+M_{s1}+M_{s2})/1E6 = 45.915 \) kNm
Location: Massive lightly-loaded column reinforced with mild steel

Modular-ratio theory: design of reinforcement for circular column

Calculations for reinforcement are in accordance with normal modular-ratio theory (i.e. an 'effective' modular ratio of $(mr-1)$ is considered where the steel is in compression). Min.steel = six bars arranged symmetrically.

Modular ratio  $mr=15$
Diameter of column  $D=1500$ mm

Axial-load and moment resistance of section as designed

Axial resistance due to concrete:
\[ N_c = f_1/2*D*D/(1-COS(BE))*(SIN(BE)^3/3-BE/2*COS(BE)+COS(BE)*SIN(2*BE)/4) = 968131 \text{ N} \]

Axial resistance due to compression reinforcement:
\[ N_{s1} = f_1*(mr-1)*R_0/PI*A_{prov}/(R-R_0*COS(AL))*(AL/2-SIN(2*AL)/4) = 239151 \text{ N} \]

Axial resistance due to tension reinforcement:
\[ N_{s2} = f_1*mr*R_0/PI*A_{prov}/(R-R_0*COS(AL))*(SIN(AL)+(PI-AL)*COS(AL)) = 206717 \text{ N} \]

Total axial resistance provided  \( N_{res} = (N_c+N_{s1}-N_{s2})/1E3 = 1000.6 \text{ kN} \)

Resistance moment due to concrete:
\[ M_c = f_1/4*D^3/(1-COS(BE))*(BE/8-SIN(4*BE)/32-COS(BE)*SIN(BE)^3/3) = 164.86E6 \text{ Nmm} \]

Resistance moment due to compression reinforcement:
\[ M_{s1} = f_1*(mr-1)*R_0*R_0/PI*A_{prov}/(R-R_0*COS(AL))*(AL/2-SIN(2*AL)/4) = 44.892E6 \text{ Nmm} \]
Resistance moment due to tension reinforcement:

\[ Ms_2 = f_1 \times m_r \times R_0 \times R_0 / \pi \times A_{P_{prov}} / (R - R_0 \times \cos(\alpha)) \times (\pi / 2 - \alpha / 2 + \sin(2 \times \alpha) / 4) \]

\[ = 40.413 \times 10^6 \text{ Nmm} \]

Total resistance moment provided \( M_{res} = (M_c + M_s_1 + M_s_2) / 10^6 = 250.16 \text{ kNm} \)

Location: Small-diameter circular column subjected to heavy load

Modular-ratio theory: design of reinforcement for circular column

Calculations for reinforcement are in accordance with normal modular-ratio theory (i.e. an 'effective' modular ratio of \( mr-1 \) is considered where the steel is in compression). Min. steel = six bars arranged symmetrically.

Diameter of column: \( D=300 \text{ mm} \)
Depth to centre of steel: \( d'=48 \text{ mm} \)
Design axial load: \( N=375 \text{ kN} \)
Design moment: \( M=45 \text{ kNm} \)
Modular ratio: \( mr=15 \)
Limiting concrete stress: \( f_{c}=15 \text{ N/mm}^2 \)
Limiting steel stress: \( f_{s}=250 \text{ N/mm}^2 \)
Characteristic steel strength: \( f_{yk}=500 \text{ N/mm}^2 \)
Main steel diameter: \( dia=20 \text{ mm} \)
Number of bars to be provided: \( num\text{Bar}=12 \)

Depth to neutral axis: \( 174.94 \text{ mm} \)
Maximum stress in concrete: \( 14.701 \text{ N/mm}^2 \) compression
Theoretical min. concrete stress: \( 10.51 \text{ N/mm}^2 \) tension
Max. stress in steel near top: \( 160.01 \text{ N/mm}^2 \) compression
Max. stress in steel near bottom: \( 97.141 \text{ N/mm}^2 \) tension

Axial-load and moment resistance of section as designed

Axial resistance due to concrete:
\[
N_c = f_{1} \times \frac{D^2}{4} \times \frac{1}{1 - \cos (BE)} \times (\sin (BE))^3 - \frac{BE}{3} - \frac{2 \cos (BE) + \cos (BE) \times \sin (2 \times BE)}{3} = 276479 \text{ N}
\]
Axial resistance due to compression reinforcement:
\[
N_{s1} = f_{1} \times (mr-1) \times \frac{R_0 \times \text{AProv}}{(R + R_0 \times \cos (AL))} \times \left( \sin (AL) - AL \times \cos (AL) \right) = 207774 \text{ N}
\]
Axial resistance due to tension reinforcement:
\[
N_{s2} = f_{1} \times mr \times R_0 \times \text{AProv} \times \left( R - R_0 \times \cos (AL) \right) \times \left( \sin (AL) + (\pi - AL) \times \cos (AL) \right) = 101698 \text{ N}
\]
Total axial resistance provided:
\[
N_{\text{res}} = (N_c + N_{s1} - N_{s2}) / 10^3 = 382.56 \text{ kN}
\]

Resistance moment due to concrete:
\[
M_c = f_{1} \times \frac{D^3}{8} \times \left( 1 - \cos (BE) \right) \times \left( \sin (BE) / 8 - \sin (4 \times BE) / 32 - \cos (BE) \times \sin (BE) / 3 \right) = 21.791 \text{ kNm}
\]
Resistance moment due to compression reinforcement:
\[
M_{s1} = f_{1} \times (mr-1) \times R_0 \times \text{AProv} \times \left( R - R_0 \times \cos (AL) \right) \times \left( AL / 2 - \sin (2 \times AL) / 4 \right) = 15.398 \text{ kNm}
\]
Resistance moment due to tension reinforcement:
\[ Ms2 = f1 \times mr \times R0^2 \times \frac{R0}{\pi} \times AProv \times (R - R0 \times \cos(AL)) \times (\pi/2 - AL/2 + \sin(2\times AL)/4) \]
\[ = 8.7252E6 \text{ Nmm} \]

Total resistance moment provided: \[ Mres = (M_r + M_s1 + M_s2) / 1E6 = 45.915 \text{ kNm} \]

**SUMMARY**

Check on span/effective-depth ratio

The staircase is assumed to be a simply-supported slab.
Basic ratio for simp.-sup.slab \( \text{bs}'d = 20 \) (see Table 3.9)
From Table 3.10 of Code, with \( f_s = 71.235 \text{ N/mm}^2 \) and \( M/bd^2 = 0.65025 \)
Mod.factor for tension steel \( \text{modf}1 = 2 \)
Maximum permissible span/effective-depth ratio \( ps'd = \text{bs}'d \times \text{modf1} = 40 \)
Actual span/effective-depth ratio as \( d = 1000 \times \text{span}/d = 16.129 \)
Since this does not exceed 46, this is Acceptable.

Shear in longitudinal zone of solid slab of given width

Since distance from support varies throughout zone considered, enhancement of shear resistance due to proximity to support is not applicable.

The calculations for shear in the zone of solid slab are in accordance with Clauses 3.5.5 of BS8110 throughout.
In the case of a uniform load, the design section to be considered need not be less than a minimum distance from support equal to effective depth.
Dia of tension bars @ shear sect  dias=16
No of tension bars @ shear sect  nbars=4

Effective depth of section  ds=157 mm

Since design shear stress of 0.15921 N/mm² is less than critical shear stress of 0.62089 N/mm², no special shear reinforcement is required.

Check on span/effective-depth ratio

The staircase is assumed to be a simply-supported slab.
Basic ratio for simp.-sup.slab       bs'd=20 (see Table 3.9)
From Table 3.10 of Code, with fs=199.79 N/mm² and M/bd²=1.5519
Mod.factor for tension steel       modf1=1.4941
Maximum permissible
span/effective-depth ratio          ps'd=bs'd*modf1=29.882
Actual span/effective-depth ratio  as'd=1000*span/d=27.273
Since this does not exceed 29.882, this is Acceptable.

Shear in longitudinal zone of solid slab of given width

Since distance from support varies throughout zone considered, enhancement of shear resistance due to proximity to support is not applicable.
The calculations for shear in the zone of solid slab are in accordance with Clauses 3.5.5 of BS8110 throughout. In the case of a uniform load, the design section to be considered need not be less than a minimum distance from support equal to effective depth. 

Dia of tension bars @ shear sect dias=16
No of tension bars @ shear sect nbars=4
Effective depth of section ds=217 mm

Since design shear stress of 0.13872 N/mm² is less than critical shear stress of 0.56646 N/mm², no special shear reinforcement is required.
Location: Exl - Staircase between Beams C1-C2 and D1-D2

Reinforced concrete staircase spanning between supports at the end of the flight. No landings. Design in accordance with EC2:Part 1.

Number of treads TrdNo=10
Total length of treads on flight Trdlen=2500 mm

Deflection check
Actual span to depth ratio 1'd=L*1000/d=15.72
Allowable span/depth ratio 1'da=k*N*F1*F2*F3=157
Absolute value of span/depth 1'da=40*k=40

| DESIGN | Actual 1/d ratio | 15.72 |
| SUMMARY | Basic 1/d ratio | 104.6 |
| DEFLECTION | Span factor | 1 |
| | Flange beam factor F1 | 1 |
| | Long spans factor F2 | 1 |
| | Steel stress factor F3 | 1.5 |
| | Allowable 1/d ratio | 46 |

NOTE: Care should be taken with the EC2 values as the deflection equations used give unrealistically high values. National Annex to EC2 Part 1:2004, Table NA.5 gives span/effective depth ratios for lightly stressed concrete (C30/37 & ρ=0.5%) as follows:
Simply supported spans 23
Continuous spans 30
Shear in longitudinal zone of solid slab of given width

Location for shear calculation: Stair 22
Shear force due to ultimate load \( V_{Ed} = 25.59 \text{ kN} \)
Term for shear resistance \( v_{Rdc} = (\rho_1 f_{ck})^{1/3} = 1.593 \)
Shear resistance \( V_{Rdc} = C_{Rdc} ks v_{Rdc} bw d / 1000 = 66.86 \text{ kN} \)
Minimum stress \( v_{min} = 0.035 ks^{1.5} f_{ck}^{0.5} = 0.495 \text{ N/mm}^2 \)
Minimum shear resistance \( V_{Rdm} = v_{min} bw d / 1000 = 86.57 \text{ kN} \)
Modified shear resistance \( V_{Rdc} = V_{Rdm} = 86.57 \text{ kN} \)

NOTE: Care should be taken with the EC2 values as the deflection equations used give unrealistically high values. National Annex to EC2 Part 1:2004, Table NA.5 gives span/effective depth ratios for lightly stressed concrete \( \text{C30/37} \ & \ p=0.5\% \) as follows:
Simply supported spans 23
Continuous spans 30
Shear in longitudinal zone of solid slab of given width

Location for shear calculation: Stair 22
Shear force due to ultimate load \( V_{Ed}=25.59 \text{ kN} \)
Term for shear resistance \( v_{Rdc}=(\rho_1*f_{ck})^{(1/3)}=1.593 \)
Shear resistance \( v_{Rdc}=C_{Rdc}*k_s*v_{Rdc}*b_w*d/1000=66.86 \text{ kN} \)
Minimum stress \( v_{min}=0.035*k_s^{1.5}*f_{ck}^{0.5}=0.495 \text{ N/mm}^2 \)
Minimum shear resistance \( v_{Rdm}=v_{min}*b_w*d/1000=86.57 \text{ kN} \)
Modified shear resistance \( v_{Rdc}=v_{Rdm}=86.57 \text{ kN} \)

Location: Typical problem

Design of concrete nibs to BS8110

Design to BS8110(1997), partial safety factor for steel gams=1.15

In addition to providing shear resistance for beam, these links must be sufficiently strong to transfer load on nib to compression zone of beam.

Load acting on nib: load=26.3 kN/m
Dist. from load to CL beam links: av=120 mm
Concrete grade: fcu=40 N/mm²
Steel strength: fy=500 N/mm²
Designated exposure class is XC1
Specified fixing tolerance: tol=10 mm
Concrete cover to nib steel: cover=25 mm
Size of nib bars: diam=8 mm
Chosen nib thickness: h=115 mm
Chosen bar spacing: Sprov=265 mm

SUMMARY

Characteristic strength 500 N/mm²
Diameter of bars 8 mm
Spacing of bars 265 mm
Area required 188.97 mm²
Area provided 189.68 mm²

Check shear resistance

Permissible shear stress: vcp=vc*sdfact=0.94009 N/mm²
Actual shear stress: vca=Nload/(b*d)=0.30581 N/mm²
Shear resistance is satisfactory.
Location: Heavy loading on large nib with mild steel reinforcement

Design of concrete nibs to BS8110

Design to BS8110(1997), partial safety factor for steel gams=1.15

In addition to providing shear resistance for beam, these links must be sufficiently strong to transfer load on nib to compression zone of beam.

Load acting on nib load=100 kN/m
Dist. from load to CL beam links av=500 mm
Concrete grade fcu=35 N/mm²
Steel strength fy=250 N/mm²
Designated exposure class is XC3
Specified fixing tolerance tol=10 mm
Concrete cover to nib steel cover=70 mm
Size of nib bars diam=12 mm
Chosen nib thickness h=300 mm
Chosen bar spacing Sprov=110 mm

SUMMARY

Characteristic strength 250 N/mm²
Diameter of bars 12 mm
Spacing of bars 110 mm
Area required 1026.8 mm²
Area provided 1028.2 mm²

Check shear resistance

Permissible shear stress vcp=vc*sdfact=0.63045 N/mm²
Actual shear stress vca=Nload/(b*d)=0.44643 N/mm²
Shear resistance is satisfactory.
Location: Light loading on small nib with non-standard reinforcement

Design of concrete nibs to BS8110

Design to BS8110(1997), partial safety factor for steel gams=1.15

In addition to providing shear resistance for beam, these links must be sufficiently strong to transfer load on nib to compression zone of beam.

Load acting on nib
- load=5 kN/m

Dist. from load to CL beam links
- av=350 mm

Concrete grade
- fcu=25 N/mm²

Steel strength
- fy=300 N/mm²

Min. permiss. proportion of steel
- Pmin1=0.00218

Bond coefficient β
- beta=0.5

Designated exposure class is XC1

Specified fixing tolerance
- tol=10 mm

Concrete cover to nib steel
- cover=40 mm

Size of nib bars
- diam=16 mm

Chosen nib thickness
- h=100 mm

Chosen bar spacing
- Sprov=170 mm

SUMMARY
- Characteristic strength 300 N/mm²
- Diameter of bars 16 mm
- Spacing of bars 170 mm
- Area required 1169 mm²
- Area provided 1182.7 mm²

Check shear resistance

Permissible shear stress
- vcp=vc*sdfact=1.3842 N/mm²

Actual shear stress
- vca=Nload/(b*d)=0.096154 N/mm²

Shear resistance is satisfactory.
Location: Ex1 - Typical problem

Design of concrete nibs to EC2 Part 1:2004

In addition to providing shear resistance to beam, these links must be sufficiently strong to transfer load on nib to compression zone of beam.

FEd = load on nib

Nib reinforcement in form of vertical or horizontal loops with internal radius of 2Ø

Design load acting on nib

FEd = 26.3 kN/m

Dist. from load to CL beam links

av = 120 mm

Char yield strength (reinf'ment)

fyk = 500 N/mm²

Size of nib bars

dia = 8 mm

Chosen nib thickness

h = 115 mm

Chosen bar spacing

Sprov = 230 mm

SUMMARY

OF MAIN

Characteristic strength 500 N/mm²

Diameter of bars 8 mm

REINFORCEMENT

Spacing of bars 230 mm

Area of steel required 218 mm²/m

Area of steel provided 218 mm²/m

Check shear resistance

Term for shear resistance

VRdc=(rho1*fck)^(1/3)=2.0093

Shear resistance

VRdc=CRdc*ks*Vrdc*bw*d/1000=41.471 kN

Minimum stress

vmin=0.035*ks^1.5*fck^0.5=0.56 N/mm²

Minimum shear resistance

VRdm=vmin*bw*d/1000=48.16 kN

Modified shear resistance

VRdc=VRdm=48.16 kN

SHEAR SUMMARY

Design shear force 26.3 kN

Design shear resistance 48.16 kN

Hence nib shear resistance OK.
Location: Ex2 - Heavy loading on large nib with mild steel r'ment

Design of concrete nibs to EC2 Part 1:2004

In addition to providing shear resistance to beam, these links must be sufficiently strong to transfer load on nib to compression zone of beam.

FEd = load on nib

General reinforced concrete section to BS5400:Part 4:1990

Char. strength of concrete \( f_{cm} = 40 \, \text{N/mm}^2 \)
Number of cross-sections \( n_{cs} = 1 \)
Cross-section 1
Number of layers of reinforcement \( n_{ols} = 2 \)
Char. strength of reinforcement \( f_{ym} = 460 \, \text{N/mm}^2 \)
Young's modulus of reinforcement \( E_m = 200000 \, \text{N/mm}^2 \)
Layer 1
Area of reinforcement \( A_s(1) = 402 \, \text{mm}^2 \)
Depth from compression face \( d_s(1) = 50 \, \text{mm} \)
Layer 2
Area of reinforcement \( A_s(2) = 5629 \, \text{mm}^2 \)
Depth from compression face \( d_s(2) = 444 \, \text{mm} \)

Ultimate limit state : flexure of general reinforced concrete section

RESULTS FROM ULTIMATE MOMENT ANALYSIS

Section moment resistance \( 866.36 \, \text{kNm} \)
Depth to Neutral Axis \( 134.66 \, \text{mm} \)

Strain at centroid of tension reinforcement 0.0080403 is greater than limiting strain 0.004 from Clause 5.3.2.1. Ductility requirements are satisfied.

Ultimate limit state : Shear calculations to Clauses 5.3.3 & 5.4.4

Ultimate shear force \( V = 500 \, \text{kN} \)
Number of layers \( s_l = 1 \)
Layer number \( l_n(1) = 2 \)
Area to be included in calcs. \( A_{sc}(1) = 5629 \, \text{mm}^2 \)
Breadth of section for shear \( b = 1000 \, \text{mm} \)
Spacing of links along member \( s_v(1) = 200 \, \text{mm} \)
Number of legs \( s_v(2) = 4 \)
Diameter of link reinforcement \( b_{dl} = 12 \, \text{mm} \)
Characteristic strength of links \( f_{yl} = 460 \, \text{N/mm}^2 \)
Characteristic strength \( f_{yl,sa} = 460 \, \text{N/mm}^2 \)

RESULTS FROM SHEAR ANALYSIS

Slab section
Shear reinforcement adequate: \( A_s(1) = 5629 \, \text{mm}^2 \)
\( A_s(2) = 452.39 \, \text{mm}^2 \)

An area of longitudinal reinforcement 624.69 \( \text{mm}^2 \) is required in the tensile zone in excess of that required for bending.

Location: Ex4 - Flanged reinforced concrete beam Ex 6.1.4

General reinforced concrete section

Concrete compressive strength \( f_{ckm} = 35 \text{ N/mm}^2 \)
Material factor \( \gamma_{cm} = 1.5 \)
Number of cross-sections \( n_{cs} = 2 \)
Cross-section 1
Cross-section 2
Number of layers of reinforcement \( n_{ols} = 2 \)
Characteristic yield strength \( f_{ykm} = 500 \text{ N/mm}^2 \)
Young's modulus of reinforcement \( E_s = 200000 \text{ N/mm}^2 \)
Material factor for reinforcement \( \gamma_{ms} = 1.15 \)
Reinforcement stress-strain relationship
Inclined top branch with strain limits
Ductility class is constant for whole section
Ductility Class (1=A, 2=B, 3=C) \( \beta = 2 \)
Strain at maximum force \( \varepsilon_{ukm} = 0.05 \)
Multiplication factor \( k_m = 1.08 \)
Layer 1
Area of reinforcement \( A_s(1) = 7540 \text{ mm}^2 \)
Depth from compression face \( d_s(1) = 1140 \text{ mm} \)
Layer 2
Area of reinforcement \( A_s(2) = 7540 \text{ mm}^2 \)
Depth from compression face \( d_s(2) = 1220 \text{ mm} \)

Ultimate limit state: flexure of general reinforced concrete section

The calculation is based on BS EN 1992-1-1 Clause 6.1(2)P.

General reinforced concrete section

Concrete compressive strength \( f_{ckm} = 35 \, \text{N/mm}^2 \)
Material factor \( \gamma_{cm} = 1.5 \)
Number of cross-sections \( n_{cs} = 1 \)
Cross-section 1
Number of layers of reinforcement \( n_{ols} = 1 \)
Characteristic yield strength \( f_{ykm} = 500 \, \text{N/mm}^2 \)
Young's modulus of reinforcement \( E_s = 200000 \, \text{N/mm}^2 \)
Material factor for reinforcement \( \gamma_{sm} = 1.15 \)
Reinforcement stress-strain relationship
Horizontal top branch with no strain limits
Layer 1
Area of reinforcement \( A_s(1) = 2010 \, \text{mm}^2 \)
Depth from compression face \( d_s(1) = 192 \, \text{mm} \)

Ultimate limit state: flexure of general reinforced concrete section

The calculation is based on BS EN 1992-1-1 Clause 6.1(2)P.

RESULTS FROM ULTIMATE MOMENT ANALYSIS

Section moment resistance \( 151.2 \, \text{kNm} \)
Depth to Neutral Axis \( 54.432 \, \text{mm} \)

Ultimate limit state: Shear calculations to EN 1992-1-1 Cl.6

Slab section:
Longitudinal Reinforcement
Area to be included in calcs. \( A_{sc}(1) = 2010 \, \text{mm}^2 \)
Concrete Section
Effective width for shear \( b_w = 1000 \, \text{mm} \)

Distance from edge of support or centre of flexible bearings
Distance \( a_v = 1000 \, \text{mm} \)
Design shear resistance without shear reinforcement \( V_{RdC} \), as per EN 1992-2 Clause 6.2.2 (6.2a)
Shear resistance \( V_{RdC} = C_{RdC} \cdot k \cdot (100 \cdot r_{ho1} \cdot f_{ck1})^{(1/3)} \cdot b_w \cdot d/1000 = 153.05 \, \text{kN} \)

The minimum shear resistance below is to EN 1992-2 Cl.6.2.2 (6.2b)
Minimum shear resistance \( V_{Rdmin} = v_{min} \cdot b_w \cdot d/1000 = 112.45 \, \text{kN} \)
Shear resistance 153.05 kN is greater than minimum 112.45 kN
Shear reinforcement not provided.
Serviceability limit state calculations

Stresses to EN 1992-1-1 Cl.7.2 and crack widths to EN 1992-1-1 Cl.7.3

For stress calculations:
Moment from permanent effects \( M_{ps} = 12.75 \) kNm
Moment from transient actions \( M_{vs} = 72.75 \) kNm

For crack width calculations:
Moment from quasi-permanent effects \( M_{pc} = 12.75 \) kNm
Moment from associated transient actions \( M_{vc} = 5 \) kNm

Effective depth for shear  ds=250 mm
Distance of section from support  av=500 mm
Area of tension reinforcement  As=1000 mm²
Strength of concrete  fcuv=30 N/mm²
Constant KVC  KVC=0.24

RESULTS FROM SHEAR ANALYSIS

Concrete shear capacity  123.36 kN
Shear reinforcement not provided
Location: 500mm thick slab

Early Thermal Cracking in Concrete to BD 28/87 (Amd. No 1)

Calculations for distribution reinforcement for the control of early thermal cracking of reinforced and prestressed post-tensioned concrete members.

Area of effective concrete $A_c = 2.5E6 \text{ mm}^2$
Char tensile strength of r'ment $f_y = 460 \text{ N/mm}^2$
Char cube strength of concrete $f_{cu} = 40 \text{ N/mm}^2$
Ratio of $(f_{ct}/f_b)$ $b_r = 0.67$
Nominal diameter of r'ment $\phi = 16 \text{ mm}$
Permissible crack width $w = 0.25 \text{ mm}$

Short-term fall in temperature $T_1 = 35 \degree C$
Long-term fall in temperature $T_2 = 20 \degree C$
Restraint factor $R = 0.6$

Minimum r'ment area to ensure acceptable crack widths (Equation 3)

$$A_{sw} = b_r A_c \phi (R (e_{sh} 1E-6 + e_{th}) - 0.5 e_{ult} 1E-6) / (2 w) = 14836 \text{ mm}^2$$

Required reinforcement area, $A_s$, is the greater value obtained from Equation 2 and Equation 3.

Area from Equation 3 is greater than that from Equation 2

Required area from Equation 3 $A_s = A_{sw} = 14836 \text{ mm}^2$

Reinforcement that is present for other purposes may be included as part of the area of reinforcement $A_s = 14836 \text{ mm}^2$ (Section 5.10).

Arrangement of reinforcement - External edge restraint (Section 6.2)

---

Reinforcement shall be provided parallel to the restraint. Where the length to height ratio exceeds 2:1 this reinforcement shall be provided over the full height of the section. When the length to height ratio is 2:1 or less, and there is no end restraint, reinforcement need only be placed in the half of the section adjacent to the restraint.

The area of reinforcement, $A_s = 14836 \text{ mm}^2$ shall be provided in the faces of the section.
In addition to the reinforcement parallel to the edge restraint, reinforcement of the same unit area shall also be provided to control the effects of warping restraint at the ends. This reinforcement shall be perpendicular to the edge restraint and be provided over a length at the end equivalent to the lesser of the height of the section, or 0.2 times the overall length.

**SUMMARY**

*Section is subject to external edge restraint*

*Reinforcement As=14836 mm² should be arranged in accordance with Section 6.2.*
Location: Ex1 - Consider a 500mm thick slab (edge restraint)

Early Thermal Cracking in Concrete - EN 1992-1-1 and EN 1992-3

Overall depth of concrete section h=500 mm
Char. tensile strength (reinf'ment) fyk=500 N/mm²

The minimum reinforcement area to control crack spacing will be evaluated in accordance with BS EN 1992-1-1:2004 Clause 7.3.2(2).

The tensile zone is that part of the section which is calculated to be in tension just before formation of the first crack. The section behaves elastically until the tensile fibre stress reaches fctm.

For a rectangular section, the area in tension is half the slab depth.

Area of conc. within tensile zone Act=b*h/2=250000 mm²/m
Stress distribution coefficient kc=1

The coefficient (k) below allows for the effect of non-uniform self equilibrating stresses, which lead to a reduction of restraint forces.
Coefficient ( Clause 7.3.2(2) ) k'=TABLE 6.13 for h=500
=0.86

Coefficient value to be adopted k=0.86
Minimum reinforcement area Asmin=kc*k*Act*fcteff/fyk=1300.2 mm²/m
Permissible crack width wk=0.25 mm
Temp.fall: hydrat. peak & ambient T1=35 øC
Long-term drop in temperature T2=20 °C
Bond coefficient k1 k1=0.8

Crack inducing strain

Coefficient of thermal expansion aTc=12 µε/°C
Restraint factor (short-term) R1=0.5 (thermal)
Restraint factor (long-term) R2=0.5 (thermal)
Restraint factor (long-term) R3=0.5 (drying)
Shrinkage strain (short-term) ecas=16.6 µε
Shrinkage strain (long-term) ecal=55 µε
Tensile strain capacity ectus=78 µε (short-term)
Tensile strain capacity ectul=111.2 µε (long-term)

The coefficient below deals with the effect of stress relaxation due to creep under sustained loading.
Creep coefficient K1=1
Short-term crack inducing strain ecrs=K1*(aTc*T1+ecas)*R1-0.5*ectus =179.3 µε
Long-term crack inducing strain ecrl=K1*(c1+c2+c3)-0.5*ectul=469.9 µε

Check crack width

Min steel area each face Asmin=1300.2 mm²/m
Diameter of distribution steel dia=16 mm
Spacing of distribution steel spacd=150 mm
Area of distribution steel \[ A_{\text{dis}} = \text{INT}(250 \times \pi \times \text{dia}^2 / \text{spacd}) \]  
= 1340 \text{ mm}^2 / \text{m}

Cover to reinforcement \[ c = 30 \text{ mm} \]

Design crack width (short-term) \[ w_{ks} = \text{srm}_{\text{max}} \times \text{ecrs} / 10^6 = 0.08744 \text{ mm} \]

Design crack width (long-term) \[ w_{kl} = \text{srm}_{\text{max}} \times \text{ecrl} / 10^6 = 0.22916 \text{ mm} \]

The short-term crack width 0.08744 mm is less than the permissible value of 0.25 mm hence satisfactory.

The long-term crack width 0.22916 mm is less than the permissible value of 0.25 mm hence satisfactory.

**Arrangement of reinforcement**

(External edge restraint (Fig L.1(a), EN 1992-3))

Reinforcement shall be provided parallel to the restraint. Where the length to height ratio exceeds 2:1 this reinforcement shall be provided over the full height of the section. When the length to height ratio is 2:1 or less, and there is no end restraint, reinforcement need only be placed in the half of the section adjacent to the restraint. The area of reinforcement, \( A_s = 1340 \text{ mm}^2 / \text{m} \) shall be provided in the faces of the section.

In addition to the reinforcement parallel to the edge restraint, reinforcement of the same unit area shall also be provided to control the effects of warping restraint at the ends. This reinforcement shall be perpendicular to the edge restraint and be provided over a length at the end equivalent to the lesser of the height of the section, or 0.2 times the overall length.

**SUMMARY**

Section is subject to (external) edge restraint. Reinforcement \( A_s = 1340 \text{ mm}^2 / \text{m} \) should be provided parallel to the edge restraint. Furthermore provide warping reinforcement.
Location: Ex2 - Consider a 1000mm thick slab (edge restraint)

Early Thermal Cracking in Concrete - EN 1992-1-1 and EN 1992-3

Overall depth of concrete section h=1000 mm
Char. tensile strength (reinf'ment) f_yk=500 N/mm²

The minimum reinforcement area to control crack spacing will be evaluated in accordance with BS EN 1992-1-1:2004 Clause 7.3.2(2).

The tensile zone is that part of the section which is calculated to be in tension just before formation of the first crack. The section behaves elastically until the tensile fibre stress reaches fctm.

For a rectangular section, the area in tension is half the slab depth.

Area of conc. within tensile zone Act=b*h/2=500000 mm²/m

Stress distribution coefficient k_c=1
The coefficient (k) below allows for the effect of non-uniform self equilibrating stresses, which lead to a reduction of restraint forces.

Coefficient (Clause 7.3.2(2)) k'=TABLE 6.13 for h=1000

=0.65

Coefficient value to be adopted k=0.65

Minimum reinforcement area Asmin=k_c*k*Act*fcteff/f_yk=1798.1 mm²/m

Permissible crack width wk=0.25 mm

Temp. fall: hydrat. peak & ambient T_1=20 °C

Long-term drop in temperature T_2=5 °C

Bond coefficient k_1 k_1=0.8

Crack inducing strain

Coefficient of thermal expansion a_Tc=10 με/°C
Restraint factor (short-term) R_1=0.5 (thermal)
Restraint factor (long-term) R_2=0.2 (thermal)
Restraint factor (long-term) R_3=0.2 (drying)
Shrinkage strain (short-term) e_cas=13.6 με
Shrinkage strain (long-term) e_cal=45 με
Tensile strain capacity e_cus=73.6 με (short-term)
Tensile strain capacity e_cul=104.8 με (long-term)

The coefficient below deals with the effect of stress relaxation due to creep under sustained loading.

Creep coefficient K_1=1

Short-term crack inducing strain e_crs=K_1*(a_Tc*T_1+e_cas)*R_1-0.5*e_cus=70 με

Long-term crack inducing strain e_crl=K_1*(c_1+c_2+c_3)-0.5*e_cul=147.3 με

Check crack width

Min steel area each face Asmin=1798.1 mm²/m
Diameter of distribution steel dia=16 mm
Spacing of distribution steel spacd=111 mm
Area of distribution steel 
\[ A_{d\text{is}} = \text{INT}(250 \times \pi \times \text{dia}^2 / \text{spacd}) = 1811 \text{ mm}^2 / \text{m} \]

Cover to reinforcement 
\[ c = 72 \text{ mm} \]

Design crack width (short-term) 
\[ w_{k\text{s}} = \text{srmax} \times \text{ecrs} / 10^6 = 0.05919 \text{ mm} \]

Design crack width (long-term) 
\[ w_{k\text{l}} = \text{srmax} \times \text{ecrl} / 10^6 = 0.12455 \text{ mm} \]

The short-term crack width 0.05919 mm is less than the permissible value of 0.25 mm hence satisfactory.

The long-term crack width 0.12455 mm is less than the permissible value of 0.25 mm hence satisfactory.

**Arrangement of reinforcement**

(External edge restraint (Fig L.1(a), EN 1992-3))

Reinforcement shall be provided parallel to the restraint. Where the length to height ratio exceeds 2:1 this reinforcement shall be provided over the full height of the section. When the length to height ratio is 2:1 or less, and there is no end restraint, reinforcement need only be placed in the half of the section adjacent to the restraint.

The area of reinforcement, \[ A_s = 1811 \text{ mm}^2 / \text{m} \] shall be provided in the faces of the section.

In addition to the reinforcement parallel to the edge restraint, reinforcement of the same unit area shall also be provided to control the effects of warping restraint at the ends. This reinforcement shall be perpendicular to the edge restraint and be provided over a length at the end equivalent to the lesser of the height of the section, or 0.2 times the overall length.

**SUMMARY**

Section is subject to (external) edge restraint. Reinforcement \[ A_s = 1811 \text{ mm}^2 / \text{m} \] should be provided parallel to the edge restraint. Furthermore provide warping reinforcement.
Location: Ex3 - Consider a 300mm thick slab (end restraint)

Early Thermal Cracking in Concrete – EN 1992-1-1 and EN 1992-3

Overall depth of concrete section h=300 mm
Char. tensile strength (reinf’ment) fyk=500 N/mm²

The minimum reinforcement area to control crack spacing will be evaluated in accordance with BS EN 1992-1-1:2004 Clause 7.3.2(2). The tensile zone is that part of the section which is calculated to be in tension just before formation of the first crack. Coefficient (Clause 7.3.2(2)) k’=TABLE 6.13 for h=300

Coefficient value to be adopted k=1
Minimum reinforcement area Asmin=kc*k*Act*fcteff/fyk=868.94 mm²/m
Permissible crack width wk=0.25 mm

Bond coefficient k₁ k₁=0.8

Crack inducing strain

Short-term crack inducing strain ecrs=0.5*ae*kc*k*fcteff*(1+1/(ae*p))/Es=0.23282E-3 με
Long-term crack inducing strain ecrl=0.5*ae*kc*k*fcteff*(1+1/(ae*p))/Es=0.39028E-3 με

Check crack width

Diameter of distribution steel dia=20 mm
Spacing of distribution steel spacd=INT(250*PI*dia^2/As1)=100 mm
Area of distribution steel Asdis=As1=3140 mm²/m
Cover to reinforcement c=70 mm
Design crack width (short-term) wks=srmax*ecrs=0.13104 mm
Design crack width (long-term) wk1=srmax*ecrl=0.21966 mm
The short-term crack width 0.13104 mm is less than the permissible value of 0.25 mm hence satisfactory.
The long-term crack width 0.21966 mm is less than the permissible value of 0.25 mm hence satisfactory.
Arrangement of reinforcement

(External end restraint (Fig L.1(b), EN 1992-3))

 SUMMARY Section is subject to (external) end restraint. Reinforcement As=3140 mm²/m should be provided throughout the member perpendicular to the restraining edge.
Location: Ex4 - Consider a 300mm thick slab (end restraint)

Early Thermal Cracking in Concrete - EN 1992-1-1 and EN 1992-3

Overall depth of concrete section \( h = 300 \) mm
Char. tensile strength (reinf'ment) \( f_yk = 500 \) N/mm\(^2\)

The minimum reinforcement area to control crack spacing will be evaluated in accordance with BS EN 1992-1-1:2004 Clause 7.3.2(2). The tensile zone is that part of the section which is calculated to be in tension just before formation of the first crack. The section behaves elastically until the tensile fibre stress reaches \( f_{ctm} \).

For a rectangular section, the area in tension is half the slab depth. Area of conc. within tensile zone \( A_{ct} = b \times h / 2 = 150000 \) mm\(^2\)/m
 Stress distribution coefficient \( k_c = 1 \)

The coefficient \( k \) below allows for the effect of non-uniform self equilibrating stresses, which lead to a reduction of restraint forces. Coefficient (Clause 7.3.2(2)) \( k' = \text{TABLE 6.13 for } h = 300 \) mm

Coefficient value to be adopted \( k = 1 \)
Minimum reinforcement area \( A_{s,\text{min}} = k_c \times k \times A_{ct} \times f_{ct,\text{eff}} / f_yk = 868.94 \) mm\(^2\)/m
Permissible crack width \( w_k = 0.3 \) mm

Bond coefficient \( k_1 = 1.14 \)

Crack inducing strain

Short-term crack inducing strain \( \varepsilon_{crs} = 0.5 \times a_e \times k_c \times k \times f_{ct,\text{eff}} \times (1 + 1/(a_e \times p)) / E_s = 0.33603 \times 10^{-3} \) με
Long-term crack inducing strain \( \varepsilon_{crl} = 0.5 \times a_e \times k_c \times k \times f_{ct,\text{eff}} \times (1 + 1/(a_e \times p)) / E_s = 0.56328 \times 10^{-3} \) με

Check crack width

Diameter of distribution steel \( \text{dia} = 16 \) mm
Spacing of distribution steel \( \text{spacd} = \text{INT}(250 \times \pi \times \text{dia}^2 / A_s) = 96 \) mm
Area of distribution steel \( A_{s,\text{dis}} = A_s = 2094 \) mm\(^2\)/m
Cover to reinforcement \( c = 30 \) mm
Design crack width (short-term) \( w_{k,s} = s_{rm} \times \varepsilon_{crs} = 0.15245 \) mm
Design crack width (long-term) \( w_{k,l} = s_{rm} \times \varepsilon_{crl} = 0.25555 \) mm
The short-term crack width 0.15245 mm is less than the permissible value of 0.3 mm hence satisfactory.
The long-term crack width 0.25555 mm is less than the permissible value of 0.3 mm hence satisfactory.
Arrangement of reinforcement

(External end restraint (Fig L.1(b), EN 1992-3))

Reinforcement for end restraint

SUMMARY  Section is subject to (external) end restraint. Reinforcement As=2094 mm²/m should be provided throughout the member perpendicular to the restraining edge.
**Location:** Ex5 - Consider a 2500mm thick slab (internal restraint)

**Early Thermal Cracking in Concrete - EN 1992-1-1 and EN 1992-3**

Overall depth of concrete section $h=2500$ mm  
Char.tensile strength (reinf'ment) $f_yk=500$ N/mm$^2$

The minimum reinforcement area to control crack spacing will be evaluated in accordance with BS EN 1992-1-1:2004 Clause 7.3.2(2).  
The tensile zone is that part of the section which is calculated to be in tension just before formation of the first crack. The section behaves elastically until the tensile fibre stress reaches $f_{ctm}$.  
The following is in accordance with CIRIA C660 Section 4.11.3.  
Area of conc. within tensile zone $A_{ct}=b*(0.2*h)=500000$ mm$^2$/m  
The coefficient ($k$) below allows for the effect of non-uniform self equilibrating stresses, which lead to a reduction of restraint forces.  
Coefficient value to be adopted $k=1$ (internal restraint dominant)  
Minimum reinforcement area $A_{smin}=kc*k*A_{ct}*f_{cteff}/f_yk=865$ mm$^2$/m

Permissible crack width $w_k=0.3$ mm  
Bond coefficient $k_1=1.14$

**Crack inducing strain**

When designing reinforcement to control cracking caused by solely by temperature differentials, autogenous strain may be omitted from the calculation as it will occur uniformly through the section and will not contribute to differential strain. Long-term strains are also omitted as the stress condition is transient and does not extend beyond the early thermal cycle.

- Tensile strain capacity $\epsilon_{ctu}=76$ $\mu$e  
- Coefficient of thermal expansion $a_{Tc}=12$ $\mu$e/$^\circ$C  
- Temperature differential ($\Delta T$) $\Delta lT=46$ $^\circ$C  
- Short-term crack inducing strain $\epsilon_{crs}=K_1*\Delta lT*a_{Tc*R}^{-0.5}*\epsilon_{ctu}=112.7$ $\mu$e

**Check crack width**

- Min steel area each face $A_{smin}=865$ mm$^2$/m  
- Diameter of distribution steel $d_{ia}=16$ mm  
- Spacing of distribution steel $s_{pcd}=225$ mm  
- Area of distribution steel $A_{sdis}=\text{INT}(250*\pi*d_{ia}^2/s_{pcd})=893$ mm$^2$/m  
- Cover to reinforcement $c=50$ mm  
- Design crack width (short-term) $w_k=s_{rmax}*\epsilon_{crs}/10^6=0.16101$ mm

The short-term crack width 0.16101 mm is less than the permissible value of 0.3 mm hence satisfactory.

**Arrangement of reinforcement - Internal restraint**

Where the least dimension of the member exceeds 1m, and the sum of the two smallest dimensions exceeds 4m, the section is considered to be subject to internal restraint due to the temperature gradient between the core and the surface. The area of reinforcement,
As=893 mm²/m shall be provided in each of two directions in all surfaces of the member.

**SUMMARY**

Section is subject to (internal) restraint due to temperature differentials within the member. Reinforcement As=893 mm²/m should be provided in each of the two directions in all surfaces of the member.
Location: Ex6 - Consider a 500mm thick slab (edge restraint)

Early Thermal Cracking in Concrete - EN 1992-1-1 and EN 1992-3

Overall depth of concrete section \( h = 500 \text{ mm} \)
Char. tensile strength (reinf'ment) \( fyk = 500 \text{ N/mm}^2 \)

The minimum reinforcement area to control crack spacing will be evaluated in accordance with BS EN 1992-1-1:2004 Clause 7.3.2(2). The tensile zone is that part of the section which is calculated to be in tension just before formation of the first crack. The section behaves elastically until the tensile fibre stress reaches \( f_{ctm} \). For a rectangular section, the area in tension is half the slab depth. Area of conc. within tensile zone \( A_{ct} = b \times h/2 = 250000 \text{ mm}^2/\text{m} \)
Stress distribution coefficient \( k_c = 0.9 \)
The coefficient \( (k) \) below allows for the effect of non-uniform self equilibrating stresses, which lead to a reduction of restraint forces.
Coefficient \( (\text{Clause 7.3.2(2)}) \) \( k' = \text{TABLE 6.13 for } h = 500 \)
\[ = 0.86 \]
Coefficient value to be adopted \( k = 1 \)
Minimum reinforcement area \( A_{smin} = k_c \times k \times A_{ct} \times f_{cteff}/f_yk = 1303.4 \text{ mm}^2/\text{m} \)
Permissible crack width \( w_k = 0.21 \text{ mm} \)
Temp. fall: hydrat. peak & ambient \( T_1 = 27 \degree C \)
Long-term drop in temperature \( T_2 = 20 \degree C \)
Bond coefficient \( k_1 = 1.14 \)

Crack inducing strain

Coefficient of thermal expansion \( a_{Tc} = 12 \mu \varepsilon/\degree C \)
Restrainment factor (short-term) \( R_1 = 0.62 \text{ (thermal)} \)
Restrainment factor (long-term) \( R_2 = 0.62 \text{ (thermal)} \)
Restrainment factor (long-term) \( R_3 = 0.62 \text{ (drying)} \)
Shrinkage strain (short-term) \( \epsilon_{cas} = 15 \mu \varepsilon \)
Shrinkage strain (long-term) \( \epsilon_{cal} = 50 \mu \varepsilon \)
Tensile strain capacity \( \epsilon_{tus} = 76 \mu \varepsilon \text{ (short-term)} \)
Tensile strain capacity \( \epsilon_{tul} = 108 \mu \varepsilon \text{ (long-term)} \)
The coefficient below deals with the effect of stress relaxation due to creep under sustained loading.
Creep coefficient \( k_l = 0.65 \)
Short-term crack inducing strain \( \epsilon_{crs} = K_1 \times a_{Tc} \times T_1 + \epsilon_{cas} \times R_1 - 0.5 \times \epsilon_{tus} = 98.617 \mu \varepsilon \)
Long-term crack inducing strain \( \epsilon_{crl} = K_1 \times (c_1 + c_2 + c_3) - 0.5 \times \epsilon_{tul} = 251.07 \mu \varepsilon \)

Check crack width

Min steel area each face \( A_{smin} = 1303.4 \text{ mm}^2/\text{m} \)
Diameter of distribution steel \( \text{dia} = 20 \text{ mm} \)
Spacing of distribution steel \( \text{spacd} = 175 \text{ mm} \)
Area of distribution steel  
\[ A_{\text{dis}} = \text{INT}(250 \times \pi \times \text{dia}^2 / \text{spacd}) \]  
\[ = 1795 \, \text{mm}^2 / \text{m} \]

Cover to reinforcement  
\[ c = 40 \, \text{mm} \]

Design crack width (short-term)  
\[ w_{ks} = \text{srmax} \times \text{ecrs} / 10^6 = 0.079958 \, \text{mm} \]

Design crack width (long-term)  
\[ w_{kl} = \text{srmax} \times \text{ecrl} / 10^6 = 0.20357 \, \text{mm} \]

The short-term crack width 0.079958 mm is less than the permissible value of 0.21 mm hence satisfactory.
The long-term crack width 0.20357 mm is less than the permissible value of 0.21 mm hence satisfactory.

**Arrangement of reinforcement**

(External edge restraint (Fig L.1(a), EN 1992-3))

Reinforcement shall be provided parallel to the restraint. Where the length to height ratio exceeds 2:1 this reinforcement shall be provided over the full height of the section. When the length to height ratio is 2:1 or less, and there is no end restraint, reinforcement need only be placed in the half of the section adjacent to the restraint.

The area of reinforcement, \( A_s = 1795 \, \text{mm}^2 / \text{m} \) shall be provided in the faces of the section.

In addition to the reinforcement parallel to the edge restraint, reinforcement of the same unit area shall also be provided to control the effects of warping restraint at the ends. This reinforcement shall be perpendicular to the edge restraint and be provided over a length at the end equivalent to the lesser of the height of the section, or 0.2 times the overall length.

**SUMMARY**

Section is subject to (external) edge restraint. Reinforcement \( A_s = 1795 \, \text{mm}^2 / \text{m} \) should be provided parallel to the edge restraint. Furthermore provide warping reinforcement.

![Diagram of half-joint](image)

Breadth of half-joint 1100 mm

Young's modulus of reinforcement, \( E_s = 200000 \text{ N/mm}^2 \)

Number of reinforcement groups, \( n_{og} = 1 \)

Reinforcement group 1:
- Anti-clockwise angle from x axis, \( \text{ang}(1) = 0^\circ \)
- y coordinate, \( y(1) = 649 \text{ mm} \)
- Area of reinforcement, \( A_s(1) = 452 \text{ mm}^2 \)
- Diameter of bars in group, \( d(1) = 12 \text{ mm} \)
- Spacing of bars in group, \( s(1) = 275 \text{ mm} \)
- Effective area of reinforcement group normal to crack line, \( A_e(1) = A_s(1) \times (\cos(\pi/4 - \text{RAD(\text{ang}(1))}))^2 = 226 \text{ mm}^2 \)

**WARNING:**
Vertical or inclined reinforcement has not been specified.
**Location:** Ex3 - Beam B

SUMMARY

Concrete compressive strain  0.13455E-3
Crack width (from Expression 2)  0.58682 mm
Location: Ex1 - Beam A

Torsion in reinforced concrete sections to BS5400-4:1990

The areas of longitudinal and link reinforcement calculated are for torsional strength only. The reinforcement is additional to any requirements for shear and bending but may contribute to the area of reinforcement required for the control of early thermal cracking.

Rectangular section - Clause 5.3.4.4(b)

Breadth of concrete section $b=600$ mm
Depth of concrete section $h=1200$ mm
Char. strength of concrete $f_{cu}=40$ N/mm$^2$
Smaller centre line link dim. $x_1=520$ mm
Larger centre line link dim. $y_1=1120$ mm
Torsion moment due to ult. loads $T=290$ kNm
Applied shear force $V=500$ kN
Tensile r'ment effective depth $d=1139$ mm

RESULTS FROM RECTANGULAR SECTION ANALYSIS FOR TORSION

Link r'ment adequate $A_{st}$ required 77.764 mm$^2$
$A_{st}$ provided 78.54 mm$^2$
Long r'ment adequate $A_{sl}$ required 605.01 mm$^2$
$A_{sl}$ provided 804.25 mm$^2$

TORSION REINFORCEMENT ADEQUATE
Location: Ex2 - Box Section A

Torsion in RC sections to BS5400-4:1990

\(Asl\text{ provided }314.16\text{ mm}^2\)

TORSION REINFORCEMENT ADEQUATE
Rectangle B:
Link reinforcement adequate  Ast required 73.839 mm²
                        Ast provided 113.1 mm²
Long. reinforcement adequate  Asl required 53.701 mm²
                        Asl provided 314.16 mm²

TORSION REINFORCEMENT ADEQUATE
Location: Ex1 - Rectangular section

Torsion in RC sections to EN 1992-1-1:2004

Calculations are in accordance with BS EN 1992-1-1:2004 Clause 6.3 and The Concrete Centre (TCC) publication "Concise Eurocode 2 for Bridges". The areas of longitudinal and link reinforcement calculated are for torsional strength only. The reinforcement is additional to any requirements for shear and bending but may contribute to the area of reinforcement required for the control of early thermal cracking.

The proforma does not include the following adjustment which may be made to the calculated area of torsion reinforcement:

The area of longitudinal reinforcement in the compressive zone may be reduced in proportion to the available compressive force. No guidance is given on what extent of compression zone should be considered, so it is recommended that a depth equal to twice the cover to the torsion links be considered, as was utilised in BS5400-4.

The angle $\theta$ for the compression struts (EC2-1-1, Figure 6.5) should be in the range given in the NA to EN 1992-1-1, Clause 6.2.3(2) such that $1 \leq \cot(\theta) \leq 2.5$ (i.e. angle $\theta$ values are $22^\circ$ - $45^\circ$).

Rectangular section

![Rectangular section diagram]

Breadth of concrete section $\text{b}=600$ mm
Depth of concrete section $\text{h}=1200$ mm
Smaller centre line link dim. $\text{x}_1=494$ mm
Larger centre line link dim. $\text{y}_1=1094$ mm
Design torsion moment $\text{T}_e=290$ kNm
Design torsional shear stress $\text{v}_t=2*\text{T}_e*1\text{E}6/(\text{h}_{\text{min}}^2*2*(\text{h}_{\text{max}}-\text{h}_{\text{min}}/3))=1.611 N/mm^2$
Design shear force $\text{V}_e=500$ kN
Tensile r'ment effective depth $\text{d}=1147$ mm
Angle of inclination of strut $\theta'=22^\circ$
Compute cot($\theta$) $\cot(\theta)=2.4751$
Compute tan($\theta$) $\tan(\theta)=0.40403$

Crushing limit for combined shear and torsion

The following check is in accordance with EN 1992-2 Clause 6.3.2(104).

Max torsional moment resistance $\text{T}_{\text{Rdmax}}=2*\text{v}_1*\text{fck}/1.5*\text{A}_k*\text{tef}^{*}\text{comp}_{1}/1\text{E}6=620.28$ kNm
Maximum shear resistance:
\[ VR_{d_{\text{max}}} = 0.36 \times b \times d \times \left(1 - \frac{f_{ck}}{250}\right) \times \frac{f_{ck}}{((ct+tt) \times 1000)} = 2401.2 \text{ kN} \]

Interaction condition \( \text{uni} = T_{Ed}/T_{Rd_{\text{max}}} + V_{Ed}/V_{Rd_{\text{max}}} = 0.67576 \)

Therefore concrete section is adequate.

RESULTS FROM RECTANGULAR SECTION ANALYSIS FOR TORSION

| Link reinforcement adequate | Ast required 33.669 mm² |
|                            | Ast provided 113.1 mm²  |
| Long. reinforcement adequate| Asl required 412.51 mm²  |
|                            | Asl provided 490.87 mm²  |

TORSION REINFORCEMENT ADEQUATE
Location: Ex2 - Box Section

Torsion in RC sections to EN 1992-1-1:2004

**TORSION REINFORCEMENT ADEQUATE**
Torsion in RC sections to EN 1992-1-1:2004

Calculations are in accordance with BS EN 1992-1-1:2004 Clause 6.3 and The Concrete Centre (TCC) publication "Concise Eurocode 2 for Bridges". The areas of longitudinal and link reinforcement calculated are for torsional strength only. The reinforcement is additional to any requirements for shear and bending but may contribute to the area of reinforcement required for the control of early thermal cracking.

The proforma does not include the following adjustment which may be made to the calculated area of torsion reinforcement:

The area of longitudinal reinforcement in the compressive zone may be reduced in proportion to the available compressive force. No guidance is given on what extent of compression zone should be considered, so it is recommended that a depth equal to twice the cover to the torsion links be considered, as was utilised in BS5400-4.

The angle $\theta$ for the compression struts (EC2-1-1, Figure 6.5) should be in the range given in the NA to EN 1992-1-1, Clause 6.2.3(2) such that $1 \leq \cot(\theta) \leq 2.5$ (i.e. angle $\theta$ values are $22^\circ$ - $45^\circ$).

**Rectangular section**

\[
\text{Breadth of concrete section} \quad b = 300 \text{ mm} \\
\text{Depth of concrete section} \quad h = 600 \text{ mm} \\
\text{Smaller centre line link dim.} \quad x_1 = 224 \text{ mm} \\
\text{Larger centre line link dim.} \quad y_1 = 524 \text{ mm} \\
\text{Design torsion moment} \quad T_{Ed} = 24 \text{ kNm} \\
\text{Design torsional shear stress} \quad v_t = 2 \times T_{Ed} \times 10^6 / (h_{\text{min}}^2 \times (h_{\text{max}} - h_{\text{min}}/3)) = 1.0667 \text{ N/mm}^2 \\
\text{Max ultimate torsion shear stress} \quad v_{tu} = \text{TABLE 2.1 for fck=30} = 4.5643 \text{ N/mm}^2 \\
\text{Limiting torsion shear stress} \quad l_{ts} = v_{tu} \times y_1/550 = 4.3485 \text{ N/mm}^2 \\
\text{Design shear force} \quad V_{Ed} = 250 \text{ kN} \\
\text{Tensile r'ment effective depth} \quad d = 540 \text{ mm} \\
\text{Angle of inclination of strut} \quad \theta' = 22^\circ \\
\text{Compute } \cot(\theta) \quad c_t = \cot(\theta) = 2.4751 \\
\text{Compute } \tan(\theta) \quad t_t = \tan(\theta) = 0.40403
Crushing limit for combined shear and torsion

The following check is in accordance with EN 1992-2 Clause 6.3.2(104).

Max torsional moment resistance: \[ TR_{d_{\text{max}}} = 2 \times v_1 \times f_{ck} / 1.5 \times A_k \times t_{ef} \times \text{comp1} / 1 \times 10^6 \]

= 73.356 kNm

Maximum shear resistance:

\[ VR_{d_{\text{max}}} = 0.36 \times b \times d \times (1 - f_{ck} / 250) \times f_{ck} / ((c_t + t_t) \times 1000) = 534.76 \text{ kN} \]

Interaction condition

\[ \text{uni} = T_{Ed} / TR_{d_{\text{max}}} + V_{Ed} / VR_{d_{\text{max}}} = 0.79467 \]

Therefore concrete section is adequate.

TORSION REINFORCEMENT ADEQUATE
Location: Ex8 - Box Section (torsion reinforcement not required)

Torsion in RC sections to EN 1992-1-1:2004

Calculations are in accordance with BS EN 1992-1-1:2004 Clause 6.3 and The Concrete Centre (TCC) publication "Concise Eurocode 2 for Bridges". The areas of longitudinal and link reinforcement calculated are for torsional strength only. The reinforcement is additional to any requirements for shear and bending but may contribute to the area of reinforcement required for the control of early thermal cracking.

The proforma does not include the following adjustment which may be made to the calculated area of torsion reinforcement:

- The area of longitudinal reinforcement in the compressive zone may be reduced in proportion to the available compressive force.
- No guidance is given on what extent of compression zone should be considered, so it is recommended that a depth equal to twice the cover to the torsion links be considered, as was utilised in BS5400-4.

The angle $\theta$ for the compression struts (EC2-1-1, Figure 6.5) should be in the range given in the NA to EN 1992-1-1, Clause 6.2.3(2) such that $1 \leq \cot(\theta) \leq 2.5$ (i.e. angle $\theta$ values are $22^\circ$ - $45^\circ$).

Box section

- Breadth of concrete section  $b=2000$ mm
- Depth of concrete section  $h=2000$ mm
- Wall 1 thickness  $h_{w1}=400$ mm
- Smaller centre line link dim.  $x_1=1900$ mm
- Larger centre line link dim.  $y_1=1900$ mm
- Design torsion moment  $T_{Ed}=500$ kNm
- Design shear force  $V_{Ed}=100$ kN
- Effective depth wall 2  $d_2=1920$ mm
- Effective depth wall 4  $d_4=1920$ mm
- Angle of inclination of strut  $\theta'=22^\circ$
- Compute $\cot(\theta)$  $c_t=\cot(\theta)=2.4751$
- Compute $\tan(\theta)$  $t_t=\tan(\theta)=0.40403$

### Plane frame analysis

Axial and bending effects can be analysed in a plane frame model.

Bending effects for hogging releasing moment:

NOTE: The distortion should be input into the plane frame analysis using the MEMBER DISTORTIONS option with the following format.

\[
\text{<members> ROTATION Z \(-0.61896E-3\)}
\]

NOTE: The equilibrating stresses should be taken into account when the stresses at a section due to combinations of loading are calculated.

Longitudinal effects for tensile releasing force:

NOTE: The value should be input into the plane frame analysis using the MEMBER DISTORTIONS option with the following format.

\[
\text{<members> DISTORTION X 0.1788E-3}
\]

NOTE: The equilibrating stresses should be taken into account when the stresses at a section due to combinations of loading are calculated.

### Reverse Temperature Calculations

Temperature gradient – increments of depth (Figure 9, BD 37/01)

Temperature values (Figure 9 & Table 23 in BD 37/01):

\[
\begin{align*}
\text{TR1} &= -8 \\
\text{TR2} &= -1.5 \\
\text{TR3} &= -1.5 \\
\text{TR4} &= -6.3
\end{align*}
\]

Lane Loadings
Location: Ex1 - Single carriageway

Load Model 1 (LM1) - concentrated & uniformly distributed loading

The calculations are in accordance with BS EN 1991-2:2003 and the NA to BS EN 1991-2:2003 entitled Eurocode 1: Actions on structures Part 2: Traffic loads on bridges. Load model 1 represents normal loading (normal traffic) and comprises of two components: a UDL over the full width of the traffic lane and a pair of axles (this is also referred to as a Tandem System TS). In each lane (up to a maximum of three lanes) a pair of axles should be positioned centrally in the lane at a position along the lane that causes maximum adverse effect (Clause 4.3.1 & 4.3.2). Load Model 3 (LM3) represents abnormal vehicles, also needs to be considered where appropriate. The latter is beyond the scope of this proforma.

Number of carriageways: noc=1
Width of carriageway: cw(1)=3 m

**Lane Loadings**

NOTE: It is probably much easier to apply a Knife Edge Load (KEL) for each axle (i.e. distribute the weight of one axle along a line across the lane) than two isolated wheel loads, and this is considered to be adequate for global analysis. For carriageway Lane 1, the four wheels of the tandems together weigh 600 kN (i.e. 150 kN per wheel).

\[
\begin{align*}
\text{KEL} & \quad 1.2 \quad \text{KEL} \\
\text{Carriageway 1:} & \\
& \text{KEL} = Q_1 k / w l(1) = 100 \text{ kN} \\
& \text{UDL} = 5.49 \text{ kN/m} \\
& \text{Carriageway 2:} \\
& \text{KEL} = Q_1 k / w l(2) = 100 \text{ kN} \\
& \text{UDL} = 5.49 \text{ kN/m} \\
\end{align*}
\]

Lane 1: Loads per metre width of deck axles spaced at 1.2 m apart
Location: Ex6 - Dual carriageway

Load Model 1 (LM1) - concentrated & uniformly distributed loading

The calculations are in accordance with BS EN 1991-2:2003 and the NA to BS EN 1991-2:2003 entitled Eurocode 1: Actions on structures Part 2: Traffic loads on bridges. Load model 1 represents normal loading (normal traffic) and comprises of two components: a UDL over the full width of the traffic lane and a pair of axles (this is also referred to as a Tandem System TS). In each lane (up to a maximum of three lanes) a pair of axles should be positioned centrally in the lane at a position along the lane that causes maximum adverse effect (Clause 4.3.1 & 4.3.2). Load Model 3 (LM3) represents abnormal vehicles, also needs to be considered where appropriate. The latter is beyond the scope of this proforma.

Figure 5/6. K Factors for Medium Traffic Good Surface (Mg)
Location: Ex1 - Internal beam

Ultimate limit state: flexure of prestressed concrete section

Calculations are in accordance with BS5400:Part 4:1990 as implemented by DOT Departmental Standard BD 44/15.

Deck on Beams

Char. strength of concrete \( f_{cum} = 40 \text{ N/mm}^2 \)
Number of cross-sections \( ncs = 3 \)

Cross-section 1
Top of cross-section is the compression face.
Breadth at top \( x_{bt}(1) = 1000 \text{ mm} \)
Breadth at bottom \( x_{bb}(1) = 1000 \text{ mm} \)
Depth \( x_d(1) = 300 \text{ mm} \)

Cross-section 2
Breadth at top \( x_{bt}(2) = 400 \text{ mm} \)
Breadth at bottom \( x_{bb}(2) = 400 \text{ mm} \)
Depth \( x_d(2) = 550 \text{ mm} \)

Cross-section 3
Bottom of cross-section is the tension face.
Breadth at top \( x_{bt}(3) = 1200 \text{ mm} \)
Breadth at bottom \( x_{bb}(3) = 1200 \text{ mm} \)
Depth \( x_d(3) = 350 \text{ mm} \)

Number of layers of prestressing tendons and additional reinforcement \( n_{ols} = 2 \)

Layer 1
Area of tendon or reinforcement \( A_s(1) = 2412 \text{ mm}^2 \)
Depth from compression face \( d_s(1) = 1050 \text{ mm} \)
Characteristic strength \( f_y(1) = 1860 \text{ N/mm}^2 \)
Stress after all losses \( f_{al}(1) = 975 \text{ N/mm}^2 \)
Young's modulus for reinforcement \( E(1) = 200000 \text{ N/mm}^2 \)
Layer 2

Area of tendon or reinforcement \( A_s(2) = 4825 \text{ mm}^2 \)
Depth from compression face \( d_s(2) = 1130 \text{ mm} \)
Characteristic strength \( f_y(2) = 460 \text{ N/mm}^2 \)
Stress after all losses \( f_{al}(2) = 0 \text{ N/mm}^2 \)
Young's modulus for reinforcement \( E(2) = 200000 \text{ N/mm}^2 \)
Total moment from steel forces \( 3886.5 \text{ kNm} \)
Moment from concrete forces \( 1252.1 \text{ kNm} \)
Moment of resistance of section \( M_{MR} + M_C = 5138.6 \text{ kNm} \)
Depth to Neutral Axis \( 381.78 \text{ mm} \)

Ductility requirements

Strain in outermost layer of tendons 0.011001 is less than the limiting strain 0.013087 from Clause 6.3.3.1.
The calculated ultimate moment 5138.6 kNm should be at least 1.15 times the required value (Clause 6.3.3.1).

DESIGN SUMMARY

Char.compr.strength of concrete \( 40 \text{ N/mm}^2 \)
Tendon material factor \( 1.15 \)
Section moment resistance \( 5138.6 \text{ kNm} \)
Depth to Neutral Axis \( 381.78 \text{ mm} \)
The calculated ultimate moment 5138.6 kNm should be at least 1.15 times the required value (Clause 6.3.3.1).
Location: Internal beam

Ultimate limit state: flexure of prestressed concrete section

Calculations are in accordance with BS5400:Part 4:1990 as implemented by DOT Departmental Standard BD 44/15.

Breadth of section \( b = 1000 \text{ mm} \)
Effective depth to tension r'ment \( d = 1100 \text{ mm} \)
Char. strength of tendons \( f_{pu} = 1860 \text{ N/mm}^2 \)
Area of tendons in tension zone \( A_{ps} = 3000 \text{ mm}^2 \)
Char. strength of concrete \( f_{cu} = 40 \text{ N/mm}^2 \)
Depth to neutral axis \( x = t0^2*d = 303.01 \text{ mm} \)

Moment of resistance of section
\[
M_u = f_{pu}A_{ps}(d-0.5\times x)/1E6 = 4604.6 \text{ kNm}
\]

DESIGN SUMMARY

Moment of resistance of section M=MR+MC=5275.4 kNm
Depth to Neutral Axis 415.45 mm

Ductility requirements

Strain in outermost layer of tendons 0.011313 is less than the limiting strain 0.012696 from Clause 6.3.3.1.
The calculated ultimate moment 5275.4 kNm should be at least 1.15 times the required value (Clause 6.3.3.1).

DESIGN SUMMARY

Tendon material factor 1.15
Section moment resistance 5275.4 kNm
Depth to Neutral Axis 415.45 mm
The calculated ultimate moment 5275.4 kNm should be at least 1.15 times the required value (Clause 6.3.3.1).
Ultimate limit state: flexure of prestressed concrete section

Number of cross-sections \( ncs = 4 \)

Cross-section 1
Concrete compressive strength \( f_{ck}^{(1)} = 30 \text{ N/mm}^2 \)
Material factor \( \gamma_{mc} = 1.5 \)

Cross-section 2
Concrete compressive strength \( f_{ck}^{(2)} = 40 \text{ N/mm}^2 \)

Cross-section 3
Concrete compressive strength \( f_{ck}^{(3)} = 40 \text{ N/mm}^2 \)

Cross-section 4
Concrete compressive strength \( f_{ck}^{(4)} = 40 \text{ N/mm}^2 \)

Number of layers of prestressing tendons \( n_{olpt} = 4 \)
Number of layers of non prestressed reinforcement \( n_{ols} = 0 \)

Prestressing tendons:
Characteristic tensile strength \( f_{pk} = 1670 \text{ N/mm}^2 \)
Characteristic 0.1% proof stress \( f_{pl} = 1468 \text{ N/mm}^2 \)
Young's modulus of tendons \( E_p = 195000 \text{ N/mm}^2 \)
Partial material factor (tendons) \( \gamma_{sp} = 1.15 \)

Tendon stress-strain relationship:
Horizontal top branch with no strain limits

Layer 1
Area of tendon reinforcement \( A_{s(1)} = 278 \text{ mm}^2 \)
Depth from compression face \( d_{s(1)} = 600 \text{ mm} \)
Stress after all losses \( s_{tr(1)} = 901.8 \text{ N/mm}^2 \)
Characteristic tensile strength \( f_{pk(1)} = 1670 \text{ N/mm}^2 \)
Characteristic 0.1% proof stress \( f_{pl(1)} = 1468 \text{ N/mm}^2 \)
Young's modulus for reinforcement \( E(1) = 195000 \text{ N/mm}^2 \)

Layer 2
Area of tendon reinforcement \( A_{s(2)} = 278 \text{ mm}^2 \)
Depth from compression face \( d_{s(2)} = 770 \text{ mm} \)
Stress after all losses \( s_{tr(2)} = 901.8 \text{ N/mm}^2 \)
Characteristic tensile strength \( f_{pk(2)} = 1670 \text{ N/mm}^2 \)
Characteristic 0.1% proof stress \( f_{pl(2)} = 1468 \text{ N/mm}^2 \)
Young's modulus for reinforcement \( E(2) = 195000 \text{ N/mm}^2 \)

Layer 3
Area of tendon reinforcement \( A_{s(3)} = 278 \text{ mm}^2 \)
Depth from compression face \( d_{s(3)} = 820 \text{ mm} \)
Stress after all losses \( s_{tr(3)} = 901.8 \text{ N/mm}^2 \)
Characteristic tensile strength \( f_{pk(3)} = 1670 \text{ N/mm}^2 \)
Characteristic 0.1% proof stress \( f_{pl(3)} = 1468 \text{ N/mm}^2 \)
Young's modulus for reinforcement \( E(3) = 195000 \text{ N/mm}^2 \)

Layer 4
Area of tendon reinforcement \( A_{s(4)} = 2085 \text{ mm}^2 \)
Depth from compression face \( d_{s(4)} = 870 \text{ mm} \)
Stress after all losses \( s_{tr(4)} = 901.8 \text{ N/mm}^2 \)
Characteristic tensile strength \( f_{pk(4)} = 1670 \text{ N/mm}^2 \)
Characteristic 0.1% proof stress \( f_{pl(4)} = 1468 \text{ N/mm}^2 \)
Young's modulus for reinforcement $E(4) = E_p = 195000 \text{ N/mm}^2$

**Ultimate limit state : flexure of general prestressed concrete section**

The calculation is based on BS EN 1992-1-1 Clause 6.1(2)P. Strain compatibility is ensured at the centroid of the tension reinforcement or, if the characteristic strength of the reinforcement is not constant, at the centroid of each layer. No limit is placed on either the depth of concrete in compression or the value of the lever arm.

Total moment from steel forces $M_1 = 1845.3 \text{ kNm}$

The concrete forces are obtained by integrating the product of the concrete area and concrete stress for each cross-section.

Moment from concrete forces $M_2 = 859.09 \text{ kN}$

Section moment resistance $M_{yRd} = M_1 + M_2 = 2704.4 \text{ kNm}$

Depth to Neutral Axis $334.77 \text{ mm}$

**DESIGN SUMMARY**

| Char. tensile strength of tendons | 1670 N/mm² |
| Characteristic 0.1% proof stress | 1468 N/mm² |

Compressive stress at centroidal axis due to prestress (f_{cp}). The value of f_{cp} should be derived from the prestressing force after all losses have occurred multiplied by the appropriate partial safety factor from Clause 4.2.3.

Stress due to prestress $f_{cp} = 6.88$ N/mm²

Shear capacity of uncracked sections (V_{co})

Component of prestressing force $V_{vc} = 0$ kN

Uncracked section capacity

$V_{co} = V_{vc} + 0.67 \times b \times h \times \sqrt{f_{t}^2 + f_{cp} \times ft} / 1000 = 661.41$ kN

Cracked section Class 1 / 2 members (Cl. 6.3.4.3(a))

Depth to centroid of section from extreme compression fibre: $d_c = 517.5$ mm

Depth to extreme tensile fibre from centroid of concrete section: $y = h - d_c = 517.5$ mm

Second moment of area $I = 63.969E9$ mm⁴

Depth from extreme compression fibre to centroid of all tendons: $d = 893$ mm

Total area of tensioned and untensioned steel in tension zone: $A_s = 5280$ mm²

Depth from compression face to centroid of steel area in tension zone (d₁). The steel area includes tensioned and untensioned steel. $d_1 = 945.5$ mm

$f_{pt}$ is the stress due to prestress at the extreme tensile fibre and should be derived from the prestressing force after all losses have occurred and multiplied by the appropriate partial safety factor from Clause 4.2.3.

Stress $f_{pt} = 16.53$ N/mm²

Cracking moment of section

$M_{cr} = (0.37 \times \sqrt{f_{cu}} + f_{pt}) \times I / (1E6 \times y) = 2366.7$ kNm
Results from shear capacity calculations

<table>

<tr>
<th>Class 1 / 2 member</th>
<th>Uncracked Section Shear Capacity</th>
<th>661.41 kN</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Cracked Section Shear Capacity</td>
<td>734.61 kN</td>
</tr>
</tbody>
</table>

The shear force $V_c$ which can be carried by the concrete alone is the lesser of 661.41 kN and 734.61 kN. The shear force $V_c$ carried by concrete is 661.41 kN.

Shear reinforcement (Cl. 6.3.4.4)

Shear reinforcement design is for a flanged beam. The shear force due to ultimate loads $V=900$ kN is not greater than $1.8 \times V_c = 1190.5$ kN. The spacing of links along the member should be less than the smallest of $0.75 \times dt = 728.25$ mm and $4 \times bw = 1000$ mm (Clause 6.3.4.4). Shear force $V=900$ kN exceeds $V_c=661.41$ kN. The area of shear reinforcement required is $198.69$ mm$^2$ and the area provided is $226.19$ mm$^2$.

Reinforcement summary

Flanged beam section. Link reinforcement adequate. Area of effectively anchored longitudinal tensile reinforcement and prestressing tendons (excluding debonded tendons) additional to that required at the ultimate limit state for other purposes. Minimum area required $= 1124.4$ mm$^2$. 
Location: Ex2 - Beam A

Ultimate limit state - shear capacity of a prestressed concrete section

Calculations are for Class 1, 2 & 3 members in accordance with BS5400 Part 4:1990 as implemented by DOT Departmental Standard BD 44/15.

At any section the ultimate shear resistance of the concrete alone, \( V_c \), should be considered for the section both uncracked (Clause 6.3.4.2) and cracked (Clause 6.3.4.3) in flexure and if necessary shear reinforcement should be provided (Clause 6.3.4.4).

Rectangular member

- Breadth of member \( b = 250 \text{ mm} \)
- Overall depth of member \( h = 1035 \text{ mm} \)
- Char strength of concrete \( f_{cu} = 50 \text{ N/mm}^2 \)

Compressive stress at centroidal axis due to prestress \( f_{cp} \).

**Stress due to prestress** \( f_{cp} = 6.88 \text{ N/mm}^2 \)

Shear capacity of uncracked sections \( V_{co} \)

- Component of prestressing force \( V_{vc} = 44 \text{ kN} \)
- Uncracked section capacity

\[
V_{co} = V_{vc} + 0.67 \times b \times h \times \sqrt{f_t + f_{cp}} \times 1000 = 705.41 \text{ kN}
\]

Cracked section Class 1 / 2 members (Cl. 6.3.4.3(a))

- Depth to centroid of section from extreme compression fibre: \( d_c = 517.5 \text{ mm} \)
- Depth to extreme tensile fibre from centroid of concrete section: \( y = h - d_c = 517.5 \text{ mm} \)
- Second moment of area \( I = 23.098E9 \text{ mm}^4 \)
- Depth from extreme compression fibre to centroid of all tendons: \( d = 900 \text{ mm} \)
- Total area of tensioned and untensioned steel in tension zone: \( A_s = 4500 \text{ mm}^2 \)
- Depth from compression face to centroid of steel area in tension zone (\( d_1 \)). The steel area includes tensioned and untensioned steel. \( d_1 = 940 \text{ mm} \)

**f_{pt}** is the stress due to prestress at the extreme tensile fibre and should be derived from the prestressing force after all losses have occurred and multiplied by the appropriate partial safety factor from Clause 4.2.3.

**Stress f_{pt}** \( f_{pt} = 15.2 \text{ N/mm}^2 \)

**Cracking moment of section**

\[
M_{cr} = \frac{(0.37 \times \sqrt{f_{cu}} + f_{pt}) \times I}{1E6 \times y} = 795.21 \text{ kNm}
\]
Cracked section Class 3 members (Cl. 6.3.4.3(b))

Depth to centroid of section from extreme compression fibre:
\[ dc = 517.5 \text{ mm} \]

Second moment of area
\[ I = 23.098E9 \text{ mm}^4 \]

Depth from compression face to centroid of tensioned and untensioned steel area in tension zone
\[ d_1 = 940 \text{ mm} \]

Depth to centroid of tensioned and untensioned steel area in tension zone from centroid of concrete section:
\[ y_s = d_1 - d_c = 422.5 \text{ mm} \]

\( f_{pts} \) is the stress due to prestress at the depth 940 mm distance 422.5 mm from the centroid of the concrete section and should be derived from the prestressing force after all losses have occurred and multiplied by the appropriate partial safety factor from Clause 4.2.3.

Stress \( f_{pts} \)
\[ f_{pts} = 13.67 \text{ N/mm}^2 \]

Total area of tensioned and untensioned steel in tension zone
\[ A_s = 4500 \text{ mm}^2 \]

Effective force
\[ P_f = 1780 \text{ kN} \]

Area of tensioned steel
\[ A_{st} = 2000 \text{ mm}^2 \]

Area of untensioned steel
\[ A_{su} = 2500 \text{ mm}^2 \]

Char strength of tensioned steel
\[ f_{put} = 1800 \text{ N/mm}^2 \]

Char strength (untensioned steel)
\[ f_{yu} = 460 \text{ N/mm}^2 \]

Results from shear capacity calculations

Results for a Class 1 / 2 member and a Class 3 member

Uncracked section shear capacity
\[ 705.41 \text{ kN} \]

Cracked section shear capacity Class 1 / 2
\[ 337.19 \text{ kN} \]

Cracked section shear capacity Class 3
\[ 432.71 \text{ kN} \]

The shear force \( V_c \) which can be carried by the concrete alone is the least of 705.41 kN and 337.19 kN and 432.71 kN

Shear force \( V_c \) carried by concrete
\[ 337.19 \text{ kN} \]

Shear reinforcement (Cl. 6.3.4.4)

Shear reinforcement design is for a slab.

Shear force due to ultimate loads \( V = 700 \text{ kN} \)
Calculations are for a slab.

Effective depth for shear calc.
\[ d_t = 940 \text{ mm} \]

Diameter of link reinforcement
\[ b_d = 12 \text{ mm} \]

Characteristic strength of links
\[ f_{yv} = 460 \text{ N/mm}^2 \]

Section width
\[ b_w = 250 \text{ mm} \]

Shear force \( V = 700 \text{ kN} \) exceeds 1.8*\( V_c = 606.94 \text{ kN} \)
Spacing of links along the member should be less than 0.50*\( d_t = 470 \text{ mm} \) (Clause 6.3.4.4).
Spacing of links along the member \( s_v = 125 \text{ mm} \)
Lateral spacing of individual legs of the links at a cross-section should not exceed 0.75*\( d_t = 705 \text{ mm} \) (Clause 6.3.4.4).
Number of legs of links across the member at right angles to the span
\[ s_v^2 = 2 \]
Cross-sectional area of all legs of the links at a member cross-section
\[ A_{sv} = s_v^2 \pi b_d^2 / 4 = 226.19 \text{ mm}^2 \]
Area of shear reinforcement required (Clause 6.3.4.4).
Shear force \( V = 700 \text{ kN} \) exceeds \( V_c = 337.19 \text{ kN} \)
Area required  \[ A_{svr} = \left( V - V_c \right) \times 1000 + 0.4 \times \text{bw} \times \text{dt} \times \text{sv} / (0.87 \times \text{fyv} \times \text{dt}) = 151.79 \text{ mm}^2 \]

Link reinforcement adequate

Area required 151.79 mm\(^2\)
Area provided 226.19 mm\(^2\)

**Reinforcement summary**

**Slab section.**

Link reinforcement adequate  
Area required 151.79 mm\(^2\)
Area provided 226.19 mm\(^2\)

Area of effectively anchored longitudinal tensile r'ment and prestressing tendons (excluding debonded tendons) additional to that required at the ultimate limit state for other purposes.

Minimum area required = 874.56 mm\(^2\)
Location: Ex3 - Beam B

Ultimate limit state - shear capacity of a prestressed concrete section

Calculations are for Class 1, 2 & 3 members in accordance with BS5400 Part 4:1990 as implemented by DOT Departmental Standard BD 44/15.

Transmission length \( l_t = 1300 \text{ mm} \)

At any section the ultimate shear resistance of the concrete alone, \( V_c \), should be considered for the section both uncracked (Clause 6.3.4.2) and cracked (Clause 6.3.4.3) in flexure and if necessary shear reinforcement should be provided (Clause 6.3.4.4).

Compressive stress at centroidal axis due to prestress (\( f_{cp} \)). The value of \( f_{cp} \) should be derived from the prestressing force after all losses have occurred multiplied by the appropriate partial safety factor from Clause 4.2.3.

Stress due to prestress \( f_{cp} = 8.6 \text{ N/mm}^2 \)

**Cracked section Class 1 / 2 members (Cl. 6.3.4.3(a))**

Depth to centroid of section from extreme compression fibre: \( d_c = 400 \text{ mm} \)

Depth to extreme tensile fibre from centroid of concrete section: \( y = h - d_c = 550 \text{ mm} \)

Second moment of area \( I = 35.6E9 \text{ mm}^4 \)

Depth from extreme compression fibre to centroid of all tendons: \( d = 850 \text{ mm} \)

Total area of tensioned and untensioned steel in tension zone: \( A_s = 3600 \text{ mm}^2 \)

Depth from compression face to centroid of steel area in tension zone (\( d_1 \)). The steel area includes tensioned and untensioned steel. \( d_1 = 900 \text{ mm} \)

\( f_{pt} \) is the stress due to prestress at the extreme tensile fibre and should be derived from the prestressing force after all losses have occurred and multiplied by the appropriate partial safety factor from Clause 4.2.3.

Stress \( f_{pt} \) at end of transmission length: \( f_{pt} = 14 \text{ N/mm}^2 \)
Cracked section Class 3 members (Cl. 6.3.4.3(b))

Depth to centroid of section from extreme compression fibre:
\[ dc = 400 \text{ mm} \]

Second moment of area \[ I = 35.6E9 \text{ mm}^4 \]

Depth from compression face to centroid of tensioned and untensioned steel area in tension zone \[ d_1 = 900 \text{ mm} \]

Depth to centroid of tensioned and untensioned steel area in tension zone from centroid of concrete section:
\[ y_s = d_1 - dc = 500 \text{ mm} \]

\( f_{pts} \) is the stress due to prestress at the depth 900 mm distance 500 mm from the centroid of the concrete section and should be derived from the prestressing force after all losses have occurred and multiplied by the appropriate partial safety factor from Clause 4.2.3.

Stress \( f_{pts} \) at end of transmission length:
\[ f_{pts} = 13.1 \text{ N/mm}^2 \]

Total area of tensioned and untensioned steel in tension zone:
\[ A_s = 3600 \text{ mm}^2 \]

At end of transmission length
Effective prestressing force after all losses have occurred multiplied by the appropriate partial safety factor from Clause 4.2.3.
\[ \text{Effective force} = P_f = 1500 \text{ kN} \]

Area of tensioned steel \[ A_{st} = 2500 \text{ mm}^2 \]

Area of untensioned steel \[ A_{su} = 1100 \text{ mm}^2 \]

Char strength of tensioned steel \[ f_{put} = 1720 \text{ N/mm}^2 \]

Char strength (untensioned steel) \[ f_{yL} = 460 \text{ N/mm}^2 \]

Distance from start of transmission length (zero stress end):
\[ d_{lt(1)} = 500 \text{ mm} \]

Component of prestressing force \[ V_{vc} = 0 \text{ kN} \]

Total area of untensioned steel in tension zone
\[ A_{ut} = 1100 \text{ mm}^2 \]

Depth from compression face to centroid of untensioned steel
\[ d_{ut} = 960 \text{ mm} \]

Section width \[ b_w = 300 \text{ mm} \]

Distance of section from support \[ a_v = 400 \text{ mm} \]

Shear capacity from reinforced concrete design
\[ V_{rc} = e_h s * b_w * d_{ut} / 1000 = 629.43 \text{ kN} \]

Results from shear capacity calculations

Results for a Class 1 / 2 member and a Class 3 member
Uncracked section shear capacity \[ 516.79 \text{ kN} \]
Cracked section shear capacity Class 1 / 2 \[ 2309.7 \text{ kN} \]
Cracked section shear capacity Class 3 \[ 1796.2 \text{ kN} \]
Prestressed concrete shear capacity \[ 516.79 \text{ kN} \]
Reinforced concrete shear capacity \[ 629.43 \text{ kN} \]

The shear force \( V_c \) which can be carried by the concrete alone is the greater of 516.79 kN and 629.43 kN

Shear force \( V_c \) carried by concrete \[ 629.43 \text{ kN} \]
Shear reinforcement (Cl. 6.3.4.4)

Shear reinforcement design is for a flanged beam.

Shear force due to ultimate loads $V=1100$ kN
Effective depth for shear calc. $dt=900$ mm
Diameter of link reinforcement $bd_1=12$ mm
Characteristic strength of links $f_{yv}=460$ N/mm²
Calculations are for a flanged beam.
Web thickness $bw=300$ mm
Shear force $V=1100$ kN is not greater than $1.8*V_c=1133$ kN
Spacing of links along the member should be less than the smallest of $0.75*dt=675$ mm and $4*bw=1200$ mm (Clause 6.3.4.4).
Spacing of links along the member $sv=125$ mm
Lateral spacing of individual legs of the links at a cross-section should not exceed $0.75*dt=675$ mm (Clause 6.3.4.4).
Number of legs of links across the member at right angles to the span $sv^2=2$
Cross-sectional area of all legs of the links at a member cross-section $A_{sv}=sv^2*\pi*bd_1^2/4=226.19$ mm²
Area of shear reinforcement required (Clause 6.3.4.4).
Shear force $V=1100$ kN exceeds $V_c=629.43$ kN
Area required $A_{svr}=((V-V_c)*1000+0.4*bw*dt)*sv/(0.87*f_{yv}*dt)=200.79$ mm²
Link reinforcement adequate

Area provided 226.19 mm²

Reinforcement summary

Flanged beam section.
Link reinforcement adequate Area required 200.79 mm²
Area provided 226.19 mm²
Area of effectively anchored longitudinal tensile r'ment and prestressing tendons (excluding debonded tendons) additional to that required at the ultimate limit state for other purposes. Minimum area required =1374.3 mm²
Location: EX1 - Edge beam (I Beam)

Design shear resistance of a prestressed concrete section

Depth of NA from compression face \( dc = \frac{h}{2} = 517.5 \text{ mm} \)
Consider a level just underneath the top slab. First moment of area of excluded area above this level and about the centroidal axis of the section

\[
S_{\text{uf}} = b_f f_t \left( dc - \frac{f_t}{2}\right) / 1E9 = 0.089906 \text{ m}^2
\]

Shear resistance of sections uncracked in flexure (\( VR_{dc1} \))

The following shear resistance check is at the section centroid level. Prestressing force below is after all losses have occurred.

Prestressing force after loses \( N_{Ed} = 3947 \text{ kN} \)
Section cross-sectional area \( A = 0.57375 \text{ m}^2 \)
Second moment of area \( I = 0.063969 \text{ m}^4 \)
The compressive stress \( (scp) \) due to axial loading or prestressing (after losses and including appropriate partial safety factors) at the level considered is as follows:

Compressive stress \( scp = \frac{N_{Ed} \times 1E3}{A \times 1E6} = 6.8793 \text{ N/mm}^2 \)
First moment of area of excluded area above and about the centroidal axis of the section \( S = 0.093413 \text{ m}^3 \)
Prestressing coefficient \( a_1 = 0.9 \) (pre-tensioned)
compute \( comp = (fctd^2 + a_1 \times scp \times fctd)^{0.5} = 3.5804 \text{ kN} \)
Uncracked shear resistance \( VR_{dc1} = I \times bw / S \times comp = 612.96 \text{ kN} \)

Shear resistance of sections uncracked in flexure (\( VR_{dc2} \))

In certain sections such as I-beams, where the section width varies over height the maximum principal stress may occur at a level other than at the centroidal axis. In such cases EN 1992-1-1, Clause 6.2.2(2) requires that the minimum value of shear resistance is determined by calculating \( VR_{dc} \) at various levels in the cross-section. The following shear resistance check is at the underside of the top slab.

Depth below is to centroid of section from extreme compression fibre.

Depth to centroid of section \( dc = 517.5 \text{ mm} \)
Depth below is to extreme tensile fibre from centroid of section.
Depth to extreme tensile fibre \( z_{na} = h - dc = 517.5 \text{ mm} \)
Top flange thickness \( tf = 350 \text{ mm} \)
Compressive stress \( scp = 6.8793 \text{ N/mm}^2 \)
Height of the centroid of prestressing force from extreme compression fibre of the section \( z_{pf} = 893 \text{ mm} \)
Flexural stress \( sbend = N_{Ed} / comp / (I \times 1E9) = 3.8808 \text{ N/mm}^2 \)
Consider a level just underneath the top slab. First moment of area of excluded area above this level and about the centroidal axis of the section

\[
S_{\text{uf}} = 0.089906 \text{ m}^3
\]
compute \( comp = (fctd^2 + (a_1 \times scp + sbend) \times fctd)^{0.5} = 4.3788 \text{ kN} \)
Uncracked shear resistance \( VR_{dc2} = \frac{I \cdot bw}{S_{uf} \cdot \text{comp}} = 778.89 \text{ kN} \)

**Shear resistance of sections cracked in flexure** (VR_{dc3})

The area of tensile reinforcement and bonded prestressing steel may be included in the calculation of \( A_{sl} \) below (i.e. the total area of tensioned and untensioned steel in tension zone).

Area of tensioned steel \( A_{st} = 5280 \text{ mm}^2 \)

Area of untensioned steel \( A_{su} = 0 \text{ mm}^2 \)

Depth from compression face to centroid of steel area in tension zone. The steel area includes tensioned and untensioned steel.

Effective depth (tensile reinforcement) \( d = 945.5 \text{ mm} \)

Limiting compressive stress \( scp' = 5.3333 \text{ N/mm}^2 \)

compute \( \text{comp} = (CR_{dc} \cdot ks \cdot vR_{dc} + 0.15 \cdot scp') = 1.5549 \)

Shear resistance \( V_{R_{dc3}} = \text{comp} \cdot bw \cdot d / 1000 = 367.53 \text{ kN} \)

Minimum shear resistance \( V_{R_{dm}} = v_{min} \cdot bw \cdot d / 1000 = 92.298 \text{ kN} \)

Shear resistance \( V_{R_{dc3}} = 367.53 \text{ kN} \)

**Results from shear resistance calculations**

- Uncracked section shear resistance 612.96 kN
- Uncracked section shear resistance 778.89 kN
- Cracked section shear resistance 367.53 kN

The shear force \( VR_{dc} \) which can be carried by the concrete alone is the lesser of the above three values.

Shear resistance for concrete section (VR_{dc}) 367.53 kN

Design shear force (\( V_{Ed} \)) 650 kN

As \( V_{Ed} > VR_{dc} \) (650 kN > 367.53 kN), the design shear force exceeds the shear resistance. Shear reinforcement is required.

**Shear reinforcement - in accordance with Clause 6.2.3(3)**

Shear reinforcement design is for a flanged beam.

Stress coefficient to be adopted \( acw = 1 \)

Maximum shear resistance:

\[
VR_{dmax} = acw \cdot 0.18 \cdot bw \cdot d \cdot fck \cdot (1 - fck/250) \cdot \sin(\text{RAD(2*theta'))}) / 1000
\]

\[
= 993.08 \text{ kN}
\]

Design shear force \( V_{Ed} = 650 \text{ kN} \)

Effective depth for shear calc. \( dt = 971 \text{ mm} \)

Diameter of link reinforcement \( bd1 = 12 \text{ mm} \)

Characteristic strength of links \( fyk = 500 \text{ N/mm}^2 \)

Design yield strength of links \( fyd = fyk / 1.15 = 434.78 \text{ N/mm}^2 \)

Calculations are for a flanged beam section.

Spacing of links along the member should be less than the smallest of 0.75*\( dt = 728.25 \text{ mm} \) and 300 mm.

Spacing of links along the member \( sv = 125 \text{ mm} \)

Lateral spacing of individual legs of the links at a cross-section should be less than the smallest of 600 mm or 0.75*\( dt = 728.25 \text{ mm} \).

Number of legs of links across the member at right angles to the span \( sv2 = 2 \)

Cross-sectional area of all legs of the links at a member cross-section \( Asv = sv2 \cdot \pi \cdot bd1^2 / 4 = 226.19 \text{ mm}^2 \)
Area of shear reinforcement required:

\[ Asvr = VEd * \frac{1 \times 10^3 \times sv}{0.9 \times dt \times fyd \times 1 / \tan(\text{RAD}(\theta'))} = 86.397 \, \text{mm}^2 \]

Link reinforcement adequate

Area required 86.397 mm²
Area provided 226.19 mm²

**Additional longitudinal tensile force - Clause 6.2.3(7)**

The additional longitudinal tensile force, Ftd, in the longitudinal reinforcement due to shear VEd is calculated using expression 6.18 and could be provided for by extending the curtailment point of the mid-span longitudinal reinforcement as necessary to achieve the required curtailment anchorage.

\[ \cot(\theta) = \frac{1}{\tan(\text{RAD}(\theta'))} = 2.4751 \]

Additional long.tensile force \( Ftd = 0.5 \times VEd \times ctheta = 804.4 \, \text{kN} \)

**NOTE:** As an alternative to the above curtailment option, additional longitudinal reinforcement could be provided to resist the above longitudinal tensile force.

**Reinforcement summary**

**Member under consideration is a flanged beam section.**
Link reinforcement adequate

Area required 86.397 mm²
Area provided 226.19 mm²
Use 2 No/12 mm diameter legs of links across the member spaced at 125 mm centres along the member

The additional longitudinal tensile force, Ftd=804.4 kN, in the longitudinal reinforcement due to shear VEd=650 kN is catered for by extending the curtailment point of the mid-span longitudinal reinforcement as necessary to achieve the required curtailment anchorage. Alternatively additional longitudinal reinforcement could be provided to resist this additional tensile force which is beyond the scope of this proforma.
Design shear resistance of a prestressed concrete section

First moment of area of excluded area above and about the centroidal axis of the section: $S=b\cdot h^2/(8\cdot 1E9)=0.033476 \text{ m}^3$

Principal tensile stress at centroidal axis.

Shear resistance of sections uncracked in flexure (VRdc1)

The following shear resistance check is at the section centroid level.

Prestressing force after losses $N_{Ed}=1780 \text{ kN}$

The compressive stress ($scp$) due to axial loading or prestressing (after losses and including appropriate partial safety factors) at the level considered is as follows:

Compressive stress $scp=N_{Ed}\cdot 1E3/(A\cdot 1E6)=6.8792 \text{ N/mm}^2$

First moment of area of excluded area above and about the centroidal axis of the section $S=0.033476 \text{ m}^3$

Prestressing coefficient $a_1=1$ (pre-tensioned)

Compute $comp=(fctd^2+a_1\cdot scp\cdot fctd)^0.5=3.7344 \text{ kN}$

Uncracked shear resistance $VRdc1=I\cdot bw/S\cdot comp=644.18 \text{ kN}$

Shear resistance of sections cracked in flexure (VRdc3)

The area of tensile reinforcement and bonded prestressing steel may be included in the calculation of $A_{sl}$ below (i.e. the total area of tensioned and untensioned steel in tension zone).

Area of tensioned steel $A_{st}=2000 \text{ mm}^2$

Area of untensioned steel $A_{su}=2500 \text{ mm}^2$

Depth from compression face to centroid of steel area in tension zone.

The steel area includes tensioned and untensioned steel.

Effective depth (tensile r'ment) $d=940 \text{ mm}$

Limiting compressive stress $scp'=5.3333 \text{ N/mm}^2$

Compute $comp=(CR_{dc} \cdot ks \cdot v_{Rdc}+0.15 \cdot scp')=1.5447$

Shear resistance $VRdc3=comp\cdot bw\cdot d/1000=363 \text{ kN}$

Minimum shear resistance $VRdm=v_{min}\cdot bw\cdot d/1000=91.888 \text{ kN}$

Shear resistance $VRdc3=363 \text{ kN}$

Results from shear resistance calculations

Uncracked section shear resistance $644.18 \text{ kN}$

Cracked section shear resistance $363 \text{ kN}$

The shear force $VRdc$ which can be carried by the concrete alone is the lesser of the above two values.

Shear resistance for concrete section (VRdc) $363 \text{ kN}$

Design shear force ($V_{Ed}$) $660 \text{ kN}$
As \( V_{Ed} > V_{Rdc} \) (660 kN > 363 kN), the design shear force exceeds the shear resistance. Shear reinforcement is required.

**Shear reinforcement - in accordance with Clause 6.2.3(3)**

Shear reinforcement design is for a slab.

Stress coefficient to be adopted \( acw = 1 \)

Maximum shear resistance:

\[
V_{Rd,\text{max}} = acw \times 0.18 \times bw \times d \times f_{ck} \times (1 - f_{ck}/250) \times \sin(\text{RAD}(2 \times \theta'))/1000
\]

\[= 987.3 \text{ kN} \]

Design shear force \( V_{Ed} = 660 \text{ kN} \)

Calculations are for a slab section.

- Effective depth for shear calc. \( dt = 940 \text{ mm} \)
- Diameter of link reinforcement \( bd_1 = 12 \text{ mm} \)
- Characteristic strength of links \( f_{yk} = 500 \text{ N/mm}^2 \)
- Design yield strength of links \( f_{yd} = f_{yk}/1.15 = 434.78 \text{ N/mm}^2 \)
- Shear force \( V_{Ed} = 660 \text{ kN} \) exceeds \( V_{Rdc} = 363 \text{ kN} \)
- Spacing of links along the member should be less than 0.75*\( dt = 705 \text{ mm} \) or 300 mm whichever is least.
- Spacing of links along the member \( sv = 125 \text{ mm} \)
- Lateral spacing of individual legs of the links at a cross-section should be less than the smallest of 600 mm or 0.75*\( dt = 705 \text{ mm} \).
- Number of legs of links across the member at right angles to the span \( sv^2 = 2 \)
- Cross-sectional area of all legs of the links at a member cross-section \( A_{sv} = sv^2 \times \pi \times bd_1^2/4 = 226.19 \text{ mm}^2 \)

Area of shear reinforcement required:

\[
A_{svr} = V_{Ed} \times 1E3 \times sv/(0.9 \times dt \times f_{yd} \times 1/TAN(\text{RAD}(\theta')))
\]

\[= 90.619 \text{ mm}^2 \]

Link reinforcement adequate

Area required 90.619 mm²

Area provided 226.19 mm²

**Additional longitudinal tensile force - Clause 6.2.3(7)**

The additional longitudinal tensile force, \( F_{td} \), in the longitudinal reinforcement due to shear \( V_{Ed} \) is calculated using expression 6.18 and could be provided for by extending the curtailment point of the mid-span longitudinal reinforcement as necessary to achieve the required curtailment anchorage.

\[c_{theta} = 1/TAN(\text{RAD}(\theta')) = 2.4751\]

\[F_{td} = 0.5 \times V_{Ed} \times c_{theta} = 816.78 \text{ kN}\]

NOTE: As an alternative to the above curtailment option, additional longitudinal reinforcement could be provided to resist the above longitudinal tensile force.
Reinforcement summary

Member under consideration is a slab section.
Link reinforcement adequate
Area required 90.619 mm²
Area provided 226.19 mm²
Use 2 No/12 mm diameter legs
of links across the member spaced
at 125 mm centres along the member

The additional longitudinal tensile force, Ftd=816.78 kN, in the
longitudinal reinforcement due to shear VEd=660 kN is catered for
by extending the curtailment point of the mid-span longitudinal
reinforcement as necessary to achieve the required curtailment
anchorage. Alternatively additional longitudinal reinforcement
could be provided to resist this additional tensile force which
is beyond the scope of this proforma.
Design shear resistance of a prestressed concrete section

First moment of area:
$$ S = \frac{(bf \cdot tf \cdot (dc - tf/2) + comp1 + comp2 + comp3)}{1E9} = 11.364 \text{ m}^3 $$

Consider a level just underneath the top slab. First moment of area of excluded area above this level and about the centroidal axis of the section
$$ S_{uf} = \frac{bf \cdot tf \cdot (dc - tf/2)}{1E9} = 10.29 \text{ m}^3 $$

Shear resistance of sections uncracked in flexure (VRdc1)

The following shear resistance check is at the section centroid level. Prestressing force below is after all losses have occurred.

Prestressing force after loses $N_{Ed} = 92600 \text{ kN}$

Section cross-sectional area $A = 17 \text{ m}^2$

Second moment of area $I = 33.5 \text{ m}^4$

The compressive stress ($scp$) due to axial loading or prestressing (after losses and including appropriate partial safety factors) at the level considered is as follows:

Compressive stress $scp = \frac{N_{Ed} \cdot 1E3}{A \cdot 1E6} = 5.4471 \text{ N/mm}^2$

First moment of area of excluded area above and about the centroidal axis of the section $S = 11.364 \text{ m}^3$

compute $comp = (fctd^2 + a1 \cdot scp \cdot fctd)^0.5 = 3.2255 \text{ kN}$

Uncracked shear resistance $VR_{dc1} = I \cdot bw / S \cdot comp = 11857 \text{ kN}$

Shear resistance of sections uncracked in flexure (VRdc2)

In certain sections such as I-beams, where the section width varies over height the maximum principal stress may occur at a level other than at the centroidal axis. In such cases EN 1992-1-1, Clause 6.2.2(2) requires that the minimum value of shear resistance is determined by calculating VRdc at various levels in the cross-section. The following shear resistance check is at the underside of the top slab.

Depth below is to centroid of section from extreme compression fibre.

Depth to centroid of section $dc = 1588.5 \text{ mm}$

Depth below is to extreme tensile fibre from centroid of section.

Depth to extreme tensile fibre $z_{na} = h - dc = 1911.5 \text{ mm}$

Top flange thickness $tf = 350 \text{ mm}$

Compressive stress $scp = 5.4471 \text{ N/mm}^2$

Height of the centroid of prestressing force from extreme compression fibre of the section $z_{pf} = 644 \text{ mm}$

Flexural stress $sbend = \frac{N_{Ed} \cdot comp}{(I \cdot 1E9)} = -4.3392 \text{ N/mm}^2$

Consider a level just underneath the top slab. First moment of area of excluded area above this level and about the centroidal axis of the section $S_{uf} = 10.29 \text{ m}^3$

compute $comp = (fctd^2 + a1 \cdot scp + sbend) * fctd)^{0.5} = 1.9757 \text{ kN}$
Uncracked shear resistance \[ VR_{dc2} = \frac{I \times bw}{S_{uf}} \times \text{comp} = 8020.7 \text{ kN} \]

**Shear resistance of sections cracked in flexure (VR_{dc3})**

The area of tensile reinforcement and bonded prestressing steel may be included in the calculation of \( A_{sl} \) below (i.e. the total area of tensioned and untensioned steel in tension zone).

Area of tensioned steel \[ A_{st} = 105640 \text{ mm}^2 \]

Area of untensioned steel \[ A_{su} = 0 \text{ mm}^2 \]

Depth from compression face to centroid of steel area in tension zone.

The steel area includes tensioned and untensioned steel.

Effective depth (tensile reinforcement) \[ d = 3250 \text{ mm} \]

Limiting compressive stress \[ \text{scp}' = 4.6667 \text{ N/mm}^2 \]

compute \[ \text{comp} = (CR_{dc} \times ks \times vr_{dc} + 0.15 \times scp') = 1.3172 \]

Shear resistance \[ VR_{dc3} = \frac{\text{comp} \times bw \times d}{1000} = 5338.5 \text{ kN} \]

Minimum shear resistance \[ VR_{dm} = \frac{v_{min} \times bw \times d}{1000} = 1170.1 \text{ kN} \]

Shear resistance \[ VR_{dc3} = 5338.5 \text{ kN} \]

**Results from shear resistance calculations**

Uncracked section shear resistance 11857 kN

Uncracked section shear resistance 8020.7 kN

Cracked section shear resistance 5338.5 kN

The shear force \( VR_{dc} \) which can be carried by the concrete alone is the lesser of the above three values.

Shear resistance for concrete section (VR_{dc}) 5338.5 kN

Design shear force (V_{Ed}) 6000 kN

As \( V_{Ed} > VR_{dc} (6000 \text{ kN} > 5338.5 \text{ kN}) \), the design shear force exceeds the shear resistance. Shear reinforcement is required.

**Shear reinforcement - in accordance with Clause 6.2.3(3)**

Shear reinforcement design is for a flanged beam.

Stress coefficient to be adopted \( ac_w = 1 \)

Maximum shear resistance:

\[ VR_{dmax} = ac_w \times 0.18 \times bw \times d \times f_{ck} \times (1 - f_{ck}/250) \times \sin(\text{RAD}(2\times \theta'))/1000 \]

\[ = 15253 \text{ kN} \]

Design shear force \( V_{Ed} = 6000 \text{ kN} \)

Effective depth for shear calc. \( dt = 3250 \text{ mm} \)

Diameter of link reinforcement \( bd_1 = 12 \text{ mm} \)

Characteristic strength of links \( f_{yk} = 500 \text{ N/mm}^2 \)

Design yield strength of links \( f_{yd} = f_{yk}/1.15 = 434.78 \text{ N/mm}^2 \)

Calculations are for a flanged beam section.

Spacing of links along the member should be less than the smallest of 0.75*\( dt = 2437.5 \text{ mm} \) and 300 mm.

Spacing of links along the member \( sv = 300 \text{ mm} \)

Lateral spacing of individual legs of the links at a cross-section should be less than the smallest of 600 mm or 0.75*\( dt = 2437.5 \text{ mm} \).

Number of legs of links across the member at right angles to the span \( sv_2 = 6 \)

Cross-sectional area of all legs of the links at a member cross-section \( A_{sv} = sv_2 \times \pi \times bd_1^2/4 = 678.58 \text{ mm}^2 \)
Area of shear reinforcement required:

\[ Asvr = VEd * 1E3 * sv / (0.9 * dt * fyd * 1 / \text{TAN}(\text{RAD}(\theta'))) \]

\[ = 571.85 \text{ mm}^2 \]

Link reinforcement adequate

Area required 571.85 mm\(^2\)
Area provided 678.58 mm\(^2\)

**Additional longitudinal tensile force - Clause 6.2.3(7)**

The additional longitudinal tensile force, \( Ftd \), in the longitudinal reinforcement due to shear \( VEd \) is calculated using expression 6.18 and could be provided for by extending the curtailment point of the mid-span longitudinal reinforcement as necessary to achieve the required curtailment anchorage.

\[ \text{compute cot}(\theta) \]
\[ \text{ctheta} = 1 / \text{TAN}(\text{RAD}(\theta')) = 2.4751 \]

Additional long. tensile force \( Ftd = 0.5 * VEd * \text{ctheta} = 7425.3 \text{ kN} \)

**NOTE:** As an alternative to the above curtailment option, additional longitudinal reinforcement could be provided to resist the above longitudinal tensile force.

**Reinforcement summary**

Member under consideration is a flanged beam section.

Link reinforcement adequate

Area required 571.85 mm\(^2\)
Area provided 678.58 mm\(^2\)
Use 6 No/12 mm diameter legs of links across the member spaced at 300 mm centres along the member

The additional longitudinal tensile force, \( Ftd = 7425.3 \text{ kN} \), in the longitudinal reinforcement due to shear \( VEd = 6000 \text{ kN} \) is catered for by extending the curtailment point of the mid-span longitudinal reinforcement as necessary to achieve the required curtailment anchorage. Alternatively, additional longitudinal reinforcement could be provided to resist this additional tensile force which is beyond the scope of this proforma.
Location: EX4 - As Ex3 but with minimum shear links

Design shear resistance of a prestressed concrete section

First moment of area:
\[ S = \frac{bf \times tf \times (dc - tf/2) + comp1 + comp2 + comp3}{1E9} = 11.364 \text{ m}^3 \]

Consider a level just underneath the top slab. First moment of area of excluded area above this level and about the centroidal axis of the section
\[ S_{uf} = \frac{bf \times tf \times (dc - tf/2)}{1E9} = 10.29 \text{ m}^3 \]

Shear resistance of sections uncracked in flexure (VRdc1)

The following shear resistance check is at the section centroid level.

Prestressing force below is after all losses have occurred.
- Prestressing force after loses \( N_{Ed} = 92600 \text{ kN} \)
- Section cross-sectional area \( A = 17 \text{ m}^2 \)
- Second moment of area \( I = 33.5 \text{ m}^4 \)

The compressive stress (scp) due to axial loading or prestressing (after losses and including appropriate partial safety factors) at the level considered is as follows:
- Compressive stress \( scp = \frac{N_{Ed} \times 1E3}{A \times 1E6} = 5.4471 \text{ N/mm}^2 \)
- First moment of area of excluded area above and about the centroidal axis of the section \( S = 11.364 \text{ m}^3 \)
- compute \( comp = (fctd^2 + a1 \times scp \times fctd)^0.5 = 3.2255 \text{ kN} \)
- Uncracked shear resistance \( VR_{dc1} = I \times bw/S \times comp = 11857 \text{ kN} \)

Shear resistance of sections uncracked in flexure (VRdc2)

In certain sections such as I-beams, where the section width varies over height the maximum principal stress may occur at a level other than at the centroidal axis. In such cases EN 1992-1-1, Clause 6.2.2(2) requires that the minimum value of shear resistance is determined by calculating VRdc at various levels in the cross-section. The following shear resistance check is at the underside of the top slab.

Depth below is to centroid of section from extreme compression fibre.
- Depth to centroid of section \( dc = 1588.5 \text{ mm} \)
- Depth below is to extreme tensile fibre from centroid of section.
- Depth to extreme tensile fibre \( z_{na} = h - dc = 1911.5 \text{ mm} \)
- Top flange thickness \( tf = 350 \text{ mm} \)
- Compressive stress \( scp = 5.4471 \text{ N/mm}^2 \)
- Height of the centroid of prestressing force from extreme compression fibre of the section \( z_{pf} = 644 \text{ mm} \)
- Flexural stress \( sbend = \frac{N_{Ed} \times comp}{(I \times 1E9)} = -4.3392 \text{ N/mm}^2 \)

Consider a level just underneath the top slab. First moment of area of excluded area above this level and about the centroidal axis of the section
- compute \( comp = (fctd^2 + (a1 \times scp + sbend) \times fctd)^0.5 = 1.9757 \text{ kN} \)
Uncracked shear resistance \[ VRdc2 = \frac{I \times bw}{Suf \times \text{comp}} = 8020.7 \text{kN} \]

**Shear resistance of sections cracked in flexure (VRdc3)**

The area of tensile reinforcement and bonded prestressing steel may be included in the calculation of \( A_{sl} \) below (i.e. the total area of tensioned and untensioned steel in tension zone).

- Area of tensioned steel \( A_{st} = 105640 \text{ mm}^2 \)
- Area of untensioned steel \( A_{su} = 0 \text{ mm}^2 \)

Depth from compression face to centroid of steel area in tension zone.

The steel area includes tensioned and untensioned steel.

- Effective depth \( d = 3250 \text{ mm} \)
- Limiting compressive stress \( scp' = 4.6667 \text{ N/mm}^2 \)

Compute: \[ \text{comp} = (CRdc \times ks \times V_{Rdc} + 0.15 \times scp') = 1.3172 \]

Shear resistance \( VRdc3 = \text{comp} \times bw \times d / 1000 = 5338.5 \text{ kN} \)

Minimum shear resistance \( VR_{dm} = v_{min} \times bw \times d / 1000 = 1170.1 \text{ kN} \)

Shear resistance \( VRdc3 = 5338.5 \text{ kN} \)

**Results from shear resistance calculations**

Uncracked section shear resistance \( 11857 \text{ kN} \)
Uncracked section shear resistance \( 8020.7 \text{ kN} \)
Cracked section shear resistance \( 5338.5 \text{ kN} \)

The shear force \( VRdc \) which can be carried by the concrete alone is the lesser of the above three values.

Shear resistance for concrete section \( (VRdc) = 5338.5 \text{ kN} \)
Design shear force \( (VEd) = 5300 \text{ kN} \)

As \( VEd \leq VRdc \) (5300 kN \( \leq 5338.5 \text{ kN} \)), the design shear force is less than the shear resistance of the section. Hence, provide minimum shear reinforcement.

**Shear reinforcement - in accordance with Clause 6.2.3(3)**

Shear reinforcement design is for a flanged beam.

Stress coefficient to be adopted \( acw = 1 \)

Maximum shear resistance:

\[ VRdmax = acw \times 0.18 \times bw \times d \times fck \times (1 - fck/250) \times \sin(\text{RAD}(2 \times \text{theta}')) / 1000 \]
\[ = 15253 \text{ kN} \]

Design shear force \( VEd = 5300 \text{ kN} \)
Effective depth for shear calc. \( dt = 3250 \text{ mm} \)
Diameter of link reinforcement \( bd1 = 10 \text{ mm} \)
Characteristic strength of links \( f_{yk} = 500 \text{ N/mm}^2 \)
Design yield strength of links \( f_{yd} = f_{yk} / 1.15 = 434.78 \text{ N/mm}^2 \)

Calculations are for a flanged beam section.

Spacing of links along the member should be less than the smallest of 0.75\( \times dt = 2437.5 \text{ mm} \) and 300 mm.

Spacing of links along the member \( sv = 300 \text{ mm} \)
Lateral spacing of individual legs of the links at a cross-section should be less than the smallest of 600 mm or 0.75\( \times dt = 2437.5 \text{ mm} \).

Number of legs of links across the member at right angles to the span \( sv2 = 6 \)
Cross-sectional area of all legs of the links at a
member cross-section \[ \text{Asv}=\text{sv}^2\pi\text{bd}_1^2/4=471.24 \text{ mm}^2 \]
Minimum area of shear r'ment \[ \text{Asvr}=0.08*\text{fck}^{0.5}*(\text{sv}/\text{fyk})=397.56 \text{ mm}^2 \]
Link reinforcement adequate \[ \text{Area required}=397.56 \text{ mm}^2 \]
\[ \text{Area provided}=471.24 \text{ mm}^2 \]

**Additional longitudinal tensile force - Clause 6.2.3(7)**

The additional longitudinal tensile force, \( F_{td} \), in the longitudinal reinforcement due to shear \( V_{Ed} \) is calculated using expression 6.18 and could be provided for by extending the curtailment point of the mid-span longitudinal reinforcement as necessary to achieve the required curtailment anchorage.

\[ \text{compute } \cot(\theta) \quad \theta=\arctan(\text{Asv}/\pi\text{bd}^2/2) \]
\[ \text{ctheta}=1/\tan(\theta)=2.4751 \]

**Additional long.tensile force** \[ F_{td}=0.5*V_{Ed}*\text{ctheta}=6559 \text{ kN} \]

**NOTE:** As an alternative to the above curtailment option, additional longitudinal reinforcement could be provided to resist the additional longitudinal tensile force.

**Reinforcement summary**

Member under consideration is a flanged beam section.

**Link reinforcement adequate**

Area required 397.56 mm\(^2\)
Area provided 471.24 mm\(^2\)
Use 6 No/10 mm diameter legs of links across the member spaced at 300 mm centres along the member

The additional longitudinal tensile force, \( F_{td}=6559 \text{ kN} \), in the longitudinal reinforcement due to shear \( V_{Ed}=5300 \text{ kN} \) is catered for by extending the curtailment point of the mid-span longitudinal reinforcement as necessary to achieve the required curtailment anchorage. Alternatively additional longitudinal reinforcement could be provided to resist this additional tensile force which is beyond the scope of this proforma.
Location: EX5 - As Ex3 but using 2 Web Box

Design shear resistance of a prestressed concrete section

First moment of area:
\[ S = \frac{b_f t_f (d_c - t_f/2) + c_{comp1} + c_{comp2}}{1E9} = 10.981 \text{ m}^3 \]
Consider a level just underneath the top slab. First moment of area of excluded area above this level and about the centroidal axis of the section
\[ S_{uf} = \frac{b_f t_f (d_c - t_f/2)}{1E9} = 10.29 \text{ m}^3 \]

Shear resistance of sections uncracked in flexure (VR_{dc1})

The following shear resistance check is at the section centroid level. Prestressing force below is after all losses have occurred.
- Prestressing force after losses \( N_Ed = 92600 \text{ kN} \)
- Section cross-sectional area \( A = 17 \text{ m}^2 \)
- Second moment of area \( I = 33.5 \text{ m}^4 \)
The compressive stress \( (\sigma_{cp}) \) due to axial loading or prestressing (after losses and including appropriate partial safety factors) at the level considered is as follows:
- Compressive stress \( \sigma_{cp} = \frac{N_Ed}{A} = 5.4471 \text{ N/mm}^2 \)
- First moment of area of excluded area above and about the centroidal axis of the section \( S = 10.981 \text{ m}^3 \)
- Compute \( \text{comp} = (f_{ctd}^2 + a_1 \sigma_{cp} f_{ctd})^{0.5} = 3.2255 \text{ kN} \)
Uncracked shear resistance \( \text{VR}_{dc1} = I b_w/S \text{comp} = 7852.6 \text{ kN} \)

Shear resistance of sections uncracked in flexure (VR_{dc2})

In certain sections such as I-beams, where the section width varies over height the maximum principal stress may occur at a level other than at the centroidal axis. In such cases EN 1992-1-1, Clause 6.2.2(2) requires that the minimum value of shear resistance is determined by calculating VRdc at various levels in the cross-section. The following shear resistance check is at the underside of the top slab. Depth below is to centroid of section from extreme compression fibre.
- Depth to centroid of section \( d_c = 1588.5 \text{ mm} \)
- Depth below to extreme tensile fibre from centroid of section \( z_{na} = h - d_c = 1911.5 \text{ mm} \)
- Top flange thickness \( t_f = 350 \text{ mm} \)
- Compressive stress \( \sigma_{cp} = 5.4471 \text{ N/mm}^2 \)
- Height of the centroid of prestressing force from extreme compression fibre of the section \( z_{pf} = 644 \text{ mm} \)
- Flexural stress \( \sigma_{bend} = \frac{N_Ed}{I} = -4.3392 \text{ N/mm}^2 \)
Consider a level just underneath the top slab. First moment of area of excluded area above this level and about the centroidal axis of the section
\[ S_{uf} = 10.29 \text{ m}^3 \]
- Compute \( \text{comp} = (f_{ctd}^2 + (a_1 \sigma_{cp} + \sigma_{bend}) f_{ctd})^{0.5} = 1.9757 \text{ kN} \)
Uncracked shear resistance \( VR_{dc2} = I \times bw / S_{uf} \times \text{comp} = 5132.7 \text{ kN} \)

**Shear resistance of sections cracked in flexure (VR_{dc3})**

The area of tensile reinforcement and bonded prestressing steel may be included in the calculation of \( A_{sl} \) below (i.e. the total area of tensioned and untensioned steel in tension zone).

Area of tensioned steel \( A_{st} = 105640 \text{ mm}^2 \)
Area of untensioned steel \( A_{su} = 0 \text{ mm}^2 \)

Depth from compression face to centroid of steel area in tension zone.
The steel area includes tensioned and untensioned steel.

Effective depth (tensile r'ment) \( d = 3250 \text{ mm} \)
Limiting compressive stress \( scp' = 4.6667 \text{ N/mm}^2 \)

compute \( \text{comp} = (CR_{dc} \times ks \times VR_{dc} + 0.15 \times scp') = 1.3172 \)

Shear resistance \( VR_{dc3} = \text{comp} \times bw \times d / 1000 = 3416.3 \text{ kN} \)

Minimum shear resistance \( VR_{dm} = \text{vmin} \times bw \times d / 1000 = 748.77 \text{ kN} \)

Shear resistance \( VR_{dc3} = 3416.3 \text{ kN} \)

**Results from shear resistance calculations**

| Uncracked section shear resistance | 7852.6 kN |
| Uncracked section shear resistance | 5132.7 kN |
| Cracked section shear resistance  | 3416.3 kN |

The shear force \( VR_{dc} \) which can be carried by the concrete alone is the lesser of the above three values.

Shear resistance for concrete section (VR_{dc}) \( 3416.3 \text{ kN} \)
Design shear force (VE_{d}) \( 6000 \text{ kN} \)

As VE_{d} > VR_{dc} \( (6000 \mathrm{kN} > 3416.3 \mathrm{kN}) \), the design shear force exceeds the shear resistance. Shear reinforcement is required.

**Shear reinforcement - in accordance with Clause 6.2.3(3)**

Shear reinforcement design is for a flanged beam.
Stress coefficient to be adopted \( acw = 1 \)
Maximum shear resistance:

\[
VR_{dmax} = acw \times 0.18 \times bw \times d \times f_{ck} \times (1 - f_{ck}/250) \times \sin(\text{RAD}(2 \times \theta')) / 1000 = 9761 \text{ kN}
\]

Design shear force \( VE_{d} = 6000 \text{ kN} \)
Effective depth for shear calc. \( dt = 3250 \text{ mm} \)
Diameter of link reinforcement \( bd_1 = 12 \text{ mm} \)
Characteristic strength of links \( f_{yk} = 500 \text{ N/mm}^2 \)
Design yield strength of links \( f_{yd} = f_{yk} / 1.15 = 434.78 \text{ N/mm}^2 \)

Calculations are for a flanged beam section.
Spacing of links along the member should be less than the smallest of 0.75*dt=2437.5 mm and 300 mm.
Spacing of links along the member \( sv = 300 \text{ mm} \)
Lateral spacing of individual legs of the links at a cross-section should be less than the smallest of 600 mm or 0.75*dt=2437.5 mm.
Number of legs of links across the member at right angles to the span \( sv_2 = 6 \)
Cross-sectional area of all legs of the links at a member cross-section \( A_{sv} = sv_2 \times PI \times bd_1^2 / 4 = 678.58 \text{ mm}^2 \)
Area of shear reinforcement required:

\[ A_{svr} = \frac{V_E d_s \times 10^3 \times s_v}{0.9 \times d_t \times f_y d} \times \frac{1}{\tan(\theta')} \]

= 571.85 mm²

Link reinforcement adequate

Area required 571.85 mm²
Area provided 678.58 mm²

**Additional longitudinal tensile force - Clause 6.2.3(7)**

The additional longitudinal tensile force, \( F_{td} \), in the longitudinal reinforcement due to shear \( V_E d \) is calculated using expression 6.18 and could be provided for by extending the curtailment point of the mid-span longitudinal reinforcement as necessary to achieve the required curtailment anchorage.

\[ c\theta = \frac{1}{\tan(\theta')} = 2.4751 \]

Additional long. tensile force \( F_{td} = 0.5 \times V_E d \times c\theta = 7425.3 \) kN

**NOTE:** As an alternative to the above curtailment option, additional longitudinal reinforcement could be provided to resist the above longitudinal tensile force.

**Reinforcement summary**

Member under consideration is a flanged beam section.

Link reinforcement adequate

Area required 571.85 mm²
Area provided 678.58 mm²

Use 6 No/12 mm diameter legs of links across the member spaced at 300 mm centres along the member.

The additional longitudinal tensile force, \( F_{td} = 7425.3 \) kN, in the longitudinal reinforcement due to shear \( V_E d = 6000 \) kN is catered for by extending the curtailment point of the mid-span longitudinal reinforcement as necessary to achieve the required curtailment anchorage. Alternatively additional longitudinal reinforcement could be provided to resist this additional tensile force which is beyond the scope of this proforma.

Results from Shear Capacity Calculations

Concrete Section:
Uncracked Section Shear Capacity 696.14 kN

Equation 30A used to calculate cracked section capacity

Cracked Section Shear Capacity 898.73 kN

The shear force $V_c$ which can be carried by the concrete alone is the lesser of 696.14 kN and 898.73 kN.

Shear force $V_c$ carried by concrete 696.14 kN

Shear Reinforcement:
Shear capacity 321.17 kN

Total shear capacity of section 1017.3 kN

Maximum shear force as per BD 44/15 Clause 6.3.4.5.
Maximum shear force 1256.2 kN

Total shear capacity of section 1017.3 kN is less than maximum shear force 1256.2 kN.

Tensile capacity of longitudinal reinforcement 8356.2 kN is greater than the tensile capacity for bending 3699.8 kN.

Tensile capacity of longitudinal reinforcement is adequate.

Ensure that effective reinforcement extends at least 572 mm from Section 'S' in direction of decreasing bending moment.

**Beam concrete stresses - Long term**

**Composite section**

- Height from beam soffit to bottom of in-situ concrete: \( h_{sis} = 135 \text{ mm} \)
- Percentage of shrinkage remaining: \( p_s = 40 \% \)
- Percentage: \( p_{cr} = 40 \% \)
- Percentage: \( stT = 50 \% \)

Apply moment to beam to straighten it as follows:

The net moment is: \( M_c = F \cdot e / 1E3 - M_b = -145.59 \text{ kNm} \)

Stress at top of in-situ concrete:
\[
ft_{isds} = \frac{F}{(A_i \cdot mr)} - \frac{F}{(A_i \cdot mr + Ac)} - M_c \cdot 1E3 \cdot (d_i - Y_c) / I_c \cdot mr \cdot 1E3 \\
= 0.10329 \text{ N/mm}^2
\]

Stress at bottom of in-situ concrete:
\[
fb_{isds} = \frac{F}{(A_i \cdot mr)} - \frac{F}{(A_i \cdot mr + Ac)} - M_c \cdot 1E3 \cdot (hsis - Y_c) / I_c \cdot mr \cdot 1E3 \\
= 2.1815 \text{ N/mm}^2
\]

Stress at top of precast concrete beam:
\[
ft_{pbds} = \frac{F}{(A_i \cdot mr + Ac)} + M_c \cdot 1E3 \cdot (d - Y_c) / I_c + M_b \cdot 1E3 \cdot Y_t / I_{xx} \cdot 1E3 \\
= -3.0552 \text{ N/mm}^2
\]

Stress at bottom of precast concrete beam:
\[
fb_{pbds} = \frac{F}{(A_i \cdot mr + Ac)} - M_c \cdot 1E3 \cdot Y_c / I_c - M_b \cdot 1E3 \cdot Y_b / I_{xx} \cdot 1E3 = -0.42523 \text{ N/mm}^2
\]

Losses - Long term

Initial force  3400 kN
Final force  Pf=P0-loftl=2204.7 kN
Unit-weight of in-situ concrete  wc=25 kN/m³
**Composite section**

Height from beam soffit to bottom of in-situ concrete \( hs_{is} = 135 \text{ mm} \)

Percentage of shrinkage remaining \( ps = 40\% \)

Percentage \( pcr = 40\% \)

Percentage \( stT = 50\% \)

The net moment is \( Mc = F*e/1E3 - Mb = -206.13 \text{ kNm} \)

Stress at top of in-situ concrete:
\[ ft_{isds} = -(F/(Ai*mr) - F/(Ai*mr+Ac) - Mc*1E3*(d-i)/Ic)*mr*1E3 \]
\[ = 0.061653 \text{ N/mm}^2 \]

Stress at bottom of in-situ concrete:
\[ fb_{isds} = -(F/(Ai*mr) - F/(Ai*mr+Ac) - Mc*1E3*(hs_{is}-Yc)/Ic)*mr*1E3 \]
\[ = 3.0225 \text{ N/mm}^2 \]

Stress at top of precast concrete beam:
\[ ftp_{pbs} = (F/(Ai*mr+Ac) + Mc*1E3*(d-Yc)/Ic+Mb*1E3*Yt/Iyy)*1E3 \]
\[ = -4.0271 \text{ N/mm}^2 \]

Stress at bottom of precast concrete beam:
\[ fb_{pbs} = (F/(Ai*mr+Ac) - Mc*1E3*Yc/Ic-Mb*1E3*Yb/Iyy)*1E3 \]
\[ = -0.66568 \text{ N/mm}^2 \]

**Loading Combination 1**

No tensile stress permitted in precast beam.

Characteristic bending moment \( cl_b(1) = 550 \text{ kNm} \)

- **Characteristic strength** \( fcu=40 \text{ N/mm}^2 \)

**Concrete moduli**

Modulus of elasticity at transfer for concrete strength 35 N/mm\(^2\) is: \( Eci=29.5 \text{ kN/mm}^2 \)

Modulus of elasticity for concrete strength 40 N/mm\(^2\) is: \( Ecb=31 \text{ kN/mm}^2 \)

**Composite section properties**

Char strength (in-situ concrete) \( fcuc=35 \text{ N/mm}^2 \)

Modulus of elasticity for concrete strength 35 N/mm\(^2\) is: \( Ecc=29.5 \text{ kN/mm}^2 \)

Composite section is rectangular in shape.

\[ \begin{align*}
\text{TYE 9} & \quad \text{beam} \\
\text{In-situ} & \quad \text{concrete} \\
\text{breadth of rectangular section} & \quad b=765 \text{ mm} \\
\text{depth of rectangular section} & \quad di=875 \text{ mm} \\
\text{second moment of area} & \quad Ic=Ixx+Ac*(Yb-Yc)^2+mr*(Ii+Ai*(Yi-Yc)^2)=42.708E9 \text{ mm}^4
\end{align*} \]
Initial force per strand $i_f = 130$ kN
Modulus of elasticity $E_s = 200$ kN/mm$^2$

**Cross-section 1**

Distance from mid-span of beam $c_{sd}(1) = 6$ m
Number of layers of strand $n_{ls}(1) = 6$
Height above soffit $d_s(1) = 60$ mm
Number of strands $n_s(1) = 9$
Height above soffit $d_s(2) = 100$ mm
Number of strands $n_s(2) = 9$
Height above soffit $d_s(3) = 140$ mm
Number of strands $n_s(3) = 5$
Height above soffit $d_s(4) = 650$ mm
Number of strands $n_s(4) = 2$
Height above soffit $d_s(5) = 700$ mm
Number of strands $n_s(5) = 2$
Height above soffit $d_s(6) = 750$ mm
Number of strands $n_s(6) = 2$

**Losses - Long term**

Initial force 3400 kN
Final force Pf=P0-loftl=2388.2 kN

Unit-weight of in-situ concrete wc=25 kN/m³
## Composite section

Height from beam soffit to bottom of in-situ concrete: $h_{sis} = 135$ mm

Percentage of shrinkage remaining: $p_s = 40\%$

Percentage of shrinkage remaining: $p_{cr} = 40$

Percentage of shrinkage remaining: $s_T = 50\%$

The net moment is: $M_c = F \times e / 1E3 - M_b = -189.54$ kNm

Stress at top of in-situ concrete:

$$f_{tisds} = -\left(\frac{F}{(A_i \times mr)} - \frac{F}{(A_i \times mr + Ac)} - Mc \times 1E3 \times (d_i - Yc) / Ic \right) \times mr \times 1E3 = -0.49353 \text{ N/mm}^2$$

Stress at bottom of in-situ concrete:

$$f_{bisds} = -\left(\frac{F}{(A_i \times mr)} - \frac{F}{(A_i \times mr + Ac)} - Mc \times 1E3 \times (h_{sis} - Yc) / Ic \right) \times mr \times 1E3 = 2.1981 \text{ N/mm}^2$$

Stress at top of precast concrete beam:

$$f_{tpbds} = \left(\frac{F}{(A_i \times mr + Ac)} + Mc \times 1E3 \times (d - Yc) / Ic + Mb \times 1E3 \times Yt / Iyy \right) \times 1E3 = 0.27525 \text{ N/mm}^2$$

Stress at bottom of precast concrete beam:

$$f_{bpbds} = \left(\frac{F}{(A_i \times mr + Ac)} - Mc \times 1E3 \times Yc / Ic - Mb \times 1E3 \times Yb / Iyy \right) \times 1E3 = -0.82932 \text{ N/mm}^2$$

**NOTE:** The stresses from temperature differences should be added to the total stresses.

**Top of in-situ concrete:**
Compressive stress 4.4024 N/mm² is less than the maximum allowable stress of 0.6*fckc=14.4 N/mm².

**Top of beam:**
Compressive stress 8.6815 N/mm² is less than the maximum allowable stress of 0.6*fck=24 N/mm².

**Bottom of in-situ concrete:**
Tensile stress 1.7813 N/mm² is less than the maximum allowable tensile stress of 2.4956 N/mm² (EN 1992-1-1 expression 3.23).

**Bottom of beam:**
Compressive stress 0.27982 N/mm² is less than the maximum allowable stress of 0.6*fck=24 N/mm².
Location: Ex3 - 15.0 metre span TYE9 beam

Precast prestressed concrete TYE beams with in-fill concrete

Beam span under consideration span=15 m

Beam TYE 9 section properties

- Depth of beam: $d=800$ mm
- Cross-sectional area: $A_c=451581$ mm$^2$
- Centroid above soffit: $Y_b=374.03$ mm
- Section modulus top: $Z_t=61.14 \times 10^6$ mm$^3$
- Section modulus bottom: $Z_b=69.62 \times 10^6$ mm$^3$
- Unit weight of beam: $u_{wb}=25$ kN/m$^3$

Concrete compressive strengths

- Characteristic cylinder strength (transfer): $f_{ck}=32$ N/mm$^2$
- Characteristic cylinder strength: $f_{cki}=28$ N/mm$^2$

Concrete moduli (short-term)

- Concrete modulus of elasticity (transfer): $E_{cm}=32$ kN/mm$^2$
- Concrete modulus of elasticity: $E_{cmb}=33$ kN/mm$^2$

Composite section properties

- Char strength (in-situ concrete): $f_{ckc}=28$ N/mm$^2$
- Short-term modulus of elasticity for in-situ concrete: $E_{cmc}=32$ kN/mm$^2$

Composite section is rectangular in shape.

Breadth of rectangular section: $b=765$ mm
Depth of rectangular section: $d_i=875$ mm
Second moment of area: $I_c=I_{yy}+A_c(Y_b-Y_c)^2+mr^2(I_{ii}+A_i(Y_i-Y_c)^2)=42.708 \times 10^9$ mm$^4$
Modulus of elasticity (strand): $E_p=195$ kN/mm$^2$
Cross-section 1

Distance from mid-span of beam  csd(1)=6 m  
Number of layers of strand  nls(1)=6  
Height above soffit  ds(1)=60 mm

Combination 2 to 5 Loading - Stresses

Combination 3 loading. The stresses from the proforma for temperature differences should be added to the total stresses.

Top of in-situ concrete:
Compressive stress 2.3129 N/mm² is less than the maximum allowable stress of 0.5*fcuc=17.5 N/mm².
Top of beam:
Compressive stress 5.7392 N/mm² is less than the maximum allowable stress of 0.4*fcu=18 N/mm².
Bottom of in-situ concrete:
Compressive stress 1.4805 N/mm² is less than the maximum allowable stress of 0.5*fcuc=17.5 N/mm².
Bottom of beam:

Tensile stress 0.20857 N/mm² is less than the maximum allowable tensile stress of 3.0187 N/mm².
Calculations for the stresses at the Serviceability Limit State (SLS) to BS5400-4:1990 implemented by DOT Departmental Standard BD 44/15.

Span of beam: span=40 m

Beam SY 6 section properties

- Depth of beam: d=2000 mm
- Cross-sectional area: Ac=708992 mm²
- Centroid above soffit: Yb=855.36 mm
- Section modulus top: Zt=247.88E6 mm⁴
- Section modulus bottom: Zb=331.64E6 mm⁴
- Unit weight of beam: uwb=25 kN/m³

Concrete strengths

- Strength at transfer: fci=35 N/mm²
- Characteristic strength: fcu=40 N/mm²

Concrete moduli

- Modulus of elasticity at transfer for concrete strength 35 N/mm² is: Eci=29.5 kN/mm²
- Modulus of elasticity for concrete strength 40 N/mm² is: Ecb=31 kN/mm²

Composite section properties

- Char strength (in-situ concrete): fcuc=35 N/mm²
- Modulus of elasticity for concrete strength 35 N/mm² is: Ecc=29.5 kN/mm²

Losses - Long term

Initial force 2520 kN
Final force Pf=P0-loft=2125.4 kN
Unit-weight of in-situ concrete wc=24 kN/m³
### Composite section

**Height from beam soffit to bottom of in-situ concrete:** \( h_{sis} = 1570 \text{ mm} \)

**Percentage of shrinkage remaining:** \( p_s = 45 \% \)

**Percentage:** \( p_c = 45 \% \)

**Percentage:** \( s_{T} = 50 \% \)

The net moment is

\[
M_c = \frac{F}{e} - M_b = 29.445 \text{ kNm}
\]

**Stress at top of in-situ concrete:**

\[
ft_{is} = \frac{F}{A_i \cdot mr} - \frac{F}{A_i \cdot mr + Ac} - M_c \cdot 1E3 \cdot \frac{d - Y_c}{I_c} \cdot 1E3
\]

\[
= 0.56887 \text{ N/mm}^2
\]

**Stress at bottom of in-situ concrete:**

\[
f_{b_{is}} = \frac{F}{A_i \cdot mr} - \frac{F}{A_i \cdot mr + Ac} - M_c \cdot 1E3 \cdot \frac{h_{sis} - Y_c}{I_c} \cdot 1E3
\]

\[
= 0.54644 \text{ N/mm}^2
\]

**Stress at top of precast concrete beam:**

\[
f_{tp} = \frac{F}{A_i \cdot mr + Ac} + M_c \cdot 1E3 \cdot \frac{d - Y_c}{I_c} + M_b \cdot 1E3 \cdot \frac{Y_t}{I_{yy}} \cdot 1E3
\]

\[
= -2.1606 \text{ N/mm}^2
\]

**Stress at bottom of precast concrete beam:**

\[
f_{bp} = \frac{F}{A_i \cdot mr + Ac} - M_c \cdot 1E3 \cdot \frac{Y_c}{I_c} - M_b \cdot 1E3 \cdot \frac{Y_b}{I_{yy}} \cdot 1E3
\]

\[
= 0.75265 \text{ N/mm}^2
\]

### Loading Combination 1

Stress Limitations (BS EN 1992-1-1, Clause 5.10.2.2)

Top of beam:
Compressive stress 9.1382 N/mm² is less than allowable stresses of $0.7*f_{ck,i}=21$ N/mm² and $0.6*f_{ck}=21.6$ N/mm².

Bottom of beam:
Compressive stress 3.1488 N/mm² is less than allowable stresses of $0.7*f_{ck,i}=21$ N/mm² and $0.6*f_{ck}=21.6$ N/mm².

Long Term Losses (BS EN 1992-1-1, Clause 5.10.6(1))

Relaxation after transfer (%) $\text{slr}(1)=0.8$
Shrinkage per unit length $\text{sul}(1)=0.3E-3$
Creep coefficient $\phi(\omega, to)$ $\text{crf}=2$

NOTE: The stresses from temperature differences should be added to the total stresses.

Top of in-situ concrete:
Compressive stress 6.3158 N/mm² is less than the maximum allowable stress of 0.6*fckc=14.4 N/mm².

Top of beam:
Compressive stress 8.6112 N/mm² is less than the maximum allowable stress of 0.6*fck=21.6 N/mm².
Bottom of in-situ concrete:
Compressive stress 4.4586 N/mm² is less than the maximum allowable stress of 0.6*fckc=14.4 N/mm².

Bottom of beam:
Tensile stress 1.8775 N/mm² is less than the maximum allowable tensile stress of 2.9399 N/mm².
**Location:** Ex1 - 13.5 metre span T beam

**Precast prestressed concrete inverted T beams with in-fill concrete**

Calculations for stresses at the Serviceability Limit State (SLS) to BS5400-4:1990 implemented by DOT Departmental Standard BD 44/15.

Span of beam  
\[ \text{span} = 13.5 \text{ m} \]

**Beam T 5 section properties**

- Depth of beam  
  \[ d = 615 \text{ mm} \]
- Cross-sectional area  
  \[ A_c = 130560 \text{ mm}^2 \]
- Centroid above soffit  
  \[ Y_b = 244 \text{ mm} \]
- Section modulus top  
  \[ Z_t = 14.3 \times 10^6 \text{ mm}^3 \]
- Section modulus bottom  
  \[ Z_b = 21.78 \times 10^6 \text{ mm}^3 \]
- Unit weight of beam  
  \[ u_b = 25 \text{ kN/m}^3 \]

**Concrete strengths**

- Strength at transfer  
  \[ f_{ci} = 40 \text{ N/mm}^2 \]
- Characteristic strength  
  \[ f_{cu} = 50 \text{ N/mm}^2 \]

**Concrete moduli**

- Modulus of elasticity at transfer for concrete strength 40 N/mm² is:  
  \[ E_{ci} = 31 \text{ kN/mm}^2 \]
- Modulus of elasticity for concrete strength 50 N/mm² is:  
  \[ E_{cb} = 34 \text{ kN/mm}^2 \]

**Composite section properties**

- Char strength (in-situ concrete)  
  \[ f_{cuc} = 30 \text{ N/mm}^2 \]
- Modulus of elasticity for concrete strength 30 N/mm² is:  
  \[ E_{cc} = 28 \text{ kN/mm}^2 \]

Composite section is rectangular in shape.

- Breadth of rectangular section  
  \[ b = 508 \text{ mm} \]
- Depth of rectangular section  
  \[ d_i = 690 \text{ mm} \]
- Transf’med second moment of area  
  \[ I_c = I_{xx} + A_c (Y_b - Y_c)^2 + m_r (I_i + A_i (Y_i - Y_c)^2) = 12.608 \times 10^9 \text{ mm}^4 \]
Initial force per strand \( if = 116 \, \text{kN} \)
Modulus of elasticity \( Es = 200 \, \text{kN/mm}^2 \)

**Cross-section 1**

Distance from mid-span of beam \( csd(1) = 0 \, \text{m} \)
Number of layers of strand \( nls(1) = 4 \)
Height above soffit \( ds(1) = 50 \, \text{mm} \)
Number of strands \( ns(1) = 7 \)
Height above soffit \( ds(2) = 90 \, \text{mm} \)
Number of strands \( ns(2) = 6 \)
Height above soffit \( ds(3) = 540 \, \text{mm} \)
Number of strands \( ns(3) = 1 \)
Height above soffit \( ds(4) = 580 \, \text{mm} \)
Number of strands \( ns(4) = 1 \)

Beam concrete stresses - Long term

Composite section

Height from beam soffit to bottom of in-situ concrete hsis=160 mm
Percentage of shrinkage remaining ps=40 %
Percentage pcr=40
Percentage stT=50 %
The net moment is Mc=F*e/1E3-Mb=300.14 kNm

Stress at top of in-situ concrete:
\[ ftisds=\left(-\frac{F}{(Ai*mr)}\right)-\left(\frac{F}{(Ai*mr+Ac)}\right)\cdot Mc \cdot 1E3 \cdot 1E3 \cdot (di-Yc)/Ic \cdot mr \cdot 1E3 =1.8739 \text{ N/mm}^2 \]

Stress at bottom of in-situ concrete:
\[ fbisds=\left(-\frac{F}{(Ai*mr)}\right)-\left(\frac{F}{(Ai*mr+Ac)}\right)\cdot Mc \cdot 1E3 \cdot (hsis-Yc)/Ic \cdot mr \cdot 1E3 =0.25425 \text{ N/mm}^2 \]

Stress at top of precast concrete beam:
ftpbds = \(\frac{F}{(A_i \times mr + Ac)} + \frac{Mc \times 1E3 \times (d - Yc)}{Ic} + \frac{Mb \times 1E3 \times Yt}{Ixx}\) * 1E3

\(= -6.1033\) N/mm²

Stress at bottom of precast concrete beam:
\(f_fbpbds = \left(\frac{F}{(A_i \times mr + Ac)} - \frac{Mc \times 1E3 \times Yc}{Ic} - \frac{Mb \times 1E3 \times Yb}{Ixx}\right) \times 1E3 = 0.985\) N/mm²

Losses - Long term

Initial force 5046 kN
Final prestress force Pf=P₀-loftl=3586.8 kN
Unit-weight of in-situ concrete wc=24 kN/m³
Beam concrete stresses - Long term

Composite section

Height from beam soffit to
bottom of in-situ concrete  hsis=1005 mm
Perc'age of shrinkage remaining  ps=25 %
Percentage  pcr=25
Percentage  stT=67 %
The net moment is  Mc=F*e/1E3-Mb=-166.22 kNm
Stress at top of in-situ concrete:
\[ ftisds = \frac{F}{(A_i*mr)}-\frac{F}{(A_i*mr+Ac)}-\frac{Mc*1E3*(di-y_c)}{I_c} \times mr*1E3 \]
\[ = 0.09964 \text{ N/mm}^2 \]
Stress at bottom of in-situ concrete:
\[ fbisds = \frac{F}{(A_i*mr)}-\frac{F}{(A_i*mr+Ac)}-\frac{Mc*1E3*(hsis-y_c)}{I_c} \times mr*1E3 \]
\[ = 0.33212 \text{ N/mm}^2 \]
Stress at top of precast concrete beam:
\[ ftpbds = \frac{F}{(A_i*mr+Ac)} + \frac{Mc*1E3*(d-y_c)}{I_c} + Mb*1E3*Y_t/I_{yy} \times 1E3 \]
\[ = -0.55436 \text{ N/mm}^2 \]
Stress at bottom of precast concrete beam:
\[ fbpbds = \frac{F}{(A_i*mr+Ac)} - \frac{Mc*1E3*Y_c}{I_c} - Mb*1E3*Y_b/I_{yy} \times 1E3 \]
\[ = 0.15241 \text{ N/mm}^2 \]

Loading Combination 2 - Stresses

NOTE: The stresses from temperature differences should be added to the total stresses.

Top of in-situ concrete:
Compressive stress 5.5121 N/mm² is less than the maximum allowable stress of 0.6*fck=14.4 N/mm².

Top of beam:
Compressive stress 7.7627 N/mm² is less than the maximum allowable stress of 0.6*fck=21.6 N/mm².
Bottom of in-situ concrete:
Compressive stress 3.8396 N/mm² is less than the maximum allowable stress of 0.6*fckc=14.4 N/mm².
Bottom of beam:
Tensile stress 0.36779 N/mm² is less than the maximum allowable tensile stress of 2.8102 N/mm².
Location: Ex1 - 20 metre span UM beam

Precast prestressed concrete UM beams with in-situ top slab

Calculations for stresses at the Serviceability Limit State (SLS) to BS5400-4:1990 implemented by DOT Departmental Standard BD 44/15.

Span of beam span=20 m

Beam UM 6 section properties

- Depth of beam: d=1040 mm
- Cross-sectional area: \( A_c = 446150 \text{ mm}^2 \)
- Centroid above soffit: \( y_b = 387.7 \text{ mm} \)
- Section modulus top: \( Z_{t} = 65.86 \times 10^6 \text{ mm}^3 \)
- Section modulus bottom: \( Z_{b} = 111.63 \times 10^6 \text{ mm}^3 \)
- Unit weight of beam: \( u_{wb} = 25 \text{ kN/m}^3 \)

Concrete strengths

- Strength at transfer: \( f_{ci} = 40 \text{ N/mm}^2 \)
- Characteristic strength: \( f_{cu} = 50 \text{ N/mm}^2 \)

Concrete moduli

- Modulus of elasticity at transfer for concrete strength 40 N/mm\(^2\) is: \( E_{ci} = 31 \text{ kN/mm}^2 \)
- Modulus of elasticity for concrete strength 50 N/mm\(^2\) is: \( E_{cb} = 34 \text{ kN/mm}^2 \)

Composite section properties

- Char strength of in-situ concrete \( f_{cu,c} = 40 \text{ N/mm}^2 \)
- Modulus of elasticity for concrete strength 40 N/mm\(^2\) is: \( E_{cc} = 31 \text{ kN/mm}^2 \)

Breadth of slab \( b = 1500 \text{ mm} \)
Depth of slab \( d_{is} = 160 \text{ mm} \)
Depth of permanent formwork \( d_{pf} = 15 \text{ mm} \)

\[
\begin{align*}
\text{Area 1} &= 100 \\
\text{Area 2} &= 100 \times (50 - d_{pf}) \text{ mm}^2
\end{align*}
\]

Second moment of area
\[
I_c = I_{xx} + A_c (Y_b - Y_c)^2 + m_r (I_i + A_i (Y_i - Y_c)^2) = 118.59 \times 10^9 \text{ mm}^4
\]

Depth of composite section \( d_i = 1165 \text{ mm} \)
Initial force per strand \( i_f = 174 \text{ kN} \)
Modulus of elasticity \( E_s = 200 \text{ kN/mm}^2 \)

Cross-section 1

- Distance from mid-span of beam \( c_{sd (1)} = 0 \text{ m} \)
- Number of layers of strand \( n_{ls (1)} = 4 \)
- Height above soffit \( d_{s (1)} = 60 \text{ mm} \)
- Number of strands \( n_{s (1)} = 14 \)
- Height above soffit \( d_{s (2)} = 110 \text{ mm} \)
- Number of strands \( n_{s (2)} = 12 \)
- Height above soffit \( d_{s (3)} = 700 \text{ mm} \)
- Number of strands \( n_{s (3)} = 2 \)
- Height above soffit \( d_{s (4)} = 940 \text{ mm} \)
- Number of strands \( n_{s (4)} = 2 \)

Top of in-situ concrete:
Compressive stress 2.3261 N/mm² is less than the maximum allowable stress of 0.5*fcuc=20 N/mm².
Top of beam:
Compressive stress 7.0375 N/mm² is less than the maximum allowable stress of 0.4*fcu=21 N/mm².
Bottom of in-situ concrete:
Compressive stress 0.86942 N/mm² is less than the maximum allowable stress of 0.5*fcuc=20 N/mm².
Bottom of beam:
Compressive stress 3.1995 N/mm² is less than the maximum allowable stress of 0.4*fcu=21 N/mm².
Location: Ex3 – 15 metre span Y1 beam

Precast prestressed concrete Y beams with in-situ top slab

Calculations for stresses at the Serviceability Limit State (SLS) to BS5400-4:1990 implemented by DOT Departmental Standard BD 44/15.

Span of beam span=15 m

Beam Y 1 section properties

- Depth of beam d=700 mm
- Cross-sectional area Ac=310140 mm²
- Centroid above soffit Yb=255 mm
- Section modulus top Zt=24.88E6 mm³
- Section modulus bottom Zb=43.42E6 mm³
- Unit weight of beam uwb=24.5 kN/m³

Concrete strengths

- Strength at transfer fci=37.5 N/mm²
- Characteristic strength fcu=45 N/mm²

Concrete moduli

- Modulus of elasticity at transfer for concrete strength 37.5 N/mm² is: Eci=30.25 kN/mm²
- Modulus of elasticity for concrete strength 45 N/mm² is: Ecb=32.5 kN/mm²

Composite section properties

- Char strength of in-situ concrete fcuc=30 N/mm²
- Modulus of elasticity for concrete strength 30 N/mm² is: Ecc=28 kN/mm²
Transf'med second moment of area:
Depth of composite section \( di = 810 \text{ mm} \)
Nominal diameter \( \text{nomd} = 12 \text{ mm} \)
Nominal tensile strength \( \text{nomt} = 1600 \text{ N/mm}^2 \)
Nominal steel area \( \text{noma} = 90 \text{ mm}^2 \)
Characteristic breaking load \( \text{cbl} = 160 \text{ kN} \)
Initial force per strand \( \text{if} = 100 \text{ kN} \)
Modulus of elasticity \( \text{Es} = 200 \text{ kN/mm}^2 \)

**Cross-section 1**

Distance from mid-span of beam \( \text{csd}(1) = 2.4 \text{ m} \)
Number of layers of strand \( \text{nls}(1) = 3 \)
Height above soffit \( \text{ds}(1) = 50 \text{ mm} \)
Number of strands \( \text{ns}(1) = 8 \)

**WARNING:**
**Strand location is non-standard.**

Height above soffit \( \text{ds}(2) = 100 \text{ mm} \)
Number of strands \( \text{ns}(2) = 12 \)

**WARNING:**
**Strand location is non-standard.**
Height above soffit \( ds(3) = 250 \text{ mm} \)
Number of strands \( ns(3) = 6 \)

**WARNING:**

Strand location is non-standard.

Bending moment from temp.loads \( tlb(1) = 166 \text{ kNm} \)
Bending moment from other loads \( olb(1) = 191 \text{ kNm} \)

**Short Term Losses**

Relaxation at transfer ( % ) \( str = 1 \)

Losses at Transfer

Initial force 6400 kN
Force at transfer Pt=P0-loft=5713.7 kN
### Beam Concrete Stresses at Transfer

**Stress Limitations (BS EN 1992-1-1, Clause 5.10.2.2)**

**Top of beam:**

**WARNING:**
The flexural tensile stress 1.0948 N/mm² at transfer in the concrete due to prestress and co-existent dead and temporary loads during erection should not exceed 1 N/mm² (as was permitted in BS5400-4).

**Bottom of beam:**
Compressive stress 18.838 N/mm² is less than allowable stresses of $0.7*f_{cki}=22.4$ N/mm² and $0.6*f_{ck}=25.2$ N/mm².

### Long Term Losses (BS EN 1992-1-1, Clause 5.10.6(1))

Relaxation after transfer( % ) $slr(1)=1$
Shrinkage per unit length $sul(1)=0.3E-3$
Creep coefficient $\varphi(\infty, to)$ $crf=2$

Beam concrete stresses - Long term

**Composite section**

- Height from beam soffit to bottom of in-situ concrete: \( hs_{is} = 202 \ \text{mm} \)
- Percentage of shrinkage remaining: \( ps = 45 \% \)
- Percentage: \( pr_c = 45 \% \)
- Percentage: \( st_T = 60 \% \)
- The net moment is: \( Mc = F \cdot e / 1E3 - Mb = -1024.7 \ \text{kNm} \)

Stress at top of in-situ concrete:
\[
ft_{isds} = \left( \frac{F}{Ai \cdot mr} - \frac{F}{Ai \cdot mr + Ac} - Mc \cdot 1E3 \cdot (d_Y - Yc) / Ic \right) \cdot mr \cdot 1E3
\]
\[
= -0.23412 \ \text{N/mm}^2
\]

Stress at bottom of in-situ concrete:
\[
fb_{isds} = \left( \frac{F}{Ai \cdot mr} - \frac{F}{Ai \cdot mr + Ac} - Mc \cdot 1E3 \cdot (hs_{is} - Yc) / Ic \right) \cdot mr \cdot 1E3
\]
\[
= 4.3851 \ \text{N/mm}^2
\]

Stress at top of precast concrete beam:
\[
ft_{pbds} = \left( \frac{F}{Ai \cdot mr + Ac} + Mc \cdot 1E3 \cdot (d_Y - Yc) / Ic + Mb \cdot 1E3 \cdot Yt / Iyy \right) \cdot 1E3
\]
\[
= -2.9706 \ \text{N/mm}^2
\]

Stress at bottom of precast concrete beam:
\[
fb_{pbds} = \left( \frac{F}{Ai \cdot mr + Ac} - Mc \cdot 1E3 \cdot Yc / Ic - Mb \cdot 1E3 \cdot Yb / Iyy \right) \cdot 1E3
\]
\[
= -0.79191 \ \text{N/mm}^2
\]

### Composite section

Height from beam soffit to bottom of in-situ concrete: \( h_{sis} = 1065 \text{ mm} \)

Per cent of shrinkage remaining in cement paste: \( p_s = 25 \% \)

Percentage of shrinkage remaining in concrete: \( p_c = 25 \% \)

Percentage of shrinkage remaining in steel: \( s_T = 67 \% \)

The net moment is: \( M_c = F*e/1E3 - M_b = -7.8846 \text{ kNm} \)

Stress at top of in-situ concrete:

\[
\text{ftisds} = -\left( \frac{F}{(A_i \cdot mr)} - \frac{F}{(A_i \cdot mr + A_c)} - M_c \cdot 1E3 \cdot (d - Y_c)/I_c \right) \cdot mr \cdot 1E3
\]

Stress at bottom of in-situ concrete:

\[
\text{fbisds} = -\left( \frac{F}{(A_i \cdot mr)} - \frac{F}{(A_i \cdot mr + A_c)} - M_c \cdot 1E3 \cdot h_{sis} - Y_c)/I_c \right) \cdot mr \cdot 1E3
\]

Stress at top of precast concrete beam:

\[
\text{ftpbsd} = \left( \frac{F}{(A_i \cdot mr + A_c)} + M_c \cdot 1E3 \cdot (d - Y_c)/I_c + M_b \cdot 1E3 \cdot Y_t/I_{xx} \right) \cdot 1E3
\]

Stress at bottom of precast concrete beam:

\[
\text{fbpdbd} = \left( \frac{F}{(A_i \cdot mr + A_c)} - M_c \cdot 1E3 \cdot Y_c/I_c - M_b \cdot 1E3 \cdot Y_b/I_{xx} \right) \cdot 1E3
\]

Top of in-situ concrete:
Compressive stress 6.376 \( \text{N/mm}^2 \) is less than the maximum allowable stress of 0.5*fcu\(_{\text{uc}}\)=15 \( \text{N/mm}^2 \).
Top of beam:
Compressive stress 13.31 \( \text{N/mm}^2 \) is less than the maximum allowable stress of 0.4*fcu\(_{\text{cu}}\)=20 \( \text{N/mm}^2 \).
Bottom of in-situ concrete:
Compressive stress $4.8492 \text{ N/mm}^2$ is less than the maximum allowable stress of $0.5 \times f_{cu,c}=15 \text{ N/mm}^2$.

Bottom of beam:
Tensile stress $0.75768 \text{ N/mm}^2$ is less than the maximum allowable tensile stress of $3.182 \text{ N/mm}^2$. 
Location: Ex2 - 20 metre span beam

Precast prestressed concrete beam with non-standard section

Calculations for stresses at the Serviceability Limit State (SLS) to BS5400-4:1990 implemented by DOT Departmental Standard BD 44/15.

Span of beam span=20 m

Beam section properties

- Depth of beam \( d = 1040 \, \text{mm} \)
- Cross-sectional area \( A_c = 387050 \, \text{mm}^2 \)
- Centroid above soffit \( Y_b = 409 \, \text{mm} \)
- Section modulus top \( Z_t = 75.39 \times 10^6 \, \text{mm}^3 \)
- Section modulus bottom \( Z_b = 116.23 \times 10^6 \, \text{mm}^3 \)
- Unit weight of beam \( u_{wb} = 24 \, \text{kN/m}^3 \)

Concrete strengths

- Strength at transfer \( f_{ci} = 40 \, \text{N/mm}^2 \)
- Characteristic strength \( f_{cu} = 50 \, \text{N/mm}^2 \)

Concrete moduli

- Modulus of elasticity at transfer for concrete strength 40 N/mm² is: \( E_{ci} = 31 \, \text{kN/mm}^2 \)
- Modulus of elasticity for concrete strength 50 N/mm² is: \( E_{cb} = 34 \, \text{kN/mm}^2 \)

Composite section properties

- Char strength (in-situ concrete) \( f_{cuc} = 40 \, \text{N/mm}^2 \)
- Modulus of elasticity for concrete strength 40 N/mm² is: \( E_{cc} = 31 \, \text{kN/mm}^2 \)
- Depth of composite section \( d_i = 1165 \, \text{mm} \)
- Area of in-situ concrete \( A_i = 229500 \, \text{mm}^2 \)
- Centroid of in-situ concrete \( Y_i = 1087.9 \, \text{mm} \)
- Centroid of composite section \( Y_c = 661.69 \, \text{mm} \)
- Second moment of area \( I_c = 114.4 \times 10^9 \, \text{mm}^4 \)
- Initial force per strand \( i_f = 174 \, \text{kN} \)
- Modulus of elasticity \( E_s = 195 \, \text{kN/mm}^2 \)

Cross-section 1

- Distance from mid-span of beam \( c_{sd(1)} = 0 \, \text{m} \)
- Number of layers of strand \( n_{ls(1)} = 4 \)
- Height above soffit \( d_s(1) = 60 \, \text{mm} \)
- Number of strands \( n_s(1) = 11 \)
- Height above soffit \( d_s(2) = 110 \, \text{mm} \)
- Number of strands \( n_s(2) = 14 \)
- Height above soffit \( d_s(3) = 880 \, \text{mm} \)
- Number of strands \( n_s(3) = 2 \)
- Height above soffit \( d_s(4) = 930 \, \text{mm} \)
Number of strands \( ns(4) = 2 \)

Combination 2 to 5 Loading - Stresses

Combination 3 loading. The stresses from the Proforma for temperature differences should be added to the total stresses.

Top of in-situ concrete:
Compressive stress 10.914 N/mm² is less than the maximum allowable stress of 0.5*fcuc=15 N/mm².
Top of beam:
Compressive stress 15.579 N/mm² is less than the maximum allowable stress of 0.4*fcu=20 N/mm².
Bottom of in-situ concrete:
Tensile stress 5.0129 N/mm² is less than the modified maximum allowable tensile stress of 5.4 N/mm² from Table 32.

WARNING:
Bottom of beam:
Tensile stress 7.5078 N/mm² exceeds modified max allowable
tensile stress of 1.382 N/mm².
Location: Ex4 - 17.0 metre span solid section

Precast prestressed concrete beam with non-standard section

Calculations for stresses at the Serviceability Limit State (SLS) to BS5400-4:1990 implemented by DOT Departmental Standard BD 44/15.

Span of beam: span=17 m

Beam section properties

- Depth of beam: d=775 mm
- Cross-sectional area: Ac=163360 mm²
- Centroid above soffit: Yb=334 mm
- Section modulus top: Zt=24.31E6 mm⁴
- Section modulus bottom: Zb=32.1E6 mm⁴
- Unit weight of beam: uwb=25 kN/m³

Concrete strengths

- Strength at transfer: fci=35 N/mm²
- Characteristic strength: fcu=40 N/mm²

Concrete moduli

- Modulus of elasticity at transfer for concrete strength 35 N/mm² is: Eci=29.5 kN/mm²
- Modulus of elasticity for concrete strength 40 N/mm² is: Ecb=31 kN/mm²

Composite section properties

- Char strength (in-situ concrete): fcuc=35 N/mm²
- Modulus of elasticity for concrete strength 35 N/mm² is: Ecc=29.5 kN/mm²
- Depth of composite section: di=850 mm
- Area of in-situ concrete: Ai=304140 mm²
- Centroid of composite section: Yc=425 mm
- Second moment of area: Ic=28.147E9 mm⁶
- Initial force per strand: if=200 kN
- Modulus of elasticity: Es=195 kN/mm²

Cross-section 1

- Distance from mid-span of beam: csd(1)=6 m
- Number of layers of strand: nls(1)=6
- Height above soffit: ds(1)=50 mm
- Number of strands: ns(1)=4
- Height above soffit: ds(2)=90 mm
- Number of strands: ns(2)=3
- Height above soffit: ds(3)=260 mm
- Number of strands: ns(3)=1
- Height above soffit: ds(4)=500 mm
- Number of strands: ns(4)=1
Height above soffit          \( ds(5) = 620 \text{ mm} \)
Number of strands          \( ns(5) = 1 \)
Height above soffit          \( ds(6) = 740 \text{ mm} \)
Number of strands          \( ns(6) = 1 \)

Loading Combination 2 - Stresses

NOTE: The stresses from temperature differences should be added to the total stresses.

Top of in-situ concrete:
Compressive stress 8.3928 N/mm² is less than the maximum allowable stress of 0.6*fckc=19.2 N/mm².

Top of beam:
Compressive stress 15.248 N/mm² is less than the maximum allowable stress of 0.6*fck=24 N/mm².
Bottom of in-situ concrete:
Compressive stress 5.8929 N/mm$^2$ is less than the maximum allowable stress of $0.6f_{ckc}=19.2$ N/mm$^2$.

Bottom of beam:
Tensile stress 1.3411 N/mm$^2$ is less than the maximum allowable tensile stress of 3.0263 N/mm$^2$. 
Location: Ex3 - 13.5 metre span solid edge beam

Precast prestressed concrete beam with non-standard section

Beam span under consideration span=13.5 m

Beam section properties

- Depth of beam d=615 mm
- Cross-sectional area Ac=130675 mm²
- Centroid above soffit Yb=244 mm
- Section modulus top Zt=14.3E6 mm³
- Section modulus bottom Zb=21.81E6 mm³
- Unit weight of beam uwb=25 kN/m³

Concrete compressive strengths

- Characteristic cylinder strength fcki=32 N/mm² (transfer)
- Characteristic cylinder strength fck=40 N/mm²

Concrete moduli (short-term)

- Concrete modulus of elasticity Ecmi=33 kN/mm² (transfer)
- Concrete modulus of elasticity Ecmb=35 kN/mm²

Composite section properties

- Char strength (in-situ concrete) fckc=28 N/mm²
- Short-term modulus of elasticity for in-situ concrete Ecmc=32 kN/mm²

Item No. 1

- Item weighting iw1=0.91429

Rectangular column interaction diagrams for uniaxial bending

The calculation produces a column interaction diagram and tabular results for axial load and uniaxial bending on a rectangular section. The analysis is in accordance with BS5400-4:1990 as implemented by DOT Standard BD 44/15. The method used is that described in Clause 5.5.3.2 with the stresses in the concrete in compression derived from the stress-strain curve in Figure 1. The axial force is assumed to act at the centroid of the gross concrete section.

Rectangular column section

Consider bending about X-X the major axis.

Rectangular column interaction diagrams for uniaxial bending

The calculation produces a column interaction diagram and tabular results for axial load and uniaxial bending on a rectangular section. The analysis is in accordance with BS EN 1992-2:2005 and the NA to BS EN 1992-2:2005 and utilises the stresses in the concrete in compression derived from the stress-strain curve in Figure 3.3. The axial force is assumed to act at the centroid of the gross concrete section.

![Rectangular column section diagram](image)

Consider bending about Y-Y the major axis.

Breadth of concrete section \( b = 350 \text{ mm} \)
Depth of concrete section \( h = 450 \text{ mm} \)
Number of layers of reinforcement \( n = 2 \)

The calculations utilise the following material factors which are in accordance with BS EN 1992-1-1 (Table 2.1N):

- Concrete material factor \( \gamma_c \) \( \gamma_c = 1.50 \)
- Steel material factor \( \gamma_s \) \( \gamma_s = 1.15 \)
- Char. strength of reinforcement \( f_y = 500 \text{ N/mm}^2 \)
- Young's modulus for reinforcement \( E_m = 200000 \text{ N/mm}^2 \)
- Area of reinforcement \( A(1) = 1608.5 \text{ mm}^2 \)
- Depth from compression face \( d(1) = 60 \text{ mm} \)
- Area of reinforcement \( A(2) = 981.75 \text{ mm}^2 \)
- Depth from compression face \( d(2) = 390 \text{ mm} \)

Circular column interaction diagrams for uniaxial bending

The calculation produces a column interaction diagram and tabular results for axial load and uniaxial bending on a circular section. The analysis is in accordance with BS5400-4:1990 as implemented by DOT Standard BD 44/15. The method used is that described in Clause 5.5.3.2 with the stresses in the concrete in compression derived from the stress-strain curve in Figure 1. The axial force is assumed to act at the centroid of the gross concrete section.

Diameter of concrete section \( d = 900 \text{ mm} \)
Char. strength of concrete \( f_{cu} = 40 \text{ N/mm}^2 \)
Total area of reinforcement \( A_r = 7977 \text{ mm}^2 \)
Char. strength of reinforcement \( f_{ym} = 460 \text{ N/mm}^2 \)
Young's modulus for r'ment \( E_m = 200000 \text{ N/mm}^2 \)
Concrete material factor \( \gamma_m \) \( \gamma_m = 1.50 \)
Steel material factor \( \gamma_m \) \( \gamma_m = 1.15 \)
Number of bars \( n_o = 16 \)
Radial distance to centre of bars \( d_{tc} = 62 \text{ mm} \)

Circular column interaction diagrams for uniaxial bending

The calculation produces a column interaction diagram and tabular results for axial load and uniaxial bending on a circular section. The analysis is in accordance with BS EN 1992-2:2005 and the NA to BS EN 1992-2:2005 and utilises the stresses in the concrete in compression derived from the stress-strain curve in Figure 3.3.

Circular column section

Consider bending about the Y-Y axis.

Diameter of concrete section $d=900$ mm
Total area of reinforcement $A_r=7977$ mm$^2$
Char. strength of reinforcement $f_{yk}=500$ N/mm$^2$
Young's modulus for r'ment $E_m=200000$ N/mm$^2$
The calculations utilise the following material factors which are in accordance with BS EN 1992-1-1 (Table 2.1N):
Concrete material factor $\gamma_c$ $\gamma_{mc}=1.50$
Steel material factor $\gamma_s$ $\gamma_{ms}=1.15$
Number of bars $n_{ob}=16$
Radial distance to centre of bars $d_{tc}=62$ mm

Moment (kNm)
Interaction diagrams for uniaxial bending of a general column

The calculation produces a column interaction diagram and tabular results for axial load and uniaxial bending on a general column section. The analysis is in accordance with BS5400-4:1990 as implemented by DOT Standard BD 44/15. The method used is that described in Clause 5.5.3.2 with the stresses in the concrete in compression derived from the stress-strain curve in Figure 1. The axial force is assumed to act at the centroid of the gross concrete section.

Char. strength of concrete     $f_{cum}=40 \text{ N/mm}^2$
Number of cross-sections      $n_{cs}=2$
Cross-section 1
Cross-section 2
Number of layers of reinforcement $n=2$
Char. strength of reinforcement $f_{ym}=460 \text{ N/mm}^2$
Young's modulus of reinforcement $E_m=200000 \text{ N/mm}^2$
Concrete material factor $g_m=1.50$
Steel material factor $g_{ms}=1.15$
Reinforcement layer 1 :
Area of reinforcement         $A(1)=1608.5 \text{ mm}^2$
Depth from compression face   $d(1)=60 \text{ mm}$
Reinforcement layer 2 :
Area of reinforcement         $A(2)=981.75 \text{ mm}^2$
Depth from compression face   $d(2)=390 \text{ mm}$

Interaction diagrams for uniaxial bending of a general column section

The calculation produces a column interaction diagram and tabular results for axial load and uniaxial bending on a general column section. The analysis is in accordance with BS EN 1992-2:2005 and the NA to BS EN 1992-2:2005 and utilises the stresses in the concrete in compression derived from the stress-strain curve in Figure 3.3. The axial force is assumed to act at the centroid of the gross concrete section.

Number of cross-sections          ncs=2
Cross-section 1                   
Cross-section 2                   
Number of layers of r'ment        n=2
Char. strength of reinforcement   fyk=500 N/mm²
Young's modulus of r'ment         Em=200000 N/mm²
The calculations utilise the following material factors which are in accordance with BS EN 1992-1-1 (Table 2.1N):
Concrete material factor γm       γmc=1.50
Steel material factor γm          γms=1.15
Reinforcement layer 1 :           
Area of reinforcement             A(1)=1608.5 mm²
Depth from compression face       d(1)=60 mm
Reinforcement layer 2 :           
Area of reinforcement             A(2)=981.75 mm²
Depth from compression face       d(2)=390 mm

Rectangular column interaction diagrams for biaxial bending

The calculation produces a column interaction diagram and tabular results for axial load and biaxial bending on a rectangular section. The analysis is in accordance with BS5400-4:1990 as implemented by DOT Standard BD 44/15. The method used is that described in Clause 5.5.3.2 with the stresses in the concrete in compression derived from the stress-strain curve in Figure 1. The axial force is assumed to act at the centroid of the gross concrete section.

![Rectangular column section with biaxial bending.](image)

- Breadth of concrete section: \( b = 350 \text{ mm} \)
- Depth of concrete section: \( h = 450 \text{ mm} \)
- Char. strength of concrete: \( f_{cu} = 40 \text{ N/mm}^2 \)
- Number of layers of reinforcement: \( n = 2 \)
- Char. strength of reinforcement: \( f_{ym} = 460 \text{ N/mm}^2 \)
- Young's modulus for reinforcement: \( E_m = 200000 \text{ N/mm}^2 \)
- Concrete material factor: \( \gamma_m = 1.50 \)
- Steel material factor: \( \gamma_{ms} = 1.15 \)
- Reinforcement layer 1:
  - Number of bars: \( n_{ob}(1) = 7 \)
  - x co-ordinate: \( x_s(1) = 50 \text{ mm} \)
  - y co-ordinate: \( y_s(1) = 50 \text{ mm} \)
  - Location of last bar: \( x_f(1) = 300 \text{ mm} \)
  - Diameter of bars: \( d_{ob}(1) = 16 \text{ mm} \)
- Reinforcement layer 2:
  - Number of bars: \( n_{ob}(2) = 7 \)
  - x co-ordinate: \( x_s(2) = 50 \text{ mm} \)
  - y co-ordinate: \( y_s(2) = 400 \text{ mm} \)
  - Location of last bar: \( x_f(2) = 300 \text{ mm} \)
  - Diameter of bars: \( d_{ob}(2) = 16 \text{ mm} \)
Angle $\theta=45^\circ$

Faces 1 and 2 under compression from actions of biaxial bending.

Rectangular column interaction diagrams for biaxial bending

The calculation produces a column interaction diagram and tabular results for axial load and biaxial bending on a rectangular section. The analysis is in accordance with BS EN 1992-2:2005 and the NA to BS EN 1992-2:2005 and utilises the stresses in the concrete in compression derived from the stress-strain curve in Figure 3.3.

Rectangular column section with biaxial bending.

Breadth of concrete section \( b=350 \) mm
Depth of concrete section \( h=450 \) mm
Number of layers of r'ment \( n=2 \)
Char. strength of reinforcement \( f_{yk}=500 \) N/mm²
Young's modulus for r'ment \( E_m=200000 \) N/mm²

The calculations utilise the following material factors which are in accordance with BS EN 1992-1-1 (Table 2.1N):
Concrete material factor \( \gamma_c \) \( \gamma_c=1.50 \)
Steel material factor \( \gamma_s \) \( \gamma_s=1.15 \)
Reinforcement layer 1 :
Number of bars \( n_{ob}(1)=7 \)
x co-ordinate \( x_s(1)=50 \) mm
y co-ordinate \( y_s(1)=50 \) mm
Location of last bar \( x f(1)=300 \) mm
Diameter of bars \( d_{ob}(1)=16 \) mm
Reinforcement layer 2 :
Number of bars \( n_{ob}(2)=7 \)
x co-ordinate \( x_s(2)=50 \) mm
y co-ordinate \( y_s(2)=400 \) mm
Location of last bar \( x f(2)=300 \) mm
Diameter of bars \( d_{ob}(2)=16 \) mm
Depth to Neutral Axis measured from corner A along a line normal to axis of bending.

Angle $\theta=45^\circ$

Faces 1 and 2 under compression from actions of biaxial bending.

Location: Combined compression and bending on substantial section.

Analysis of wall/slab section to requirements of BS8007
and/or BS8110

Calculations are undertaken for a section 1 metre in width. Section is assumed to be subjected primarily to bending (i.e. formulae 2 and 3 in Clause B.4 of BS8007 are used to determine stiffening effect of concrete, etc.)

Design to BS8110(1997) with partial safety factor for steel \( \gamma_S = 1.15 \)

Ultimate moment per metre width \( M = 950 \text{ kNm/m} \)

Service moment per metre width \( M_z' = 665 \text{ kNm/m} \)

Maximum permissible crack width \( C_w = 0.2 \text{ mm} \)

Shear force due to ultimate loads \( V = 450 \text{ kN/m} \)

Ultimate axial load (-ve tension) \( N_{ult}' = 400 \text{ kN/m} \)

Service axial load (-ve tension) \( N' = 280 \text{ kN/m} \)

Characteristic concrete strength \( f_{cu} = 35 \text{ N/mm}^2 \)

Elastic modulus of concrete \( E_c = 12000 \text{ N/mm}^2 \)

Characteristic steel strength \( f_y = 500 \text{ N/mm}^2 \)

Overall depth of concrete section \( h = 1000 \text{ mm} \)

Size of tension bars \( d_{iat} = 25 \text{ mm} \)

Spacing of tension bars \( s_{pac} = 150 \text{ mm} \)

Maximum dia.of coarse aggregate \( h_{agg} = 20 \text{ mm} \)

Size of compression bars \( d_{iac} = 20 \text{ mm} \)

Spacing of compression bars \( s_{pac} = 150 \text{ mm} \)

Designated exposure class is XC4

Specified fixing tolerance \( t_{ol} = 10 \text{ mm} \)

Nominal concrete cover \( c_{over} = 40 \text{ mm} \)

Chosen effective depth of section \( d = 947.5 \text{ mm} \)

Chosen depth to compression bars \( d' = 50 \text{ mm} \)

Temp.zone depth for tension steel \( t_rz = 250 \text{ mm} \)

Temp.zone depth for comp.steel \( c_rz = 250 \text{ mm} \)

Temp.fall: hydration peak and ambient \( T_1 = 20 \degree C \)

Seasonal variation in temperature \( T_2 = 5 \degree C \)

Chosen ratio of \( f_{ct}/f_b \) \( f_{ratio} = 0.67 \)

External restraint factor \( R = 0.5 \)

Thermal expansion coeff.for concrete \( \alpha = 10E^{-6} \)

Direct tensile strength \( f_{ct} = 1.6 \text{ N/mm}^2 \)
### REINFORCEMENT

**Tension steel:**
- **Size:** 25 mm
- **Spacing:** 150 mm
- **Area required:** 2427.4 mm²/m
- **Area provided:** 3272.5 mm²/m
- **Percentages:** (pcrit) 1.309 %
  
  provided : (gross) 0.32725 %
- **Weight provided:** 25.689 kg/m²

**Compression steel:**
- **Size:** 20 mm
- **Spacing:** 150 mm
- **Area required:** 0 mm²/m
- **Area provided:** 2094.4 mm²/m
- **Percentages:** (pcrit) 0.83776 %
  
  provided : (gross) 0.20944 %
- **Weight provided:** 16.441 kg/m²

### SUMMARY

- **Cover to all steel:** 40 mm
- **Total weight of steel:** 42.13 kg/m²

**satisfies:**
1. Ultimate limit-state
2. Service limit-state cracking in flexure
3. Temperature-cracking requirements

**Calculated crack widths**
- **Flexure:** In tension face: between bars 0.19345 mm
- **Temperature change:** In tension face 0.079975 mm
  
  In compression face 0.099969 mm
Location: Combined tension and bending

Analysis of wall/slab section to requirements of BS8007

and/or BS8110

Calculations are undertaken for a section 1 metre in width. Section is assumed to be subjected primarily to bending (i.e. formulae 2 and 3 in Clause B.4 of BS8007 are used to determine stiffening effect of concrete, etc.)

Design to BS8110(1997) with partial safety factor for steel gammaS=1.15

Ultimate moment per metre width  M=950 kNm/m
Service moment per metre width  Mz'=665 kNm/m
Maximum permissible crack width  Cw=0.2 mm
Shear force due to ultimate loads  V=325 kN/m
Ultimate axial load (-ve tension) Nult'=-1100 kN/m
Service axial load (-ve tension)  N'=-770 kN/m
Characteristic concrete strength  fcu=35 N/mm²
Elastic modulus of concrete  Ec=12000 N/mm²
Characteristic steel strength  fy=500 N/mm²
Overall depth of concrete section  h=1000 mm
Size of tension bars  diat=25 mm
Spacing of tension bars  spac=85 mm
Maximum dia.of coarse aggregate  hagg=20 mm
Size of compression bars  diac=20 mm
Spacing of compression bars  spacc=150 mm
Designated exposure class is XC4
Specified fixing tolerance  tol=10 mm
Nominal concrete cover  cover=40 mm
Chosen effective depth of section  d=947.5 mm
Chosen depth to compression bars  d'=50 mm
Temp.zone depth for tension steel  trz=250 mm
Temp.zone depth for comp.steel  crz=250 mm
Temp.fall: hydration peak and ambient  T1=20 °C
Seasonal variation in temperature  T2=5 °C
Chosen ratio of fct/fb  fratio=0.67
External restraint factor  R=0.5
Thermal expansion coeff.for concrete  alpha=10E-6
Direct tensile strength  fct=1.6 N/mm²

WARNING:
As the actual shearing stress of 0.34301 N/mm² exceeds the critical value of 0.2574 N/mm², the section is thus inadequate in shear.
Either a higher concrete grade must be employed or a thicker section must be adopted.
Location: Combined tension & bending (as Ex.2 but greater tension).

Compression steel:  
Size: 12 mm
Spacing: 150 mm
Area required: 0 mm²/m
Area provided: 753.98 mm²/m
Percentages: (pcrit) 0.75398 %
  provided: (gross) 0.37699 %
Weight provided: 5.9188 kg/m²

Cover to all steel: 40 mm
Total weight of steel: 30.58 kg/m²

satisfies:
1. Ultimate limit-state
2. Service limit-state cracking in flexure
3. Temperature-cracking requirements

Calculated

Flexure: In tension face: between bars 0.042077 mm
Turmpature change: In tension face 0.039789 mm
In compression face 0.099472 mm
Location: Ex1 - Compression & bending on substantial section

Analysis of wall/slab section to EC2 Part 3 and/or EC2 Part 1-1

Calculations are undertaken for a section 1.0 m in width.

Section under consideration is assumed to be subjected primarily to bending.

Design partial safety factor \( g_{am}=1.15 \) (reinforcement)

Design BM before redistribution \( M_{Ed}'=950 \) kNm/m

Design BM after redistribution \( M_{Ed}=950 \) kNm/m

Maximum permissible crack width \( w_k=0.2 \) mm

Design shear force \( V_{Ed}=300 \) kNm/m

Design axial load (-ve tension) \( N_{Ed}'=400 \) kN/m

Service axial load (-ve tension) \( N'=280 \) kN/m

Characteristic steel strength \( f_yk=500 \) N/mm²

Diameter of tension bars \( d_{iat}=32 \) mm

Spacing of tension bars \( d_{spac}=125 \) mm

Maximum dia. of coarse aggregate \( h_{agg}=20 \) mm

Diameter of compression bars \( d_{iac}=25 \) mm

Spacing of compression bars \( d_{spacc}=200 \) mm

Chosen effective depth of section \( d=944 \) mm

Chosen depth to compression bars \( d'=52.5 \) mm

Temp.fall: hydrat. peak & ambient \( T_1=20 \) °C

Long-term drop in temperature \( T_2=5 \) °C

### DESIGN

- Overall depth: 1000 mm
- Effective depth: 944 mm

### SUMMARY

- Parameter \( K \): 0.0381
- Parameter \( K' \): 0.1684

### FLEXURE

- Lever arm ratio \( z/d \): 0.95
- Steel area (tension): 2436 mm²/m
- Steel percentage req.: 0.2581%
- Minimum area of steel: 1358 mm²/m
- Maximum area of steel: 40000 mm²/m
- Distribution steel: 1358 mm²/m

### Shear resistance

- Term for shear resistance: \( v_{Rdc} = (\rho_1 \cdot f_{ck})^{1/3} = 2.672 \)
- Shear resistance: \( V_{Rdc} = C_{Rdc} \cdot k_s \cdot v_{Rdc} \cdot b \cdot w / d / 1000 = 442.1 \) kN
- Minimum stress: \( v_{min} = 0.035 \cdot k_s \cdot 1.5 \cdot f_{ck} \cdot 0.5 = 0.3268 \) N/mm²
- Minimum shear resistance: \( V_{Rdm} = v_{min} \cdot b \cdot w / d / 1000 = 308.5 \) kN
SHEAR SUMMARY

Design shear force 300 kN
Design shear resistance 442.1 kN

NOTE: The axial load has been ignored in the above shear calculation.

Flexural cracking caused by loading

Coefficient (ribbed bars) k1=1.14
Maximum crack spacing (Exp. 7.11) srmax=3.4*c+0.425*k1*k2*diat/ppeff =304.68 mm
Crack width (Expression 7.8) wk1=srmax*ecr=0.13469 mm
The crack width 0.13469 mm is less than the permissible value of 0.2 mm hence satisfactory.

Shrinkage & thermal cracking caused by edge restraint to movement

For cracking due to restraint to movement the whole section will be considered to be in tension (i.e. the neutral axis depth is -d). Coefficient of thermal expansion aTc=10 με/øC Coefficient k (to CIRIA C660) k=0.65 The full thickness of the section will be used below for evaluating the area of concrete within the tensile zone.

Area of conc.within tensile zone Act=b*h=1E6 mm²
The minimum steel area below is applicable in both directions.
Minimum steel area required Asmin=kc*k*Act*fcteff/fyk=3614 mm²/m
Min steel area required each face Asmin'=1807 mm²/m
The area of tension and compression reinforcement provided exceeds the minimum area required to control thermal and shrinkage cracking. Hence satisfactory.

(A) Tension reinforcement (outside layer):
Shrinkage strain (short-term) ecas=13.6 με
Shrinkage strain (long-term) ecal=45 με
The short-term crack width 0.033135 mm is less than the permissible value of 0.2 mm hence satisfactory.
The long-term crack width 0.069726 mm is less than the permissible value of 0.2 mm hence satisfactory.

(B) Compression reinforcement (outside layer):
Effective concrete area 1 a1c=b*2.5*(c'+diac/2)=131250 mm²
Effective concrete area 2 a2c=b*h/2=500000 mm²
The short-term crack width 0.054861 mm is less than the permissible value of 0.2 mm hence satisfactory.
The long-term crack width 0.11544 mm is less than the permissible value of 0.2 mm hence satisfactory.

**Shear resistance**

Term for shear resistance \( \nu_{Rdc} = (\rho_1 f_{ck})^{1/3} = 2.575 \)
Shear resistance \( \nu_{Rdc} CR_{dc} ks V_{Rdc} bw d/1000 = 427.2 \text{ kN} \)
Minimum stress \( \nu_{min} = 0.035 ks^{1.5} f_{ck} 0.5 = 0.3265 \text{ N/mm}^2 \)
Minimum shear resistance \( \nu_{Rdm} = \nu_{min} bw d/1000 = 309.4 \text{ kN} \)
SHEAR SUMMARY

Design shear force 325 kN
Design shear resistance 427.2 kN

NOTE: The axial load has been ignored in the above shear calculation.

Flexural cracking caused by loading

Coefficient (ribbed bars) $k_1=1.14$
Maximum crack spacing (Expression 7.11) $s_{rmax}=3.4c+0.425k_1k_2\frac{d_{iat}}{p_{peff}}=273.64$ mm
Crack width (Expression 7.8) $w_{k_1}=s_{rmax}ec_{r}=0.1367$ mm
The crack width 0.1367 mm is less than the permissible value of 0.2 mm hence satisfactory.

Shrinkage & thermal cracking caused by edge restraint to movement

For cracking due to restraint to movement the whole section will be considered to be in tension (i.e. the neutral axis depth is $-\infty$).
Coefficient of thermal expansion $a_{Tc}=10 \mu e/\circ C$
Coefficient $k$ (to CIRIA C660) $k=0.65$
The full thickness of the section will be used below for evaluating the area of concrete within the tensile zone.
Area of conc. within tensile zone $A_{ct}=bh=1E6$ mm$^2$
The minimum steel area below is applicable in both directions.
Minimum steel area required $A_{smin}=kc_kA_{ct}f_{cet eff}/f_{yk}=3614$ mm$^2/m$
Min steel area required each face $A_{smin}'=1807$ mm$^2/m$
The area of tension and compression reinforcement provided exceeds the minimum area required to control thermal and shrinkage cracking. Hence satisfactory.

(A) Tension reinforcement (outside layer):
Shrinkage strain (short-term) $e_{cas}=13.6 \mu e$
Shrinkage strain (long-term) $e_{cal}=45 \mu e$
The short-term crack width 0.02879 mm is less than the permissible value of 0.2 mm hence satisfactory.
The long-term crack width 0.060582 mm is less than the permissible value of 0.2 mm hence satisfactory.

(B) Compression reinforcement (outside layer):
Effective concrete area 1 $a_{1c}=b(2.5(c'+d_{iac}/2))=125000$ mm$^2$
Effective concrete area 2 $a_{2c}=bh/2=500000$ mm$^2$
The short-term crack width 0.050003 mm is less than the permissible value of 0.2 mm hence satisfactory.
The long-term crack width 0.10522 mm is less than the permissible value of 0.2 mm hence satisfactory.

Coefficient (ribbed bars) \( k_1 = 1.14 \)

Maximum crack spacing (Exp. 7.11) \( s_{\text{rmax}} = 3.4c + 0.425k_1k_2\text{diat/peff} = 251.05 \text{ mm} \)

Crack width (Expression 7.8) \( w_{k1} = s_{\text{rmax}} \text{ecr} = 0.056751 \text{ mm} \)

The crack width 0.056751 mm is less than the permissible value of 0.2 mm hence satisfactory.

### Shrinkage & thermal cracking caused by edge restraint to movement

For cracking due to restraint to movement the whole section will be considered to be in tension (i.e. the neutral axis depth is \( -\infty \)).

Coefficient of thermal expansion \( a_{TC} = 10 \text{ æî/øC} \)

The full thickness of the section will be used below for evaluating the area of concrete within the tensile zone.

Area of conc.within tensile zone \( A_{ct} = bh = 200000 \text{ mm\^2} \)

The minimum steel area below is applicable in both directions.

Minimum steel area required \( A_{smin} = k_c k A_{ct} f_{ct\text{eff}}/f_{yk} = 1112 \text{ mm\^2/m} \)

Min steel area required each face \( A_{smin'} = 556 \text{ mm\^2/m} \)

The area of tension and compression reinforcement provided exceeds the minimum area required to control thermal and shrinkage cracking. Hence satisfactory.

(A) Tension reinforcement (outside layer): Shrinkage strain (short-term) \( \varepsilon_{\text{cas}} = 13.6 \text{ æî} \)
Shrinkage strain (long-term) \( \varepsilon_{\text{cal}} = 45 \text{ æî} \)

The short-term crack width 0.041906 mm is less than the permissible value of 0.2 mm hence satisfactory.

The long-term crack width 0.09836 mm is less than the permissible value of 0.2 mm hence satisfactory.

(B) Compression reinforcement (outside layer):

Effective concrete area 1 \( a_{1c} = bh(2.5c') = 115000 \text{ mm\^2} \)

Effective concrete area 2 \( a_{2c} = bh/2 = 100000 \text{ mm\^2} \)

The short-term crack width 0.054501 mm is less than the permissible value of 0.2 mm hence satisfactory.

The long-term crack width 0.12792 mm is less than the permissible value of 0.2 mm hence satisfactory.

Parameter K 0.0367
Parameter K' 0.1684
Lever arm ratio z/d 0.95
Steel area (tension) 469.1 mm²/m
Steel percentage req. 0.2665 %
Minimum area of steel 265.1 mm²/m
Maximum area of steel 10000 mm²/m
Distribution steel 265.1 mm²/m

SUMMARY

FLEXURE

Shear resistance

Term for shear resistance VRdc=(rho1*fck)^(1/3)=3.015
Shear resistance VRdc=CRdc*ks*VRdc*bw*d/1000=127.4 kN
Minimum stress vmin=0.035*ks^1.5*fck^0.5=0.5422 N/mm²
Minimum shear resistance VRdm=vmin*bw*d/1000=95.43 kN
**Shear Summary**

**Design shear force:** 82 kN  
**Design shear resistance:** 127.4 kN

**Flexural cracking caused by loading**

Coefficient (ribbed bars) \( k_1 = 0.8 \)

Maximum crack spacing (Exp. 7.11) \( s_{r_{\text{max}}} = 3.4 \cdot c + 0.425 \cdot k_1 \cdot k_2 \cdot \text{diat}/p_{\text{peff}} = 337.34 \text{ mm} \)

Crack width (Expression 7.8) \( w_{k_1} = s_{r_{\text{max}}} \cdot e_{\text{cr}} = 0.094186 \text{ mm} \)

The crack width 0.094186 mm is less than the permissible value of 0.2 mm hence satisfactory.

**Shrinkage & thermal cracking caused by edge restraint to movement**

For cracking due to restraint to movement the whole section will be considered to be in tension (i.e. the neutral axis depth is \( -\infty \)).

Coefficient of thermal expansion \( a_{Tc} = 12 \cdot \mu \text{r}/\degree \text{C} \)

The full thickness of the section will be used below for evaluating the area of concrete within the tensile zone.

Area of conc. within tensile zone \( A_{t} = b \cdot h = 250000 \text{ mm}^2 \)

The minimum steel area below is applicable in both directions.

Minimum steel area required \( A_{s_{\min}} = k_c \cdot k \cdot A_{t} \cdot f_{c_{\text{teff}}} / f_{yk} = 1450 \text{ mm}^2 / \text{m} \)

Min steel area required each face \( A_{s_{\min}'} = 725 \text{ mm}^2 / \text{m} \)

The area of tension and compression reinforcement provided exceeds the minimum area required to control thermal and shrinkage cracking. Hence satisfactory.

(A) Tension face reinforcement:

Shrinkage strain (short-term) \( e_{c_{as}} = 15 \cdot \mu \text{r} \)

Shrinkage strain (long-term) \( e_{c_{al}} = 50 \cdot \mu \text{r} \)

Creep coefficient \( K = 1 \)

Calculation assumes internal condition (i.e. ambient RH=45%).

Design crack width (long-term) \( w_{k_{2l}} = s_{r_{\text{max}}} \cdot e_{c_{rl}} / 10^6 = 0.19868 \text{ mm} \)

The short-term crack width 0.050155 mm is less than the permissible value of 0.2 mm hence satisfactory.

The long-term crack width 0.19868 mm is less than the permissible value of 0.2 mm hence satisfactory.

(B) Compression face reinforcement:

Effective concrete area 1 \( a_{1c} = b \cdot 2.5 \cdot (c' + \text{diac}/2) = 120000 \text{ mm}^2 \)

Effective concrete area 2 \( a_{2c} = b \cdot h / 2 = 125000 \text{ mm}^2 \)

The short-term crack width 0.044617 mm is less than the permissible value of 0.2 mm hence satisfactory.

The long-term crack width 0.17674 mm is less than the permissible value of 0.2 mm hence satisfactory.

Shear resistance

\( V_{Rdc} = (\rho_1 \cdot f_{ck})^{1/3} = 3.399 \)

Shear resistance \( V_{Rdc} = C_{Rdc} \cdot k_s \cdot V_{Rdc} \cdot bw \cdot d/1000 = 187.3 \text{ kN} \)

Minimum stress \( v_{min} = 0.035 \cdot k_s \cdot 1.5 \cdot f_{ck} \cdot 0.5 = 0.5072 \text{ N/mm}^2 \)

Minimum shear resistance \( V_{Rdm} = v_{min} \cdot bw \cdot d/1000 = 121.7 \text{ kN} \)
**Shear Summary**

- **Design shear force**: 82 kN
- **Design shear resistance**: 187.3 kN

**Flexural Cracking caused by Loading**

- Coefficient (ribbed bars): \( k_1 = 0.8 \)
- Maximum crack spacing (Exp. 7.11): \( sr_{max} = 3.4c + 0.425k_1k_2\frac{d_{iat}}{p_{eff}} = 249.93 \text{ mm} \)
- Crack width (Expression 7.8): \( wk_1 = sr_{max}ecr = 0.061381 \text{ mm} \)

The crack width 0.061381 mm is less than the permissible value of 0.22 mm hence satisfactory.

**Shrinkage & Thermal Cracking caused by End Restraint to Movement**

For cracking due to restraint to movement the whole section will be considered to be in tension (i.e. the neutral axis depth is \(-\infty\)).

- Coefficient of thermal expansion: \( \alpha_T = 12 \mu \text{m/°C} \)
- The full thickness of the section will be used below for evaluating the area of concrete within the tensile zone.
- Area of conc. within tensile zone: \( Act = b\times h = 300000 \text{ mm}^2 \)
- The minimum steel area below is applicable in both directions.
- Minimum steel area required: \( As_{min} = kc\times k\times Act\times f_{ct\text{eff}}/fyk = 1740 \text{ mm}^2/m \)
- Min steel area required each face: \( As_{min}' = 870 \text{ mm}^2/m \)

The area of tension and compression reinforcement provided exceeds the minimum area required to control thermal and shrinkage cracking. Hence satisfactory.

(A) Tension reinforcement (outside layer):

- The short-term crack width 0.11512 mm is less than the permissible value of 0.22 mm hence satisfactory.
- The long-term crack width 0.19297 mm is less than the permissible value of 0.22 mm hence satisfactory.

(B) Compression reinforcement (outside layer):

- Effective concrete area 1: \( a_{1c} = b\times 2.5\times (c' + d_{iat}/2) = 100000 \text{ mm}^2 \)
- Effective concrete area 2: \( a_{2c} = b\times h/2 = 150000 \text{ mm}^2 \)

The short-term crack width 0.074108 mm is less than the permissible value of 0.22 mm hence satisfactory.
- The long-term crack width 0.12423 mm is less than the permissible value of 0.22 mm hence satisfactory.

Shear resistance

Term for shear resistance \( \nu_{Rdc} = (\rho_{1} \cdot f_{ck})^{1/3} = 2.98 \)
Shear resistance \( \nu_{Rdc} = C_{Rdc} \cdot k_{s} \cdot \nu_{Rdc} \cdot b \cdot w_{d} / 1000 = 243 \) kN
Minimum stress \( \nu_{min} = 0.035 \cdot k_{s} \cdot 1.5 \cdot f_{ck} \cdot 0.5 = 0.4284 \) N/mm²
Minimum shear resistance \( \nu_{Rdm} = \nu_{min} \cdot b \cdot w_{d} / 1000 = 170.3 \) kN
SHEAR SUMMARY

**Design shear force**: 150 kN
**Design shear resistance**: 243 kN

**Flexural cracking caused by loading**

Coefficient (ribbed bars) \( k_1 = 0.8 \)
Maximum crack spacing (Exp. 7.11) \( s_{r\text{max}} = 3.4 \times c + 0.425 \times k_1 \times k_2 \times \text{diat/ppeff} = 273.19 \text{ mm} \)
Crack width (Expression 7.8) \( w_k = s_{r\text{max}} \times e_{cr} = 0.16391 \text{ mm} \)
The crack width 0.16391 mm is less than the permissible value of 0.169 mm hence satisfactory.

**Shrinkage & thermal cracking caused by edge restraint to movement**

For cracking due to restraint to movement the whole section will be considered to be in tension (i.e. the neutral axis depth is \( -\infty \)).
Coefficient of thermal expansion \( a_Tc = 12 \mu e/\circ C \)
The full thickness of the section will be used below for evaluating the area of concrete within the tensile zone.
Area of conc.within tensile zone \( A_t = b \times h = 450000 \text{ mm}^2 \)
The minimum steel area below is applicable in both directions.
Minimum steel area required \( A_{s\text{min}} = k_c \times k \times A_t \times f_{c\text{teff}}/f_{yk} = 2336 \text{ mm}^2/\text{m} \)
Min steel area required each face \( A_{s\text{min}'} = 1168 \text{ mm}^2/\text{m} \)
The area of tension and compression reinforcement provided exceeds the minimum area required to control thermal and shrinkage cracking. Hence satisfactory.

(A) Tension face reinforcement:
Shrinkage strain (short-term) \( e_{c\text{as}} = 15 \mu e \)
Shrinkage strain (long-term) \( e_{c\text{al}} = 50 \mu e \)
Creep coefficient \( K = 1 \)
Calculation assumes internal condition (i.e. ambient RH=45%).
Design crack width (long-term) \( w_{k2l} = s_{r\text{max}} \times e_{cr1}/10^6 = 0.14488 \text{ mm} \)
The short-term crack width 0.040649 mm is less than the permissible value of 0.169 mm hence satisfactory.
The long-term crack width 0.14488 mm is less than the permissible value of 0.169 mm hence satisfactory.

(B) Compression face reinforcement:
Effective concrete area 1 \( a_{1c} = b \times 2.5 \times (c' + \text{diac}/2) = 131250 \text{ mm}^2 \)
Effective concrete area 2 \( a_{2c} = b \times h/2 = 225000 \text{ mm}^2 \)
The short-term crack width 0.040649 mm is less than the permissible value of 0.169 mm hence satisfactory.
The long-term crack width 0.14488 mm is less than the permissible value of 0.169 mm hence satisfactory.

**FLEXURE**

**Shear resistance**

Term for shear resistance \( v_{Rdc} = (\rho_1 f_{ck})^{1/3} = 2.766 \)
Shear resistance \( V_{Rdc} = CR_{dc} * k_{s} * V_{Rdc} * b_{w} * d / 1000 = 75.68 \text{ kN} \)
Minimum stress \( v_{min} = 0.035 * k_{s} * 1.5 * f_{ck} * 0.5 = 0.56 \text{ N/mm}^2 \)
Minimum shear resistance \( V_{Rdm} = v_{min} * b_{w} * d / 1000 = 63.84 \text{ kN} \)
**SHEAR SUMMARY**

Design shear force  
1 kN

Design shear resistance  
75.68 kN

**Flexural cracking caused by loading**

Coefficient (ribbed bars)  
k1=0.8

Maximum crack spacing (Exp. 7.11)  
srmax=3.4*c+0.425*k1*k2*diat/ppeff  
=319.68 mm

Crack width (Expression 7.8)  
wk1=srmax*ecr=0.10123 mm

The crack width 0.10123 mm is less than the permissible value of 0.3 mm hence satisfactory.

Design shear stress \( v_{Ed} = V_{Ed} \times 10^3/(0.9 \times b \times d) = 0.6024 \text{ N/mm}^2 \)

Concrete strut capacity \( v_{Rdm} = 0.124 \times f_{ck} \times (1 - f_{ck}/250) = 3.083 \text{ N/mm}^2 \)

Angle of inclination of strut \( \theta' = 22^\circ \)

Number of shear legs \( nsl = 4 \)

Chosen spacing \( s = 300 \text{ mm} \)

**SHEAR SUMMARY**

- **Design shear force**: 450 kN
- **Design shear stress**: 0.6024 N/mm²
- **Concrete strut capacity**: 3.083 N/mm²
- **Area/spacing ratio**: 0.6773
- **Diameter of links**: 10 mm
- **Area of links**: 314 mm²
- **Maximum spacing**: 463 mm
- **Actual spacing**: 300 mm
Shrinkage & thermal cracking caused by edge restrained to movement

For cracking due to restraint to movement the whole section will be considered to be in tension (i.e. the neutral axis depth is negative). Coefficient of thermal expansion $a_{Tc} = 12 \, \mu e/°C$

The area of tension and compression reinforcement provided exceeds the minimum area required to control thermal and shrinkage cracking. Hence satisfactory.

(A) Tension reinforcement:
- Shrinkage strain (short-term) $e_{cas} = 13.6 \, \mu e$
- Shrinkage strain (long-term) $e_{cal} = 45 \, \mu e$

The short-term crack width 0.0187 mm is less than the permissible value of 0.2 mm hence satisfactory.

The long-term crack width 0.0854 mm is less than the permissible value of 0.2 mm hence satisfactory.

(B) Compression reinforcement:
The short-term crack width 0.0324 mm is less than the permissible value of 0.2 mm hence satisfactory.

The long-term crack width 0.1479 mm is less than the permissible value of 0.2 mm hence satisfactory.

Seasonal variation in temperature \( T_2 = 10 \text{ °C} \)
Design shear stress \( v_{Ed} = V_{Ed} \times 10^3 / (0.9 \times b \times d) = 1.069 \text{ N/mm}^2 \)
Concrete strut capacity \( v_{Rdm} = 0.124 \times f_{ck} \times (1 - f_{ck}/250) = 3.274 \text{ N/mm}^2 \)
Angle of inclination of strut \( \theta' = 22^\circ \)
Number of shear legs \( n\text{sl} = 4 \)
Chosen spacing \( s = 250 \text{ mm} \)

**SHEAR SUMMARY**

- Design shear force: 800 kN
- Design shear stress: 1.069 N/mm²
- Concrete strut capacity: 3.274 N/mm²
- Area/spacing ratio: 0.7867
- Diameter of links: 8 mm
- Area of links: 201 mm²
- Maximum spacing: 255 mm
- Actual spacing: 250 mm
Shrinkage & thermal cracking caused by edge restrained to movement

For cracking due to restraint to movement the whole section will be considered to be in tension (i.e. the neutral axis depth is -\infty ).

Coefficient of thermal expansion \( a_{TC} = 12 \, \mu e/\degree C \)

The area of tension and compression reinforcement provided exceeds the minimum area required to control thermal and shrinkage cracking. Hence satisfactory.

(A) Tension reinforcement:
Shrinkage strain (short-term) \( e_{cas} = 15 \, \mu e \)
Shrinkage strain (long-term) \( e_{cal} = 50 \, \mu e \)

The short-term crack width 0.0167 mm is less than the permissible value of 0.2 mm hence satisfactory.

The long-term crack width 0.0469 mm is less than the permissible value of 0.2 mm hence satisfactory.

(B) Compression reinforcement:

The short-term crack width 0.0308 mm is less than the permissible value of 0.2 mm hence satisfactory.

The long-term crack width 0.0864 mm is less than the permissible value of 0.2 mm hence satisfactory.

WARNING:

Spacing of bars is too great to satisfy service limit-state conditions.
Location: Ex3 Combined tension & bending, as Ex2 but greater tension

Analysis of rectangular beam section to EC2 Part 3 and/or Part 1-1

All bars test
Location: Example A.1 in 'Reinf. Concrete Design to BS8110' by Allen

Properties of transformed sections of reinforced concrete

Formulae for transformed section taken from Table 136 in 10th edition of 'Reinforced Concrete Designer's Handbook' by Reynolds and Steedman.

Rectangular cracked section (and flanged section where x ≤ hf )

\[ b \]
\[ d' \]
\[ d \]
\[ A's = \text{area of steel in compression} \]
\[ As = \text{area of steel in tension} \]

Width of section \( b = 1000 \) mm
Modular ratio \( \alpha_e = 7 \)
Tension reinforcement:
Depth to centroid of steel \( d = 124 \) mm
Size of bars \( \text{diam} = 12 \) mm
Spacing of bars \( \text{spct} = 200 \) mm
Area of tension steel \( A_s = \text{diam}^2 \pi/4 \times b / \text{spct} = 565.49 \) mm\(^2\)
Compression reinforcement:
Depth to centroid of steel \( d' = 25 \) mm
Area of compression steel \( A's = 0 \) mm\(^2\)
Depth to neutral axis \( x = d \times \text{SQR}(c_3^2 + 2 \times (c_2 + c_1 \times d'/d)) - d \times c_3 \)
\( = 27.623 \) mm
Second moment of area \( I_e = c_5 \times (c_4^3 / 3 + c_2 \times (1 - c_4)^2 + c_1 \times c_6^2) \)
\( = 43.793E6 \) mm\(^4\)
Location: Pier section at foundation

Elastic biaxial bending of a rectangular RC section

Units used in the calculations:
Input   Dimensions and bar diameters   mm
Forces                         kN
Bending moments                kNm
Output  Dimensions and co-ordinates    mm
Stresses                       N/mm²

Sign Convention for loading
A positive axial load causes compression in the section.
A positive moment is clockwise about the x or y axes.

Location: Fully cracked section. Axial load moves to centroid.

Elastic biaxial bending of a circular RC section

Units used in the calculations:

Input  Dimensions and bar diameters  mm
Forces                         kN
Bending moments                kNm

Output  Dimensions and co-ordinates  mm
Stresses                       N/mm²

Sign Convention for loading

A positive axial load causes compression in the section.
A positive moment is clockwise about the x or y axes.

A reinforcement set is defined by the following parameters:

Number of bars. Diameter of bars. Edge distance to centre of bars.
Anti-clockwise angle (θ) measured in degrees from local axis y' to locate first bar in set. Subsequent bars (if any) are positioned in an anti-clockwise sense from the first bar at equal centres.

Number of iterations 7
Location: Dodecagon with circular void

Elastic biaxial bending of a user defined reinforced concrete section

Units used in the calculations:
Input  Dimensions and bar diameters  mm
Forces  kN
Bending moments  kNm
Output  Dimensions and co-ordinates  mm
Stresses  N/mm²

Sign Convention for loading
A positive axial load causes compression in the section.
A positive moment is clockwise about the x or y axes.

Calculations in accordance with BS 5950 Part 3 Section 3.1 'Code of practice for design of simple and continuous composite beams'—July 1990 and with 'BS 5950-1: 2000' for construction stage design.

Deck ribs transverse to beam.

Beam span \( L_1 = 9 \) m
Beam centres (floor width carried) \( C = 3 \) m
Concrete cube strength \( f_{cu} = 25 \) N/mm\(^2\)
Air dry density for concrete \( D_c = 17.6 \) kN/m\(^3\)
Freshwet density for concrete \( D'_c = 18.8 \) kN/m\(^3\)
Deck spans onto supporting beam. 305 x 102 x 33 UB.
Young's Modulus \( E = 205 \) kN/mm\(^2\)
Slab depth \( D_s = 115 \) mm
Depth of profiling \( D_p = 50 \) mm
Centres of profiles \( C_t = 300 \) mm
Width at inside of profile \( b = 125 \) mm
Width at outside of profile \( p = 175 \) mm
Profiled steel deck \( d_{ecwt} = 0.12 \) kN/m\(^2\)
Reinforcement allowance \( d_{reinwt} = 0.04 \) kN/m\(^2\)
Steel beam allowance \( d_{selfwt} = 0.15 \) kN/m\(^2\)
Construction load allowance \( w_c = 0.5 \) kN/m\(^2\)
Other UDL on beam \( w'_d u = 0 \) kN/m
Ceiling and services \( w_{cs} = 0.25 \) kN/m\(^2\)
Imposed \( w_i = 3 \) kN/m\(^2\)
Partitions \( w_p = 1 \) kN/m\(^2\)
Wall or other UDL \( w_{du} = 0 \) kN/m
Number of studs across flange \( n_r = 1 \)
Spacing of connectors \( s_{apc1} = 225 \text{ mm} \)

Check on transverse reinforcement omitted.

Total permanent load \( V_{fp} = 81 \text{ kN} \)

| COMPOSITE | 305 x 102 x 33 UB Grade S 355 with 40 No. 19 dia. stud connectors @ 225 centres. |
| SECTION    | Section is satisfactory for construction, composite, elastic, plastic, moment, shear, deflection and natural frequency requirements. |
| SUMMARY    | |  

| FIRE | Exposed surface area 919.4 \( \text{ mm}^2 \) |
| RESISTANCE | Area of section 41.8 \( \text{ cm}^2 \) |
| SUMMARY    | Section factor 215 /m |

Load Ratio (R) 0.51253
Section does not have an inherent fire resistance of 30 minutes.
Fire protection should be provided
Location: Access steel example

Composite steel deck floor

Internal beam with U.D.Loading

Calculations in accordance with BS 5950 Part 3 Section 3.1 'Code of practice for design of simple and continuous composite beams'- July 1990 and with 'BS 5950-1: 2000' for construction stage design.

Deck ribs transverse to beam.

Beam span $L_1 = 7.5 \text{ m}$
Beam centres (floor width carried) $C = 3 \text{ m}$
Concrete cube strength $f_{cu} = 25 \text{ N/mm}^2$
Air dry density for concrete $D_c = 23.6 \text{ kN/m}^3$

WARNING:
For lightweight concrete grade of concrete should be C25 to C40
For normal concrete grade of concrete should be C30 to C50
**Location: Example 1 - Internal beam with UDL**

Beam span: \( L_1 = 9 \, \text{m} \)
Beam centres (floor width carried): \( C = 3 \, \text{m} \)
Concrete density (const. stage): \( D'_c = 19 \, \text{kN/m}^3 \)
Concrete density (final stage): \( D_c = 18 \, \text{kN/m}^3 \)
Deck spans onto supporting beam and restraints compression flange.

356 x 171 x 51 UKB

**DESIGN SUMMARY**

406 x 140 x 46 UKB Grade S 275

**CONSTRUCTION**

Steel yield strength 275 N/mm²
Concrete strength 25 N/mm²
Maximum moment 158 kNm
Moment resistance 244 kNm
Unity factor 0.648 ≤ 1
Maximum shear force 70.4 kN
Shear resistance 473 kN
Unity factor 0.149 ≤ 1
Deflection to span ratio
(G + Q) 1: 330

**DESIGN SUMMARY**

Effective width 2.25 m
Stud shear resistance 63.1 kN
Number of studs per rib 1 No.
Number of 19 mm studs 30 No.
Stud spacing 300 mm

**FINAL STAGE**

Design compressive force:
Concrete 1612 kN
Studs 947 kN
Shear connection ratio 0.588
Partial shear connection provided
Maximum moment 358 kNm
Moment resistance 408 kNm
Unity factor bending 0.88 ≤ 1
Maximum shear force 159 kN
Shear plastic resistance 473 kN
Unity factor shear 0.337 ≤ 1
Deflection to span ratio
at final stage (G + Q) 1: 254
Slab shear stress 1.5 N/mm²
Slab resistance 2.72 N/mm²
Min transverse reinft. 140 mm²/m
Normal weight concrete (NWC) assumed
Location: Example 9 - As Example 1 but using SCI P405 rules

Beam span: L1=9 m
Beam centres (floor width carried): C=3 m
Concrete density (const. stage): D'c=19 kN/m³
Concrete density (final stage): Dc=18 kN/m³
Deck spans onto supporting beam and restraints compression flange.

Dimensions (mm): h=355 b=171.5 tw=7.4 tf=11.5 r=10.2

DESIGN SUMMARY
610 x 305 x 149 UKB Grade S 355

CONSTRUCTION
Steel yield strength 345 N/mm²
Concrete strength 25 N/mm²

STAGE
Maximum moment 250 kNm
Moment resistance 1584 kNm
Unity factor 0.158 ≤ 1
Maximum shear force 66.6 kN
Shear resistance 1568 kN
Unity factor 0.042 ≤ 1

Deflection to span ratio
(G + Q) 1: 865

DESIGN SUMMARY
Effective width 1.54 m

FINAL STAGE
Stud shear resistance 65.8 kN
Studs across flange in pairs
Number of 19 mm studs 100 No.
Stud spacing 300 mm

Design compressive force:
Concrete 3188 kN
Studs 3188 kN

Shear connection ratio 1
Full shear connection provided

Maximum moment 469 kNm
Moment resistance 2196 kNm
Unity factor bending 0.213 ≤ 1
Maximum shear force 125 kN
Shear plastic resistance 1568 kN
Unity factor shear 0.08 ≤ 1

Deflection to span ratio
at final stage (G + Q) 1: 633
Slab shear force 438 kN/m
Slab resistance 439 kN/m
Min transverse reinft. 768 mm²/m

Lightweight concrete (LWC) assumed
Location: Ex3

Beam span \( L_1 = 9 \text{ m} \)
Beam centres \( C = 3 \text{ m} \)

### CONSTRUCTION

- **Steel yield strength**: 355 N/mm²
- **Concrete strength**: 25 N/mm²
- **Maximum moment**: 142 kNm
- **Moment resistance**: 256 kNm
- **Unity factor**: 0.555
- **Maximum shear force**: 48.1 kN
- **Shear resistance**: 461 kN
- **Unity factor**: 0.104

### DESIGN SUMMARY

- **Effective width**: 1.5 m
- **Stud shear resistance**: 72.6 kN
- **Number of studs per rib**: 1 No.
- **Number of 19 mm studs**: 22 No.
- **Stud spacing**: 270 mm

### FINAL STAGE

- **Design compressive force**:
  - **Concrete**: 1700 kN
  - **Studs**: 799 kN
- **Shear connection ratio**: 0.47
- **Partial shear connection provided**: True
- **Maximum moment**: 317 kNm
- **Moment resistance**: 381 kNm
- **Unity factor bending**: 0.832
- **Maximum shear force**: 106 kN
- **Shear plastic resistance**: 461 kN
- **Unity factor shear**: 0.231

### Deflection to span ratio:
- **At final stage (G + Q)**: 1: 327
- **Slab shear force**: 135 kN/m
- **Slab resistance**: 135 kN/m
- **Min transverse reinf.**: 174 mm²/m
- **Lightweight concrete (LWC) assumed**: True
Location: Ex2 - Solid slab

Location: Example 1 - beam on grid line A3

Beam span \( L_1 = 6 \text{ m} \)
Secondary beam span \( L_2 = 6 \text{ m} \)
Concrete cube strength \( f_{cu} = 25 \text{ N/mm}^2 \)
Air dry density for concrete \( D_c = 17.6 \text{ kN/m}^3 \)
Freshwet density for concrete \( D'c = 18.8 \text{ kN/m}^3 \)
Deck is parallel to supporting beam.
305 x 102 x 28 UB.
Young's Modulus \( E = 205 \text{ kN/mm}^2 \)
Slab depth \( D_s = 115 \text{ mm} \)
Depth of profiling \( D_p = 50 \text{ mm} \)
Centres of profiles \( C_t = 300 \text{ mm} \)
Width at inside of profile \( b = 125 \text{ mm} \)
Width at outside of profile \( p = 175 \text{ mm} \)
Profiled steel deck \( decwt = 0.12 \text{ kN/m} \)
Reinforcement allowance \( reinwt = 0.04 \text{ kN/m} \)
Steel beam allowance \( selfwt = 0.15 \text{ kN/m} \)
Construction load allowance \( wc = 0.5 \text{ kN/m}^2 \)
Other UDL on beam \( w'du = 0.33 \text{ kN/m} \)
Ceiling and services \( wcs = 0.25 \text{ kN/m}^2 \)
Imposed \( wi = 3 \text{ kN/m}^2 \)
Partitions \( wp = 1 \text{ kN/m}^2 \)
Wall or other UDL \( wdu = 7.83 \text{ kN/m} \)
Number of studs across flange  \( n_r = 1 \)
Spacing of connectors  \( s_p = 400 \text{ mm} \)

Check on transverse reinforcement omitted.

| COMPOSITE | 305 x 102 x 28 UB Grade S 355 |
| SECTION | with 16 No. 19 dia. stud |
| SUMMARY | connectors @ 375 centres. |

Section is satisfactory for construction, composite, elastic, plastic, moment, shear, deflection and natural frequency requirements.

| Construction stage moment | 50.717 kNm |
| Steel beam mom. capacity | 143.07 kNm |
| Const. stage deflection | 8.1747 mm |
| Composite stage moment | 176.25 kNm |
| Ultimate mom. capacity | 238.69 kNm |
| Vertical shear force | 75.193 kN |
| Ult. shear capacity | 394.52 kN |
| Composite stage deflection | 6.2614 mm |
Location: Example 2 - long span with solid slab

Beam span                      L1=15 m
Secondary beam span            L2=6 m
Concrete cube strength         fcu=25 N/mm²
Air dry density for concrete   Dc=17.6 kN/m³
Freshwet density for concrete  D'c=18.8 kN/m³
610 x 229 x 113 UB.
Young's Modulus                E=205 kN/mm²
Slab depth                     Ds=150 mm
Profiled steel deck            decwt=0.12 kN/m²
Reinforcement allowance        reinwt=0.04 kN/m²
Steel beam allowance           selfwt=0.55 kN/m²
Construction load allowance    wc=0.5 kN/m²
Other UDL on beam              w'du=0 kN/m
Ceiling and services           wcs=0.25 kN/m²
Imposed                        wi=3 kN/m²
Partitions                     wp=1 kN/m²
Wall or other UDL              wdu=0 kN/m
Number of studs across flange  nr=1
Percentage to be provided      per=90 %

Check on transverse reinforcement omitted.
COMPOSITE
